JOHNSON'S
NEW
UNIVERSAL CYCLOPÆDIA:
A
SCIENTIFIC AND POPULAR
TREASURY
OF
USEFUL KNOWLEDGE.

ILLUSTRATED WITH MAPS, PLANS, AND ENGRAVINGS.

EDITORS-IN-CHIEF.

FREDERICK A. P. BARNARD, S.T.D., LL.D., L.H.D., M.N.A.S.,
PRESIDENT OF COLUMBIA COLLEGE, NEW YORK;

ARNOLD GUYOT, PH.D., LL.D., M.N.A.S.,
PROFESSOR OF GEOLOGY AND PHYSICAL GEOGRAPHY, COLLEGE OF NEW JERSEY.

ASSOCIATE EDITORS.

MARTIN B. ANDERSON, A.M., LL.D.,
President of the University of Rochester, N. Y.;

JOHN G. BARNARD, A.M., LL.D., M.N.A.S.,
Col. U. S. Engineers, Bvt. Major-Gen. U. S. A.;

CHAS. F. CHANDLER, PH.D., M.D., LL.D., M.N.A.S.,
Prof. Anal. Chem., School of Mines, Columbia College;

AARON L. CHAPIN, A.M., S.T.D.,
President of Beloit College, Wisconsin;

HENRY DRISLER, A.M., LL.D.,
Jay Professor of Greek, Columbia College;

THEODORE W. DWIGHT, A.M., LL.D.,
Professor of Municipal Law, Columbia College;

CALEB G. FORSHEY, A.M., C.E.,
Formerly Prof. of Math. and Civ. Eng. in Jefferson Coll., Miss.;

OCTAVIUS B. FROTHINGHAM, A.M.,
Pastor Third Unitarian Society, N. Y. City;

THEODORE GILL, A.M., M.D., PH.D., M.N.A.S.,
Late Senior Assistant Librarian of the Library of Congress;

ASA GRAY, M.D., LL.D., M.N.A.S.,
Fisher Professor of Natural History, Harvard University;

HORACE GREELEY, LL.D.,
Founder of the New York Tribune;

SAMUEL S. HALDEMAN, A.M., LL.D., M.N.A.S.,
Prof. of Comparative Philology in the Univ. of Penn.;

WILLIAM T. HARRIS, A.M., LL.D.,
Ed. of The Journal of Speculative Phil., St. Louis, Mo.;

JOSEPH HENRY, LL.D., M.N.A.S.,
Secretary of Smithsonian Institution;

ROSWELL D. HITCHCOCK, A.M., S.T.D., LL.D.,
Washburn Prof. of Ch. Hist., Union Theo. Sem., N.Y.;

CHARLES P. KRAUTH, A.M., S.T.D., LL.D.,
Vice-Provost of the University of Penn.;

JOHN LE CONTE, A.M., M.D.,
President of the University of California;

GEORGE P. MARSH, LL.D., M.N.A.S.,
Envoy Extr. and Minis. Plenipo. of U.S. at Rome, Italy;

JOHN S. NEWBERRY, M.D., LL.D., M.N.A.S.,
Prof. of Geology and Palæontology, Columbia College;

FOXHALL A. PARKER, U.S.N.,
Commodore and Chief Signal Officer of the U.S. Navy;

WILLARD PARKER, A.M., M.D., LL.D.,
Professor of Surgery, Columbia College, Med. Dept.;

PHILIP SCHAFF, PH.D., S.T.D., LL.D.,
Baldwin Prof. of Sacred Lit., Union Theo. Sem., N.Y.;

JULIUS H. SEELYE, A.M., S.T.D., LL.D.,
President of Amherst College, Mass.;

WILLIAM STAUNTON, S.T.D.,
Founder and First Rect. of St. Peter's Ch., Brooklyn, N.Y.;

ALEXANDER H. STEPHENS, A.M., LL.D.,
Of Georgia, Member 43d Congress, U.S.A.;

ABEL STEVENS, A.M., LL.D.,
Formerly Editor of The Methodist, New York;

THOMAS O. SUMMERS, S.T.D., LL.D.,
Professor of Syst. Theol., Vanderbilt Univ., Tenn.;

WILLIAM P. TROWBRIDGE, A.M., M.N.A.S.,
Higgin Prof. of Dynam. Engineering, Yale Coll., Conn.;

THEODORE D. WOOLSEY, S.T.D., LL.D.,
Ex-President of Yale College, Conn.

ASSISTANT EDITORS.

PORTER C. BLISS, A.M., LINUS P. BROCKETT, A.M., M.D., CLARENCE COOK, A.M.,
CLEMENS PETERSEN, A.M., JOHN N. POMEROY, LL.D., HENRY WURTZ, A.M.

WITH NUMEROUS CONTRIBUTIONS FROM WRITERS OF DISTINGUISHED EMINENCE IN EVERY DEPARTMENT OF LETTERS AND SCIENCE IN THE UNITED STATES AND IN EUROPE.

Complete in Four Volumes, including Appendix.

VOLUME I.

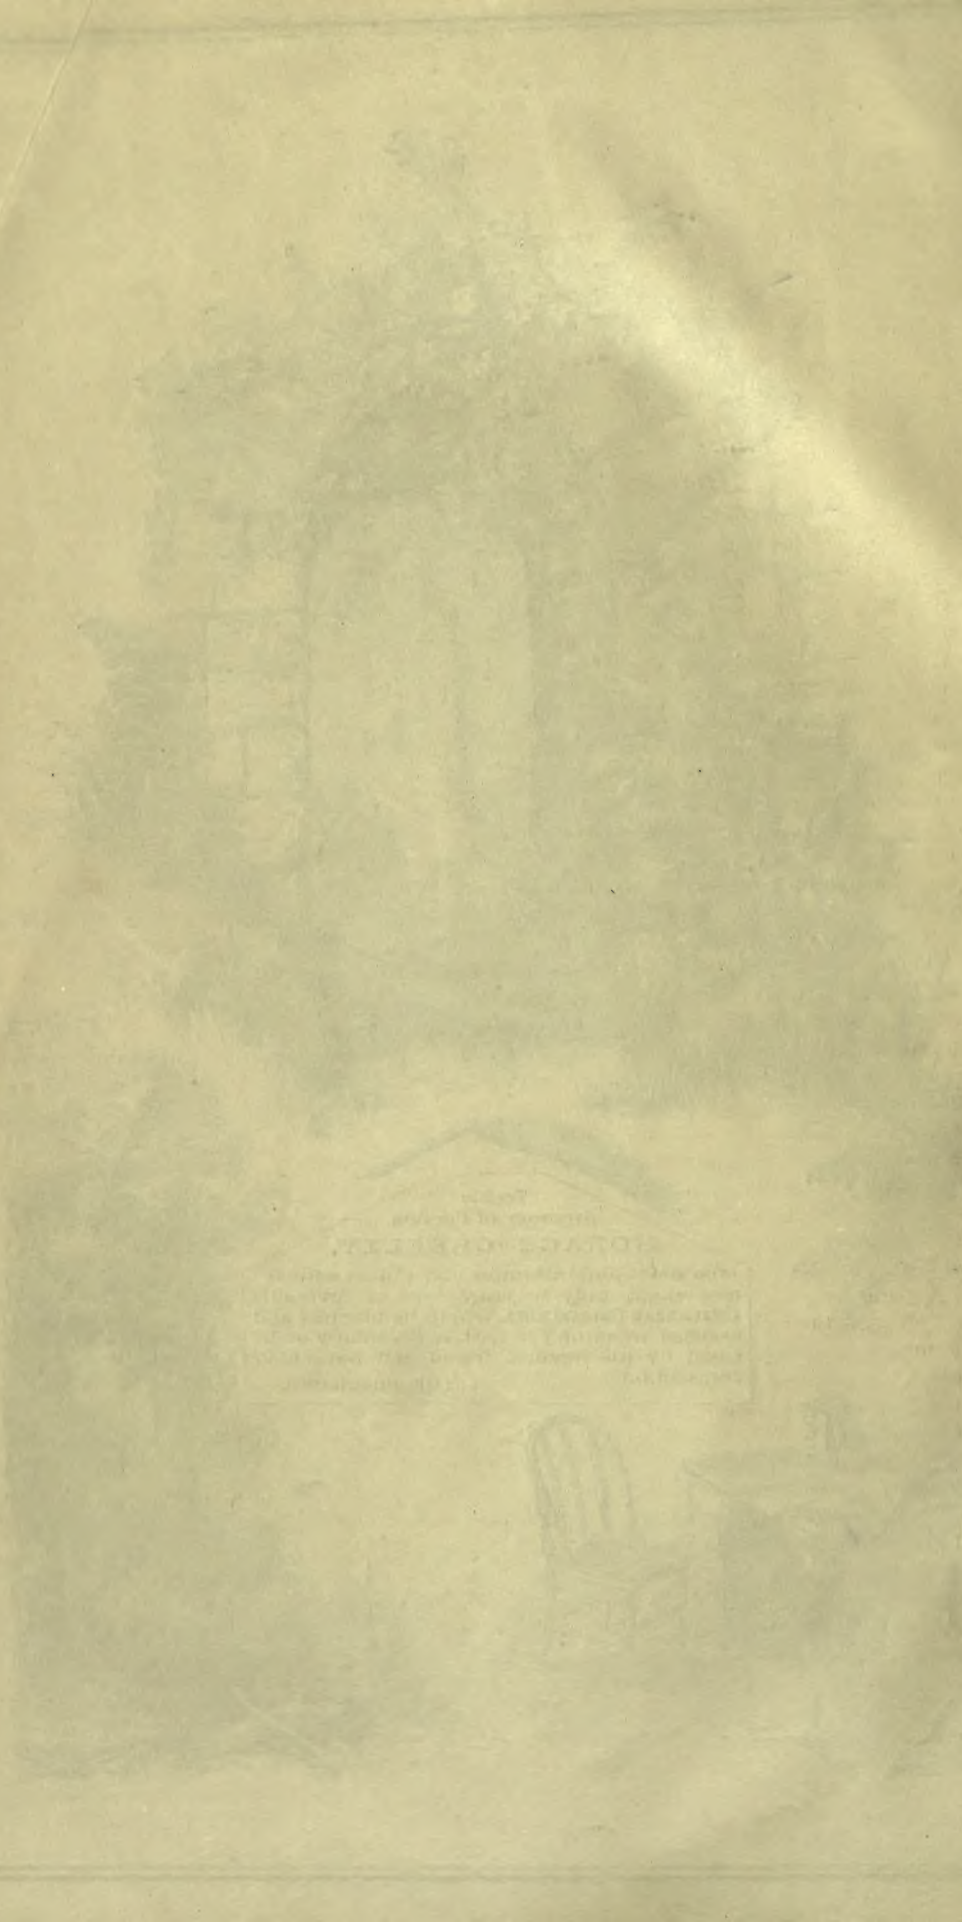
ENTERED ACCORDING TO ACT OF CONGRESS, IN THE YEAR ONE THOUSAND EIGHT HUNDRED AND SEVENTY-FOUR, BY A. J. JOHNSON, IN THE OFFICE OF THE LIBRARIAN OF CONGRESS, AT WASHINGTON.

ALL RIGHTS RESERVED.

ELECTROTYPED BY
WESTCOTT & THOMSON,
Philadelphia.

PRINTED BY
S. W. GREEN, 18 JACOB STREET,
New York.



ENGRAVINGS PRINCIPALLY BY
REDMAN & KENNY,
New York.

PAPER MANUFACTURED BY
THE SEYMOUR PAPER COMPANY,
New York.

BOUND BY
JAMES SOMERVILLE,
New York.

To the
memory of the late
HORACE GREELEY,
the great philanthropist and public educator—whom only to know was to love—this UNIVERSAL CYCLOPÆDIA, which he planned and assisted in editing in part, is reverently dedicated by his devoted friend and household companion,
THE PUBLISHER.

PUBLISHER'S ANNOUNCEMENT.

WITH profound gratitude to the American people for the unprecedented favor heretofore extended to him—a favor which has manifested itself in the purchase of more than half a million copies of his previous publications—the Publisher now takes pleasure in laying before the same generous public the entirely new and very elaborate work herewith presented, entitled JOHNSON'S NEW UNIVERSAL CYCLOPÆDIA. In doing this he respectfully solicits the continuance of the liberal patronage which has been thus far bestowed on him, and which he has endeavored to deserve by faithfully laboring to meet the intellectual wants of an enlightened and cultivated people. He does not claim perfection for this work, though it has been prepared without regard to labor or expense. Still, whatever imperfections the critical eye may discover in it, no one who gives it a candid examination can fail to concede that it possesses, in many important particulars, such a superiority over any other encyclopædia yet published as must make it invaluable, if not indispensable, to the scholar, the man of business, and the general reader.

To explain the principles which have governed the preparation of this work belongs properly to the province of the Editors. The Publisher may, nevertheless, be permitted to observe, that in bringing together the vast amount of material here accumulated, recourse has been had to every accessible source of authentic information. The most recent publications, not only in English, but in all the leading languages of the continent of Europe (particularly the German, French, and Italian), have been constantly consulted. And in order to guard against the possibility of being betrayed into error by relying too implicitly on printed authorities, all articles compiled from such sources have been subjected to the scrutiny of accomplished critics in the departments of knowledge to which they severally belong. A very important feature in the plan, moreover, which has been systematically pursued throughout, has been to place all the most important subjects in the hands of living authorities of distinguished eminence, to be originally treated expressly for this work. Each of the articles thus specially prepared is attested by the signature of its author; and, immediately following this Announcement, a list of the many eminent writers who have been already thus engaged is given in full.

The original suggestion of this work is due to the late Hon. HORACE GREELEY, LL.D., for more than ten years the intimate friend of the undersigned, and for the last two years or more of his life a member of his family. It has been dedicated to his memory, therefore, not only in testimony to the warm personal regard which, during this long period, he won to himself by his many kindly traits of character; but also in just recognition of his early participation in the preparation of the work itself, and of the fact that it may, without impropriety, be said to owe to him its existence. As an indefatigable laborer and prolific writer for the daily press (to say nothing of the more permanent monuments of literary industry which he created in the course of a long and "busy life"), dealing constantly with topics of immediate and stirring interest in the political, industrial, and social world, where the whole force of an argument or trustworthiness of a conclusion must depend constantly on the correctness of the assumed premises, Mr. Greeley had long felt the need of a comprehensive book of general reference better adapted to his needs, and to the needs of all active workers like himself, than any then in existence. His experience taught him that the existing encyclopædias, all of which have their merits, fail to meet the wants of the class of busy and practical men to which he belonged, for several reasons. In the first place, they are generally too voluminous: occupying a whole shelf in a library, instead of a corner of a writing-table, they cannot be consulted without disarrangement, loss of time, and serious inconvenience. Secondly, since many of their articles have much the form of treatises, the important facts in them of which the busy man is in need are spread over a large surface, and can only be found by a search involving vexatious delay. And thirdly, in respect to accuracy of statement and freshness of

information, these works are very unequal. Even in the new editions of the most approved encyclopædias—editions professedly rewritten throughout—errors of long standing continue in many instances to be perpetuated, and statistical and scientific statements which belong to a period long passed by are often presented.

The busy man's cyclopædia, according to Mr. Greeley, should be something different in every one of the particulars here specified. It should be, first of all, a *table-book:* that with him was a *sine qua non*. It should, furthermore, be pre-eminently a book of facts, and to a very limited extent, if at all, a volume of discussions or of critical opinions. Finally, it should be severely and uniformly accurate; and should be brought up, in every article, to the actual state of knowledge at the date of publication. With Mr. Greeley, to perceive a mode in which the world might be benefited was to feel an irrepressible desire to secure the benefit. In many earnest conversations, two years or more before the end of his useful life, he urged upon the undersigned himself to undertake the publication of a work of such a character as is here briefly outlined; promising to contribute personally a large share of the literary labor which the preparation of the work would require. The magnitude of the pecuniary responsibility involved in so vast an enterprise prevented an immediate acquiescence in this proposal; and it was only after it had been repeatedly presented that the undersigned finally yielded to these pressing solicitations, and consented to assume the heavy burden. Some of the words used by the zealous originator and early advocate of the scheme, in the conversations above referred to, are still remembered; and now that he has passed away for ever, they may perhaps be read with interest, as illustrating his peculiarities of expression in earnest social intercourse with his daily associates. The decision of the undersigned to comply in this matter with the wishes of his distinguished friend was reached during a drive with Mr. Greeley in the Central Park of New York City in December, 1870; and in the course of that memorable drive, Mr. Greeley said, emphatically, "I want just three books constantly at my elbow when I am writing: *Johnson's Family Atlas of the World, Webster's Dictionary*, and an *Encyclopædia* of not more than four volumes—three would be better; and this book should have every general article abridged as much as possible, or, as they say in Vermont, 'boiled down.'" In another explanation of his views as to the kind of condensation to be given to the work, he said, "I don't care upon whose shoulders Humboldt's cloak may have fallen, or if he had one, even; but I simply want to know when and where he was born, what he did, and when he died. The rest would be good for nothing except to lumber up the book. The lives and labors of men are the best kind of history, and the history that is needed; but lengthy dissertations upon them in a book of reference would be misplaced."

The preparation of the work having been resolved on, and Mr. Greeley having promised it from the beginning the aid of his counsel and his pen, it might naturally have been anticipated that he would cheerfully assume, or perhaps claim as due to him of right, the position of its Editor-in-chief. This, however, would have been impracticable with him, considering the numerous and absorbing duties already pressing upon him; which did not prevent him, however, from allowing his name to be placed as that of an associate on the editorial staff. He gave to the matter probably as much thought as if he had been in the chief direction, but he had not time to attend in person to the practical execution of the working plans. As soon as the proper literary assistance could be secured, repeated consultations took place between the Editors and the Publisher in the private room of Mr. Greeley at the residence of the undersigned in this city; and in these conferences he unfolded his views in so lucid and masterly a manner as strongly to impress all who heard him with admiration of his comprehensive grasp of the subject, and to convince them of his own wonderful fitness to contribute personally to the successful execution of the scheme.

Before the business arrangements for prosecuting the work had been actually completed, it occurred to the undersigned that there might be some advantage in transferring the responsibility of the publication to some other well-known publishing house in this city or elsewhere; reserving only to himself the task of managing the sale. Messrs. Charles Scribner & Co. of New York, and afterwards Messrs. James R. Osgood & Co. of Boston, were applied to, but without success; for while, on other accounts, they were not indisposed to regard the proposition favorably, they hesitated to stake upon a single enterprise so large an amount of capital as seemed likely to be required to carry out this work with the thoroughness contemplated. This caused, however, only a temporary delay. After having put his hand to the plough, the undersigned had at no time the idea of looking back; and when it became evident that, if the work was to be carried through, the entire responsibility must rest upon himself alone, he came to the deliberate conclusion that his shoulders were broad enough to bear it. In point of fact, however, the cost of the publication has proved even more serious than was at first anticipated. The design from the beginning having been to make a good book, no other consideration has been at any time allowed to interfere for a moment with it. The circle of eminent contributors has been constantly extending; and it is believed that no similar work has ever been produced in this country, or elsewhere, in which the literary labor of preparation has been more liberally compensated. At

this very time arrangements are nearly completed by the Editors, by means of which the future volumes of the work will be enriched by a largely increased number of articles from distinguished foreign contributors; and some of these articles have already been received. Judging from the experience of the past, it is a reasonable estimate to say that the complete work will involve an outlay which cannot fall much below $200,000, and may materially exceed that large sum.

The active labor of preparing the work was vigorously set on foot as early as the spring of 1871, under the direction, at first, of two editors only, but with an able and thoroughly competent staff of regular writers, and the promised aid of many eminent special contributors. Mr. Greeley entered upon that part of the task which he had chosen for himself with even more than his wonted enthusiasm; and notwithstanding the multiplicity of his cares and the endless demands upon his time, his proper department never dragged so long as he was able to hold a pen. Even in the midst of the excitements which followed his nomination to the presidency in 1872, and under the oppressive heats of one of the most exhausting seasons ever known, he prepared the elaborate article on the "Confederate States," which will be found in this volume—an article which was probably the last important literary production of his life. In putting this, which proved to be his final contribution to the present work, into the hands of the undersigned, he remarked, with that simplicity which was his most striking characteristic, "I hope it will be acceptable, for I have done my best to tell the truth, and not to offend the people of either the North or the South."

As the work advanced, and its magnitude began to be more fully appreciated by its conductors, the principle of the division of labor which had guided its execution from the beginning was brought more distinctly out, and made more efficacious, by enlarging the editorial corps, and incorporating into it men not only thoroughly competent to direct the several departments of which they assumed the charge, but known to be so by the public. Time also was given to such of these gentlemen as had not been engaged until after some progress had been made in preparing the electrotype plates, to revise thoroughly all of the work which had thus been put into shape, and to propose additions or emendations with the most perfect freedom; and all the suggestions of improvement made by them were unhesitatingly adopted without regard to expense. This has to some degree retarded the appearance of the volume, which it had been originally designed to lay before the public some time in 1873; but the Publisher has the satisfaction of believing that the delay thus occasioned has been vastly more than compensated, in having secured for the work the careful scrutiny and approval of the body of able and distinguished men whose names appear on the title-page as Editors and Associate Editors. It is not without a feeling of natural pride that the Publisher calls public attention to the galaxy of talent there exhibited; each departmental editor having been engaged in consequence of the honorable eminence already achieved by him in some one of the many paths of letters or science. No name has been included in the list merely to give an adventitious lustre to the book. All are the names of active workers, and they are placed there to give the public a secure guaranty of the trustworthiness of the varied information which these volumes embrace.

There remains, in conclusion, one pleasant duty to discharge, that of making public and honorable mention of the efficient services rendered by those whose superior practical skill has clothed the work of the literary laborers in its visible garb; among whom should be named Mr. L. F. Thomas of Philadelphia, Pa., who read the proofs; Messrs. Westcott & Thomson of the same city, who set up the type and made the plates; Messrs. Redman & Kenny of New York, who prepared nearly all the graphic illustrations; Mr. C. X. Craig, who engraved the maps; and Messrs. T. W. Baker and F. S. Jones, who in a variety of ways have lent most valuable aid in furthering this colossal undertaking.

The first volume of the work is now before the public, who will be able to judge for themselves how nearly it approaches to that ideal of excellence which should be the object of all human effort, but which no human effort can be expected ever completely to attain. One merit it may nevertheless claim, which is not likely to be disputed—that, having been prepared under the supervision of an editorial corps in which every section of the country and every leading religious denomination is represented, no shadow of political prejudice, or taint of sectional jealousy, or trace of sectarian bitterness, will be found to disfigure its pages.

With these preliminary observations, which the occasion seemed to require, the undersigned has now only to make his best obeisance to the public and retire behind the scene; confident that the verdict which will presently be pronounced upon the fruit of so much care and labor and outlay as have been lavished on this work, will be as favorable as it is certain to be just, and as it must be final.

Faithfully,

A. J. JOHNSON,
PUBLISHER OF ATLASES, MAPS, AND BOOKS.

11 GREAT JONES STREET, NEW YORK
(near Broadway),
June, 1874.

PREFACE.

When a new book of general reference is presented for the first time to the public, it becomes its originators to state the reasons which have induced them to undertake the labor of its preparation, and to explain the principles which have guided them in the performance of their task. There are many encyclopædias already in existence, from the merits of which the present Editors are by no means disposed to detract. They, like most men whose lives are given to study, have made much use of works of this description, and have learned by experience to appreciate their value. But the same experience has taught them that there are certain particulars in which all the works of this class with which they are acquainted are more or less unsatisfactory.

In explanation of what is here meant, it must be premised that no cyclopædia, however it may be named, can be, in the strictest sense, universal, and that therefore every such work must sometimes fail to respond to the demands of the inquirer. The misfortune is, that the particulars as to which these works are thus occasionally disappointing are too often precisely those on which information is most frequently needed in the ordinary affairs of life. In statistics, for example, they deal much in aggregates and little in details. In geography they are full upon countries, and provinces, and capitals, and populous cities; but whatever lies beyond this they leave to the gazetteers. And while, as to the men whose names have come down to us from other times, the information they furnish leaves little to desire, in regard to those who have made themselves conspicuous among the living generation, they are either silent, or their notices are imperfect and few.

But, in the second place, the information which these works contain is often scattered through too large a space: facts of detail, of which the need is immediate and pressing, are so submerged beneath the multitude of words that the hurried inquirer finds his time and his patience alike too limited to permit him to study them out. The works of this class which have cost their editors the largest labor and their publishers the largest outlay —such, for instance, as the "Encyclopædia Metropolitana" and the "Encyclopædia Britannica"—have, as a necessary consequence of their ambitious design, and in virtue of the very pains expended in carrying this faithfully out, sacrificed to a great degree their every-day usefulness. For quiet perusal, with abundance of leisure, they are invaluable; but they are libraries rather than books of reference. They are in no proper sense dictionaries, but groups of systematic treatises loosely linked together; and though their general titles are arranged in alphabetic order, they can only be conveniently consulted for the purposes of occasional reference by the aid of an independent index.

But, thirdly, these elaborate and costly works have not only the character of a library, they have almost the bulk of a library. They fill many volumes, and occupy so large an amount of space as to unfit them altogether for table use. A condition indispensable to the usefulness of a book of reference is, nevertheless, that it shall be always near the inquirer's hand—on the table of the student, on the desk of the merchant, on the bench of the artisan;—a condition which deprives every voluminous cyclopædia, however great in other respects may be its merits, of its principal practical value for the every-day uses of practical men.

Another fault of most works of this class is, that the information they give cannot always be trusted. In this respect they are very unequal. An article, for example, in

the "Encyclopædia Britannica," which bears the signature of Thomas Young, or Henry Brougham, or Sir John Herschel, will of course command universal confidence; but besides such as these, there are in the same work many articles of unknown authorship, derived probably, in most instances, from previous similar publications, and originally affected by unsuspected errors which they continue to perpetuate.

Finally, it is too often the case that books of general reference are behind the actual state of knowledge at the date of their publication. In the progress of the sciences, in the growth and decline of industries, in the incessant social and political mutations which time brings with it, any occasional résumé of the aspects of human affairs must largely lose in value in proportion as the point of time for which it is true recedes into the past. Every inquirer, therefore, who has sought from books of reference information as to matters of living interest, must have been often disappointed to find that, while they tell him so very much, they fail to tell him precisely what he wants to know.

Entering thus upon their task with a lively recollection of the particulars in which they have found the books of general reference at their command to fail them at their need, the Editors of this one have faithfully labored, not wholly they trust without success, to avoid the faults here signalized. To this end, considering in the outset that no work, however comprehensive its scope, can be absolutely exhaustive of all human knowledge, they have aimed to give the largest space to matters concerning which the need of exact information is most generally and most frequently felt; keeping in view, at the same time, the wants of the student in his closet, and those of the practical man in the daily affairs of life.

They have, secondly, treated all large subjects *analytically*, exhibiting each elementary topic under its own head in alphabetic order. Titles are thus multiplied and separate articles abridged. The work becomes its own index, and is made to combine the character of a dictionary with that of a cyclopædia. Upon topics of principal importance or of immediate and living interest, nevertheless, it has not been considered incompatible with this plan to introduce systematic essays; but these when admitted are practically indexed, by including their subordinate titles in the alphabetic arrangement, with cross-references to the principal articles. The accuracy of the information conveyed in these more elaborate essays is in all cases attested by the signatures of their writers, who will be recognized in general as the highest authorities on the subjects thus treated. In the list of these valued contributors, elsewhere given, will be noticed the names of very many gentlemen of distinguished eminence in letters and science in the United States and in Europe; and negotiations recently completed, or now in progress, with foreign writers no less eminent, will largely extend this list for the future volumes.

In the articles of the class by far most numerous, however, the principle has been adhered to of compressing the largest number of facts or truths into the smallest possible compass. These articles are therefore very brief, but pithy in proportion to their brevity. Comments, discussions, speculations—even, as a rule, criticisms upon the *chefs d'œuvre* of art or letters—have been avoided. These have no fit place in a book of reference, of which the proper object is to give facts of positive knowledge, and not the opinions of men about such facts. This was the principle laid down by the eminent man with whom, as the Publisher has elsewhere stated in a narrative of deep interest, the project of this work originated. "Give me the facts—I will find you the words," seems always to have been the unuttered motto of Horace Greeley. And the only book of reference which Mr. Greeley required was a book of facts. The character of the present work will be found to have been largely controlled by this fundamental principle of its projector. Had he lived to rejoice with us in its publication, it might have been more largely so; but the present editors have remembered that to most men facts are sometimes made more useful, and principles more intelligible, by concise illustrations of their significancy.

Still, the condensation given to the articles in general has made it possible to introduce an amount of information in detail, principally geographical, biographical, and statistical, quite beyond what will be found in any other cyclopædia.

1. As to Geography. So far as the United States are concerned, this work is a complete gazetteer. Every township in every State or Territory will be found recorded in its proper place, with its population according to the census of 1870; and every town of more than

one thousand inhabitants has been written up expressly for this work by a competent authority resident on the spot, wherever such could be found. The larger towns, and the States themselves, have been made the subjects of elaborate articles by accomplished experts, whose names, attached to the articles, will be a sufficient guaranty of the fidelity with which they have been prepared.

Nor has foreign geography been a subject of less careful or less conscientious attention, although it has not been followed into so minute detail as that of our own country. Compact notices are given of all towns numbering more than five thousand inhabitants; in which are exhibited all the important statistical facts relating to them, whether industrial, educational, social, religious, or in any manner otherwise interesting. Every important country has been treated, by specially competent writers, in a variety of aspects, including its physical geography; its political divisions; its growth or decline in population; its geology, natural history, and mineral resources; its agriculture and manufactures, and their characteristic products; its commerce and commercial marine; its inland navigation and railway communications; its political institutions; its systems of civil and criminal jurisprudence; its postal and telegraphic service; its provision for the maintenance of religion, the support of education, the cultivation of art, and the encouragement of science; its methods of organized benevolence; its literature, ephemeral and permanent; its military and naval strength; and finally, in brief outline sketch, the history of its past, as a key to its actual condition. Provinces and large towns have been treated in accordance with the same plan, in so far as it is applicable to them; and, for the volumes which are to follow, arrangements recently concluded will secure a more effectual execution of the plan than is shown even in the thorough and carefully studied articles contained in the present. Hereafter, foreign countries and their principal towns will be described by eminent foreign writers, members of the geographical and statistical societies of European capitals, or gentlemen of distinguished reputation whose studies have been specially devoted to these subjects. Some of the articles prepared under these arrangements for the ensuing volume have already been received.

2. As to Biography. In this department, the present work may fairly claim a certain merit, not only for what it has added of matter wholly new, but also for what it has omitted. Many names handed down from the distant past, which have long encumbered the dictionaries of biography without sensibly enhancing their value, will be looked for in the present publication in vain. They are names of men who were no doubt useful in their day, but who have been long since nearly swallowed up in that practical oblivion which awaits the great majority of mankind, however prominent among the men of their own generation. The space thus gained has been more usefully filled, by introducing in large number the biographies of living men, whose names are constantly encountered in journals or heard on people's lips, but of whom little is generally known beyond those facts of their history which have secured for them honorable distinction, or simple notoriety. The materials for these biographical notices have been gathered by writers perfectly well acquainted with their subjects; and the statements they embrace may be accepted as entirely authentic. It may probably be remarked that some of the names here given are not those of men entitled to permanent pedestals in a national Walhalla. To this entirely just observation the reply may be, that the object of these volumes is not to dispense laurels, nor to distinguish, among the candidates for immortality, those who are most deserving. Their single object is to furnish to the people such information as the people need—information, moreover, of a kind which the people have heretofore had no ready means of obtaining. But though among the names which appear in these volumes for the first time there are doubtless some which may have for the world, and even for the American portion of it, only a temporary interest, and which will therefore, sooner or later, drop from the places here assigned them, there are none, it is believed, concerning which the men of the present generation are not likely more or less frequently to desire information. They are names of men who have been, or who are now, conspicuous in public affairs, or prominent as religious teachers and leaders, or influential as writers or journalists, or distinguished as members of the Bar or Bench, or widely known as philanthropists, scholars, educators, engineers, naturalists, physicists, chemists, or devotees of abstract or applied science. It is of course not to be expected that a first

attempt to gather the biographies of noted living men shall have included all who are fairly entitled to notice, or shall fail to have included some whose claims to such distinction are doubtful. The Editors can only promise that omissions and errors of this nature shall be corrected so soon as discovered.

3. As to Law. It is at once the duty and the interest of every member of an organized political society to acquaint himself with his rights as a citizen, and with the obligations under which he lies to his fellow-citizens and to the government under which he lives. Keeping this proposition in view, the Editors have felt that it would add very greatly to the practical value of a book which is likely to be a hand-book and a table-book in the dwellings of the people, if there were here presented, more fully than they are elsewhere to be found except in works strictly professional, all the leading principles of municipal law, with clear explanations of the various modes of proceeding in law and in equity, and with descriptions of the most important legal forms and written instruments. This has been done with a thoroughness which will be understood, when it is stated that the present volume alone contains more than two hundred important articles belonging to this class.

Nor has what is called public law, or the law which is supposed to regulate the intercourse of nations, received less careful attention. The present Cyclopædia is believed to be the first of its class, published in this country, which has embraced in its plan a provision for the full and systematic unfolding of the principles of international law. The treatment of this weighty subject belongs in regular order to the second volume, but the work has been already completed, and is from the hand of a recognized master of the science. Questions of international obligation and international courtesy have been in our time of so frequent occurrence, that an authoritative exposition of the principles according to which they should be settled cannot fail to possess a high value for every citizen.

4. As to Pathology and Medicine. The Editors of this work are by no means inclined to favor the maxim that every man should be his own physician. But they are satisfied that a little of that kind of pathological knowledge which may enable a man to identify a disease, and a little of that acquaintance with therapeutics which may qualify him to judge what it is best to do for the patient before the professional practitioner can arrive, may often be the means of alleviating suffering, and perhaps of saving life. It is certainly better to use remedies with some knowledge of them, than to attempt their use, as is often done, with no knowledge of them at all. A book of reference, therefore, which is destined to lie on the table in many dwellings remote from towns or villages, where hours must often intervene before, in a case of emergency, medical aid can be obtained, will be largely increased in its usefulness if, in its preparation, there shall have been introduced into it such simple descriptions of the symptoms of the most frequently occurring diseases, and such suggestions as to the means to be earliest resorted to in order to palliate their violence, as can be understood and employed by any person of ordinary intelligence. In the preparation of the present work this object has been constantly kept in view. The diseases of children have received special attention; and it is confidently believed that this feature of the work will add much to its acceptability among the people.

5. As to Physics, Chemistry, Natural History, and the sciences generally, exact and applied. The design of the present Cyclopædia having been to make a work pre-eminently practical, it may be fairly claimed as a merit that it has given a larger proportion of its space to the sciences of nature, and their numerous applications, than is usual in works of its class. The fact is here simply noted, without descending to particulars or enlarging upon the importance of this feature. The most cursory inspection of the pages of the work will show the extent of its prevalence.

The foregoing points embrace the principal peculiarities which distinguish the present Cyclopædia from those which have gone before. Some few still remain which deserve a moment's attention.

First among these may be mentioned the careful attention which has been given to subjects distinctively American. In all the encyclopædias published abroad—and hundreds of copies of these are annually sold in the United States—these subjects are very imperfectly exhibited, or are left unnoticed altogether; nor has this defect been adequately

repaired in any similar publication in our own country. In the preparation of the present work, no time or labor has been spared to secure a satisfactory presentation of whatever relates to the political or social history of the American people and the eminent men by whom this history has been adorned; to the form and principles of our government; to our laws and usages; our systems of education and educational institutions; our religious organizations; our public charities; our methods of agriculture; our artificial channels of transportation; the statistics of our population, commerce, manufactures, and mining; the characteristic features of our physical geography, with their accompanying varieties of climate, soil, and productions; the languages, habits, and habitations of the aboriginal occupants of the continent; the scattered traces yet remaining of extinct races which preceded these; and numerous topics of a kindred nature which are likely to interest especially the American reader. The present volume will furnish ample evidence of the steadiness with which this object has been kept in view.

Something may be claimed, in the next place, for the sincerity with which it has been endeavored to keep this work entirely free from every kind of bias. In books of general reference there must unavoidably be embraced many subjects on which opinions differ; and—a thing of much greater consequence—on which feelings are even more widely at variance than opinions. To this class belong grave questions of public policy, momentous events in the history of the still living generation, and the doctrines which distinctively divide the differing schools of religious thought. In regard to all these, the Editors have steadily endeavored that the views of every party, section and denomination should be presented fairly, and with entire respect for the views of others. To the end that this desirable result might be more surely attained, they have associated with themselves a number of distinguished gentlemen, who will be recognized as fairly representing the different portions of our country geographically, and its principal religious denominations. Security has thus been provided that every class of opinions shall be expounded by its friends; while, by the simple expedient of never admitting any paragraph or sentence which, to any member of the editorial staff, seemed, either in statement or in spirit, objectionable, the work has been kept, it is hoped, free from liability to any just imputation of prejudice or partiality. A similar impartiality has thus likewise been secured for it in the collection of the numerous biographical notices which it contains of conspicuous members, still living, of different religious denominations; the associate editors representing such denominations having undertaken, each within his own, to gather such notices, and all of them having largely contributed in this department with their own hands.

The means, thirdly, which have been employed to ascertain with exactness the statistics of towns, villages, public works and public institutions, and to gather facts of local history and personal interest, have been probably without example in the conduct of any similar enterprise. Communications have been opened with some hundreds of local correspondents scattered throughout all the States and Territories of the United States, involving the interchange of letters to the number of many thousands, besides the transmission of a still larger number of forms for the registration of the information gathered. The necessary manuscript correspondence has been too voluminous to be maintained in any other way than by dictation to phonographic clerks or other rapid writers. In the management of this very laborious branch of the business, the Editors have to acknowledge their obligations to the energetic Publisher, by whom the principal burden of it has been borne, and who has thus left them a larger freedom to maintain the necessary correspondence, also very heavy, with the special writers occupied with topics of greater importance and wider scope.

For the preparation of articles compiled from printed authorities, an able staff of editorial assistants and other writers has been employed in the office, whose time is given exclusively to this work. A comprehensive library has been provided expressly for their use, embracing every cyclopædia, general or special, and every dictionary or compendium of art, science, law, medicine, theology, biblical literature, mythology, history, archæology, technology, geography, natural history, biography, etc. etc., known to have been published in this country, in England, or on the continent of Europe, within the last twenty years. To these have been added the proceedings of geographical and statistical societies, periodical

journals devoted to these sciences, the reports and public documents published under the authority of governments, relating to population, commerce, agriculture, manufactures, coinage, currency, etc., and in general all publications entitled to be regarded as authentic sources of information as to important matters of fact. All the articles prepared by the writers in the office have passed under the critical scrutiny of three or four, at least, of the editorial staff, before being finally given to the press. With these ample provisions to secure accuracy and to guard against errors of ignorance or inadvertency, it is to be hoped that the faults of this work will consist rather in its unavoidable omissions than in any seriously mistaken statements.

As additional evidence of the thoroughness with which the work of this Cyclopædia has been, at least in intention, conducted, it may be further remarked, that the number of specially qualified writers engaged in it is unprecedentedly great. No argument is necessary to secure assent to the proposition, that an article upon any important subject prepared by one who, through the study and investigation of a lifetime, has made the subject his own, must be at once more clear in its method and more instructive in its details, than any that can be compiled by an ordinary writer, even with the best printed authorities before him. The rule has been, therefore, to place such subjects in such hands; and this has been followed out so persistently that, in not a few instances, after articles in themselves quite unexceptionable had been already prepared by the office-writers, and had even been set up in type, they have been subsequently cancelled and set aside in favor of new articles by living authorities upon the same subjects, whose co-operation had been later secured. In regard to changes of this nature, in many instances involving delay and no slight expense, the Editors feel bound to acknowledge—and they do here publicly acknowledge—the unfailing cheerfulness with which the Publisher has received all their suggestions, and the prompt liberality with which he has carried them into effect.

After saying so much of the pains taken with the literary labor of the Cyclopædia, it may seem like descending to matters comparatively trivial to speak of the work as a pronouncing dictionary. This, however, is a feature in it which will strongly recommend it to most readers; for nothing is more embarrassing, either in public speaking or in ordinary conversation, than the uncertainty which is often felt as to the proper mode of accenting an unfamiliar word. In this book the place of the accent is marked in the title of every article, and thus the essential guide is given to its just pronunciation.

One important observation remains to be made in conclusion. No cyclopædia, however correctly it may represent the state of the world's knowledge or of its material condition at the date of its publication, can continue to do so for a long period of years. Works of this kind, nevertheless, have often been reprinted from the same plates unaltered, for a quarter of a century or more; long before the end of which period, in regard to all matters to which time brings change, they cease to be authorities altogether. With the present work it is proposed to pursue a different plan. Editions will be printed from month to month, as the demand may require; but no edition will be published without such corrections in the plates as the progress of time may render necessary. The book will therefore always, so far as vigilance can accomplish that result, be kept up in its record of facts to the date of its delivery to purchasers; and its latest issues will stand on a level, in point of authority, with its earliest. It follows that whatever errors may be found to have escaped notice in the present issue, will be corrected as soon as discovered; and the Editors will feel themselves under obligations to any who will call their attention to such as they may chance to observe.

By means of this system of continual emendation, by supplying omissions, by adding immediately on their announcement new facts which the progress of discovery may bring to light, and by entirely rewriting, from time to time, such articles as are capable of being improved by reconstruction, the Editors trust that the work may not only preserve its original value, but that it may even, with lapse of time, grow more and more useful to the public for whose benefit it has been designed, and to whose judgment it is now submitted.

FREDERICK A. P. BARNARD,
ARNOLD GUYOT,
EDITORS.

NEW YORK, June, 1874.

ORGANIZATION OF THE EDITORIAL STAFF.

*** The following statement shows the subjects to which the different members of the editorial staff have severally given their more particular attention, not only in themselves preparing articles relating to those subjects, but also in securing contributions from others, and in carefully scrutinizing all such contributions with a view both to ensure accuracy and to exclude anything which might seem objectionable.

DIRECTING EDITOR-IN-CHIEF:

FREDERICK A. P. BARNARD.

ADVISORY EDITOR-IN-CHIEF:

ARNOLD GUYOT.

DEPARTMENTS

(see Title-Page for honorary degrees and positions):

Public Law, Intercourse of Nations, etc.	THEODORE D. WOOLSEY.
Municipal, Civil, and Constitutional Law, etc.	THEODORE W. DWIGHT.
English and Foreign Literature, etc.	GEORGE P. MARSH.
Grecian and Roman Literature, etc.	HENRY DRISLER.
Presbyterian Church—History, Doctrine, Biographies, etc.	ROSWELL D. HITCHCOCK.
Philosophy, Psychology, etc.	WILLIAM T. HARRIS.
Comparative Philology and Linguistics	SAMUEL S. HALDEMAN.
Social Science, Political Economy, etc.	AARON L. CHAPIN.
American History, Southern Geography, Statistics, etc.	ALEXANDER H. STEPHENS.
The Fine Arts, Liberal Christianity, Biographies, etc.	OCTAVIUS B. FROTHINGHAM.
Ecclesiastical History and Biblical Literature	PHILIP SCHAFF.
Meteorology, Electricity, and Magnetism	JOSEPH HENRY.
General Physics, Statistics of the Pacific Coast, etc.	JOHN LE CONTE.
Mathematics, Applied Science, Protestant Episcopal Church, Education, etc.	FRED. A. P. BARNARD.
Physical Geography, Foreign Geography, Climatology, etc.	ARNOLD GUYOT.
Military Engineering, Science and Material of War, Biographies, etc.	JOHN G. BARNARD.
Zoology, Comparative Anatomy, and Animal Physiology	THEODORE GILL.
Naval Affairs, Naval Construction, Navigation, Biographies, etc.	FOXHALL A. PARKER.
Mechanics, Mechanical Engineering, etc.	WILLIAM P. TROWBRIDGE.
Music, Theory of Harmony, Composition, Musical Terms, etc.	WILLIAM STAUNTON.
Chemistry, its Applications, etc.	CHARLES F. CHANDLER.
Botany and Vegetable Physiology	ASA GRAY.
Geology and Palæontology	JOHN S. NEWBERRY.
Civil Engineering, Hydrography, etc.	CALEB G. FORSHEY.
Medicine, Surgery, the Collateral Sciences, etc.	WILLARD PARKER.
American History, Statistics, Agriculture, etc.	HORACE GREELEY.*
Baptist Church—History, Doctrine, Biographies, etc.	MARTIN B. ANDERSON.

Philosophical and Church Dogmatics; Lutheran Church—Biographies, etc.	CHARLES P. KRAUTH.
Methodist Church, South—History, Doctrine, Biographies, etc.	THOMAS O. SUMMERS.
Methodist Church, North—History, Doctrine, Biographies, etc.	ABEL STEVENS.

ASSISTANTS:

PORTER C. BLISS,	LINUS P. BROCKETT,	CLARENCE COOK,
CLEMENS PETERSEN,	JOHN NORTON POMEROY,	HENRY WURTZ.

* The latest labors of Mr. Greeley's life were given to this work, to which he contributed largely. It is with justice, therefore, that his name is preserved in the list of its Editors.

CONTRIBUTORS TO THE FIRST VOLUME

OF

JOHNSON'S NEW ILLUSTRATED UNIVERSAL CYCLOPÆDIA, ETC.

Names of additional contributors to the Second, Third, and Fourth Volumes will be found in the list immediately following the present. Besides the writers here mentioned, more than fifteen hundred gentlemen connected with the press in the principal centres of population scattered throughout the United States have already furnished for this Cyclopædia succinct accounts of the cities, towns, and villages in which they respectively reside; and the number of these contributions is daily increasing, and will continue to increase to the end of the work.

Abbot, Henry L., M. N. A. S., Willett's Point, N. Y.,
Maj. U. S. Eng., Bvt. Brig.-Gen. U. S. A., Bvt. Maj.-Gen. Vols.

Armitage, Rev. Thomas, S. T. D., New York,
President of American Bible Union.

Baird, Rev. John G., A. M., New Haven, Conn.,
Assist. Secretary State Board of Education of Connecticut.

Barker, George F., M. D., Philadelphia,
Professor of Physics, University of Pennsylvania.

Barnard, Hon. Henry, LL.D., Hartford, Conn.,
Editor of the American Journal of Education.

Barry, William F., U. S. A., Fortress Monroe, Va.,
Col. U. S. Artillery, Bvt. Maj.-Gen. U. S. A.

Beard, Richard, S. T. D., Lebanon, Tenn.,
Professor of Theology in Cumberland Univ.

Beatty, Ormond, LL.D., Danville, Ky.,
President of Centre College.

Benedict, B. L., Esq., Burlington, Vt.,
City Directory and Free Press.

Berri, William, Jr., Esq., Brooklyn, New York,
Editor of the Carpet Trade.

Betts, Rev. Beverley R., A. M., New York,
Librarian of Columbia College.

Bishop, J. B., Esq., New York,
Ed. Staff of the New York Tribune.

Blake, John R., A. M., Mecklenberg co., N. C.,
Prof. of Natural Philosophy and Astronomy in Davidson Coll.

Blake, William P., A. M., Ph. B., New Haven, Conn.,
Former Prof. of Mineral. and Geology, College of California.

Blodget, Hon. Lorin, Philadelphia, Pa.

Bradley, Hon. Joseph P., LL.D., Newark, N. J.,
Associate Justice Supreme Court of the United States.

Brühl, G., M. D., Cincinnati, O.

Camp, William A., Esq., New York,
Manager of the Clearing House New York City.

Chase, George, LL.B., New York,
Assistant in Columbia College Law School.

Chase, Thomas, A. M., West Haverford, Pa.,
Professor of Philology and Literature in Haverford College.

Child, Francis J., Ph. D., Cambridge, Mass.,
Boylston Prof. Rhetoric and Oratory, Harvard University.

Clark, J. Nelson, M. D., York, Pa.,
President of Cottage Hill College.

Clinton, J. W., Esq., Clinton, Ia.,
Agent Cornell College.

Coffin, John H. C., A. M., M. N. A. S., Wash., D. C.,
Editor of the United States Nautical Almanac.

Comfort, George F., A. M., Syracuse, N. Y.,
Prof. of Mod. Languages and Æsthetics, Syracuse University.

Cook, Clarence, Esq., New York,
Art Critic New York Tribune.

Cope, Prof. Edward D., A. M., M. N. A. S., Haddonfield, N. J.

Cullum, George W., New York,
Col. U. S. Engineers, Bvt. Maj.-Gen. U. S. A.

Dalton, John C., M. D., M. N. A. S., New York,
Prof. of Physiology and Hygiene, School of Med. Columbia Coll.

Dana, James D., LL.D., M.N.A.S., New Haven, Conn.,
Silliman Prof. of Geology and Mineralogy, Yale College.

De Peyster, Gen. J. Watts, A. M., New York.

Dillmann, Christian F. A., Ph. D., Berlin, Germany,
Professor of Exegetical Theology in Berlin University.

Drown, Thomas M., M. D., Philadelphia, Pa.,
Mining Engineer; Sec. American Inst. of Mining Engineers.

Egleston, Thomas, A. M., E. M., New York,
Prof. of Mineral. and Metall., Sch. of Mines, Columbia Coll.

Elliott, Ezekiel B., Esq., Washington, D. C.,
Chief Clerk Bureau of Statistics, Treas. Dept., Wash., D. C.

Eve, Paul F., M. D., Nashville, Tenn.,
Prof. of Operative and Clinical Surgery, Univ. of Nashville.

Fairchild, Rev. E. H., Berea, Ky.,
President of Berea College.

Fogg, A. G., Esq., Concord, N. H.,
Editor of New Hampshire Gazetteer.

Foster, John G., New York,
Lt.-Col. U. S. Engineers, Bvt. Maj.-Gen. U. S. A.

Garfield, Hon. James A., Hiram, Ohio,
Maj.-Gen. Vols., Rep. in Cong. for the 19th Cong. Dist. Ohio

Gibbons, James S., Esq., New York.

Gillmore, Quincy A., New York,
Lt.-Col. U. S. Engineers, Bvt. Maj.-Gen. U. S. A.

Gilman, Daniel C., Ph. D., Oakland, Cal.,
President of the University of California.

Gilman, Rev. Edward W., S. T. D., New York.

Gilmore, Joseph H., A. M., Rochester, N. Y.,
Prof. of Logic, Rhetoric, etc. in the University of Rochester.

Grier, William M., S. T. D., Due West, S. C.,
President of Erskine College.

Hagner, Gen. Peter V., U. S. Ordnance, Watervliet Arsenal, West Troy, N. Y.

Hampton, Gen. Wade, Columbia, S. C.

Hartshorne, Henry, A. M., University Penna.,
Professor of Hygiene, University of Pennsylvania.

Hasselquist, T. N., S. T. D., Paxton, Ill.,
Pres. of Augustana Coll. and Theol. Seminary.

Hendrix, Rev. W. W., McKenzie, Tenn.,
President of Bethel College.

Higginson, Col. Thomas W., Newport, R. I.

Hilgard, Eugene W., Ph. D., M. N. A. S., Ann Arbor, Mich.,
Prof. of Geology, Zoology, and Botany, University of Michigan.

Hilgard, Julius E., M. N. A. S., Washington, D. C.,
Assist. Superintendent of the U. S. Coast Survey.

Hillman, Prof. S. D., Carlisle, Pa.,
Dickinson College.

Hinsdale, B. A., A. M., Hiram, Ohio,
President of Hiram College.

Hodge, Archibald A., S. T. D., Allegheny City, Pa.,
Professor of Theology in Allegheny Seminary.

Homes, Henry A., LL.D., Albany, N. Y.,
Librarian of the State Library, Albany.

Hughes, Thomas, Q. C., London, England,
Late Member for Frome of the House of Commons.

Jacobi, Abraham, M. D., New York,
Clinical Prof. of the Diseases of Children, School of Medicine, Columbia College.

Jacobi, Mary C. Putnam, M. D., New York.

Jacobs, William, A. M., Philadelphia.

Johnson, Samuel W., A. M., M. N. A. S., New Haven, Conn.,
Prof. of Agricultural and Analytical Chemistry, Yale College.

Joy, Charles A., Ph. D., New York,
Professor of Chemistry, Columbia College.

Leonowens, Mrs. Anna H., New Brighton, N. Y.,
Author of The English Governess at the Siamese Court.

Longley, Abner T., Esq., Washington, D. C.,
Department of Agriculture.

March, Francis A., LL.D., Easton, Pa.,
Prof. of the Eng. Language and Com. Philology, Lafayette Coll.

Mayer, Alfred M., Ph. D., M. N. A. S., Hoboken, N. J.,
Prof. of Physics, Stevens Technological Inst., Hoboken, N. J.

Meigs, Montgomery C., M.N.A.S., Washington, D. C.,
Quartermaster-Gen., Brig.-Gen., Bvt. Maj.-Gen. U. S. A.

Middleton, N. Russell, LL.D., Charleston, S. C.,
President of College of Charleston.

Moore, Joseph, A. M., Richmond, Ind.,
President of Earlham College.

Morgan, Hon. Lewis H., LL.D., Rochester, N. Y.

Morton, Henry, Ph. D., M. N. A. S., Hoboken, N. J.,
Pres. Stevens Technological Institute, Hoboken, N. J.

Newcomb, Simon, M. N. A. S., Washington, D. C.,
Professor of Astronomy, U. S. Naval Observatory.

Newton, Hubert A., LL.D., M. N. A. S., New Haven, Conn.,
Professor of Mathematics, Yale College.

Northrop, Hon. Birdsey G., A. M., New Haven, Conn.,
Secretary of the State Board of Education.

O'Conor, Charles, LL.D., New York.

Oliver, James E., A. M., Ithaca, N. Y.,
Professor of Mathematics, Cornell University.

Osgood, Prof. Howard, S. T. D., Upland, Pa.,
Crozer Theological Seminary.

Parton, James, Esq., New York,
Author of People's Book of Biography, etc.

Perine, George E., Esq., Engraver, New York.

Pierce, C. Newlin, Dentist, Philadelphia, Pa.

Plympton, George W., C. E., Brooklyn,
Prof. of Natural Philosophy, Polytechnic Institute; of Chemistry, Long Island Medical College; of Mechanics, Cooper Union, New York.

Pomeroy, Prof. John N., LL.D., Rochester, N. Y.

Richardson, Wilson G., A. M., Mecklenburg Co., N. C.,
Prof. of Ancient and Modern Languages, Davidson College.

Rood, Ogden N., A. M., M. N. A. S., New York,
Professor of Mechanics and Physics, Columbia College.

Russell, A. J., C. E., Ottawa, Canada,
Crown Timber Agent.

Schem, Alexander J., Hoboken, N. J.,
Ed. of Deutsch Amerikanisches Conversations Lex.

Shedd, William G. T., S. T. D., New York,
Prof. of Biblical Literature in Union Theological Seminary.

Sheppard, Charles E., Esq., Bridgeton, N. J.,
Attorney and Member of Board of Trade.

Shields, Charles W., S. T. D., Princeton, N. J.,
Professor of History in the College of New Jersey.

Shreve, Samuel H., C. E., Esq., Toms River, N. J.

Shurtleff, Hon. Nathaniel B., Boston, Mass.,
Ex-Mayor.

Simmons, George C., Esq., New York,
Clerk U. S. Board of Engineers.

Smith, Asa D., S. T. D., LL.D., Hanover, N. H.,
President of Dartmouth College.

Smith, John Jay, Esq., Philadelphia, Pa.,
Superintendent Laurel Hill Cemetery.

Smith, O. L., S. T. D., Oxford, Ga.,
President of Emory College.

Somerville, James, Esq., New York,
Bookbinder.

Spooner, Alden J., Esq.,
Late Editor of Long Island Star.

Stevens, J., Esq., Granville, Ohio,
Denison University.

Stockbridge, Hon. Henry, Baltimore, Md.

Studer, Jacob H., Esq., Columbus, O.,
Author of History of Columbus, O., etc.

Sumner, William G., A. B., New Haven, Conn.,
Professor of Political and Social Science, Yale College.

Tenney, Sanborn, A. M., Williamstown, Mass.,
Professor of Natural History, Williams College.

Thomas, John J., Esq., Union Springs, N. Y.,
Editor of The Country Gentleman.

Thomas, Prof. Joseph, M.D., LL.D., Philadelphia, Pa.,
Author of Dictionary of Biography and Mythology.

Tillman, Samuel D., LL.D., New York,
Prof. of Mechanical Philosophy and Technology, Am. Inst.

Tryon, George W., Jr., Philadelphia, Pa.

Tuttle, Hudson, Esq., Berlin Heights, O.

Tyler, William S., S. T. D., Amherst, Mass.,
Williston Prof. of the Greek Lan. and Lit. in Amherst College.

Van Name, Addison, A. M., New Haven, Conn.,
Librarian of Yale College.

Verrill, Addison E., A. M., M. N. A. S., New Haven, Conn.,
Professor of Zoology, Yale College.

Ward, Rev. William H., S. T. D., New York,
Editor of Independent.

Watson, James C., Ph. D., M. N. A. S., Ann Arbor, Mich.,
Professor of Astronomy, University of Michigan.

Welling, James C., LL.D., Washington, D. C.,
President of Columbian College.

Whedon, Daniel D., S. T. D., LL.D., New York,
Editor of the Methodist Quarterly Review.

White, Hon. Andrew D., LL.D., Ithaca, N. Y.,
President of Cornell University.

White, Richard Grant, Esq., New York.

Winter, William, Esq., New York,
Ed. Staff of the New York Tribune.

Winthrop, Hon. Robert C., LL.D., Boston, Mass.

Youmans, Prof. Edward L., M. D., New York,
Editor of the Popular Science Monthly.

Zachos, J. C., Esq., New York,
Curator of Cooper Union.

CONTRIBUTORS TO SECOND, THIRD, AND FOURTH VOLUMES.

Articles for the Second, Third, and Fourth Volumes of this work will be contributed by many of the writers mentioned in the foregoing list; and others are in course of preparation, or have already been prepared, by those whose names are given below.

Abbe, Prof. Cleveland, Washington, D. C.,
Meteorologist, Weather Signal Office.

Abbot, Ezra, S. T. D., LL.D., Cambridge, Mass.,
Bussey Prof. of New Testament Criticism and Interpretation.

Adams, Hon. Charles F., Sr., D. C. L., LL.D., Boston, Mass.,
Late U. S. Minister Plenipotentiary to Great Britain.

Adams, Col. Julius W., C. E., New York,
President of the American Society of Civil Engineers.

Adams, William, S. T. D., LL.D., New York,
Dean of the Faculty of the Union Theological Seminary.

Adler, Felix, Ph. D., Ithaca, New York,
Prof. of Hebrew and Oriental Literature and History in Cornell University.

Adler, Rev. Samuel, Ph. D., New York City,
Rabbi of Temple Emanu-El, Fifth Avenue.

Agnew, Cornelius R., M. D., New York.

Aiken, Charles Augustus, Ph. D., S. T. D., Princeton, New Jersey,
Prof. of Christian Ethics and Apologetics, Princeton Theological Seminary.

Alexander, Stephen, LL.D., Princeton, New Jersey,
Professor of Astronomy in the College of New Jersey.

Allen, Hon. Elisha H., Chief-Justice of Sandwich Islands.

Allen, Frederick D., Ph. D., Cincinnati, Ohio,
Professor of Greek in the University of Cincinnati.

Alvord, Gen. Benjamin, Washington, D. C.,
Paymaster-General of the U. S. Army.

Anderson, Rev. R., Boston, Mass.

Andree, Prof. Karl, Ph. D., Dresden, Saxony.

Andree, Richard, Ph. D., Leipsic, Saxony,
Professor in the University of Leipsic.

Andrews, George L., West Point, N. Y.,
Prof. of the French Language in the U. S. Military Academy.

Andrews, Rev. S. J., S. T. D., Hartford, Conn.

Arnold, Albert N., S. T. D., Chicago, Ill.,
Prof. of New-Testament Greek in Bap. Theol. Sem. of Chicago.

Arnold, John W. S., M. D., New York,
Prof. of Physiology in the N. Y. University Medical College.

Atterbury, Rev. W. W., New York,
Secretary of New York Sabbath Com., Bible House.

Aucaigne, Prof. Félix, A. M., LL.B., New York,
Foreign Editor of New York Com. Advertiser.

Austin, Coe F., Esq., Closter, N. J.

Axon, William E. A., Esq., Manchester, England.

Bacon, Rev. Leonard, S.T.D., LL.D., N. Haven, Conn.,
Lecturer on Church Polity and Am. Church History, Yale Coll.

Badeau, Gen. Adam,
U. S. Consul, London, England.

Bailey, William W., Esq., A. M., Providence, R. I.

Ball, Rev. George H., New York,
Editor of the Baptist Union.

Ball, John, F. R. S., M. R. I. A., etc., London, England.

Barnes, P., Esq., Pittsburg, Pa.

Bayley, G. W. R., New Orleans, La.,
Civil Engineer.

Behm, E., Gotha, Saxony,
Assist. Editor of Petermann's Geographischen Mittheilungen.

Bellows, Rev. Henry W., S. T. D., LL.D., New York,
Pastor of the Church of All Souls, Fourth Avenue.

Benton, Col. James G., U. S. Ordnance.

Bergh, Henry, Esq., New York,
Pres. of the N. Y. Society for Prevention of Cruelty to Animals.

Bermingham, Edward J., M. D., New York.

Bessels, Emil, Ph. D., New York,
Astronomer to the Polaris Arctic Expedition.

Billings, John S., M. D., Washington, D. C.,
Assistant Surgeon U. S. Army.

Birch, Samuel, LL.D., London, England,
Of the British Museum.

Bird, Rev. F. M., Hightstown, N. J.

Bishop, Hon. Charles R., Sandwich Islands.

Blackie, Prof. George S., M. D., Ph. D., New York.

Blades, William, Esq., Abchurch Lane, London, Eng.

Blunt, George W., Esq. New York,
Member of the Board of Commissioners of Pilots.

Boccardo, Prof. G., Florence, Italy.

Bolton, H. Carrington, A. M., Ph. D., New York,
Assist. in Analytical Chemistry, School of Mines, Col. Coll.

Brace, Charles L., New York,
Secretary Children's Aid Society.

Brachelli, Prof. Hugo F., Ph. D., Vienna, Austria,
Court Counsellor and President of Department of Statistics of the Imperial Ministerium, Vienna, Austria.

Brackett, Col. Albert G., U. S. Army, Fort Sanders, Wyoming Ter.

Bradford, Lt.-Com. Royal B., U. S. Navy.

Brand, Rev. William F., A. M., Emmerton, Md.,
Rector of St. Mary's Church, Emmerton.

Brewer, Thomas M., M. D., Boston, Mass.,
Ed. of the History of North American Birds.

Brialmont, Alexis, Belgium,
General Belgian Army.

Briggs, Rev. Charles A., New York,
Provisional Professor of Hebrew and the Cognate Languages, Union Theological Seminary.

Bright, Marshall H., New York,
Managing Editor of Christian at Work.

Brittan, Miss Harriet G., Calcutta, Hindostan.

Brooks, Vincent, Esq., London, Eng.

Brown, Edward, Esq., Brooklyn, N. Y.

Brown, Rev. S. Gilman, S. T. D., LL.D., Clinton, N. Y.,
President of Hamilton College.

Bryant, William Cullen, LL.D., New York,
Editor of the New York Evening Post.

Buck, Gurdon, M. D., New York.

Bullen, George, Esq., London, Eng.,
Curator of the British Museum Reading Room.

Burgess, John W., LL.B., Amherst, Mass.,
Professor of History and Political Science in Amherst College.

Buttz, Prof. Henry A., A. M., Madison, N. J.,
Professor of Greek in the Drew Theological Seminary.

Caland, P., Belgium.

Caldwell, R. C., Esq., London, England.

Cameron, Henry C., Ph. D., Princeton, N. J.,
Professor of Greek in the College of New Jersey.

Chadbourne, Rev. P. A., S. T. D., Williamstown, Mass.,
President of Williams College.

Chandler, William H., A. M., Ph. D., Bethlehem, Pa.,
Professor of Chemistry in the Lehigh University.

Chapin, Rev. Edwin H., S. T. D., New York,
Pastor of the Fourth Universalist Church, Fifth Avenue, N. Y.

Cheney, Ward, Esq., New York,
Pres. of American Silk Association.

Chesbrough, E. S., C. E., Chicago, Ill.,
Chief Engineer City of Chicago.

Church, Prof. John A., E. M., New York,
Associate Editor Army and Navy Journal, New York.

Clark, Alonzo, M. D., New York,
Professor of Pathology and Practical Medicine, Medical Department Columbia College, N. Y.

Clark, John E., New Haven,
Prof. of Mathematics, Yale College.

Clymer, Meredith, M. D., New York.

Colyar, Hon. A. St. Clair, Nashville, Tenn.

Comstock, Gen. Cyrus B., U. S. Engineers.

Cooke, Josiah P., A. M., Cambridge, Mass.,
Professor of Chemistry and Mineralogy, Harvard University.

Cooke, M. C., Esq., A. M., F. R. S., London, England,
Author of Handbook of British Fungi.

Cornwall, Henry B., E. M., Princeton, N. J.,
Prof. of Analytical Chemistry, Mineralogy, etc., College of N. J.

Corson, Baron de, Amboise, France.

Crane, Edward A., Esq., London, Eng.,
Ed. of American Register.

Craven, E. R., S. T. D., Newark, N. J.

Crosby, Rev. Howard, S. T. D., LL.D., New York,
Chancellor of the University of the City of New York.

Curry, Jabez L. M., S. T. D., LL.D., Richmond, Va.,
President of Richmond College.

Curtis, Edward, M. D., New York,
Professor of Materia Medica and Therapeutics, Medical Department of Columbia College, N. Y.

Curtius, Prof. Ernst, Ph. D., M. R. A. S., Berlin, Prussia,
Perpetual Sec. of the Acad. of Sciences, Berlin, and Professor in the University.

Dana, Richard H., LL.D., Boston, Mass.,
Author of Two Years Before the Mast.

Davids, T. W. Rhys, Esq., London, Eng.

Davidson, Thomas, Esq., A. M., St. Louis, Mo.

Davis, Adm. C. H., LL.D., U. S. N., Washington, D. C.,
Superintendent of the Naval Observatory.

Davis, Rev. James, London, Eng.,
Sec. of Brit. Evangelical Alliance.

Dawson, Benjamin F., M. D., New York.

Dawson, John, Wokingham, Eng.,
Prof. in the Hindustani Staff College.

Dawson, Prof. John W., LL.D., F. R. S., Montreal,
Principal of McGill College, Montreal, Canada.

Day, Edward C. H., Esq., New York,
Prof. of Geology and Physiology in the New York Normal Coll.

Delafield, Francis, M. D., New York.

Delepierre, Octave, Paris.

Delesse, A., Paris, France,
Professor of Mining Engineering in the School of Mines, Paris.

Detmold, William, M. D., New York,
Professor Emeritus of Clinical and Military Surgery, Medical Department Columbia College, N. Y.

Dewey, Rev. Orville, S. T. D., LL.D., Sheffield, Mass.

Dexter, Ransom, M. A., M. D., Chicago, Ill.,
Professor of Zoology, Comparative and Human Anatomy, and Physiology in the University of Chicago.

Dixon, W. J., Esq., London, England.

Dole, Rev. George T., Stockbridge, Mass.

Dorner, Rev. Isaac A., D. D., Berlin, Germany,
Professor in University of Berlin.

Draper, Henry, M. D., New York,
Prof. of Analytical Chemistry in the Medical School of New York City University.

Draper, John W., M. D., LL.D., New York,
Prof. of Chemistry, etc. in the Univ. of the City of New York.

Duveyrier, Henry, Paris, France,
Author of Travels in Sahara.

Eaton, Daniel C., M. A., New Haven, Conn.,
Professor of Botany, Yale College.

Egle, William H., M. D., Harrisburg, Pa.,
Author of History of Pennsylvania.

Elliott, Maj. Geo. H., U. S. Engineers.

Elliott, H. R., Esq., Closter, New Jersey.

Emerson, George B., LL.D., Boston, Mass.

Engelmann, Geo., M. D., M. N. A. S., St. Louis, Mo.

Ernst, Capt. Oswald H., U. S. Engineers, West Point, N. Y.,
Instructor in Practical Military Engineering, etc. in the U. S. Military Academy.

Farlow, Prof. Wm. G., M. D., Cambridge, Mass.,
Assistant Professor of Botany in Harvard University.

Farquhar, Com. Norman H., U. S. Navy.

Feuchtwanger, Lewis, M. D., New York.

Field, David Dudley, LL.D., New York.

Field, Rev. Henry M., S. T. D., New York,
Editor of the New York Evangelist.

Fisher, Rev. Ebenezer, S. T. D., Canton, N. Y.,
President of St. Lawrence University Theological School.

Fisher, George J., M. D., Sing Sing, New York,
President of the New York State Medical Society.

Fisher, George P., S. T. D., New Haven, Conn.,
Professor of Ecclesiastical History, Yale College.

Fiske, John, Esq., LL.B., Cambridge, Mass.,
Assistant Librarian, Harvard University.

Flint, Austin, M. D., New York.

Foster, Frank P., M. D., New York.

Fox, Hon. Gustavus V., Lowell, Mass.,
Late Assistant Secretary of the Navy.

Frizell, Joseph P., Esq., C. E., Boston, Mass.

Frost, Benjamin D., C. E., North Adams, Mass.,
Chief Engineer of the Hoosac Tunnel.

Gardiner, Frederick, S. T. D., Middletown, Conn.,
Prof. of the Literature and Interpretation of the Old Testament, Berkeley Divinity School.

Garnett, Richard, Esq., London, England.

Garrison, William Lloyd, Esq., Boston, Mass.

Geddes, Hon. George, Fairmount, N. Y.,
Late Senator State of New York.

George, W. S., Esq., Lansing, Mich.,
Editor of Lansing State Republican.

Gibbs, Wolcott, M. D., LL.D., M. N. A. S., Cambridge, Mass.,
Rumford Professor of the Application of Science to the Useful Arts in Harvard University.

Gifford, George, Esq., New York.

Gihon, Albert L., M. D., Medical Inspector U. S. Navy.

Godet, Rev. Frederick, S.T.D., Neufchâtel, Switzerland,
Professor of Theology.

Godet, Rev. George, Neufchâtel, Switzerland.

Goessman, Ch. A., Ph. D., Amherst, Mass.,
Professor of Chemistry in the Mass. Agricultural College.

Goodale, George L., A. M., Cambridge, Mass.,
Assistant Prof. of Vegetable Physiology in Harvard Univ.

Gorgas, Albert C., Medical Inspector U. S. Navy.

Gould, Benjamin A., Ph. D., M. N. A. S., Cordova, Buenos Ayres,
Director of the Observatory of the Argentine Republic.

Graham, Hon. William A., LL.D., Hillsboro', N. C.,
Ex-Governor of North Carolina.

Green, Com. S. D., U. S. Navy.

Green, William H., D. D., Princeton, N. J.,
Professor of Oriental and Old-Testament Literature in the Princeton Theological Seminary.

Greene, Charles W., A. M., M. D., North Andover Dépôt, Mass.

Gubernatis, Prof. Angelo de, Florence, Italy.

Haanel, Hugo, Ph. D., St. Louis, Mo.

Hains, Col. P. C., Washington, D. C., U. S. Engineers.

Haldeman, Miss Eliza S., Chickies, Pa.

Hall, James, LL.D., M. N. A. S., Albany, N. Y.,
Paleontologist to the Nat. Hist. Surv. of the State of New York.

Hamilton, Allan McLane, M. D., New York.

Hammond, William A., M. D., New York,
Late Surgeon-General U. S. A.

Hamy, Ernest T., M. D., Paris, France,
Member of the Society of Anthropology, Paris

Hart, Prof. J. Morgan, New York.

Harrington, Lt.-Com. Purnell F., U. S. Navy.

Hayden, Prof. Ferdinand V., M.D., M.N.A.S., Washington, D. C.,
Chief of the U. S. Western Exploring Expeditions.

Hayes, Isaac I., M. D., New York,
Commander of the Kane Search Expedition of 1860.

Hearn, E. D., A. M., London, England,
Editor of the Mining Journal.

Herrick, Rev. J. R., S. T. D., South Hadley, Mass.

Herrick, Mrs. S. B., Baltimore, Md.,
Associate Editor of the Southern Review.

Hickok, Laurens P., S. T. D., LL.D., Amherst, Mass.,
Late President of Union College, Schenectady.

Hill, Walter N., Newport, R. I.

Hitchcock, Charles H., A. M., Ph. D., Hanover, N. H.,
Hall Prof. of Geology and Mineralogy, Dartmouth College.

Hitchcock, Edward, A. M., M. D., Amherst, Mass.,
Prof. of Hygiene and Physical Education in Amherst Coll.

Hogg, John W., Chief Clerk, Navy Department.

Holder, J. B., M. D., New York,
Curator of the Museum of Natural History, Central Park.

Holley, Alexander L., C. E., Brooklyn, N. Y.

Holyoake, George Jacob, Esq., London, England.

Horsford, Prof. Eben N., M. D., Cambridge, Mass.,
Late Professor of Chemistry in Harvard University.

Hough, Prof. George W., LL.D., Albany, N. Y.,
Director of the Dudley Observatory.

Houston, Col. David C., U. S. Army.

Howard, Benjamin, A. M., M. D., New York.

Howard, Gen. Oliver O., LL.D., U. S. Army, Washington, D. C.,
Late Chief of Freedmen's Bureau.

Hubbard, G. Gardiner, Esq., Cambridge, Mass.

Hubbard, Stephen A., Esq., Hartford, Conn.,
Editor of the Hartford Courant.

Hudson, E. D., Jr., M. D., New York.

Hudson, Frederick, Esq., Concord, Mass.

Humphrey, Rev. Zephaniah M., S. T. D., Philadelphia, Pa.

Hunt, T. Sterry, F. R. S., LL.D., M. N. A. S., Boston, Mass.,
Prof. of Geology in the Massachusetts Institute of Technology.

Hurst, John F., S. T. D., Madison, N. J.,
President of Drew Theological Seminary.

Inglis, David, LL.D., Brooklyn, N. Y.

Johnson, John, LL.D., Middletown, Conn.,
Fisk Prof. Emeritus of Nat. Science in the Wesleyan Univ.

Johnson, Oliver, Esq., New York,
Managing Editor Christian Union.

Jordan, Gen. Thomas, New York.

Kelley, Hon. William D., Esq., Philadelphia, Pa.,
Member of House of Representatives, 43d Congress.

Kelton, Col. John C. (Brev. Brig.-Gen.), U. S. Army.

Kendrick, Asahel C., S. T. D., LL.D., Rochester, N. Y.,
Munro Prof. of the Greek Lan. and Lit. in Rochester Univ.

Editor of Transcript.

Rowell, E. T., Esq., Lowell, Mass.,
Editor of Lowell Daily Courier.

Schram, N. H., Esq., Newburgh, N. Y.,
Editor of Newburgh Telegraph.

Simmons, W. E., Jr., Esq., Charleston, S. C.,
Late Editor of News and Courier.

Skeels, R. M., Esq., Lockport, New York,
Editor of The Daily Union.

Snowden, E., Esq., Alexandria, Va.,
Editor of Alexandria Gazette.

Stickney, N. F., Esq., Gloucester, Mass.,
Editor of Gloucester Telegraph.

Strong, Tim. F., Jr., Esq., Fond du Lac, Wis.,
Editor of Fond du Lac Journal.

Tefft, B. F., Esq., Bangor, Maine,
Editor of Northern Border.

Vater, S., Esq., La Fayette, Indiana,
Editor of La Fayette Journal.

Waldo, G. C., Esq., Bridgeport, Conn.,
Editor of Daily Standard.

Wittington, Nathan N., Esq., Newburyport, Mass.,
Editor of Newburyport Herald.

Wolfe, J. M., Esq., Omaha, Neb.,
Editor of Omaha Directory.

Woodruff, O., Esq., Newark, New Jersey,
Associate Editor of Newark Daily Advertiser.

JOHNSON'S

NEW ILLUSTRATED

UNIVERSAL CYCLOPÆDIA.

A.

A, the first letter of all known phonetic alphabets, except the Abyssinian (or Ethiopian), in which it forms the thirteenth, and the Runic, in which it is the tenth. The cause of its being placed at the head of all the principal European and Asiatic alphabets is not certainly known, but is probably to be found in the fact that the original sound of the letter (similar to that of our *a* in *far*) is the most easily formed of all the vowels, requiring for its utterance scarcely any effort, and the slightest possible change in the position of the vocal organs, except simply opening the mouth; it is accordingly the first sound that children usually utter. *A* with a stroke above it (*a̅*), in the ancient Greek, denoted the first numeral, but *a* with the stroke beneath stood for 1000. *A* in Latin stands for 500, and with a stroke over (*A̅*) for ten times that number (or 5000). *A* is also used to mark a note in Music (which see). *A* is frequently used as an abbreviation. (See Abbreviations.) In logic, *A* is the sign employed to denote a universal affirmative proposition. A^1 (or "A No. 1") is often applied in mercantile affairs to denote any article of the very highest class. In registering vessels, *A* designates the character of the hull of the vessel, while the figure 1 marks the efficient state of her anchors, cables, stores, etc. In Latin, *A* stands for several proper names, especially for the prænomen *Aulus*.

A, Ab, or **Abs,** a Latin particle signifying "from," "off," "away," and forming the prefix of a multitude of English words, as *abduct*, to "lead or take away;" *abstract*, to "draw away or from;" *avert*, to "turn away."

An, the name of several rivers or streams in Germany, Switzerland, Holland, Russia, and France. It is supposed to signify "water," and to be etymologically related to the Latin *aqua*. The Icelandic word for "river" is Á. In Swedish this primitive form becomes Å, and in Danish **aa,** and these syllables become very often the termination of names of rivers in the three countries mentioned. **Aach,** or **Ach,** another form of the same, constitutes a

part of several geographical names, as *Aachen* (the German of Aix-la-Chapelle), *Biberach*, etc.

Aachen. See AIX-LA-CHAPELLE.

Aagard (CARL FREDRIK), a Danish painter, born in 1833, at first gave his attention to decorative painting, but afterwards turned to landscape painting. One of his most celebrated pictures is a scene from a zoological garden, which was exhibited at Stockholm in 1866.

Aal'borg (*i. e.* "Eel Castle" or "city"), a seaport of Denmark, in Jutland, on the south shore of the Lymfiord, through which vessels pass into the Cattegat, and 63 miles N. W. of Aarhuus. The number of vessels arriving here annually amounts to about 400. Pop. in 1870, 11,721.

Aa'len, a town of Würtemberg, on the Kocher, 48 miles by rail E. N. E. of Stuttgart. Pop. in 1871, 5552.

Aa'li Pash'a (MEHEMED EMIN), a Turkish statesman, was born in 1815 at Constantinople, was appointed minister of foreign affairs Aug. 15, 1845, which position he filled three times within the period from 1846 to 1853. In Dec., 1845, he became chancellor of the divan, in 1846 pasha, and in 1852 for the first time grand vizier, which position he afterwards held several times. In 1855 he represented Turkey at the conferences of Vienna and Paris, and signed the treaty of Paris of Mar. 30, 1856. In May, 1864, he presided at the conference of European powers for settling the Rumanian question. In 1867, while the sultan undertook a tour over the Continent, Aali Pasha was appointed regent of the empire. In the same year he went to Candia to settle the difficulties on that island amicably. He was also well known as a poet. Died Sept. 6, 1871.

Aalten, a town of the Netherlands, province of Guelderland, on the Aar, 29 miles E. of Arnhem. Pop. in 1867, 6160.

Aar, a river of Switzerland, rising in the Grimsel and Schreckhorn Mountains in the canton of Berne, forms the remarkable fall of Handeck, traverses the lakes of Brienz and Thun, and enters the Rhine opposite Waldshut. Length, 175 miles. It is navigable from Thun to its mouth. AAR is also the name of several rivers of Germany.

Aa'rau, a town of Switzerland, capital of Aargau, on the river Aar, 63 miles by railway W. of Zürich. It has manufactures of silk and cotton stuffs, mathematical instruments, etc. In 1798 it was the capital of the Helvetic republic. (See SWITZERLAND.) Pop. in 1870, 5449.

Aard-Vark, *i. e.* "earth-pig" (*Orycter'opus Capen'sis*), an animal of the class Mammalia, order Edentata, abounds in Cape Colony. It is a plantigrade, is about five feet long, including the tail, burrows in the ground if pursued, and quickly enters so far that it is beyond the reach of the pursuer. It feeds on ants, seeking its prey by night; it readily breaks down the walls of the ant-hills, catching the insects with its long prehensile and slimy tongue. Its flesh is often used as food.

Aard-Vark.

Aard-Wolf, *i. e.* "earth-wolf" (*Prot'eles crista'tus*), a carnivorous digitigrade quadruped of the class Mammalia, is a native of Caffraria. It is about equal in size to a fox, and resembles a hyæna in structure and other respects, having the fore legs longer than the hind legs. It is called earth-wolf because it digs burrows or holes in the ground, in which it passes the day. It is considered by some as a connecting link between the hyæna and the dog.

Aar'gau [Fr. *Aargovie*], a canton in the N. part of Switzerland, is bounded on the N. by Germany, on the E. by Zurich, on the S. by Lucerne, and on the W. by Basel and Solothurn. Area, 543 square miles. The chief rivers are the Aar and the Limmat. It consists chiefly of fertile and well-cultivated hills. Fruit of all kinds is produced in large quantities, and many cattle are raised here. It has important cotton factories. There are mineral springs at Baden and Schinznach. In 1871 the population was 198,873, of whom 107,703 were Protestants, 89,180 Roman Catholics, 449 belonged to other Christian churches, and 1541 were Jews. The canton was organized in 1803. The constitution is dated from 1841, and was revised in 1852 and in 1862. The income in 1867 amounted to 2,046,685 francs, the expenses to 2,581,685 francs, and the debt was estimated at 1,000,000 francs. It contributes 14,762 men to the federal army. Capital, Aarau. (See MÜLLER, "Der Aargau," 1870.)

Aar'huus, a seaport of Denmark, in North Jutland, on the Cattegat, 37 miles S. E. of Viborg. It has a cathedral, a museum, a library, and various manufactories. Pop. in 1870, 15,025.

Aar'on [Heb. אַהֲרֹן], the first high priest of the Israelites, was a descendant of Levi, probably in the eighth or ninth generation. He was three years older than his brother Moses (Ex. vii. 7), and apparently (Ex. ii. 4) some years younger than their sister Miriam. An impulsive and eloquent man, he was appointed spokesman to Moses, whom he assisted in the deliverance of the Israelites from the bondage in Egypt. He died on Mount Hor, which is still called the "Mountain of Aaron," and was succeeded in the priesthood by his son Eleazar.

Aaron (SAMUEL), a Baptist minister and educator, born in 1800 at New Britain, Pa., was ordained in 1829, and held pastorates at New Britain and Norristown, Pa., and at Burlington and Mount Holly, N. J. He also gained great reputation as a teacher in various schools, especially at Treemount Seminary, near Norristown, and the Mount Holly Institute. He was the author of various text-books. Died April 11, 1865.

Aar'sens, or Aarssens, van (FRANCISCUS), born at The Hague in 1572, was the son of the Dutch statesman Cornelis van Aarsens (1543–1624). The younger Van Aarsens was sent to the court of France as resident in 1598, and as ambassador in 1609 and in 1627; to Venice from 1609 to 1615, and again in 1619; to England in 1626 and in 1640, when he negotiated the marriage between the prince of Orange (William II. of Nassau) and the princess Mary, daughter of Charles I. of England. Died in 1641.

Aa'sen (IVAR ANDREAS), a Norwegian writer, born Aug. 5, 1813, at Orsteen, was at first a school-teacher, but subsequently devoted himself wholly to the study of the Norwegian dialects. He was supported in this study by the Drontheim Association of Sciences, which furnished him the means of visiting all parts of the country. He wrote "Det Norske folkesprogs grammatik" (1848), "Ordbog over det Norske folkesprog" (1852; new and much improved ed. 1873), and "Norske ordsprog" (1856).

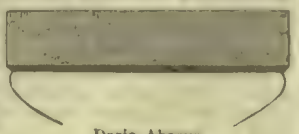
Aas'vær is the name of a group of small islands under the Arctic polar circle, about 10 miles from the Norwegian coast, which until recently were entirely unnoticed. The owner leased them for a small price to two poor fishermen. At present they are one of the most important fishing-places in Europe. About Dec. 10, when the herrings arrive, over 10,000 fishermen come here, and in two or three weeks catch about 200,000 kegs of herrings. From Jan. 1 to Dec. 1 the islands are almost deserted, being inhabited by only a few families.

Ab, the eleventh month of the Jewish civil year, and the fifth of the ecclesiastical year.

Abab'de, a village of Middle Egypt, on the east bank of the Nile, 8 miles S. of Beni Hassan. Near it are the ruins of the ancient Antinoë (or Antinoöpolis), a city built by the emperor Hadrian (or Adrian) in honor of his favorite Antinoüs.

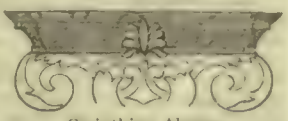
Ababdeh, a negro tribe of nomads in Upper Egypt and Nubia, are chiefly employed as guides through the deserts.

Ab'aca, or **Manila Hemp,** is the fibre of the leaf-stalk of a species of plantain (*Mu'sa troglodyta'rum*, otherwise called *Mu'sa tex'tilis*), growing abundantly in the Philippine Islands, from which many thousand tons are annually exported. Of the fibres of this tree a cordage is made which has the property of floating on water; sea-water does not rot it, and it therefore requires no tarring. A portion of the fibre which is fine and white is manufactured into a kind of linen. It is an excellent material for paper.



Aback', in sea-language, denotes the position of the sails when laid flat against the mast, either by the force of the wind or for the purpose of avoiding some imminent danger.

Ab'aco, or **Great Abaco,** the largest of the Bahama Islands, is 80 miles long, its N. E. point being in lat 26° 18′ N., lon. 76° 57′ W. Area, about 96 square miles. Carleton is the chief town, and its southern point is in lat. 25° 51′ N., lon. 77° 09′ W. LITTLE ABACO lies W. of the northern part of Abaco.



Ab'acot, an antique cap of state, worn formerly by the kings of England. It was made in the shape of a double crown.

Ab'acus [Gr. ἄβαξ, gen. ἄβακος], a calculating instrument which was used in mercantile transactions by the ancient Greeks and Romans, and is sometimes used in schools by the moderns. One form common in the U. S. for teaching children addition and multiplication consists of a frame somewhat like that of a slate, with twelve wires running through it, and twelve beads or small balls

on each wire. *Ab'acus Pythagor'icus* was anciently a name for the multiplication table. In architecture, *abacus* signifies the level tablet placed between the entablature and the capital of a column. The old Ionic as well as the Tuscan abacus is similar to the Doric (as here represented), but the new Ionic resembles the Corinthian.

Doric Abacus.

Corinthian Abacus.

Abâd, an affix of Persian origin, signifying "abode," and occurring in the names of many cities in the East; as *Hyderâbâd*, the "abode or city of Hyder."

Abâd' is also the name of several kings who reigned in Moorish Spain. Abâd I. was the first Moslem king of Seville. He began to reign in 1023, and died in 1042. Abâd III., the last of this dynasty, died in 1095.

Abad'don, a Hebrew name applied to the angel of the bottomless pit; the same as the Asmodeus of Tobit iii. 8, and the Apollyon of Rev. ix. 11.

Abaft', a sea-term signifying at or towards the stern of a vessel.

Abaissé, or **Abaissed** (*i. e.* "lowered"), a term in heraldry applied to any armorial figure when it is depressed or placed below the centre of the shield.

Ab'ana, the name of one of the rivers of Damascus mentioned in the Bible (2 Kings v. 12). Its identification with the modern Barada is now generally accepted. (See PORTER'S "Five Years in Damascus," 1855.)

Abancay', a town of Peru, in the department of Cuzco, is situated on the river Abancay, 74 miles W. S. W. of Cuzco. It has large sugar-refineries. Pop. estimated at about 5000.

Abancourt, d' (CHARLES FREROT), a distinguished French engineer, born in Paris, resided many years in Turkey in the employ of the French government. Several of the maps of Eastern Europe prepared by him have a high reputation. Died at Munich in 1801.

Abancourt, d' (CHARLES XAVIER JOSEPH FRANQUEVILLE), a minister of Louis XVI. of France, was born at Douai in 1758. He was a nephew of the celebrated Calonne. He was massacred at Versailles Sept. 9, 1792.

Aban'donment [from the Fr. *abandonner*], in law, is used in several senses, depending upon the subject to which it is applied:

1. *In Insurance.*—In this branch of the law it is applied to recovery by the insured in case of loss. Loss is either total or partial. In certain cases of partial loss the insured may, at his election, transfer the entire property to the insurers, and claim a total loss. The insurers would thus become the owners of the property in its impaired condition. This act is abandonment, and the "total loss" thus occasioned is termed constructive. It is applicable particularly to marine insurance. The subject is governed by rules differing somewhat in England and in America. The general principle is, that a serious injury must have happened by a marine peril to the ship or cargo (the value must have usually been diminished more than one-half), or the purposes of the voyage as to the ship must have been substantially defeated, as in the case of an embargo for an indefinite time. The act of abandonment must be exercised not upon mere conjecture, but upon credible information, and without delay. No particular form is necessary.

2. *As to Personal Property.*—An owner may cast away or otherwise relinquish personal property, so as to cause his ownership to cease. This may readily occur in the case of property at sea. The intent is a principal subject of inquiry. Property in this condition is otherwise called "derelict."

3. *Real Estate.*—Abandonment in this branch of the law applies to incorporeal rights, such as easements. There can be no abandonment of the ownership of the land itself. This must be parted with by some recognized mode of conveyance, such as a deed, or the principle of estoppel must be invoked or the rules of the statute of limitations.

4. In the legal relation of husband and wife the word abandonment is frequently employed as an equivalent to desertion. It is in some instances defined by statute.

Abar'ca (JOAQUIN), a Spanish bishop and leader of the absolutist party, born in 1780, was, on account of his zealous advocacy of the principles of absolutism, made a bishop by Ferdinand VII. Subsequently he became prime minister of Don Carlos, but after a time fell into disfavor for being too moderate. He was banished, and died in 1844 in a convent near Turin, Italy.

Aba'rim (meaning "regions beyond"), a mountain-range of Moab, on the E. side of Jordan, opposite Jericho, mentioned in Num. xxvii. 12 and elsewhere. Pisgah is either the same as Abarim or a part of it. This line of mountains rises to the height of nearly 3000 feet above the Mediterranean, and more than 4000 feet above the Dead Sea. As seen from Jericho or the Mount of Olives, the summit of the range is apparently almost level. But recent explorers report considerable inequalities of surface. The highest of the peaks, still called Mount Neba or Nebbeh, is thought to be the Nebo from which Moses viewed the Land of Promise (Deut. xxxiv. 1–4).

Abascal' (JOSÉ FERNANDO), a Spanish commander, born at Oviedo in 1743. He entered the army in 1762, served against the French and the English, became intendant of New Galicia, and in 1804 was appointed viceroy of Peru. He was an able and popular ruler, and accomplished much for the people of Peru. In 1812 he was made a marquis. He was recalled in 1816. Died at Madrid June 30, 1821.

Abatement [from the Fr. *abattre*, to "strike away"] is a legal term applied in various branches of the law.

1. *Title to Real Estate.*—Here it refers to the wrongful entry of a stranger upon land after an ancestor's death, and before the entry of an heir or devisee, and thus keeping him out of possession. The wrong-doer is termed an abator.

2. *Nuisances.*—In this case it means the act of destroying or removing a nuisance, which may take place without legal process. No unnecessary damage must occur, and the act must be done without a breach of the peace.

3. In respect to legacies and creditors' claims the word means a proportionate reduction of them where there are not sufficient assets to make full payment.

4. In actions the word has two significations: (1.) In respect to pleadings. A defendant may assert by a "plea in abatement" that the plaintiff's action ought to cease by reason of some informality or irregularity. It is called a *dilatory* plea, because it does not meet the case upon the merits. Such pleas are not favored in modern law, and there is a tendency to confine them by statute within narrow limits. If the cause is abated on such grounds, a new action may be brought. (2.) In respect to the termination of a litigation by the occurrence of some event during its progress, such as the death or disability of a party. In a court of law the regular effect of the death of a party was to cause the action to abate altogether. In a suit in equity proceedings were suspended, and might be revived by established methods. Similar rules were applied to disabilities, such as the marriage of a female party to an action. The effect of this doctrine is largely modified in codes of procedure in this country, and in England by the "Common-Law Procedure" act. Under these statutory regulations an action may, after the death of a party, be continued by or against his representatives, on motion to the court in which the action is pending. The application is subject to regulations to prevent unnecessary delay. There are certain actions in which there can be no revival. An instance is that of a cause of action for a personal wrong (tort). This is said to "die with the person." In other words, it cannot be prosecuted by or against the executors or administrators of a party sustaining or inflicting the wrong.

T. W. DWIGHT.

Abatement, in heraldry, denotes symbols of disgrace introduced into a coat-of-arms; these are scarcely mentioned by any heraldic writers except the English. A *delf toad* is the sign of a revoked challenge; a *point-d-point* denotes a coward; a *gusset sinister* denotes drunkenness.

Abattis, or **Abatis** [Fr.], in fortification, a bulwark or obstruction formed by trees felled and placed side by side, so that their tops are directed towards the enemy. Sometimes the ends of the branches are cut off and sharpened.

Abattoir, a public establishment in which cattle, sheep, etc. are killed with such sanitary arrangements as will guard the population of a city against the nuisances of private slaughter-houses. This improvement originated in Paris in 1807. The principal abattoirs for the city of New York are near Jersey City, N. J.

A Battuta [It.], a term in music signifying in strict or measured time.

Aba-Ujvar, a county of Hungary, is bounded by the counties of Zips, Saros, Zemplin, Torna, and Borsod. Area, 1109 square miles. The country consists entirely of picturesque mountains. The soil, which is very fertile, yields wine in abundance. Gold, silver, iron, and copper are found here. Pop. in 1869, 166,666. Chief town, Kaschau.

Abauzit (FIRMIN), a celebrated French Protestant phil-

osopher and mathematician, was born at Uzès, Languedoc, Nov. 11, 1679, was educated at Geneva, travelled in England and Holland, and wrote several works on theology, antiquities, etc. He was a friend and correspondent of Sir Isaac Newton, who esteemed him highly, and he was profoundly versed in many branches of learning and science. Died in Geneva Mar. 20, 1767.

Abbadie (JACQUES), D. D., a French Protestant divine, born in Béarn in 1658. He removed to England in 1688, preached in London, and became dean of Killaloe in Ireland. His chief work is a "Treatise on the Truth of the Christian Religion" (in French, 2 vols., 1684), which was received with favor by both Protestants and Roman Catholics. Died in London Nov. 7, 1727.

Abbadie, d' (ANTOINE and ARNOULD MICHEL), two brothers and French travellers, born in Dublin in 1810 and 1815, who explored Abyssinia and Upper Egypt between 1838 and 1848, travelled up the White Nile, and even visited Darfoor. Their more important works are "Nouvelles du haut fleuve Blanc," "Note sur la route du Darfour," "Sur les nègres Yambo," "Géodésie d'Éthiopie," etc. (1860–63), and "Douze ans dans la Haute-Éthiopie" (2 vols., 1868). Their collection of Ethiopic and Amharic manuscripts, numbering 234, was until recently the largest collection in Europe.

Abbandonamen'te [It.], in music, signifies "with self-abandonment," despondingly.

Abbas', or, more fully, **Abbâs-Ibn-Abd-il-Moot'talib,** a paternal uncle of Mohammed, and the ancestor of the dynasty of Abbassides, was born at Mecca about 566 A. D. He fought against Mohammed at the battle of Bedr, but was afterwards converted, and rendered important services to that prophet.

Abbâs I., or **Shâh Abbâs,** surnamed THE GREAT, a king of Persia, born in 1557, was a son of Mohammed Mirza. He began to reign about 1584, and distinguished himself by his ability and energy. In 1605 he defeated the Turks in a great battle, and recovered the Persian provinces which they had occupied. Died in 1628.

Abbâs-Mir'za, a son of Fatah Ali Shah, king of Persia, was born in 1783. He commanded the Persian army which was defeated by the Russians in 1811. He was a prince of superior talents, and promoted the introduction of European culture and military tactics into Persia. He died before his father, in 1833.

Abbâs Pasha, viceroy of Egypt (the third of the present dynasty), a grandson of Mehemet Ali, was born at Yedda, in Arabia, in 1813. He succeeded his uncle, Ibrahim Pasha, Nov. 9–10, 1848, and died in July, 1854. He was succeeded by his uncle, Saïd Pasha.

Abbassides (pronounced ab-bas'sidz; sing. **Abbasside,** ab-bas'sid), or **Abbasi des** [Lat. *Abbasidæ;* called by the Arabs BENI ABBÂS, *i. e.* "sons or descendants of Abbâs"], the name of a celebrated dynasty of caliphs who reigned at Damascus, and afterwards at Bagdad, from 762 to 1258 A. D. They traced their genealogy to Abbâs, the uncle of Mohammed. To this dynasty belonged the caliphs Harun-al-Rashid and Al-Mamun.

Abbatu'cci (CARLO, or CHARLES), a Corsican general, born in 1771. He served in the French army under the republic, and was killed at Huningue in 1796.

Abbatucci (CHARLES), a son of Jean Charles, born in 1816, became under Napoleon III. counsellor of state, and was in June, 1872, elected to the National Assembly as the candidate of the Bonapartist party.

Abbatucci (GIACOMO PIETRO, or JACQUES PIERRE), a Corsican, born in 1726, became a general of division in the French service. Died in 1812.

Abbatucci (JACQUES PIERRE CHARLES), a French lawyer, a nephew of Carlo, noticed above, was born in Corsica in 1791. He became in 1848 a partisan of Louis Napoleon, who appointed him minister of justice in 1852. Died in 1857.

Abbatucci (SÉVERIN), son of Jean Charles, was in 1871 elected member of the National Assembly, and in August resigned his seat in order to give to Rouher, the leader of the Bonapartist party, an opportunity to be elected.

Abbé, ăb'bĕ', a French term formerly applied to ecclesiastics and students of theology who were supported by the revenue of monasteries. They often devoted themselves to literary pursuits or were employed as tutors in wealthy families. Before the Revolution the king had the power to nominate 225 *abbés commendataires,* whose offices were sinecures. (See ABBOT.)

Abbeoku'ta, or **Abbekuta** (*i. e.* "under the rock"), a large town of Western Africa, and capital of the kingdom of Yorruba or Yarriba, is built on granite hills around a rock 250 feet high, and is situated on the left bank of the Ogoon River, 120 miles N. W. of Benin. The negro bishop Crowther has established a newspaper here in the Egba language; the number of Christians is estimated at 2000. It was founded in 1825 by some fugitives, and has rapidly increased. Pop. estimated at 150,000.

Ab'bess [Lat. *abbatis'sa*], the superior of a convent of women, corresponding in rank and authority to an abbot, except that she cannot exercise the functions of the priesthood.

Abbeville, ăb'vĕl', a fortified city of France, situated on the river Somme, in the department of Somme, on the Northern Railway, 36 miles by rail N. W. of Amiens. It contains a fine cathedral and manufactories of woollen cloths, etc. Abbeville has in late years been made famous by the discovery of many interesting relics of pre-historic man in the valley of the Somme at that place. Pop. in 1866, 19,385.

Ab'beville, a county in the W. N. W. of South Carolina, bordering on Georgia. Area, 960 square miles. It is bounded on the S. W. by the Savannah River, and on the N. E. by the Saluda, and is intersected by the Greenville and Columbia R. R. Generally fertile and well watered. Gold is found in the county. Cattle, grain, cotton, and wool are raised. Pop. 31,129. Capital, Abbeville.

Abbeville, the capital of Henry co., Ala., finely situated 3 miles from Yattanabbee Creek and 100 miles S. E. of Montgomery. It has two churches, one academy, and one weekly paper. Pop. of township, 1267.

M. A. SHEEHAN, ED. "HENRY COUNTY REGISTER."

Abbeville, a post-village, capital of Wilcox co., Ga.

Abbeville, a post-village, capital of Vermilion parish, La. It has one weekly newspaper. Pop. 545.

Abbeville, a post-village of Lafayette co., Miss., on the Central Mississippi R. R., 56 miles N. by E. of Grenada.

Abbeville, the capital of Abbeville co., S. C., is 97 miles W. by N. of Columbia, on a branch of the Greenville and Columbia R. R. It has some manufactures, a male and female academy, three schools, five churches, a library, two newspapers, a Bible society, and various public buildings. Pop. of Abbeville township, 3034.

J. C. HEMPHILL, ED. "MEDIUM."

Abbey (RICHARD), a Methodist clergyman and author, born in Genesee co., N. Y., Nov. 16, 1805, removed to Illinois in 1816, and to Natchez, Miss., in 1825. In 1844 he entered the ministry in the Methodist Church, and is now (1873) a member of the Mississippi Conference of the Methodist Episcopal Church South. He has been an extensive newspaper and review writer. His first book, "Letters to Bishop Green on Apostolic Succession," was published in 1853, and was soon followed by the "End of the Apostolic Succession," a written debate with Yerger and Smedes on High-Church doctrines. His "Ecclesiastical Constitution" was published in 1856, "Creed of All Men," against deism, appeared in 1855, "Church and Ministry" in 1859, and "Diuturnity" in 1866. In 1868 he published anonymously "Ecce Ecclesia," and in 1872 "The City of God and the Church-Makers." He has also published "Baptismal Demonstrations," "Divine Assessment," "Strictures on Church Government," "The Divine Call to the Ministry," etc. In 1858 he was elected financial secretary of the Southern Methodist Publishing House.

Abbia'ti (PHILIPPO), a skilful Italian painter, born at Milan in 1640; died in 1715.

Abbitib'bie, or **Abbitib'be,** a lake, river, and trading-station in British North America, near James's Bay, into which the river flows.

Abbon the Crooked (in Latin, *Ab'bo Cer'nuus*), a French monk of St.-Germain-des-Prés, described the siege of Paris by the Northmen (885–887) in an epic poem which has been translated into French by Guizot. Died in 923.

Abbon of Fleury [in Latin, *Ab'bo Floriacen'sis*], an eminent French monk, born near Orleans in 945, was one of the most learned men of his age. He became abbot of Fleury. Died in 1004.

Ab'bot [Lat. *ab'bas;* Fr. *abbé;* from the Hebrew *abba,* "father"], the superior of a convent or monastery, and an ecclesiastic of high rank in the Roman Catholic Church. Abbots were ranked as prelates of the Church next to the bishops, and had the right to vote or speak in the general councils. In England there were formerly a number of *mitred abbots,* who sat and voted in the House of Lords.

Abbot, a post-township of Piscataquis co., Me. It has manufactures of lumber, carriages, etc. Pop. 712.

Abbot, a township of Potter co., Pa. Pop. 534.

Abbot of Misrule, or **Abbot of Fools,** called in Scotland the "Abbot of Unreason," a title given in the Middle Ages to the master of revels, and especially to the person appointed to preside over Christmas festivities.

Abbot (Abiel), D.D., born at Andover, Mass., Aug. 17, 1770, graduated at Harvard in 1792, was a Congregational minister in Haverhill, Mass. (1795–1803), and in Beverly, Mass., until 1827, when he sailed for Cuba. Died of yellow fever at Staten Island, N. Y., June 7, 1828. His "Letters from Cuba" (1829), and a volume of his sermons (1831), with a memoir, have been published.

Abbot (Abiel), D.D., born at Wilton, N. H., Dec. 14, 1765, graduated at Harvard in 1787. He studied theology, was tutor at Harvard (1791–95), minister of the Congregational church at Coventry, Conn. (1795–1811), and of the Unitarian church, Peterborough, N. H. (1827–48). He published a "History of Andover," Mass. (1829), etc. Died Jan. 31, 1859.

Abbot (Benjamin), LL.D., an eminent teacher, was born at Andover, Mass., Sept. 17, 1762, and graduated at Harvard College in 1788. He was principal of Phillips Academy at Exeter, N. H., for fifty years (till 1838). Among his pupils were Daniel Webster, Alexander H. Everett, Edward Everett, Lewis Cass, Jared Sparks, and George Bancroft. Of fine character and courtly manners, he had great power over his pupils. He died Oct. 25, 1849.

Abbot (Charles), Lord Colchester, born Oct. 14, 1757, Speaker of the British House of Commons (1802–17), was made peer in 1817, and died May 8, 1829.

Abbot (Ezra), born in Jackson, Me., April 29, 1819, graduated at Bowdoin College in 1840, became in 1856 assistant librarian in Harvard College, in 1872 professor of New Testament criticism and interpretation in the Cambridge Divinity School; published "Literature of the Doctrine of a Future Life" (1864–71). He has also served as assistant and editor of such works as Norton's "Gospels," Hackett's revision of Smith's "Bible Dictionary," Noyes' "New Testament," and Hudson's "Concordance." He has also published many review articles, etc.

Abbot (Francis Ellingwood), born at Boston, Mass., Nov. 6, 1836, graduated at Harvard, and was (1870–73) editor of the "Index," a journal devoted to the interests of Free Religion. He also published articles on the "Philosophy of Space and Time," "The Conditioned and the Unconditioned," "Philosophical Biology," etc., in the "North American Review" and other periodicals.

Abbot (George), D. D., born in Surrey Oct. 29, 1562, was educated at Oxford. He became bishop of London in 1610, and archbishop of Canterbury in Jan., 1611. He was noted for his liberal principles, and was a rival or opponent of Laud. Died Aug. 4, 1633.

Abbot (Gorham Dummer), LL.D., a younger brother of Jacob Abbott, was born Sept. 3, 1808, graduated at Bowdoin College in 1826, and took a part of the theological course at Andover in the class which graduated in 1831. He was pastor for three years at New Rochelle, N. Y., and for thirteen years principal of the Spingler Institute in New York City. He has published "The Family at Home," "Nathan Dickerman," "Mexico and the U. S." (1869), and other works. Died July 31, 1874.

Abbot (Henry L.), an American officer, born Aug. 13, 1831, at Beverly, Mass., graduated at West Point 1854, major of engineers Nov. 11, 1865, served as assistant on Pacific R. R. surveys, 1854–57, and was associated with General Humphreys on the hydrographic survey of the delta of the Mississippi, 1857–61, the results being set forth in an elaborate report, "Physics and Hydraulics of the Mississippi River." In the civil war served in the Manassas campaign, 1861; engaged at Blackburn's Ford and Bull Run (wounded and brevet captain); in the construction of the defences of Washington, 1861–62; in the Virginia Peninsula, 1862; engaged at Yorktown (brevet major) and the Seven Days' operations before Richmond; as chief topographical engineer of Banks's expedition to the Gulf of Mexico, 1862–63; as colonel of the First Connecticut Artillery Volunteers, in command of siege artillery before Petersburg, 1864–65 (brevet lieutenant-colonel U. S. A., and brevet brigadier-general U. S. V.); engaged in various actions; as chief of artillery of expedition to Fort Fisher, 1865; and in command of a brigade in the defences of Washington, 1865–65. Brevet colonel and brigadier general U. S. A. Mar. 13, 1865, and brevet major-general U. S. V. Since the war he has been superintending defences and in command of engineer battalion and torpedo school of practice at Willet's Point, N. Y., member of engineer boards, and observer on solar eclipse expedition to Sicily, 1870–71. He is the author of professional papers, and a member of American Academy of Sciences and other associations. G. W. Cullum, *U. S. Army.*

Abbot (Joel), Dr. See Appendix.

Abbot (Robert), D. D., a learned English bishop, a brother of Archbishop George Abbot, was born in 1560. He became a popular preacher, and in 1615 bishop of Salisbury. Died Mar. 2, 1617. He left several theological, controversial, and political works, once highly valued for their learning.

Abbot (Samuel), a wealthy merchant of Boston, born at Andover, Mass., was one of the founders of the theological seminary at Andover, towards the building of which he gave $20,000 during his lifetime and $100,000 at his death. He also contributed large sums for various other charitable purposes. Died April 30, 1812, aged eighty.

Abbot (Walter), U. S. N., born in 1843 in the State of Massachusetts, graduated at the Naval Academy in 1861, became an ensign in 1862, a lieutenant in 1864, a lieutenant-commander in 1866, served on board the steam frigate Mississippi at the passage of Forts St. Philip and Jackson and the capture of New Orleans in 1862, and on board the ironclad New Ironsides from 1863 to 1865 in her numerous engagements with the forts off Charleston, and in the fight with Fort Fisher at Wilmington, N. C. Died at Funchal, Madeira, in the winter of 1873.

Foxhall A. Parker, U. S. N.

Ab'botsford, the seat of Sir Walter Scott, is situated on the right bank of the Tweed, about three miles from Melrose Abbey. It is surrounded by beautiful scenery. This estate was purchased in 1811 by Sir Walter, who expended a large sum of money in the erection of a picturesque and irregular pile of buildings, which has been characterized as "a romance in stone and lime." The expense of this building was the chief cause of Scott's failure in 1826. (See Scott, Sir Walter.)

Ab'bott (Austin). See Appendix.

Abbott (Benjamin), a noted Methodist preacher, was born in Pennsylvania in 1732. He travelled and preached extensively in his native State, in New Jersey, Delaware, and Maryland, and was one of the chief founders of his denomination in those States. His native eloquence was extraordinary. His autobiographical records, embodied in Firth's "Life of Abbott," are among the most remarkable of the early writings of Methodism. He was a man of little education, but of saintly character. Died in 1796.

Abbott (Benjamin Vaughan). See Appendix.

Abbott (Charles), Lord Tenterden, an eminent English judge, born at Canterbury in 1762. He published in 1802 a "Treatise on the Law of Merchant Ships and Seamen," which is a standard work; became a judge in the court of common pleas in 1816, and lord chief-justice of the king's bench in 1818. In 1827 he was raised to the peerage as Lord Tenterden. Died in 1832.

Abbott (Jacob), a prolific and popular writer, was born at Hallowell, Me., Nov. 14, 1803, graduated at Bowdoin College in 1820, studied theology at Andover, Mass., from 1822 to 1824, was tutor in Amherst College from 1824–25, and professor of mathematics in the same institution from 1825 to 1829, was principal of the Mount Vernon School (for young ladies) in Boston from 1829 to 1834, when he was ordained and took charge of the Eliot church in Roxbury (till 1836). For several years he made his home in New York City, though frequently absent in foreign countries. He now (1873) resides at the old family homestead in Farmington, Me. His reputation as an author was established by the "Young Christian Series," consisting of "The Young Christian" (1832), "The Corner-Stone" (1834), "The Way to Do Good," "Hoaryhead," and "McDonner." But he is best known as the author of "The Rollo Books" (28 vols.), "The Franconia Stories" (10 vols.), "Harper's Story-Books" (36 vols.), and other juvenile works, some of which have been translated into various languages.

Abbott (Rev. John Stevens Cabot), brother of Jacob, was born at Brunswick, Me., Sept. 18, 1805, graduated at Bowdoin College in 1825, at Andover Theological Seminary in 1829, and was settled as minister in Worcester, Roxbury, Nantucket, and New Haven. Since 1866 he has resided in Fair Haven, Conn. Among his works may be named "The Mother at Home" (1833), and "History of Napoleon Bonaparte," 2 vols. 8vo, "History of the Civil War" (1865), and his American histories (about 25 vols.). Among the most important of his recent works is his "History of Napoleon III." (1868).

Abbott (Lyman), third son of Rev. Jacob Abbott, was born in Roxbury, Mass., Dec. 18, 1835, graduated at the New York University in 1853, practised law for a time in New York City, studied theology with his uncle, Rev. John S. C. Abbott, was settled in the ministry at Terre Haute, Ind., from 1860 to 1865, was connected with the Freedmen's Commission from 1865 to 1868, then accepted the pastorate of the New England Congregational church in New York City, which he resigned in 1869, and now (1873) resides at Cornwall, on the Hudson, engaged in literary pursuits. Since 1871 he has edited for the American Tract Society its "Illustrated Christian Weekly," the only *illustrated* re-

ligious weekly paper in the country. Besides other literary work, he has published "Jesus of Nazareth, His Life and Teachings" (1869), "Old Testament Shadows of New Testament Truths" (1870), "Morning and Evening Exercises, selected from the Writings of Henry Ward Beecher" (1871), "Laicus, or the Experiences of a Layman in a Country Parish" (1872), and is now engaged in carrying through the press of Harper & Brothers a "Popular Religious Dictionary" of about 1200 pages.

Abbott (Robert O.), M. D., brevet colonel and surgeon U. S. A., born in 1824, entered the army as assistant surgeon in 1849. In 1862 he became medical director of the Fifth Corps, and in the summer of that year medical director of the department of Washington—a difficult position, the duties of which he performed with great honor and administrative ability and rare professional skill. Died, in consequence of overwork, June 10, 1867.

Ab'bott's, a township of Bladen co., N. C. Pop. 716.

Ab'bott's Creek, a post-township of Forsyth co., N. C. Pop. 753.

Abbrevia'tio Placito'rum ("abbreviation of pleadings"), in legal history, an abstract of ancient pleadings made prior to the Year Books. (See Year Books.)

Abbreviations [Lat. *abbreviationes*, from *abbre'vio, abbrevia'tum*, to "shorten" (from *bre'vis*, "short")], customary contractions of words and phrases used in writing, in order to save time and space. They are formed by the omission of some letters or words, or by the substitution of arbitrary signs. In mediæval manuscripts abbreviations are so numerous that special study and training are required to decipher them.

The following are the more important abbreviations in common use:

āā., ana, "of each."
A. A. A. G., of Acting Assistant Adjutant-General.
A. A. G., Assistant Adjutant-General.
A. B., *Artium Baccalaureus*, Bachelor of Arts.
A. B. C. F. M., American Board of Commissioners for Foreign Missions.
Abp., Archbishop.
A. C., *Ante Christum*, before Christ; also Arch-Chancellor.
Acct., account.
A. D., *Anno Domini*, "in the year of our Lord."
Ad. or Adv., adverb.
Adj., adjective.
Admr., administrator.
Admx., administratrix.
Æt. or ætat., *ætatis*, of age.
A. G., Adjutant-General.
A. H., *Anno Hegiræ*, "in the year of the Hegira" (flight of Mohammed).
Ala., Alabama.
A. M., *Anno Mundi*, "in the year of the world."
A. M., *Ante Meridiem*, "before noon."
A. M., *Artium Magister*, Master of Arts.
Anon., anonymous.
Ans., answer.
Apr., April.
A. Q. M., Assistant Quartermaster.
A. R. A., Associate of the Royal Academy (London).
Ari., Arizona.
Ark., Arkansas.
A. U. C., *Ab Urbe Condita*, "from the Founding of the City" (*i. e.* Rome).
Aug., August.
A. V., Authorized Version.
A. Y. M., Ancient York Masonry.
B. A. or A. B., Bachelor of Arts.
Bart. or Bt., Baronet.
Bbl., barrel.
B. C., before Christ.
B. C. L., Bachelor of Civil Law.
B. D., Bachelor of Divinity.
B. L., Bachelor of Laws, *legum baccalaureus*.
Bp., Bishop.
Brig.-Gen., Brigadier-General.
Bro., brother.
Bush., bushel. [*Beata Virgo.*
B. V., Blessed Virgin, Lat.
C., *centum*, a "hundred;" also "centigrade."
C., Consul; also chapter.
Ca., *circa*, about.
Cal., California.
Cal. or Kal., Kalends.
Cantab., *Cantabrigiensis*, "of Cambridge."
Cantuar., of Canterbury.
Cap., *capitulum*, "chapter."
Capt., Captain.
C. B., Companion of the Bath; also Cape Breton.
C. C., Caius College.
c. c., cubic centimetre.
C. C. P., Court of Common Pleas.
C. E., Civil Engineer.
Cent., *centum*, "hundred."
Cf., *confer*, compare.
C. G. H., Cape of Good Hope.
Chap. or ch., chapter.
Chron., Chronicles.
C. J., Chief-Justice.
C. M., common metre.
Co., company; also county.
C. O. D., cash on delivery.
Col., Colonel; also Colorado.
Coll., college.
Com., Commodore, Commissioner.
con., *contra*, "against."
Cor., Corinthians.
Cor. Sec., Corresponding Secretary.
Cos., cosine.
Coss., *Consules* or *Consulibus*, "consuls" (of Rome).
Cr., creditor.
Crim. Con., criminal connection or conversation.
C. S. A., Confederate States of America.
Ct. or Conn., Connecticut.
Cwt., a hundredweight.
Cyc., cyclopædia.
d., penny, pence, *denarius*.
D., five hundred; also Denarius.
D. A. G., Deputy Adjutant-General.
Dak., Dakota.
Dan., Daniel, Danish.
D. C., District of Columbia; also *da capo*, "from the beginning."
D. C. L., Doctor of Civil Law.
D. D., Doctor of Divinity.
D. D. S., Doctor of Dental Surgery.
Dea., deacon.
Dec., December.
Deg., degree.
Del., Delaware; also *delineavit*, "he designed" (on engravings).
Dept., department.
Deut., Deuteronomy.
D. F., *Fidei defensor*, "Defender of the faith."
Dft., defendant.
D. G., *Dei gratiâ*, "by the grace (or favor) of God."
Dist., district.
Do., ditto, "the same."
Doz., dozen.
Dr., Doctor; also debtor.
D. T., Dakota Territory.
D. V., *Deo volente*, "God willing."
Dwt., pennyweight.
E., east.
Ebor., *Eboracum*, York.
Eccl., Ecclesiastes.
Ecclus., Ecclesiasticus.
E. D., Eastern District (of Brooklyn, N. Y.).
Ed., editor, edition.
Edin., Edinburgh.
E. E., Errors excepted.
e. g., exempli gratiâ, "for example."
E. I., East Indies.
E. I. C., East India Company.
E. M., Mining Engineer.
Encyc., encyclopædia.
E. N. E., east north-east.
Eng., English, Engineers.
Eph., Ephes., Ephesians.
E. S. E., east south-east.
Esth., Esther.
Esq., Esquire.
et al., et alii, "and others."
etc., *et cætera*, "and the rest;" *i. e.* other such things; and so forth.
Et seq., *et sequens*, "and the following."
Exr., executor.
Exod., Ex., Exodus.
Exon., *Exonia*, Exeter.
Exx., executrix.
Ez., Ezra.
Ezek., Ezekiel.
F. or *f.*, franc, florin, farthing, foot.
F. and A. M., Free and Accepted Masons.
F. or Fahr., Fahrenheit.
F. A. S., Fellow of the Antiquarian Society; Fellow of the Society of Arts.
F. A. S. E., Fellow of the Antiquarian Society of Edinburgh.
F. B. S., Fellow of the Botanical Society.
F. D., *Fidei defensor*, "Defender of the faith."
Feb., February.
F. F. V., first families of Virginia.
F. G. S., Fellow of the Geological Society.
Fla., Florida.
F. L. S., Fellow of the Linnæan Society.
F. R. A. S., Fellow of the Royal Astronomical (or Asiatic) Society.
F. R. C. P., Fellow of the Royal College of Physicians.
F. R. C. S., Fellow of the Royal College of Surgeons.
Fri., Friday.
F. R. G. S., Fellow of the Royal Geographical Society.
F. R. S., Fellow of the Royal Society.
F. R. S. E., Fellow of the Royal Society of Edinburgh.
F. S. A., Fellow of the Society of Antiquarians.
F. S. S., Fellow of the Statistical Society.
F. Z. S., Fellow of the Zoological Society.
Ga., Georgia.
Gal., Galatians.
gal., gallons.
G. B., Great Britain.
G. C. B., Grand Cross of the Bath.
G. M., Grand Master.
Gen., General, Genesis.
Ger., German.
Gov., Governor.
Gr., Greek.
G. T., Good Templars; Grand Tiler.
Gtt., *guttæ*, "drops."
Hab., Habakkuk.
Hag., Haggai.
H. B. C., Hudson's Bay Company.
H. B. M., His or Her Britannic Majesty.
Hdkf., Handkerchief.
h. e., hoc est, "this is."
Heb., Hebrews.
hhd., hogshead.
Hist., history.
H. I. H., His or Her Imperial Highness.
H. M. S., His or Her Majesty's Ship.
Hon., Honorable.
Hos., Hosea.
H. R., House of Representatives.
H. R. H., His or Her Royal Highness.
H. S. S., *Historiæ Societatis Socius*, Fellow of the Historical Society.
I., Is., Isl., island.
Ia., Iowa.
Ibid. or Ib., *ibidem*, "in the same place."
Id., *idem*, "the same."
Id., Idaho.
i. e., id est, "that is."
I. H. S., *Jesus Hominum Salvator*, "Jesus Saviour of men."
Ill., Illinois.
incog., *incognito*, "unknown."
Ind., Indiana.
Ind. Ter., Indian Territory.
In lim., *in limine*, "at the outset."
In loc., *in loco*, "in the place."
I. N. R. I., *Jesus Nazarenus Rex Judæorum*, "Jesus of Nazareth, King of the Jews."
Inst., institute.
inst., *instante mense*, "in the present month."
Int., interest.
I. O. O. F., Independent Order of Odd Fellows.
I. O. S. M., Independent Order of the Sons of Malta.
Isa., Isaiah.
It., Italian.
J. A., Judge Advocate.
Jam., Jamaica.
Jan., January.

Jas., James.
J. C., Jurisconsult.
J. C. D., *Juris Civilis Doctor*, Doctor of Civil Law.
J. D., *Juris Doctor*, Doctor of Law.
Jer., Jeremiah.
Jno., John.
Jona., Jonathan.
J. P., Justice of the Peace.
Jr. or Jun., Junior.
Jud., Judith.
J. U. D., *Juris utriusque Doctor*, Doctor of both Canon and Civil Law.
Judg., Judges.
J. V. D., *Juris utriusque Doctor*, Doctor of Civil and Canon Law.
K., King.
Kal. or Cal., Calends.
Kan., Kansas.
K. B., Knight of the Bath.
K. C., King's Counsel.
K. C. B., Knight Commander of the Bath.
K. G. C. B., Knight Grand Cross of the Bath.
K. G., Knight of the Garter.
K. P., Knight of St. Patrick.
K. T., Knight of the Thistle.
Kt., Knight.
Ky., Kentucky.
La., Louisiana.
Lam., Lamentations.
Lat., latitude.
Lat., Latin.
L. D., Lady Day.
Lev., Leviticus.
L. H. D., *Literarum Humaniorum Doctor*, Doctor of Literature—conferred only by the Regents of the University of the State of N. Y.
L. I., Long Island.
Lib., *liber*, book.
Lib., lb., l., *libra*, a "pound."
Lieut., Lieutenant.
LL.B., Bachelor of Laws.
LL.D., *Legum Doctor*, "Doctor of Laws."
L. S., *Locus Sigilli*, "Place of the seal."
Lon., longitude.
L. R. C. P., Licentiate of the Royal College of Physicians.
L. R. C. S., Licentiate of the Royal College of Surgeons.
L. S. D., *Libri, Solidi, Denarii*, "pounds, shillings, [and] pence."
M., Monsieur, *mille* (a "thousand"), a mile; noon.
M., 10,000.
M. A., Master of Arts.
Macc., Maccabees.
Mad. or Mme., Madame.
Mag., magazine.
Maj.-Gen., Major-General.
Mal., Malachi.
Mar., March.
Masc., masculine.
Mass., Massachusetts.
Matt., Matthew.
M. B., Bachelor of Medicine.
M. C., Member of Congress.
Md., Maryland.
M. D., *Medicinæ Doctor*, "Doctor of Medicine."
Me., Maine.
M. E., Methodist Episcopal.
M. E. S., Methodist Episcopal South.
M. H. S., Massachusetts Historical Society.
Messrs. or MM., Messieurs, "gentlemen."
Mic., Micah.
Mich., Michigan.
Minn., Minnesota.
Miss., Mississippi.
Mlle., Mademoiselle.
Mme., Madame.
M. N. A. S., Member of the National Academy of Sciences.
Mo., Missouri.
Mon., Montana.
M. P., Member of Parliament.
M. R. A. S., Member Royal Academy of Sciences.
M. R. C. S., Member of the Royal College of Surgeons.
M. R. I. A., Member of the Royal Irish Academy.
MS., manuscript; pl. MSS.
Mt., mount.
Mus. D., Doctor of Music.
N., north, or noon.
N. A., North America.
N. A. S., National Acad. of Sci.
N. B., *Nota Bene*, "mark well;" also North Britain and New Brunswick.
N. C., North Carolina.
N. E., north-east, New England.
Neb., Nebraska.
Neh., Nehemiah.
Nem. Con., *Nemine contradicente*, or Nem. Diss., *Nemine dissidente*, "no one contradicting or opposing."
Nev., Nevada.
N. F., Newfoundland.
N. G., New Granada.
N. H., New Hampshire.
N. J., New Jersey.
N. M., New Mexico.
N. N. E., north north-east.
N. N. W., north north-west.
No., *Numero*, "Number."
N. O., New Orleans.
Nov., November.
N. P., Notary Public; also New Providence Island.
N. S., Nova Scotia, New Style.
N. T., New Testament.
Num., Numbers.
N. W., north-west.
N. W. T., North-west Terr.
N. Y., New York.
N. Z., New Zealand.
O., Ohio.
Ob., *obiit*, "died."
Obad., Obadiah.
Obdt., obedient.
Obs., obsolete.
Oct., October.
Ol., *oleum*, oil.
Ol. or Olym., Olympiad.
Or., Oregon.
O. S., Old Style.
O. T., Old Testament.
Oxon., *Oxoniensis*, "Oxonian" or "of Oxford."
Oz., ounce.
P., *Père*, "father."
Pa., Pennsylvania.
Parl., Parliament.
P. C., Privy Councillor.
P. E. I., Prince Edward's Island.
P. E., Protestant Episcopal.
Per Ann., Pr. An., *Per Annum*, "by the year."
Per Cent., *Per Centum*, "by the hundred."
Pet., Peter.
Ph. D., *Philosophiæ Doctor*, "Doctor of Philosophy."
Phil., Philippians, Philip.
Phila., Philadelphia.
Philem., Philemon.
Philom., *Philomathes*, "a lover of learning."
Philomath., "a lover of learning."
Pinxt. or pxt., *pinxit*, "he painted."
Pk., peck.
pl., plu., or plur., plural.
plff., plaintiff.
pluprf., pluperfect.
P. M., *Post Meridiem*, "after noon."
P. M., Postmaster.
P. O., Post-office.
P. of H., Pat. of Husbandry.
Pop., population.
Port., Portuguese.
PP., *Patres*, "fathers."
pp., pages.
P. P. C., *pour prendre congé*, "to take leave."
P. R., Porto Rico.
Pres., President.
Priv., privative.
Prof., Professor.
Pro tem., *Pro tempore*, "for the time."
Prob., problem.
Prov., Proverbs.
Prox., *Proximo* or *Proximo mense*, "in the next month."
Ps., Psalm.
P. S., postscript, privy seal.
Pub. Doc., public document.
Pxt., *pinxit*, painted it.
q., farthing (*quadrans*).
Q., Queen, question, Quintus.
Q. C., Queen's Counsel.
Q. d., *Quasi dicat*, "As if he should say."
Q. E. D., *Quod Erat Demonstrandum*, "which was to be demonstrated."
Q. E. F., *Quod Erat Faciendum*, "which was to be done."
Q. M., Quartermaster.
Q. P., "as much as you please."
Qr., quarter, farthing.
Q. S., *Quantum Sufficit*, "a sufficient quantity."
Qu., query.
Q. V. or *q. v.*, *quod vide*, "which see," or *quantum vis*, "as much as you please."
R. (*Rex*), "King," or *Regina*, "Queen."
R. A., Royal Academician, or Royal Artillery.
R. C., Roman Catholic.

Sc. or Ss., *scilicet*, "to wit;" also *sculpsit*, "he engraved it" (on engravings).
S. E., south-east.
Sec., Secretary.
Sept., September.
Y^e, Y^t, The, That. (This use of Y originated in the Anglo-Saxon character Þ, which was equivalent to the modern *th*. In manuscripts this character degenerates into a form like a black letter y (ꝥ), which was retained after its origin and real sound had been lost sight of.)
sin., since.
S. J., Society of Jesus.
S. J. C., Supreme Judical Court.
S. M., *Sa Majesté*, His or Her Majesty.
Sp. or Span., Spanish.
S. P. Q. R., *Senatus Populusque Romanus*, "the Roman senate and people."
Sq. or Seq., *sequens*, the following; Sqq., *sequentes*, the same in plural.
Sq. ft., square foot.
Sq. in., square inch.
Sq. m., square mile.
SS., saints; also "esses," a collar worn by knights and others in heraldry.
Ss. or Sc., *scilicet*, "to wit," "namely."
Ss., *semis*, "half."
S. S., Sunday School.
S. S. E., south south-east.
S. S. W., south south-west.
St., saint and street.
S. T. D., *Sacrosanctæ Theologiæ Doctor*, Doctor of Theology.
S. of T., Sons of Temperance.
S. T. P., *Sacrosanctæ Theologiæ Professor*, Professor of Theology.
S. W., south-west.
Syr., Syriac.
T. E., Topographical Engineers.
Tenn., Tennessee.
Tex., Texas.
Text. Rec., *Textus Receptus*.
Thess., Thessalonians.
Tit., Titus.
U. G. R. R., Underground Railroad.
Ult., *Ultimo, ultimo mense*, "in the last month."
U. P., United Presbyterian.
U. S., United States.
U. S. A., United States Army.
U. S. A., United States of America.
U. S. N., United States Navy.
U. S. P., United States Pharmacopœia.
U. S. S., United States ship or steamer.
U. T., Utah Territory.
V. or vs., *versus*, against.
Va., Virginia.
V. D. M., *Verbi Dei Minister*, "preacher of the word of God."
Ven., Venerable.
V.-G., Vicar-General.
Viz., *Videlicet*, "namely."
V.-P., Vice President.
vs., *versus*, "against."
Vt., Vermont.
W., west.
Wash., Washington.
W. I., West Indies.
Wis., Wisconsin.
W. N. W., west north-west.
W. S. W., west south-west.
W. T., Washington Territory.
W. Va., West Virginia.
Wy., Wyoming Territory.
X. Χριστος, Christ.
Xmas., Christmas; Xtian, Christian, etc.
Yr., year, your.
Zech., Zechariah.
Zeph., Zephaniah.
&, and.
&c., *et cætera*, or and so forth.

Abbrevia'tor, a notary of the papal court and of the church councils, whose business is to prepare briefs and perform various important services as secretary. The number of these notaries was formerly about seventy-two.

Abbt (THOMAS), an eminent German author, born at Ulm in 1738. He became professor of mathematics at Rinteln in 1761, and contributed to the improvement of the German language. His chief works are "Vom Verdienste" ("On Merit," 1765) and "Vom Tod fürs Vaterland" ("On Dying for [one's] Fatherland," 1761). Died in 1766.

Abd, an Arabic word which signifies "servant" or slave, and forms the prefix of many Oriental names, as ABD-ALLAH, "servant of Allah," ABD-ER-RAHMAN, "servant of the Merciful" (*i. e.* of God).

Abd-el-Hamid (DU COURET), a French traveller, born in 1812, set out in 1834 for the East, visited Egypt, travelled up the Nile, through Abyssinia, to the shores of the Red Sea, and returned along the Red Sea to Cairo. In consequence of the Eastern habits contracted on his travels, he embraced Mohammedanism, and assumed the name of Abd-el-Hamid. After having been imprisoned in Persia for political reasons, he was released through the intervention of France, and returned to his native country in 1847. In 1848 he was despatched by the government to Timbuctoo. He published the result of this exploration in "Mémoire à Napoléon III." (1855); he also published "Médine et la Mekke" (3 vols., 1855).

Abd-el-Kâ'der (*i. e.* the "servant of the Powerful," in other words, the "servant of God"), a distinguished Arab chieftain, born near Mascara, in Algeria, in 1807. His father, Mehi-ed-Deen, was a maraboot, or religious noble, of no little influence. Algeria having been invaded by the French in 1830, Abd-el-Kâder was chosen emir (prince) by the Arabs of that country. He defeated the French at Macta in 1835. A treaty of peace was concluded in 1837. In 1839 hostilities were again renewed, and in the war which followed, against a power so much superior to his own, Abd-el-Kâder displayed extraordinary energy, combined with a marvellous fertility of resources, but he was at length, in 1847, obliged to yield to overwhelming odds: he laid down his arms on condition that he should be sent to Alexandria or St. John d'Acre. But, in direct violation of the terms of capitulation, he was taken to France, where he was detained as a prisoner until 1852. In 1860, when the Christians of Syria were threatened with massacre by the fanatical Mohammedans of that country, Abd-el-Kâder, with extraordinary diligence and at the risk of his own life, protected many thousands of those defenceless people so long as the danger lasted. In 1864 he paid a visit to Egypt, where he was well received by the viceroy, and received from M. de Lesseps a piece of land. He also joined the order of Freemasons. In 1865 he visited Constantinople, where he was received with great honors. In 1867 he attended the Universal Exhibition of Paris. Abd-el-Kâder has written in the Arabic language a work which he sent to the French Academy, and which was translated into French by Dugat, under the title "Rappel à l'Intelligent, avis à l'Indifferent" (1858). Abd-el-Kâder contributed important notes and commentaries to DAUMAS' "Les Chevaux du Sahara." (See "Life," by CHURCHILL, London, 1867.)

Abd-el-Latif', an Arabian historian and physician, born at Bagdad in 1162. He wrote a valuable work on the history, antiquities, and geography of Egypt, of which De Sacy published a French version. Died about 1230.

Abd-el-Wahâb', the founder of the sect of Wahabites or Wahâbees, was born in Nejed, Arabia, in 1691. He recognized the Koran, and endeavored to reform the Mohammedan religion, which he affirmed had become corrupted. Died in 1787. (See WAHÂBEES.)

Abde'ra [Gr. Ἄβδηρα], an ancient city of Thrace, noted as the birthplace of the philosopher Democritus. The stupidity and ignorance of the people of Abdera was proverbial.

Abd-er-Rahman III., surnamed AN-NÂSIR-LIDIN-ILLAH, or AL-NASSER-LIDÍNILLAH, a celebrated caliph, was born about 888 A. D. He began to reign at Córdova in 912. He was distinguished as a patron of learning and the arts. During his long reign the Moslem empire in Spain was raised to the highest pitch. Died in 961.

Abdication, or the resignation of his throne by a king, was in former times of very rare occurrence, and generally occasioned by mental exhaustion, not to say derangement, as in the cases of Diocletian, Charles V., and Christina of Sweden. But in our century it has become a common affair, frequently resorted to for political ends. Charles IV. of Spain abdicated in 1808; Gustavus Adolphus IV. of Sweden in 1809; Louis I. of Holland in 1810; Napoleon I. 1814 and 1815; Victor Emmanuel I. of Sardinia in 1821; Charles X. of France in 1830; Louis Philippe of France, Louis I. of Bavaria, and Ferdinand I. of Austria in 1848; Charles Albert of Sardinia in 1849; and Amadeus of Spain in 1873.

Abdo'men [Lat. *abdo'men* (gen. *abdom'inis*), from *abdo, abdere,* to "hide"], that portion of the trunk of the human body which lies below the diaphragm. It contains the liver, pancreas, spleen, and kidneys, as well as the stomach, the small intestines, and the colon. The abdomen is lined by a serous membrane, the peritoneum, which is folded over the viscera, allowing them a certain freedom of motion, but retaining them in their proper relations to each other by means of the mesenteric fold. The external wall of the abdomen is divided by writers into thirteen "regions," by means of four imaginary transverse lines and five vertical ones. The first transverse line crosses the point of the ensiform cartilage; the second is on the lowest ribs; the third goes through the anterior superior spinous process of the ilium; the fourth is on the upper margin of the pubic bone. The first and fifth vertical lines run through the shoulder-joint, from the insertion of Poupart's ligament into the pubes; the second and fourth lines ascend from a point on the crest of either ilium vertically towards the posterior border of the axilla; the third line passes along the spinous processes of the vertebræ. Of the thirteen regions, five are anterior, four are lateral, and four are posterior. From above downward, the anterior are the epigastric, umbilical, hypogastric, and right and left inguinal regions. The lateral regions are the right and left hypochondriac and the right and left iliac. The posterior regions are the inferior dorsal and lumbar regions of either side.

ABDOMEN, in entomology, the hindmost of the three regions into which the body of an insect is divided. It is composed, typically, of eleven rings or segments, more or less distinct from each other, but the number is often only ten. It contains a portion of the intestines and the sexual organs. In the perfect insect its segments have attached to them no legs or wings. In many insects its last segments bear appendages of various uses and forms, as pincers, stings, ovipositors, etc. In some insects the abdomen is not well differentiated from the thorax.

Abdomina'les [the plu. of the Latin adjective *abdomina'lis,* "belonging to the abdomen"], or **Abdominal Fishes,** in the Linnæan classification, an order including all osseous fishes of which the ventral fins are beneath the abdomen and behind the pectoral fins. In the system of Cuvier the name is given to an order of more limited extent, a subdivision of the Malacopterygii or soft-rayed fishes, having the ventral fins, if present, beneath the abdomen and not attached to the bones of the shoulder. It includes the Cyprinidæ (carp, etc.), Esocidæ (pike, etc.), Siluridæ, Salmonidæ (trout, salmon, etc.), Clupeidæ (herring, etc.), Cyprinodontidæ, etc. The order is not recognized by all naturalists.

Abduc'tion [from the Lat. *ab,* "away," and *duco, ductum,* to "lead"], in law, the forcible or fraudulent carrying away of a person. It is usually confined to females removed with a view to their marriage or seduction. It is allied to the word *kidnapping,* which would include the case of males. Abduction is an offence severely punished by statute law, both in England and in this country.

Abd-ul-Aziz' [written in French *Abdoul-Aziz,* and in German *Abd-ul-Azis*], a son of Mahmood II., was born in 1830, and succeeded his brother, Abd-ul-Medjid, as sultan of Turkey, June 25, 1861. He reduced the imperial civil list from seventy-five million piasters to twelve million, abolished, among other barbarous practices, that of assassinating the sons of the princesses, favored the introduction of Western manners and customs, and did much to destroy the old traditions of the Turks; deposed May 28, 1876; committed suicide June 4, 1876. (See TURKEY.)

Abd-ul-Medjid' [written in French *Abdoul-Medjid,* and in German *Abd-ul-Medschid*], sultan of Turkey, the eldest son of Mahmood II., was born in 1823. He succeeded his father July 1, 1839, when his capital was menaced by the victorious army of Mehemet Ali, viceroy of Egypt. This danger was averted by the intervention of England and other great powers in July, 1840. He favored religious liberty and the reforms which his father had initiated, but his good-will was partially frustrated by the resistance of his fanatical subjects. He died June 25, 1861, and was succeeded by his brother, Abd-ul-Aziz. (See TURKEY.)

Abeceda'rians, a sect founded in the sixteenth century by a person named Storck, who professed that learning was not necessary, not even the knowledge of the alphabet (A B C, hence their name), for the proper understanding of the Scriptures; and some went so far as to maintain that it was not desirable to know how to read.

A'Beck'et (GILBERT ABBOT), a humorous English writer

and lawyer, born in London about 1810. He contributed to the London "Times" and "Punch." Among his works is "The Comic Blackstone" (1844–46). Died in 1856.

A'Becket (THOMAS). See BECKET.

Abed'nego ["slave of Nego," the second god of the Babylonians], the name given in Babylon to Azariah (Dan. i. 7), one of Daniel's three friends.

Abeel' (DAVID), D. D., an American missionary, born at New Brunswick, N. J., June 12, 1804. He published "A Journal of a Residence in China, 1829–33," "A Missionary Convention in Jerusalem, 1838," and "The Claims of the World to the Gospel." Died at Albany Sept. 4, 1846.

A'beken (BERNHARD RUDOLPH), a German writer, born at Osnabrück Dec. 1, 1780, became in 1808 tutor to the sons of the poet Schiller, and afterward director of the gymnasium in Osnabrück. He published "Cicero in seinen Briefen" ("Cicero in his Letters," 1835), which is highly commended, and has been translated into English. Died at Osnabrück Feb. 24, 1866.

A'bel, the second son of Adam and Eve, was killed by his brother Cain. He is regarded as a type of faith and as the first martyr. (See Genesis iv. and Hebrews xi. 4.)

Abel (CLARKE), an English surgeon and naturalist, born in 1780. He served as naturalist to Lord Amherst's embassy to China in 1816, and published a "Narrative of a Journey in the Interior of China" (1818). Died at Cawnpore, India, Nov. 24, 1826.

Abel (JOSEPH), an historical painter, born near Linz on the Danube in 1768, worked in Rome and Vienna. Among his works is "Prometheus Bound." Died in 1818.

Abel (NIELS HENRIK), an eminent mathematician, born at Findö, in Norway, in 1802. He gained distinction by his discoveries in the theory of elliptic functions, and was highly eulogized by Legendre. Died in 1829.

Abelard [Lat. *Abælardus*], or **Abailard** (PIERRE), a celebrated French philosopher and dialectician, born near Nantes, in Bretagne, in 1079. He studied dialectics under the Nominalist Roscellinus and the Realist William de Champeaux, and afterwards theology under Anselm of Laon. He taught in various places, largely in Paris, drawing around him great numbers of pupils from different parts of Europe. He sought to avoid the extremes of Nominalism and Realism, though his doctrine is not far removed from strict Nominalism. He had marvellous subtlety; he was able to foil the first masters of his age in logic; and was as audacious in propounding his notions as he was ingenious in defending them. But he lacked moral courage; he loved truth less than he thirsted for fame; his vanity and selfishness had no bounds; and his treatment of one of his pupils, the beautiful and accomplished Eloise, whom he first seduced, afterwards married, and then deserted, leaves upon his memory an indelible stain. He was one of the most prominent founders of Scholasticism, and exerted a larger influence upon the intellectual activity of his time than any other man. He died in 1142. The most complete work on Abelard is Charles de Rémusat's "Abélard," Paris, 1845. (See also COUSIN'S "Introduction to the Works of Abelard;" BERINGTON'S "History of Abelard and Heloise," and WIGHT'S "Abelard and Eloise," N. Y., 1853.) J. H. SEELYE.

Abel, von (KARL), a German statesman, born at Wetzlar in 1788, was a leader of the absolutist and ultramontane party. He became Bavarian minister of the interior in 1838, and was removed from office by the influence of Lola Montez in 1847. Died at Munich in Sept., 1859.

A'belites, or **Abe'lians,** a sect of Christians who lived in Northern Africa in the fourth century. They enjoined marriage without carnal intercourse, in order not to propagate original sin, claiming in support of their practice the example of the patriarch Abel. They adopted children, who were brought up to the same kind of marriage. They were extinct before the time of Augustine.

Aben, Ebn, or **Ibn,** a prefix to many Arabic proper names, denoting "son of."

Abenaquis. See ABNAKIS.

Aben'cerrage, the name of a noble Moorish family of Granada, in Spain. The implacable feud between this family and the Zegris formed the subject of several Spanish and French dramas.

A'bendberg, a mountain of the Bernese Alps, in the Swiss canton of Berne, rises abruptly from the S. shore of Lake Thun, and has an altitude of about 5000 feet above the sea. On its southern slope was an asylum for cretins, founded about 1842, but since abandoned.

A'ben Ez'ra, a Spanish Jew and eminent commentator on the Bible, born at Toledo about 1090–1100. He excelled as a mathematician, linguist, physician, and poet. Died about 1167–76. The dates are uncertain.

A'bensberg, a small town of Bavaria, 18 miles S. W. of Ratisbon, has a castle and a mineral spring. Here Napoleon defeated the Austrians April 20, 1809.

A'ber, a Cymric term signifying "meeting-place of waters," occurs as a prefix to names of places in Great Britain—*e. g.* Aberdeen. It is probably etymologically related to the Persian *ab*, "water." The corresponding Gaelic term is *Inver*—*e. g.* Inverness.

Aberbrothwick. See ARBROATH.

Ab'ercorn, DUKES OF, marquesses of Abercorn (in the Irish peerage, 1790), Viscounts Hamilton (in the peerage of Great Britain, 1786), earls of Abercorn (1606), barons of Paisley (1587), of Abercorn (1603), of Hamilton, Mountcastle, and Kilpatrick (in the peerage of Scotland, 1606), Viscounts Strabane (1701), Barons Strabane (1616), Mountcastle (in the Irish peerage, 1701), marquesses of Hamilton (in the Irish peerage, 1868), and dukes of Chatelhérault (in France, 1548), one of the most prominent noble families of Great Britain.

Abercorn (JAMES **Hamilton**), FIRST DUKE OF, born Jan. 21, 1811, succeeded his grandfather as marquis of Hamilton in 1818, and became lord lieutenant of Ireland in 1866, which position he held until 1868, when he was created duke of Abercorn. He is at present lord lieutenant of Donegal co., Ireland, and major-general of the Royal Archers.

Ab'ercrombie (JAMES), a British general, born in 1706, who in 1758 took command of near 50,000 men in New York, in order to recover the forts which the French had taken. On the 8th of July he attacked Ticonderoga, but was repulsed by the French with great loss, and was soon removed from the command. Died April 28, 1781.

Abercrombie (JAMES), D. D., an eloquent Episcopalian clergyman and scholar, born Jan. 26, 1758, preached in Philadelphia, where he died June 26, 1841.

Abercrombie (JOHN), M. D., an eminent Scottish physician, born at Aberdeen in 1780. He graduated as M. D. in 1803, practised in Edinburgh, and attained the reputation of being the first consulting physician in Scotland. He published "Inquiries concerning the Intellectual Powers of Man" (1830), and "The Philosophy of the Moral Feelings" (1833), which were highly esteemed. Died in 1844.

Abercrombie (JOHN J.), an American officer, born in 1798 in Tennessee, graduated at West Point in 1822, colonel Seventh Infantry Feb. 25, 1861, and Aug. 31, 1861, brigadier-general U. S. volunteers. He served chiefly on the Western frontier (1822–61); as adjutant First Infantry (1825–33); in the Black Hawk war in 1832; in the Florida war, 1837–40; engaged at Okee-cho-bee (brevet major); in the war with Mexico, 1846–48; engaged at Monterey (wounded and brevet lieutenant-colonel), Vera Cruz, Cerro Gordo, and aide-de-camp to Major-General Patterson, 1846–47; as superintendent of recruiting service, 1853–55. In the civil war served in the Shenandoah campaign, 1861–62; engaged at Falling Waters; in the Virginia Peninsula, 1862; engaged at Fair Oaks (wounded) and Malvern Hill, and till 1864 in command of troops before Washington, D. C. Brevetted brigadier-general U. S. A. for long and faithful services, and retired from active service June 12, 1865. GEORGE W. CULLUM, *U. S. Army.*

Ab'ercromby (JAMES), BARON DUNFERMLINE, born in 1776, was a son of General Sir Ralph Abercromby. He was chosen Speaker of the House of Commons by the Whigs in 1835, and resigned in 1839, when he passed into the House of Lords. Died in 1858.

Abercromby (Sir RALPH), a distinguished British general, born in Clackmannanshire Oct., 1734, entered the army in 1758. After the peace of 1783 he passed ten years at home in retirement. He distinguished himself in the disastrous campaigns in Holland in 1794 and 1795. In 1795 he took command of an expedition sent to the West Indies, where he captured several islands from the French. He was the second in command of the army which the duke of York led to Holland in 1799, and was appointed in 1800 commander-in-chief of the expedition to Egypt, which was then occupied by the French under Bonaparte. The British army, which landed early in Mar., 1801, was attacked by Menou, near Alexandria, on the 21st of that month. In this action the French were defeated, but Sir Ralph was mortally wounded, and died on the 28th of Mar., 1801. He was distinguished for superior talents, bravery, and humanity.

Ab'erdeen', or **Aberdeen'shire,** a county of Scotland, is bounded on the N. and E. by the North Sea, on the S. by Kincardine, Forfar, and Perth, and on the W. by Inverness and Banff. It has an area of 1970 square miles. The Grampian range of mountains extends along the southern boundary of this county, which contains several high peaks. Among these are Ben-Macdhui, 4390 feet,

and Cairngorm, 4060 feet high. It is drained by the Dee and the Don. The principal rocks are granite and mica-slate. More cattle are raised in Aberdeen than in any other county in Scotland. Pop. in 1851, 212,032; in 1871, 244,607.

Aberdeen, a city and seaport of Scotland, and the capital of the county of Aberdeen, is on the North Sea, at the mouth of the river Dee, 93 miles N. N. E. of Edinburgh. It is a handsome city, with spacious streets and granite houses, and is celebrated as a seat of learning. Among the principal public buildings are the town-house, several churches, and Marischal (pronounced mar'shal) College, founded in 1593. Aberdeen has a good harbor and an extensive trade, the chief articles of export being fine cotton and woollen fabrics, granite, grain, cattle, and fish. Here are flourishing manufactories of cotton and woollen goods, combs, machinery, etc. Old Aberdeen, which is near the mouth of the Don, about 1 mile N. of the new city, is the seat of King's College and University, founded in 1494. Pop. of the parliamentary burgh in 1871, 88,125.

Aberdeen, capital of Monroe co., Miss., is on the W. side of the Tombigbee River, and connected by a branch railroad with the Mississippi and Ohio R. R. It buys and ships 16,000 bales of cotton yearly. It has a fine court-house, one of the best river bridges in the South, a female college, and a great trade. It contains five steam-mills and a steam cotton-compress, and is but 18 miles from the famous Greenwood Springs. It has a tri-weekly newspaper. Pop. 2022. S. A. Jonas, Ed. and Pub. "Examiner."

Aberdeen, a thriving post-village of Huntington township, Brown co., O., on the Ohio River opposite Maysville, Ky., and 60 miles above Cincinnati. Pop. 871.

Aberdeen (George Hamilton **Gordon**), fourth earl of, a British statesman, born in Edinburgh Jan. 24, 1784, graduated at Cambridge in 1804. He began his public life as a Tory, was sent as ambassador to Vienna in 1813, and was raised to the British peerage as Viscount Gordon in 1814. In 1828 he became secretary of state for foreign affairs in the cabinet of the duke of Wellington, with whom he resigned in Nov., 1830. He was reappointed to that office by Sir Robert Peel in 1841, gradually abandoned the high Tory principles, and favored a pacific foreign policy. In 1846 he resigned office with Sir Robert Peel, after whose death (1850) he was regarded as the chief of the Peelite party. He became, in Jan., 1853, prime minister in a cabinet formed by a coalition of parties. In 1854 England was involved in a war against Russia, to which measure Lord Aberdeen gave a reluctant support. Either from this cause, or because the war was conducted with ill success, the ministers became very unpopular. Lord Aberdeen resigned in Feb., 1855, and was succeeded by Lord Palmerston. Died Dec. 14, 1860.

Aberdeen (George John James), fifth earl of, oldest son of the preceding, born Sept. 28, 1816, was for a number of years, as Lord Haddo, a member of the House of Commons, where he voted with the Liberals. He succeeded his father in the peerage in 1860. Died Mar. 22, 1864.

Aberdeen, earls, Viscounts Formantine, Barons Haddo, Methlic, Tarves, and Kellie (in the Scottish peerage since 1682), Viscounts Gordon (in the peerage of the United Kingdom since 1814), and baronets (in the Scottish peerage since 1642), one of the most prominent noble families of Great Britain, an offshoot of the ancient Scotch family of the Gordons.—Sir John Gordon of Haddo was in 1642 created baronet by Charles I. for services rendered to that monarch in the battle of Turriff.—Sir George Gordon of Haddo was lord high chancellor of Scotland when in 1682 he was created an earl. He was an uncompromising opponent of William of Orange. Died in 1720.

Abergavenny, commonly pronounced ab-er-gă'ne, a market-town of England, in Monmouthshire, on the Usk, which is here joined by the Gavenny, and crossed by a fine bridge, 13 miles W. of Monmouth.

Abergavenny, earls of, and Viscounts Nevill (in the peerage of Great Britain, 1784), barons of Avergavenny since the time of Henry III., a prominent noble family in the peerage of Great Britain.—William Nevill, fifth earl of, was born Sept. 16, 1826, and succeeded his father in 1868. His oldest son and heir is Reginald William Bransby, Viscount Nevill, born Mar. 4, 1853.

Ab'ernethy (John), a dissenting minister, born at Coleraine, in Ireland, in 1680. He was for many years pastor of a Presbyterian church at Antrim, and incurred the censure of the synod by his independent spirit. About 1730 he removed to Dublin, where he preached to an independent congregation. Died in 1740.

Abernethy (John), an eminent English surgeon, born about 1765, was a grandson of the preceding, and a pupil of John Hunter. He was chosen assistant surgeon of St. Bartholomew's Hospital, London, in 1786, and eventually chief surgeon of the same. As a lecturer on anatomy and surgery he gained immense popularity. He published in 1809 an important work, "On the Constitutional Origin and Treatment of Local Diseases," the doctrines of which have greatly contributed to improve the science of surgery. Many anecdotes are related of his eccentric manners and of his witty or petulant speeches to his patients. Died in 1831.

Aberra'tion [Lat. *aberra'tio*, from *ab*, "from," and *er'ro, erra'tum*, to "wander"], a term variously employed: in optics it denotes the unequal deviation of rays of light when refracted by a lens or reflected from a concave mirror. There are two kinds of optical aberration—viz., Chromatic (from the Greek χρῶμα, "color") Aberration, or Aberration of Refrangibility, and Spherical Aberration, or Aberration of Sphericity. In astronomy also there is the Aberration of the Celestial Bodies, sometimes (but less correctly) termed the Aberration of Light.

1. *Chromatic Aberration, or Aberration of Refrangibility.*—A convex lens may be regarded as a number of prisms having their bases in contact. Hence, when a sheaf of rays of white light passes through it, the rays undergo not only refraction, but also decomposition; and since the variously colored rays into which white light is divided by a prism possess different refrangibilities, it follows that when light is converged by a convex lens it is refracted to different foci. The violet rays, being the most refrangible, form a focus nearest to the lens; while the red rays, being the least refrangible, form a focus farthest from the lens. Thus, in place of one focus, there are, in reality, an almost infinite number—viz., one for each of the differently refracted rays (the rays even of the same general color being not all refracted equally), and in the order of violet, indigo, blue, green, yellow, orange, red. Hence the rays do not meet at the same focus of the lens; and this deviation of the foci is called the *chromatic aberration* of a lens.

2. *Spherical Aberration, or Aberration of Sphericity.*—Lenses and mirrors are usually ground with spherical surfaces, and so long as the aperture does not exceed eight or ten degrees, the rays of homogeneous light refracted or reflected by different parts of them meet very nearly at the same focus of the lens or mirror. But as the aperture of a spherical mirror increases, the rays reflected from the edges cross each other at a point on the axis nearer to the mirror than those which are reflected from portions of the mirror near its centre. Thus, the rays are deviated from the true focus of the mirror. Again, with regard to spherical lenses of large aperture, the rays which pass through the lens near its circumference are refracted to a point nearer to the lens than those which pass through its central portion. In the case of mirrors this deviation of light from the focus is called *spherical aberration by reflection*, while in the case of lenses it is called *spherical aberration by refraction*. It may be remedied by giving lenses and mirrors parabolic surfaces—a plan which is almost invariably followed in the construction of specula for astronomical purposes.

3. *Aberration of the Celestial Bodies*, often (but less correctly) termed the *Aberration of Light*, in astronomy, an apparent displacement of a celestial object, due to the progressive motion of light. This aberration is caused—1, by the motion of the earth in its orbit; and 2, by the motion of the observed celestial objects. It was discovered by Bradley in 1727. This astronomer reasoned that if the earth's motion bears only an appreciable relation to the velocity of light, we ought to expect that the rays from a star would seem to come from a point nearer than is actually the case to that point in the heavens towards which the earth's course is directed. The phenomenon he had observed corresponded exactly with this explanation. The change of place due to the velocity of light, estimated from the eclipses of Jupiter's satellites, corresponded (within the limits of observational error) with the observed changes in the apparent positions of the fixed stars. It follows, from a consideration of the earth's path, that each star appears to describe a small ellipse about its true place. This fact is of great importance in its direct bearing on observational astronomy, but it is perhaps no less important on account of the evidence it supplies as to the motion of the earth.

The correction of the observed position of a celestial object for aberration gives the true position for the moment when the light which makes it visible left it; but this is not the true position for the moment of observation, except on supposition that the observed object is at rest. If the body itself is in motion, then, in addition to the correction of position for aberration, there must be a correction for the amount of proper motion which has taken place in the interval since the light which makes it visible left it. In order to make this correction we must know the rate of

proper motion and the distance of the body. If the absolute proper motion of the body is given in miles, or length-measure, and not the apparent in angular measure, and is parallel to the motion of the earth, then the whole correction may be treated as aberration, by taking the sum or the difference of the velocities per second of the two bodies, according as they are in the opposite or in the same direction, and comparing this with the velocity of light. If the velocities of the two bodies are in the same direction and equal, their difference is zero, and the correction is *nil*. Hence, a body moving in the same direction as the earth, and with the same velocity, is unaffected in apparent position by aberration. The same will be true of a body not moving in the same direction as the earth, provided that when its velocity is decomposed into rectangular components, one of which is parallel to the earth's motion, this latter component velocity is equal to the earth's velocity and in the same direction.

It follows from the foregoing that the bodies of a group or system, as observed the one from the other, are unaffected by aberration in consequence of any common motion in which all participate alike, but that they suffer displacement from this cause only in consequence of their relative motions. The moon partakes of the annual motion of the earth round the sun, but suffers no aberration on that account; and so the sun, though it may have a proper motion in space, is unaffected by this cause in its apparent position, as viewed from the earth or from any other member of the solar system, since this motion is one in which all the bodies of the system equally participate.

F. A. P. Barnard.

A'bert (John J.), a graduate of the U. S. Military Academy, class of 1811, born in Maryland, 1785. Immediately resigning, he became a lawyer in the District of Columbia; and in the war with Great Britain, 1812–15, served as private in the militia at the battle of Bladensburg, Aug., 1814. Appointed brevet major of U. S. Topographical Engineers, Nov. 22, 1814, he was placed in charge of the bureau, Mar. 19, 1829, and on the organization of an independent *corps* of that title was made, with rank of colonel, its chief, July 7, 1838. Retired from active service Sept. 9, 1861. Died at Washington, D. C., Jan. 27, 1863. As an officer, and as chief of Topographical Engineers, Colonel Abert exercised an important agency in the development of the earlier national works of civil engineering in the U. S.—*e. g.* the canal around the Falls of the Ohio at Louisville; the Chesapeake and Ohio Canal; the Potomac aqueduct, etc. His exhaustive report on water-supply, in connection with the Chesapeake and Ohio Canal (1838), has since been a standard of reference; and his official reports on kindred subjects exhibit great research and sound judgment. He was a member of the Geographical Society of France and other learned societies.

Ab'eryst'with, a market-town, seaport, and fashionable watering-place of Wales, at the mouth of the Ystwith, 34 miles N. E. of Cardigan. It has good hotels. Pop. in 1871, 6898.

Abey'ance [Norman Fr. *abbaiaunce*, "expectation;" literally, "gaping" or waiting with open mouth], a legal term signifying "in expectation or suspense." It is used to indicate the condition of property where there is no person in whom its ownership is vested. In the law of real estate it is generally applied to a fee, which is said to be in *abeyance* when there is no particular owner of the inheritance. It has been laid down that a fee can be in abeyance only while there is a freehold estate (or life interest) in the land vested in some person. It is denied by writers of high authority that a fee can be in abeyance. The tendency of modern law certainly is to discountenance this theory, and to reduce the cases of abeyance to the narrowest possible limits. The term has been applied in some instances to personal property, as in case of captures at sea in time of war, as to the title after capture and before condemnation in the prize court.

Ab'gar, or **Ab'garus** [Gr. Ἄβγαρος], written also **Abagarus, Agbarus,** and **Augarus,** a name common to several kings of Edessa, in Mesopotamia. The fourteenth of these kings, Abgar Uchomo, is said to have been in correspondence with Christ. The genuineness of this correspondence has found defenders even in the nineteenth century.

Abgil'lus (John), son of the king of the Frisii, became a Christian, and accompanied Charlemagne in several of his expeditions. He received the title of Prester, or Priest, on account of the excessive severity of his life. He is not to be confounded with the Mongolian Prester John of the eleventh century.

A'bib (after the Babylonian captivity called **Nisan**), the first month of the Hebrew sacred year, and the seventh of the civil year.

Abida-Jebel, a volcanic mountain of Abyssinia, in Mudaito: lat. 10° 9′ N., lon. 41° E.

A'bies [Lat. *abies*, a "fir tree"], the name of a genus of coniferous trees which have leaves growing singly on the stem, as the fir and the spruce. The *Abies excelsa* produces the valuable timber called "white deal," also Burgundy pitch and frankincense; the *Abies balsamea* yields the balm of Gilead, or Canadian balsam. The famous cedar of Lebanon, which affords excellent timber, is called *Abies cedrus* by some botanists. Several species of *Abies* are highly prized as evergreen ornamental trees—viz. *Abies excelsa* (the Norway fir), *Abies alba* (white spruce), *Abies nobilis* (noble silver fir), *Abies pectinata* (European silver fir), and *Abies balsamea* (balsam fir). The *Abies balsamea*, *Abies Canadensis* (hemlock spruce), *Abies alba*, *Abies Fraseri*, and *Abies nigra* are natives of the Eastern U. S., while the most magnificent species of the genus, *Abies Douglasii*, *Abies Menziesii*, *Abies nobilis*, *Abies grandis*, and *Abies amabilis*, grow on the western coast of North America. It has been proposed to divide this large genus into three—*Abies*, for the spruces; *Tsuga*, for hemlock-firs; and *Picea*, for the true firs.

Ab'ila, capital of the tetrarchy of Abilene, identified, some fifty years ago, with Sûk, on the right bank of the Barada, near the point where it breaks through the Antilibanus range of mountains towards the plain of Damascus. It was on the great road between Heliopolis and Damascus, 32 miles from the former city and 18 miles from the latter. There was another Abila E. of the Jordan, a few miles S. of the Yarmuk (or Hieromax), the northern boundary of Gilead.

Abile'ne, an ancient tetrarchy, whose capital was Abila (which see). It is impossible to fix its limits. St. Luke (iii. 1) speaks of it as the tetrarchy of Lysanias, who was apparently a son of the Lysanias mentioned by Josephus. (See Krafft's "Topographie Jerusalems," 1847.)

Abilene, a post-village, capital of Dickinson co., Kan., on the Kansas River and Kansas Pacific R. R., 95 miles by railroad W. of Topeka. It has one weekly newspaper. It is a great point for shipping cattle eastward by rail.

Abim'elech ("the royal father"). I. A king of Gerar, a city of the Philistines in the time of Abraham (Gen. xx. 1, *sq.*). II. Another king of Gerar in Isaac's time (Gen. xxvi.), perhaps a son of the foregoing. III. A son of Shechem (Judges ix.), was for three years (B. C. 1322–1319) a self-constituted king over a great part of Israel.

Ab'ingdon, a market-town of England, in Berkshire, on the Ock where it joins the Isis, 51 miles W. N. W. of London. It sends a member to Parliament. Pop. of the parliamentary borough in 1871, 6583; of the municipal borough, 5805.

Abingdon, a city of Knox co., Ill., on the Chicago Burlington and Quincy R. R., 85 miles N. E. of Quincy. It is surrounded by a rich agricultural district, and is the seat of Hedding College, controlled by the Methodist Episcopal Church, and of Abingdon College, sustained by the Christian denomination. It has four hotels, three churches, one plough-factory, two steam-mills, and one wagon-factory. The city has three public parks, and one weekly newspaper. Pop. in 1870, 948.

W. H. Heaton, Ed. and Prop. "Knox Co. Democrat."

Abingdon, a post-twp. of Harford co., Md. Pop. 2598.

Abingdon, the capital of Washington co., Va., in a township of its own name, on the Virginia and Tennessee R. R., 315 miles W. S. W. of Richmond. It has three female colleges of high grade, an extensive iron-foundry, and is the birthplace of several distinguished men. It has a weekly paper. The county was organized in 1776, and is the first spot of earth named in honor of the Father of his Country. Emory and Henry College is in this county, and a large male academy, both flourishing institutions. The Maury Literary Society of Abingdon has a valuable library. Immense deposits of salt and gypsum are found here, and a very large part of the salt used in the Southern States during the war was obtained from salt-wells bored in this vicinity. Pop. of township, 3163; of village, 715.

Geo. R. Dunn, Pub. "Abingdon Virginian."

Abingdon, a township of Gloucester co., Va. Pop. 4506.

Abingdon, earls of, Baron Norreys (1572, in the English peerage), a noble family of Great Britain. The first earl was created in 1682.—Montagu Bertie, the sixth earl, was born June 19, 1808, and succeeded his father in 1854. He is lord lieutenant of Berkshire.

Ab'inger (Sir James **Scarlett**), Lord, born in Jamaica, 1769, was educated at Cambridge and the Middle Temple, and was called to the bar in 1791. He became one of the most accomplished barristers of his time. In 1818 he entered Parliament as a Whig, but afterwards became a

decided Tory. In 1827, and again in 1829, he was attorney-general. He was raised to the peerage in 1834, and was appointed chief baron of the exchequer. He died April 7, 1844.

Ab'ington, a township of Mercer co., Ill. Pop. 931.

Abington, a post-township of Wayne co., Ind. P. 833.

Abington, a post-township of Plymouth co., Mass., on the Old Colony R. R., 18 miles S. by E. of Boston, has four post-villages (North, East, Centre, and South Abington), manufactures of boots, shoes, and tacks, one national and two savings banks, three weekly newspapers, eleven churches, and forty-two schools. The Hanover branch and the Abington and Bridgewater R. R. traverses this town, which is the largest in the county. Pop. 9308.

ARTHUR P. FORD, ED. "JOURNAL."

Abington, a township of Luzerne co., Pa. Pop. 2362.

Abington, a post-twp. of Montgomery co., Pa. P. 2440.

Abipones, a tribe of Indians living in the Gran Chaco, in the Argentine Confederation. They lived formerly W. of the Paraná, between lat. 28° and 30° S., between Santa Fé and Santiago del Estero, but at present have removed towards Corrientes. The Abipones are of high stature, good swimmers, and tattoo themselves. Long lances and arrows with iron points are their weapons. In 1783 their number was estimated at 5000, but they have been reduced to 100 at the present day. They are related to the Tobas.

Abka'sia, or **Aba'sia,** a narrow territory in Western Asia, belonging to Russia, lies between the Caucasus Mountains and the Black Sea, which bounds it on the S. W. Area, estimated at 3486 square miles. Pop. about 80,000. The inhabitants, under the emperor Justinian, became Christians, but subsequently embraced Mohammedanism.

Ab'lution [Lat. *ablutio*, from *ab*, "from," and *lu'o*, *lu'tum*, to "wash"], a religious ceremony of the Roman Catholic Church, signifies the washing of the sacramental cup and of the hands of the priest.

Abna'ki, or **Abenaqui,** frequently called **Tarrantenes** or **Taranseens,** a name given to the former tribes of Algonquin Indians of Maine and vicinity. They were once formidable enemies of the Indians of Southern New England and of the colonists, siding with the French against the English, but the latter overcame them and expatriated the greater part. Their remnants are Catholics, their ancestors having been converted by the labor of Sébastien Rale (1658–1724) and others. Rale compiled a dictionary of their language (published in 1833). Their history has been written by Maurault (1866) and by Vetromile (1866).

Ab'ner (the "enlightener"), the uncle of Saul, the first king of Israel. Abner became commander-in-chief of Saul's army, and for some time after the death of the king he was the chief support of Ishbosheth, his successor; but subsequently went over to the side of David, then king of Judah. With David he found such favor that the jealousy of Joab was aroused, and Abner was slain by him B. C. 1046.

Åbo [Sw. pronunciation, ō'boo], a Russian city and seaport, on the Aurajoki near its entrance into the Gulf of Bothnia; lat. 60° 26′ 58″ N., lon. 22° 17′ E. It was built by Eric IX. of Sweden in 1157, was subsequently taken by the Russians, and in 1809 was, with the whole of Finland, ceded to Russia. It was the capital of Finland until 1819, and is now the see of a Lutheran archbishop. The University of Åbo, having been destroyed by fire in 1827, was rebuilt at Helsingfors. Pop. in 1867, 18,109.

Åbo-Björneborg, a government of Finland, is bounded by the governments of Wasa and Tawastehus, and by the Gulfs of Finland and of Bothnia. Area, 9895 square miles. The chief occupation of the inhabitants is commerce and shipbuilding. The government has also some factories. Pop. in 1867, 319,784. Chief town, Åbo.

Åbo, Peace of, concluded August 17, 1743, between Sweden and Russia, put an end to the war begun by Sweden at the instigation of France in 1741. During this contest, and through the misconduct of the Swedish generals, the Russians gained entire possession of Finland. The greater part of this territory they offered to restore on condition that Sweden should elect the prince of Holstein-Gottorp successor to the throne. This condition the Swedes complied with, and the treaty of peace was accordingly signed at Åbo.

Aboite, a post-township of Allen co., Ind. Pop. 906.

Abolition of Slavery. Ancient servitude of the constrained, involuntary kind appears to have risen, flourished, decayed, and passed away without provoking any organized moral or religious opposition. That, so far at least as Europe was affected, was irrespective of race or color; for, though the Egyptians and Arabs bought and held negro slaves, they were not known in Europe till introduced into Spain by the Moorish invasion and conquest. After the slavery of negroes had been firmly planted in, and quite generally diffused over, the New World, slaves began to be taken to Europe by their American masters, and legal opinions for a time affirmed the validity of their bondage in countries where no law forbade it; but this was arrested, so far at least as Great Britain was concerned, by the famous decision of Lord Mansfield, who, in the case of the negro Somerset, brought to England from the West Indies by his master, held that slavery can only exist by virtue of positive law, and that, there being no such law in England, the master, though a Briton, forfeited all right in and power over him by taking him to that country.

The first systematic agitation for the overthrow of slavery began with certain American Quakers—John Woolman and Anthony Benezet of Philadelphia being conspicuous among them—about the middle of the last century. Benezet published in 1762 a book in exposure and denunciation of the slave-trade. His friend William Dillwyn removed to England some time afterwards, and there enlisted Granville Sharpe and others in the cause. The agitation soon after arising in this country against the Stamp Act and other arbitrary measures of the British government, incited many Americans to consider questions of natural right, and thus to condemn and oppose slavery. Hence, Thomas Jefferson, himself a slaveholder, yet opposed to slavery, had no difficulty in inducing a majority (sixteen to seven) of the Congress which met next after the acknowledgment of our independence to vote to exclude slavery (in March, 1784) absolutely and for ever from all the Union not included in any State. The proposition did not then prevail, since the votes of a majority (seven) of all the States were required to enact it, and the absence of a delegate from New Jersey reduced the States voting yea to *six*, against three voting nay — North Carolina being divided. The proposition, restricted to an inhibition of slavery in the territories already ceded by the States to the Confederation, was renewed in 1787, when it was unanimously passed, and it was reiterated with like unanimity by the first Congress which assembled under the Federal Constitution, when it received the approval of President Washington.

Meantime, the convention which formed that Constitution had authorized Congress to prohibit the importation of slaves after twenty years; and this was done—Congress having forbidden, in 1794, our people to engage in carrying slaves to other lands, absolutely outlawing all participation in the slave-trade by our people, and all importation of slaves into this country, by an act passed March 2, 1807—twenty-three days *before* the British Parliament, after a struggle which had lasted nearly a quarter of a century, did likewise.

A British society for the suppression of the slave-trade was organized by Dillwyn, Granville Sharpe, and Thomas Clarkson in 1787, to whom William Wilberforce, already in Parliament, soon lent his powerful aid. William Pitt, then prime minister, admitted the justice of their cause, and gave them a cold and hesitating support; Charles James Fox, his great rival, was its hearty supporter; so was Edmund Burke. Yet bill after bill for the suppression was defeated either directly or by postponement until after Pitt's death and Fox's accession to the premiership, when (in June, 1806) a resolve pledging the House to the measure passed the Commons by 100 yeas to 41 nays, and a bill founded thereon was next winter carried through both Houses, and received the royal assent Mar. 25, 1807.

Great Britain was slowly followed in this step by Sweden, Denmark, Holland, France, and several of the South American republics. Spain and Portugal reluctantly promised to do likewise, but were tardy in fulfilling their compact, even though they had accepted money or favor from Great Britain as a consideration therefor. The slave-trade was first declared a felony by act of Parliament in 1811, while acts passed in 1824 and 1837 made it piracy, punishable by transportation for life.

So soon as the slave-trade had been placed under the ban of the law, its British adversaries reorganized for a war upon slavery itself, against which they had hitherto put forth no combined or systematic efforts. Mr. Wilberforce presented their petition to the House of Commons in 1823, when it was defeated; Mr. Brougham took the lead in their behalf in 1830; and the struggle for parliamentary reform which followed the death of George IV. and the accession of William IV. brought a large adhesion of strength to their cause; so that in May, 1833, Mr. Stanley (the late earl of Derby) introduced, as secretary for the colonies, resolves which proposed the total (though gradual) emancipation of the slaves held in the British colonies, and a payment to their owners of £20,000,000. These resolves passed both Houses, and were followed by a bill of like tenor, which likewise passed and received the royal assent Aug. 2, 1833. It took effect Aug. 1, 1834, but an

apprenticeship system was engrafted upon the measure, whereby the slavery of some was virtually prolonged for four, and that of others for six years. Experience proved this apprenticeship tainted with all the vices of slavery, relieved by scarcely any of its advantages; so the last traces of slavery were, by common consent, effaced from British soil Aug. 1, 1838.

The more northern of our States are justly entitled to the credit of having first in modern times discerned and proclaimed the wrong and mischief of slaveholding. Abolition received in Great Britain powerful and, for a time, commanding influence in Church and State; but the slaveholders were distant colonists, not directly represented in Parliament, and their defeat would not disturb the existing social order in the mother-country. Not so in the original New England States, New York, New Jersey, and Pennsylvania. Rhode Island, then eminently commercial, was long the focus of an extensive slave-trade, wherein some of her first families were involved; and slaves were held as firmly, though not so numerously, in New York and Pennsylvania as in Virginia and the Carolinas before the Revolution. Soon after the Declaration of Independence, Massachusetts adopted a bill of rights, which her highest court soon decided was incompatible with slavery, which was thereby outlawed. In Pennsylvania an abolition society, whereof Dr. Franklin was a member, was organized in 1780, and did not cease its earnest efforts until it had seen that State made a home for freemen only. In New York a similar organization was effected somewhat later, and the State was brought to decree the emancipation of her slaves by the constitution of 1821, though, with regard to some who were then minors, the liberation did not take effect till about 1830. In New Jersey the work was still more gradual, but hardly a handful were held in a nominal bondage after that date. Slavery had ceased to be a power north of Delaware and Maryland as early as 1820, save through the political, commercial, and social ligaments which bound the North and the South closely together, and made the wishes and supposed interests of the latter potent throughout the former.

As in England the early efforts of the abolitionists were directed against the African slave-trade exclusively, and a general crusade against slavery disclaimed, so in this country the anti-slavery spirit was long contented with resisting the extension of slavery into regions previously unscourged by it. There were, indeed, unconditional abolitionists, of whom Benjamin Lundy, William Lloyd Garrison, Alvan Stewart, Nathaniel P. Rogers, Lewis Tappan, and Elijah P. Lovejoy may be deemed representative pioneers; but their school was limited in numbers, and had little immediate influence on legislation or government, since an overwhelming majority of those earnestly opposed to slavery held that the spirit, if not the letter, of the Federal Constitution forbade all interference by Congress with the internal polity of a State, and restricted to moral influence the efforts of the citizens of one State to subvert or modify the institutions of another State. But when, in 1818, the Territory of Missouri framed a constitution and applied for admission into the Union as a State—said constitution recognising and upholding slavery—the representatives of the free States very generally resisted such admission until she should provide at least for gradual emancipation. The Senate opposed any such restrictions, but a compromise was ultimately effected whereby Missouri was admitted as a slave State on condition that slavery should never exist in any territory of the U. S. north of the parallel of 36° 30′ N. latitude. The House consented to this by barely three majority (90 to 87), nearly all the nays being cast by Northern opponents of slavery. (See MISSOURI COMPROMISE.) On the admission of the republic of Texas into the Union in 1845 the Missouri Compromise line of division was agreed upon and extended through all the public domain then acquired. In 1846, pending the war with Mexico, Mr. David Wilmot of Pennsylvania introduced into the House a proposition to prohibit for ever slavery from all new territory that might be acquired from Mexico, at the termination of that war. This proposition became celebrated as the Wilmot Proviso, and gave rise to continued and heated discussions in the House and the Senate until 1850, when another compromise, as it was called, was effected. (See SLAVERY COMPROMISE OF 1850.) The agitation was renewed again in 1854, when a bill was introduced into the Senate by the Hon. Stephen A. Douglas for the organization of State governments in the Territories of Kansas and Nebraska, and providing for the repeal of the so-called Missouri Compromise act of 1820. The bill was adopted by the Senate by a large majority, but in the House it encountered very strong opposition, passing finally by a vote of 113 to 100. The question whether slavery should exist within the States to be formed under this act was thus referred to the people of the Territories themselves, and was left to be decided by what, in the popular parlance of that day, was called "squatter sovereignty." As the Territories were thinly peopled, there consequently arose a rapid migration towards them, especially towards Kansas, from both North and South, each section aiming to secure a predominance in the popular vote and in the constitutional convention. Occasional collisions between these rival colonists naturally occurred, attended in some instances with serious violence: and the struggle for power was protracted through several years. Both parties prepared and presented constitutions to Congress embodying their respective views. The election of Mr. Lincoln as President in 1860 finally decided the controversy, and Kansas was admitted as a free State in 1861. The same event occasioned the withdrawal from their seats in Congress of the Senators and members of the House from seven of the Southern States, and gave the advocates of slavery restriction by Federal legislation a majority in the Senate for the first time since the government was organized. The House was still more decidedly anti-slavery. As the war went on, defeats, even more than victories, diffused and intensified among Unionists the hatred of slavery; so that when Mr. Lincoln (Sept. 22, 1862) proclaimed that if the revolted States should still continue in rebellion he would, on the 1st of January ensuing, declare free all who were held as slaves within those States, public sentiment was ripe for sustaining that policy. Secession being still rampant, the President issued his second proclamation on the day appointed; after which no Federal commander was at liberty to remand slaves who had fled from their masters to find protection within the Union lines. From that date the war for the Union became, what in essence it had necessarily been from the outset, a struggle for freedom to all, and European rulers, who had smiled upon the Confederacy in the earlier stages of the contest, were repelled from taking its part openly when it was seen that its fate involved that of American slavery.

The Thirty-seventh Congress initiated the work of direct, outright emancipation by an act proposed by Senator Wilson of Massachusetts, abolishing slavery in the Federal District, and paying the owners an average compensation of $300 for each slave liberated. This bill passed the Senate, April 3, 1862, by 29 yeas to 14 nays, and the House, April 10, by 92 yeas to 39 nays. This was followed by an attempt to proffer a like compensation to the so-called Border States if they would consent to emancipation; but it was strenuously opposed by their representatives and by the entire Democratic party, and ultimately failed in the House for lack of a two-third vote to take it up out of its order on the last day of the session. A bill prohibiting absolutely all slaveholding in any Federal territory became a law, by the President's approval, June 19, 1862. A bill decreeing the freedom of all slaves of persistent rebels found in any place occupied or commanded by the forces of the Union, forbidding their rendition to their masters, and providing that negroes might be enlisted to fight for the Union, after undergoing sundry transmutations ultimately passed the House by 82 yeas to 42 nays, and the Senate by 27 yeas to 12 nays, and became a law, by the President's approval, July 17, 1862.

A constitutional amendment (the thirteenth), abolishing and prohibiting evermore the enslavement of human beings, was proposed in the Senate by Mr. Henderson of Missouri at the former session, when it passed that branch, April 8, 1864, by 38 yeas to 6 nays—six Senators not voting. Being sent to the House, it failed to command the requisite two-thirds—yeas, 85; nays, 66; when Mr. Ashley of Ohio kept it alive by changing his vote to nay and then moving a reconsideration. When that Congress reassembled, Dec. 6, 1864, for its final session, Mr. Lincoln had been triumphantly re-elected and the civil war was plainly near its end. The President, in his annual message, recommended a reconsideration and passage of the amendment aforesaid; and this was accomplished, Jan. 31, 1865, by 119 yeas to 57 nays—12 chosen as Democrats or Conservatives voting with all the Republicans in the affirmative—every Republican present and voting; eight Democrats absent. By the ratification of three-fourths of the States, and by the utter collapse of the civil war, this amendment became a part of the supreme law of the land, and its authority has never been contested. By its force slavery was banished from the U. S., as it had already been from every portion of this continent except Brazil and the Spanish islands of Cuba and Porto Rico. In Brazil an act was passed in Sept., 1871, freeing all the slaves belonging to the government, and securing freedom to all those born after the date of the enactment. (There has not yet been published any complete history of the abolition of slavery; the best work on the abolition of the slave-trade is CLARKSON'S "History of the Abolition of the Slave-Trade," 2 vols., 1808.)

HORACE GREELEY.

Aboli"tionists, a name applied to those persons—more particularly in the U. S.—who were distinguished for their zeal against the institution of slavery. (See ANTI-SLAVERY SOCIETY, by HON. HORACE GREELEY, LL.D.)

Abo'mey, an African town, capital of the kingdom of Dahomey; lat. 7° 30′ N., lon. 1° 40′ E. It contains several royal palaces. Pop. estimated at from 50,000 to 60,000.

Abo'ny, a town of Hungary, in the county of Csongrad, 47 miles S. E. of Prague. Pop. in 1869, 10,232.

Aborig'i-nes [a Latin word derived from *ab*, "from," and *ori'go* (gen. *ori'ginis*), "source," "origin"], the earliest original inhabitants of a country—that is, those who occupied it at the period when it began to be known, and who either were (according to a once prevalent opinion) indigenous to the soil, or had immigrated thither before the dawn of history. Some of the ancients supposed they had always inhabited the same soil, and sprang from it, as the Athenians, who thence called themselves *autoch'thones* (from αὐτός, "itself," and χθών, "earth," "soil," "land"); *i. e.* sprung from the land or soil itself. But the Romans and modern nations use the word aborigines to designate those inhabitants of a country of whose origin nothing certain is known. Thus the Indians of America are properly called aborigines, because they were found there at its discovery, and as to their origin we have only their own tradition (which is not uniform) that their ancestors came from a distant region in the North-west.

Abor'tion [Lat. *abortio*], the premature birth or exclusion of the human fœtus. It is doubtful whether the act of causing an abortion is an offence at common law unless the mother is quick with child, on the untenable ground that life does not begin until that period. The early statutes took the same distinction. Later legislation in England wholly discards it, and makes it a felony to procure the miscarriage of a female by unlawful means at any period of her pregnancy. The laws of the various States in this country still maintain to some extent the older rule.

About (EDMOND), a popular French novelist and political writer, born at Dieuze (Meurthe) Feb. 14, 1828. In 1868 he wrote, as one of the contributors to the "Gaulois," a series of witty and satirical letters, in consequence of which that paper was suppressed by the authorities; but he was nevertheless assisted by the imperial government, which in 1870 appointed him councillor of state. At the beginning of the war he was for a short time war-correspondent for the "Soir." Sept. 14, 1872, he was arrested by the Germans, but was released Sept. 21. He published in 1855 a work on modern Greece, "La Grèce contemporaine," which was much admired. He had been sent to the French school of art in Athens by his government. Among his works are novels entitled "Tolla" (1855), "Germaine" (1857), a political treatise on "The Roman Question" (1860), "Madelon" (1863), "Le Progrès" (1864), "La vieille roche" (3 vols., 1865–66), "L'intame" (1867), "Les mariages de province" (1868), "L'A B C du travailleur" (1868). His "Le Roi des Montagnes" (1856) is one of his best works.

Aboville (FRANÇOIS MARIE), COUNT, a French general, born at Brest Jan. 23, 1730. He directed the artillery at Yorktown, Va., in 1781, and was inspector-general of artillery under Napoleon I. Died Nov. 1, 1819.

Abrabanel', or **Abarbanel',** sometimes written **Barbanella** (ISAAC), a celebrated Spanish rabbi, born in Lisbon in 1437, was liberally educated. He was greatly distinguished for his intellectual powers and various erudition. Having been banished from Portugal in 1481, he found refuge in Spain until 1492, when the Jews were expatriated. He died at Venice in 1508. His commentaries on the Holy Scriptures were once highly esteemed.

Abracadab'ra, a term probably of Persian origin, was in former times highly prized as a magical formula, and supposed to be efficacious in the cure of fevers.

A'braham, originally **Abram,** an eminent Hebrew patriarch, called the "Father of the faithful," was born at Ur, in Chaldea, according to Hales, 2153 B. C.; according to Ussher, 1996 B. C. (Bunsen says he lived about 2850 B. C.). "Abraham" signifies "the father of a numerous people." He migrated to Canaan, where he led a nomadic life in tents, was greatly renowned for piety and wisdom, and was called a friend of God. He died at the age of 175 years. (See Genesis xi.–xxv.; Acts vii.; Hebrews xi. 8–17.)

A'braham-a-Sanc'ta-Cla'ra, a popular German preacher and Augustine friar, whose name was ULRICH MEGERLE, was born in Suabia June 4, 1644. He was appointed preacher to the imperial court at Vienna in 1669, and published many religious works. His sermons were seasoned with witty, humorous, or whimsical expressions. Died Dec. 1, 1709.

A'brahamites, the name of a sect of Bohemian deists, who are said to have rejected all parts of the Bible except the Ten Commandments and the Lord's Prayer. They were suppressed in 1783.

A'braham Osh'ki, a Jew of Portuguese descent, who translated the Bible, word for word, into Spanish. It was published in 1553 at Ferrara, and although the first edition is now seldom met with, it is still esteemed in Spain both by Christians and Jews.

Abran'tes, a fortified town of Portugal, in Estremadura, on the Tagus, 73 miles N. E. of Lisbon. Grain, oil, and fruit are sent from it to the market of Lisbon. Pop. in 1863, 5590.

Abrantes, DUKE OF. See JUNOT.

Abraxas Stones is the name of a kind of gems found in Syria, Egypt, and Spain. They are of various forms, but all have the word Abraxas or Abrasax engraved on them in connection with certain mystical symbols, mostly consisting of fantastical figures, composed of the body of a serpent, the head of a bird, and other incongruous parts. The word Abraxas was first used by the Egyptian gnostic Basilides, and denoted not the supreme being, but the assemblage of the 365 world-spirits; the letters composing the word expressing, according to the Greek numeration, the number of 365. His disciples, who used this kind of gems as amulets or talismans, and after whom they are often called Basilidian stones, spread them all over Egypt and Syria, and in the fourth century the disciples of Priscillianus brought them to Spain.

Abridg'ment [Fr. *abréger*, to "shorten"], a condensation or compendium of a book or literary work. In the law of copyright an abridgment, when fairly made, is regarded as a new work, and accordingly its publication is not an infringement of the copyright. A distinction is taken in the legal decisions between an abridgment and a compilation. The latter is more readily regarded as an infringement, as the words of an author are reproduced, while in a true abridgment the thoughts are expressed in other words and in a condensed form.

Abro'lhos (*i. e.* "open your eyes"), a group of small rocky islands which belong to the province of Espirito Santo, Brazil. The largest of these, Santa Barbara, 40 miles from the coast, has a lighthouse in lat. 17° 58′ S., lon. 38° 42′ W.

Abru'zzo, the northern part of the former kingdom of Naples, but now included in the kingdom of Italy. It is bounded on the N. E. by the Adriatic. It is divided into three provinces—viz. Chieti, formerly called Abruzzo Citeriore (or Citra); Teramo, formerly Abruzzo Ulteriore (or Ultra) I.; and Aquila, formerly Abruzzo Ulteriore II.

Ab'salom, the third son of King David, by Maacah, a Syrian princess, was remarkable for his personal beauty. Having, by his popular arts and fair speeches, gained the favor of the people, he rebelled against his father and raised a large army, which was defeated by the army of the king. Retreating from this battle, Absalom was killed by Joab, although David had given orders that his life should be spared. (See 2 Samuel xiii.–xix.)

Ab'salon, called also **Axel,** an eminent prelate and general, born in Iceland in 1128, was a liberal patron of learning, and was distinguished for his wisdom in council. He was one of the ministers of the Danish king Waldemar I., and became archbishop of Lund in 1178. Died in 1201.

Ab'scess [Lat. *abscess'us*, from *abs*, "away from," and *ce'do*, to "go," because the pus separates itself from the rest of the body], in surgery, is a circumscribed collection of pus in any part of the animal organism, as distinguished from "purulent infiltration," which designates such a collection not circumscribed. The term "diffuse abscess" is, however, applied, though improperly, to purulent infiltration. An "acute abscess" is one which is the result of active inflammation. "Cold abscess" is the result of chronic inflammation. The tendency of an acute abscess is to "point" or "come to a head;" that is, from the outward pressure of the accumulating pus, the walls yield mechanically in the direction of least resistance. In favorable cases the evacuation of the pus, natural or artificial, is the initiation of recovery; but if the abscess be of the "cold" variety, or be deep-seated and extensive, or be associated with metastatic symptoms or septicæmia, the question of recovery becomes a much more complicated one. Deep-seated abscesses, when they traverse considerable tracts of the body and "point" at a distant part, are called "congestive abscesses"—a term which is very properly passing out of use. Such abscesses are often for a long time difficult of detection, and their treatment taxes, too often in vain, the best skill of the surgeon. In general, abscess is detected by observation of the general and local symptoms. The general symptoms are fever and subsequent rigors; the

local are "pain, heat, redness, and swelling," followed by softness and fluctuation of the fluid contents. (See Pus.)

Abscis'sa [from the Lat. *abscindo, abscissum*, to "cut off"], a term used in geometry to denote a segment cut off from a straight line by an ordinate to a curve.

Abse'cum, or Absecom, a post-village of Atlantic co., N. J., on the Camden and Atlantic R. R., and near Absecum Bay, 7 miles N. W. of Atlantic City. Absecum lighthouse is a brick structure, standing on the S. side of Absecum Inlet; lat. 39° 21′ 55″ N., lon. 74° 24′ 32″ W. It shows a fixed white dioptric light of the first order, 165 feet above the sea.

Absentee, a term applied to capitalists and proprietors of land who do not reside on their estates, but spend their incomes in other countries. This practice is very prevalent among the Irish nobility and gentry, and some political economists ascribe the poverty of Ireland partly to this absenteeism.

Absinthe [Fr. for "wormwood"], a liqueur much used in France, prepared from alcohol mixed with volatile oil of wormwood, oil of anise, and other ingredients. It has peculiarly intoxicating effects, which are due to the oil of wormwood, the state resulting from its use being very different from the result of alcohol poisoning. Trembling, vertigo, fearful dreams, and epileptiform convulsions are among its severer consequences. Absinthe-drinking is one of the most dangerous forms of stimulation yet invented—the more so because its immediate consequences are usually more agreeable than those of alcohol.

Ab'sis, or Ap'sis [Gr. ἁψις, an "arch"], a name given formerly to that part of a church in which the clergy were seated or the altar was placed. It was either circular or polygonal on the plan, and covered with a dome.

Ab'solute [from the Lat. *ab*, "from," and *solu'tus*, "loosed," a "part" (from *sol'vo, solu'tum*, to "loose")], originally, loosed or freed from all conditions, absolutely independent; hence, positive, unconditional, unlimited. As a scientific term it is the reverse of relative, as *absolute velocity*. In metaphysics it represents the unconditioned infinite and self-existent. Absolute monarchy is that which is not limited or restricted by constitutional checks.

Absolute Alcohol. See Alcohol, by C. F. Chandler.

Absolu'tion [Lat. *absolutio*], in canon law, is the pardon and remission of sins which a Roman Catholic priest pronounces to a penitent offender.

Absor'bents [for etymology, see Absorption], a term applied to a set of vessels of a peculiar character in the animal body. (See Lymphatics.)

Abso'rokas, a tribe of American savages. (See Crows.)

Absorp'tion [Lat. *absorp'tio*, from *ab*, "from," and *sor'beo, sorp'tum*, to "sip or suck"] is the function by which nutritive matter is absorbed into an animal or plant. Plants absorb carbonic acid gas by their leaves and other green parts, and it is supposed that this absorption takes place principally through the *stomata* of the leaves, and both by the upper and under surface of the leaf; in some plants much more powerfully by the one surface than by the other. But plants also derive their nourishment partially, although not principally, from their roots, and it is at the extremities of their fibrils that absorption takes place most rapidly, by capillary attraction and a process called Endosmose (which see). Absorption in animals is known to be largely by endosmose, and that process, mechanical rather than vital, is affected, it is believed, only indirectly by the nervous energy.

Abs'tinence [from *abs*, "from," and *te'neo*, to "hold," "keep"], the act or state of abstaining from food, drink, etc.

Abstinence, Total, that is, from all indulgence in the use of intoxicating beverages, was practised in early ages by the Nazarites and Rechabites, mentioned in Scripture. Some of the Hebrew prophets rigorously inveigh against the prevalence of drunkenness, yet hardly indicate total abstinence as the proper remedy. The Essenes (which see)—a Jewish sect contemporary with the Messiah—were distinguished for temperance in eating and drinking, eschewing generally the use of flesh and wine. Mohammed peremptorily forbade the use of wine as a beverage by his followers. In the feudal ages, societies designed to shield their members and others from the evils of drunkenness were often formed, but not on the basis of absolute disuse of stimulants. The discovery of alcohol by an Arabian chemist about 1000 A. D. had, through the art of distillation, greatly expanded and intensified the evils of intemperance, especially in Northern Europe, where beer had generally been the most potent stimulant attainable by the masses. The discovery and settlement of America, largely increasing the average rewards of manual labor, especially on this continent, rendered intemperance more common, by increasing the ability of the common people to purchase alcoholic stimulants; and this country, especially throughout the half century succeeding its Declaration of Independence, was hardly equalled in the prevalence of intoxication even by the British and Scandinavian kingdoms, and was unapproached by any other nation.

The earliest known organization of a total abstinence society in the U. S. was "The Temperate Society of Milton and Northumberland" (Saratoga co., N. Y.), founded by Dr. Billy J. Clarke in 1808, which at its commencement had forty-three members. Distilled liquors and wines were absolutely prohibited by its rules, but not the moderate use of beer. In 1813 was formed the "Massachusetts Society" for the suppression of intemperance. In 1826 the American Temperance Society was organized. The evils resulting from the free use of ardent spirits were so general and glaring that kindred societies were soon formed in many cities, villages, and rural townships, the movement being strongly aided, especially among zealous Christians, by Dr. Lyman Beecher's "Six Sermons on Intemperance." Dr. Eliphalet Nott, president of Union College, was also early and honorably distinguished as a pioneer in the temperance cause. It was not till 1833 that, at a national meeting of the friends of temperance, held in Philadelphia, the principle of "total abstinence from all that may intoxicate" was propounded, only to be voted down; but it was again proposed, and adopted, at a national convention held at Saratoga Springs in August, 1836, and became henceforth the basis of the temperance movement, to which a great impulse was given by the "Washingtonians" (in good part reformed drunkards), who began their work in 1841, and for a time seemed destined to sweep all before them. The first State to prohibit the sale of intoxicating beverages was Maine, in 1851. The other New England States soon followed her example. New York had already (in 1846) authorized the voters of her several cities and townships to forbid such sale by a popular vote; but her court of appeals pronounced this unconstitutional, as it likewise did (in 1859) a law of absolute prohibition enacted in 1855. Chief-Justice Shaw of Massachusetts held that every citizen injured or annoyed by the proximity of a grogshop might lawfully abate it as a nuisance, but his two associates, on appeal, overruled him.

Partial, if not general, prohibition was enacted in several Western States, but here, as elsewhere, most imperfectly enforced. The Washingtonian effort gradually spent its strength and faded out, being succeeded by new organizations, whereof the "Sons of Temperance," "Good Templars," "Rechabites," "Good Samaritans," and "Cadets of Temperance" are still active and flourishing.

The total abstinence movement in Great Britain first attracted public attention in 1831. The "pledge" to drink no intoxicating liquors was first adopted by a national gathering at Manchester in 1834. It has never yet become so influential in that as in this country, and its upholders have only ventured to ask of Parliament a "permissive" act—that is, one allowing any locality to forbid and outlaw the liquor traffic by a majority vote—and this has never been conceded. The votaries of total abstinence in Great Britain are generally found in the humbler walks of life.

In Ireland total abstinence was first effectively commended by Father Mathew, who, by his simple expositions and exhortations, persuaded millions of his countrymen and fellow-Catholics to take the pledge, which many of them have since broken. Since his death, in 1856, the reform has decidedly lost ground in Ireland, while it has as yet made little headway in any part of Continental Europe or South America. Horace Greeley.

Abstinents, a Christian sect of Gaul and Spain in the latter part of the third century A. D., who condemned marriage and the use of flesh-meats and wine, declaring that they were made by the devil, and not by God.

Ab'stract [from the Lat. *abs*, "from," and *tra'ho, trac'tum*, to "draw"], literally, that which is drawn away or separated (or viewed separately) from all external circumstances or conditions, and hence opposed to Concrete (which see).

Abstrac'tion (see preceding article), the intellectual process by which the mind separates one of the attributes of an object from the others, and thinks of it exclusively. An idea or notion of an abstract or theoretical nature is sometimes called an abstraction.

Abstract Science (metaphysics, logic, mathematics) starts from a proposition, not derived from experience, but found as an axiom in the human understanding; from which proposition a whole system is evolved by inference and deduction. All discoveries, as far as they are not incidental, are made by application of abstract science (experiment), as all inventions are made by application of knowledge of the real object (experience).

Absurd'um, Reduc'tio ad, a term used in geometry to denote a mode of demonstration, in which the truth of a proposition is demonstrated by proving that the contrary is absurd or impossible.

Abt (FRANZ), a German composer, born at Eilenburg Dec. 22, 1819. He became in 1855 first chapelmaster to the duke of Brunswick. His works are chiefly songs, which enjoy great popularity in Germany and the U. S.

Abu (also written in English *Aboo*), an Arabic word, signifying "father," occurs as a prefix to many Oriental names.

Abu, a mountain of India, in Rajpootana, connected with the Aravulli range, is about 5000 feet above the level of the sea. It is a celebrated place of pilgrimage for the Jainas, who have four temples at Dilwara, near the middle of the mountain. One of these is said to be the most superb of all the temples of India.

Abubekr', or **Aboo-Bekr,** a caliph, the first of Mohammed's successors, was born in Arabia about 570 A. D. His original name was ABD-EL-KAABA, which was exchanged for ABOO-BEKR (*i. e.* "father of the virgin"), because his virgin daughter Ayesha was married to the prophet. He began to reign in 632 A. D., and died in 634, leaving a high reputation as a man and a ruler.

Abugirgeh, a large Fellah town of Middle Egypt, about 2 miles W. of the Nile and 122 miles above Cairo.

Abukir', a village of Egypt, on the site of the ancient Canopus, and on the sea-coast at the west side of Abukir Bay, 15 miles N. E. of Alexandria. Here is a castle.

Abukir Bay is on the coast of Lower Egypt, between the village and castle of Abukir and the Rosetta mouth of the Nile. In this bay Admiral Nelson gained a decisive victory over the French fleet, Aug. 1, 1798, and the Turks were defeated by the French under Napoleon I., July 25, 1799.

Abulca'sis, or **Abulka'sis,** written also **Abul-Kasem, Khalaf Ebn Abbas,** a celebrated Arab physician and surgical writer, born near Córdova, in Spain. His principal work was published in 1778, under the title of "Abulcasis de Chirurgia." The portion of it devoted to surgery is regarded as the most valuable treatise of the kind that has come down to us from early times. Died about 1110.

Abulfa'raj [Lat. *Abulfara'gius*] (GREGORIUS), a learned historical writer, born in Armenia in 1226, became maphrian or primate of the eastern division of the Jacobite Christians in 1266. He wrote in Syriac and Arabic several valuable works, among which is a "History of the Dynasties." Died in 1286.—There was also a famous Oriental poet, Ali Abulfaraj (897–997).

Abul-Fazl, an eminent Oriental historian, who in 1574 became vizier or prime minister of the great Mogul emperor Akbar. He was a wise and liberal statesman. He was assassinated about 1600. Among his important works are a history of Akbar, called "Akbar Nameh," and "Institutes of Akbar" ("Ayeen Akbari").

Abulfe'da, a Moslem prince and celebrated Arabian author, was born at Damascus about 1273. He fought with distinction for the sultan of Syria against the Tartars or Mongols, and was rewarded with the title of prince of Hamah. He wrote an important work entitled "An Abridgment of the History of Mankind," and another, "The Description of the Countries," which is regarded as the best Arabic work on geography that is extant. Died in 1331.

Abu Sambul, Abusimbal, or **Ipsambul,** a ruined place in Nubia, on the W. bank of the Nile, 1014 miles above Cairo and 8 miles above the Second Cataract. It contains two of the best-preserved specimens of the great rock-hewn temples of ancient Egypt. It has also four sitting colossal statues, which are not only the largest, but are considered the finest, specimens of Egyptian plastic art. One of these figures is fifty feet high as it sits.

Abutment, the part of a pier or wall from which an arch springs, and which resists the lateral or outward pressure. (See BRIDGE, by GEN. J. G. BARNARD, U. S. Army.)

Aby'dos, an ancient city of Upper Egypt, on the left bank of the Nile, 5 or 6 miles from the river, and about 100 miles below Thebes. Here are the ruins of a temple of Osiris and a temple of Memnon, in which Mr. Bankes discovered in 1818 the celebrated tablet of Abydos, now in the British Museum. A second tablet of Abydos, more complete than the first, has recently been discovered in another temple by Mariette.

Aby'dus, or **Aby'dos** [Gr. Ἄβυδος], an ancient city on the Hellespont opposite Sestos, where Xerxes crossed over to Europe on a bridge of boats, 480 B. C. It was also celebrated for its connection with the story of Hero and Leander.

Ab'yla and **Cal'pe,** the names of the pillars of Hercules, standing on both sides of the Straits of Gibraltar. The former was in Africa.

Abyssin'ia [Arab. *Habesh*], in a wider sense, is the name commonly given by European geographers to the entire Ethiopic plateau which rises on the W. of the Red Sea, extending to the S. W., and descending on the N. to the lowlands of Nubia, and on the W. to the plains of Sennaar and Kordofan. On the E. it is bounded by Adal, and the southern part, which is as yet almost entirely unexplored, extends for an unknown distance into the interior of Africa. The population is estimated by the Catholic bishop of Massaja at 12,000,000, of which over 9,000,000 are Sidamas and Gallas.

Abyssinia, in a more limited application, comprises the three former kingdoms of Tigre, Amhara, and Shoa. It is bounded on the N. E. by the Red Sea, on the S. by the country of the Gallas, and on the N. W. by Nubia. Its area is estimated at about 158,000 square miles, and the population at 4,000,000. The country ascends from the W. in broad terraces, which in the E. descend abruptly, and reach a height, in some places, of 8000 feet. The plateaus are encircled by mountain-ranges of 12,000 to 14,000 feet in height. The low and waterless district of the savage Danakil tribes separates the fissured plateau, with its mighty streams and ravines (which occasionally widen into deep valleys), from the sea, which is only accessible from three points—Massowa, in the N., Amphilla Bay, about 100 miles farther to the S. E., and Tajurrah, in the S. The hydrographic centre of the country is Lake Tsana or Dembea, which is crossed by the Abai, the chief river of Abyssinia. The next river of importance is the Atbara, which flows in a north-westerly direction towards the Nile, and receives the Tacazze from the S. E. The beds of the upper Abai, of the Atbara, and of the Tacazze are surrounded by three mountain-ranges, of which that in the E. of the upper Tacazze forms the orographic crown of the country. The mountains consist mostly of porphyry, basalt, and limestone. Its wild, romantic character the country owes to a grand volcanic action of the later tertiary period. The hot springs in the interior, occasional eruptions on the coast of the Red Sea, as well as earthquakes (1854), prove that volcanic action is not entirely extinct as yet. The surface of the country is, however, subject to much greater changes to-day in consequence of the action of the mountain-streams, which for thousands of years have carried to the valley of the Nile the fertile soil of the plateaus. Deeper and deeper they dig into the rocks, and transform the narrow ravines into broad valleys. The vegetation of the valleys is of an exceedingly luxuriant, tropical character. But in consequence of fevers, serpents, and beasts of prey it is not well adapted to habitation. The plateau, however, with very few animals, and swept by strong winds, has a healthy, temperate climate and a fertile soil. It has but few forests, and in some parts is entirely without trees, but a rich grass covers the ground, which is traversed by many springs and brooks throughout the year. All the different kinds of grain of the East and of Europe, such as corn, barley, rye, oats, etc., grow here exceedingly well; while the lowlands produce cotton, sugar-cane, and tobacco, and the best coffee grows wild everywhere. The eastern plains of the sub-alpine region are occupied by lawless hordes of Mohammedan Asebo Gallas, who make almost uninterrupted incursions into the plateaus, which are inhabited by Christians.

The most important city of the country is Gondar, which is also the residence of the abuna. Other cities are Adowa (the capital of Tigre), Antalo, Ankobar (the capital of Shoa), Angolola, and Aliya Amba.

The Abyssinian peasant is an industrious workman. The soil, indeed, needs only to be scratched to produce three harvests a year, and cattle of all kinds thrive finely. But as the rural districts are subject not only to large tributes, but also to constant robberies from all sides, the peasants generally suffer greatly from poverty.

Most of the inhabitants belong to the ABYSSINIAN CHURCH (which see). Some of the border districts have been occupied by Mohammedans, who appear to be advancing. The Falasha are a peculiar Jewish tribe, living in the Sainen Mountains and in several other districts. The Roman Catholic Church, which in the course of the sixteenth century was several times on the point of gaining a great influence, began its missionary operations again in 1833, and was vigorously supported by the influence of France. The great hopes which the conversion of a prominent Abyssinian prince raised in the missionaries were, however, not fulfilled; the membership in 1872 did not exceed a few hundred, and in that year the missionaries were again expelled from Tigre by Kassa. The first Protestant missionary who labored among the Abyssinians was Gobat (subsequently Anglican bishop of Jerusalem), who was followed by many others; none of whom, however, have succeeded in firmly establishing Protestantism in Abyssinia.

History.—The Abyssinians, who, according to Arabian traditions, emigrated from Yemen, are a mixed race. Even at the present day the inhabitants of the different provinces differ widely both in their language and in their physiognomy. In history the Abyssinians first appear in the empire of Axum. Under a family of kings who claimed to be descended from Solomon and the queen of Sheba, and who ruled to the end of the fourth century, the country advanced greatly. In the middle of the fourth century Christianity was introduced. The advance of the Mohammedans, however, broke off every connection with the remainder of the Christian world, and left the country entirely to Coptic influences. As the patriarch, according to law, must necessarily be a Copt, and generally was an ignorant monk, the clergy, who had formerly not been wanting in theological and scholastic learning, could not reach a high state of education. In 1603 the combined efforts of the Portuguese (who had saved the empire from total destruction by the Mohammedans and Gallas) and of the Jesuits succeeded in converting the royal family to Catholicism. Civil wars were the result, as the people remained true to their old faith; and only when the connection with the Church of Rome was fully severed (about 1630) did the country again become quiet.

The power of the imperial family, the Hazie, was gradually reduced to a mere shadow, until in the present century its authority was totally set aside by Ras Ali, the governor of Amhara. Nominally, the Hazie continued, however, to rule until Lij Kassa was crowned as *negus negussie* (king of kings) in 1855. Kassa, descended from noble but poor parents, was made by the favor of the regent Menene, the mother of the nominal king, Ras Ali, governor of the province of Kuara. Impelled by ambition, he soon rebelled and seized the province of Dembea. After several years of quiet, varied by a few successful raids into the neighboring lowlands, he undertook a great expedition against Egypt, which was a complete failure. This induced Menene to take up arms against him again, but the royal troops were completely beaten. After several more victories over Gocho, the most powerful chief of Gondar, and over Ras Ali himself, Kassa was in possession of the whole of Amhara. Then, after he had also defeated Ubië, the independent prince of Tigre, at Deraskye (1855), he was master of the whole of Abyssinia, and was crowned king under the name of Theodore II. Increasing vanity and pride now took the place of the pleasing manners which had gained him the affection of those around him, especially of the Europeans. He still continued, however, to be a good ruler as long as his friend and adviser, the Englishman John Bell, who had come to Abyssinia in 1842, remained with him. The attempts at reform to which Bell tried to encourage him remained almost entirely fruitless, although Theodore destroyed the power of the feudal nobles and of the priesthood. When in 1860 he had lost his friend Bell in a war against the rebels, he became a bloodthirsty tyrant and the scourge of his people. For three years terrorism kept the country in subjection; then, unable to bear his extortions for the maintenance of the army, numbering 150,000 men, the people rose in a general rebellion. Wherever Theodore came with his army the people fled into the mountains, and only returned after he had left. He found nowhere an open enemy, but famine reduced his army so quickly that it only numbered 7000 men when the difficulties with England began.

The English-Abyssinian War.—Walter Plowden, who at one time had just as much influence with Theodore as Bell, had been sent to Gondar as English consul, and had in 1849 concluded a commercial treaty with Ras Ali. Theodore intended to send an embassy to England. Lord Clarendon answered through Powell that Queen Victoria would receive the embassy if Theodore would desist from his plan of conquering Egypt. This caused the first bitterness, for the king's favorite plan was the restoration of the ancient Ethiopian empire. After Plowden's death in 1860, Cameron was sent as English consul to Abyssinia. Theodore sent him with a letter to Queen Victoria to open negotiations for a war with the Turks. (The story that he wanted to marry Victoria was invented by the French newspapers.) One Bardel was sent for the same purpose to Paris. Cameron himself remained in Africa, and sent the letter by mail. Before an answer could be expected he returned to Abyssinia. Theodore, who meanwhile had been strongly prejudiced against the Europeans by the imprudent conduct of the French consul Lejean, and the unfavorable reception which Bardel had received in Paris, regarded the conduct of Cameron as an insult. At this time the missionary Stern, who was in the service of an English missionary society, by an error of etiquette angered the king, who punished him severely. Imprudently Stern told the Frenchman Bardel that he had written a book, "Wanderings among the Fellashas of Abyssinia," which might bring him into trouble. Bardel translated the most insulting portions of it to the king, who in the greatest rage imprisoned Stern and Rosenthal, another missionary who was guilty of a similar offence. As no answer came from Queen Victoria, Cameron, according to orders from his government, asked for permission to return to his post at Massowa. In answer to this, Theodore put him and his companions in chains (Jan. 4, 1864), and brought him in November to the mountain-fortress of Magdala. This caused the British government to answer Theodore's letter, and to charge the Syrian Hormuzd Rassam with its delivery. He had to wait, however, until July, 1865, before he received permission from the king to enter Abyssinia. In Jan., 1866, he met Theodore, and so far won his favor that the prisoners were released, and were permitted to depart. Suddenly, however, Rassam and those just released were again imprisoned, because Theodore had understood Queen Victoria's letter as proposing that Rassam should remain with him in exchange for the prisoners, and therefore considered Rassam's intention to leave immediately as a breach of treaty. The efforts of several German scholars residing in Abyssinia, as Dr. Schimper and Zander, succeeded in bringing about a reconciliation. But still the whole party were kept in captivity, which, though not severe, could still only be broken by force of arms. As Theodore did not answer a letter demanding the release of the prisoners, Lord Stanley sent the king on Sept. 9, 1867, his ultimatum, which Rassam, however, did not deliver, fearing that the consequences might be fatal to the prisoners. The English government resolved therefore to send an armed expedition from Bombay, and gave Sir Robert Napier the command. Colonel Merewether, the British resident in Aden, and the Swiss WERNER MUNZINGER (which see) had for some time been engaged in trying to discover the best means to secure the success of the difficult undertaking. At the head of a large reconnoitering party they found the best road to the plateau, and established friendly relations with the natives, in which they were most efficiently aided by the German missionary Dr. Krapf. Therefore, when Napier landed, Jan. 3, 1868, at Mulkutto, in the shallow bay of Annesley—which Colonel Merewether had transformed into a convenient harbor by building a long pier—he found almost all obstacles removed. In Scratch the army, consisting of 4000 Englishmen and 8000 East Indians, with 10,000 mules and twenty elephants for the transportation of the artillery and the provisions, first gained a footing in the highlands. Thence they moved in a southerly course to the fortress of Magdala, which was considered almost impregnable, and into which Theodore had retired, being pressed on all sides by rebellious princes. The difficulties of the ground, as well as the extreme carefulness of Napier, caused the army to advance but slowly. On the 10th of April the first action took place, at Arogy, in which Theodore's troops were driven back into the fortress. Theodore now released the prisoners, but Napier demanded an unconditional surrender, and, as that was refused, proceeded on April 13 to storm the fortress, which was taken with but little trouble. Theodore was found dead on a hill, having killed himself. Napier conducted the difficult retreat with great success, and took the prince Alamayu, the only legitimate son of Theodore, to England. After the British had left, the country returned to the old state of anarchy, from which Theodore had for a time raised it. In 1869, Gobazie, prince of Amhara, proclaimed himself king, but only ruled as far as his arms prevailed. He was in 1871 defeated in a great and decisive battle near Adowah by Prince Kassa of Tigre, who early in 1872 was crowned with great solemnity as Emperor John of Ethiopia, but was likewise unable to break the opposition of a number of the independent princes. In Sept., 1872, Kassa was involved in serious difficulties with the khedive of Egypt, which led to the occupation of some mountain-districts (which were claimed by Kassa as belonging to Abyssinia) by Werner Munsinger, who had been appointed by the khedive governor of Massowah. After his victory over Gobazie, the new emperor had appointed Prince Voronya as ras of Amhara; who, however, when the emperor returned to Adowa, endeavored to make himself independent. The emperor subdued Amhara again, took Gondar without resistance, and compelled Voronya to sue for pardon. Ten days after this had been granted to him, Voronya escaped from the residence of the emperor, and again placed himself at the head of his troops. Early in 1873 he was, however, again defeated; the emperor once more entered Gondar, and his rule over Amhara and Tigre was regarded as more firmly established than at any previous period. (See HOLTON, "Abyssinia," 1871: it contains a complete list of all printed works on Abyssinia; ANDRÉE, "Abyssinien," 1869; MARKHAM, "A History of the Abyssinian Expedition," 1869.)

A. J. SCHEM.

Abyssin'ian Church. Abyssinia was converted to Christianity in the early part of the fourth century. The

church is national and independent, and with regard to doctrine Monophysitic. The visible head or *abuna* ("our father") is ordained by the Coptic patriarch of Alexandria. Circumcision is practised in the Abyssinian Church, preceding baptism. Communion is administered daily to the laity, and confession is rigidly enforced, even among priests. The efforts made, both by the English and Roman Catholic churches, to elevate the religious tone of the Abyssinians have hitherto, owing in part perhaps to political influences, been attended with but little success.

Aca'cia [from the Gr. ἀκή, a "sharp point," on account of the thorns on the tree], a genus of the order Leguminosæ, found in Asia, Africa, America, and Australia, comprising many beautiful trees, among which is *A. Arabica*, which produces some of the gum-arabic of commerce, but the most and best is yielded by *A. verek*. (See Gums.) Catechu is an extract from the wood of *A. Catechu* of India and Burmah; this and other species are much valued for timber, etc. The species with willow-like foliage, cultivated in conservatories, are nearly all Australian.

Acacia Arabica.

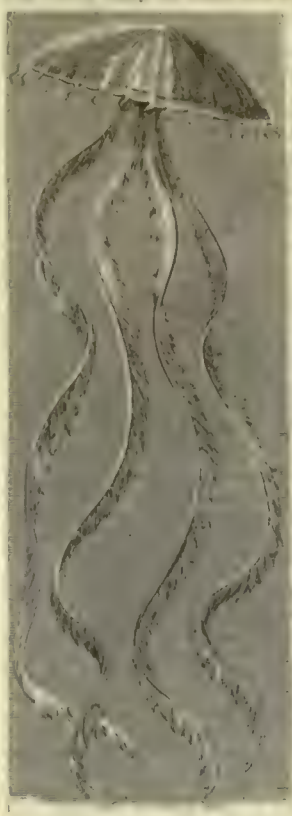
Acad'emy [Gr. Ἀκαδημία; Lat. *acade'mia;* Fr. *académie*], a word originally applied to an Athenian garden or grove and to the school of philosophy which Plato founded in that place, which was in a suburb of Athens. The name is supposed to have been derived from Academus or Hecademus, a mythical person who, according to Greek tradition, presented the garden to the people of Athens. The modified systems or schools of philosophy which the successors of Plato adopted were designated by the titles of the Middle and the New Academy. The word academy is also applied to a society of authors, savants, or artists founded for the improvement of literature, science, or art. The first institution of which we read, at all corresponding to this idea, was the Museum, a society of scholars established at Alexandria by Ptolemy Soter in the third century B. C., which concentrated in that city all that was most eminent in science, philosophy, poetry, or criticism. The Jews in different cities, the Constantinopolitan emperors, and the Arabian caliphs founded societies of the same description. Charlemagne, among his various efforts for the propagation of literature, collected an association of learned men, who read and compared the works of antiquity, and gave themselves in their academic intercourse the assumed names of different ancient authors. But this institution was dissolved at the death of Alcuin; nor do we find any memorial of a similar society, except a few among artists, chiefly in France, until after the taking of Constantinople by the Turks, when the Greek scholars driven into Italy held literary meetings, which gradually assumed a more regular form. In 1560 a society called the Academia Secretorum Naturæ, was founded at Naples in the house of Baptista Porta, but was abolished by a papal interdict. It was, however, succeeded by the Academia Lyncei at Rome, of which Galileo was a member, the objects of which, like those of the former, were chiefly connected with the pursuit of natural history. From the beginning of the seventeenth century academies multiplied in Italy. Among the most eminent of those bearing a philosophical character was the Academy del Cimento at Florence in that century; and in more recent times the Academy of Sciences at Bologna deserves to be mentioned with honor. But Italy has been most prolific in academies of literature and philology, which form by far the greatest number in the catalogue of 550 such institutions which have been enumerated as existing or having existed in that country. A general and somewhat ridiculous fashion prevailed in the seventeenth and eighteenth centuries, among literary men of that country, of forming themselves into societies for the promotion of literary objects, to which they gave fanciful symbolic names, every member assuming in his own person some analogous appellation. Among the most celebrated was the Academy (It. *Accademia*) degli Arcadi at Rome, of which the meetings were held in a meadow, and the members enacted shepherds and shepherdesses. It was founded about 1690, and still subsists, having various affiliated societies in other places. The Accademia degli Umidi, one of the oldest of these associations, became afterwards the Florentine Academy. The Accademia degli Intronati ("of the Deafened"), degli Umoristi ("of the Humorists"), and others with similar quaint appellations, have acquired celebrity in Italy. Of her philological academies the most illustrious is the Accademia della Crusca (*i. e.* "Academy of the bran" *), founded at Florence in 1582, which by its famous dictionary established the Tuscan dialect as the standard of the national language. It is now incorporated with the Accademia Fiorentina.

The first institution of this kind in France, the Académie Française, was founded in 1635, by Cardinal Richelieu. It was formed for the purpose of refining the French language and style, and, although in its first period it was chiefly remarkable for the adulation which it bestowed on its vain though able founder, it became in process of time by far the most celebrated and influential of all European literary societies. It consisted of forty members, and a place among them was eagerly sought after for a long period as one of the highest honors which could be attained by an author. Like that of La Crusca, it published a dictionary of the national language in 1694. The Royal Academy of Sciences was founded by Louis XIV. in 1666, and published 130 volumes of memoirs up to the year 1793, when it was abolished by the Convention. The Academy of Painting and Sculpture, and that of Inscriptions and Belles-Lettres, were the other two principal academies of Paris. The latter was founded by Colbert in 1663, and remodelled in 1701. At the Revolution all four were abolished, and in 1795, at the suggestion of Condorcet, the National Institute of France was established in their stead. It consisted of four classes, arising out of the four academies of which it was composed. According to its reorganization by Napoleon in 1806, these classes were remodelled, and each of them consisted of a certain number of sections, each furnished with a specified number of acting and corresponding members. The first class, or that of sciences, had sixty-three members and 100 correspondents; that of languages, forty, and sixty correspondents; that of history and antiquities, forty, and sixty correspondents; that of the arts, twenty-eight, and thirty-six correspondents. The first, third, and fourth each named eight foreign associates. In 1816 the Institute was again remodelled by Louis XVIII. The four classes again took the name of academies, and became more independent of one another, their joint property being managed by a commission of eight members, two from each, under the superintendence of the minister of the interior. The first academy (that of sciences) retained the same number of members; the second and third were reduced to thirty-eight and thirty-seven respectively; the fourth was increased to forty. To the Academy of Inscriptions and Belles-Lettres and that of Sciences was added a class of free academicians, of the number of ten, with no privilege except that of attendance. The Academy of Arts had the right to choose its own number of free members.

Of similar institutions in Germany, the oldest was the Academia Naturæ Curiosæ, a scientific association, founded in 1662 in Franconia, afterwards taken under imperial protection, when it received the name of the Academia Cæsareo-Leopoldina. The Royal Academy of Sciences at Berlin was founded in 1700 by Frederick I. of Prussia; Leibnitz was its first director. Other German academies of sciences are those of Göttingen, established in 1750; the Bavarian Academy at Munich, established in 1759, chiefly for history, and in 1829 divided into three sections; and the Saxon Association of Science, founded in 1846, and divided into two classes. The Imperial Royal Academy of Sciences at Vienna originated in 1846. Turkey established a similar institution in 1851, and Egypt in 1859. The Imperial Academy of Sciences at St. Petersburg was founded by Catherine I., and endowed by Catherine II. with great munificence, but established on the French model. She separated from it the Academy of Arts.

In England the name of academy has been chiefly confined to associations for promoting the arts. The Royal Academy of Arts was founded in 1768, and consists of forty members. It has separate professors of painting, architecture, anatomy, and perspective, and a council of nine is elected annually. The Academy of Ancient Music was founded by private association in 1710; the Royal Academy of Music, under the patronage of George III., but dissolved shortly after. The present Academy of Music was founded in 1822. The principal literary and philosophical societies, answering in character to the branches of the French Institute, are: 1. The Royal Society of London, which is confined to objects of a scientific character. It had its origin as early as 1645, but was established by royal charter in 1662. Its acts have been published under the name of "Philosophical Transactions" from 1665 to the present day. 2. The Antiquarian Society, which was established in 1751, and whose acts are published under the title of "Archæologia." 3. The Society of Arts, which originated in 1718. 4. That of Literature, which was founded in 1823. Besides these, there are numerous societies which bear the name of the peculiar branch of science to which their exertions are confined. The Royal Society of Edinburgh obtained a charter in 1783, and another, with more liberal provisions, in 1811.

* In allusion to its office of winnowing or purifying the national language.



Among the most valuable published transactions of academies and similar societies, besides those already mentioned, are those of Colbert's "Académie des Inscriptions et Belles-Lettres" (50 vols. 4to, from 1701 to 1793); those of the Institute being continuations of the memoirs of the former academies of which it was composed; those of the Royal Academy of the Sciences and Belles-Lettres at Berlin; at first in Latin, then in French (from its remodelling in 1744 by Frederick the Great), now in German; the "Acta" of the Imperial Academy of St. Petersburg; the "Commentarii" of the Academy of Bologna; and the "Antichità d'Ercolano," published by the Herculanean Academy of Naples. The "Vetenskaparnes Sällskap" at Stockholm has published over 100 vols. of its valuable "Transactions."

The American Academy of Sciences and Arts was founded in 1780 by the council and house of representatives of Massachusetts. The National Academy of Sciences of the U. S., incorporated by the Thirty-seventh Congress in 1863, was limited by the original charter to fifty members, citizens of the U. S., fifty foreign associates, and a variable number of honorary members. Its stated meetings are held twice a year. Special meetings are held on call. Committees pursue at all times investigations required by the government. The Academy of Natural Sciences of Philadelphia was founded in 1812. Besides a valuable scientific library, it contains one of the best natural-history collections in the world, especially rich in birds. (See MILITARY ACADEMY, and also NAVAL ACADEMY.) J. THOMAS.

Aca'dia [Fr. *Acadie*], sometimes called **Arca'dia, Acca'dia,** or **Ca'die,** the peninsula now called **Nova Scotia.** It was settled by the French in 1604. Acadia originally included New Brunswick and a part of Maine. It was the subject of frequent quarrels between the French and English on account of the valuable fisheries near its coast, and was finally ceded to England in 1713. The inhabitants having refused to take the oath of allegiance to the British king and to bear arms against the French, the governor and his council resolved to remove them to the other British provinces. The French settlers, 18,000 in number, were forced to give up their property, and were sent off in such haste that many families were separated. This event has furnished the subject of "Evangeline," one of Longfellow's most admired poems.

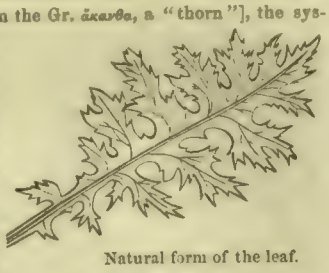
Acajut'la, a town and seaport in the Central American republic of San Salvador, is situated on the Pacific Ocean, 12 miles S. of Sonsonate. It consists, besides the custom-house and the dwelling of the captain of the port, of a large warehouse, almost entirely in ruins at present, and a few huts and sheds. Under the Spanish rule it was for a long time the only port on the W. coast between Acapulco and Realejo; at present it is second in importance in San Salvador, and has over one-third of the foreign trade of this republic. The chief article of export here is Peruvian balsam, of which 20,000 pounds are annually exported.

Acale'phæ (or, in English, **Ac'alephs,** and sometimes **Acale'phans**), [from the Gr. ἀκαλήφη, a "nettle"], (in the singular **Acale'pha** or **Ac'aleph**), a class of radiated animals according to the system of Cuvier. They are commonly called jelly-fishes or sea-nettles, and sometimes sea-blubber. The body of these animals is composed of a transparent, gelatinous substance, and in one section of the class, the true Medusæ, the body is entirely unsupported by any hard framework. The quantity of solid matter contained in them is very small, over ninety-nine per cent. being water; they may therefore be described as almost "living water." If one of them be taken from the sea and laid upon the surface of a dry board or rock, it deliquesces very rapidly. One of these, weighing fifty ounces when taken from the water, has been found not long afterwards to be nothing but a little dry cellular tissue, weighing only five or six grains. All the senses in the Acalephæ save that of touch are thought to be wanting. They possess, however, a muscular and a nervous system, as well as a distinct digestive apparatus. The digestive organs are lodged in a common centre or a longitudinal axis. From this centre proceed ray-like processes, with tentacular appendages presenting a great variety of form. In these are the peculiar *nettling* organs, which are generally composed of an oval capsule containing a spirally-coiled filament, which is suddenly thrown out whenever the animal is in any way disturbed. These filaments are lined to their very extremities by barbules, which are arranged in such a manner as always to point backward when the filament is projected. A system of vessels from the gastric cavity proceeds through the body. The existence of blood has not yet been detected. The acalephs have no teeth; in some of the animals of this class, such as the *Physalia* (or Portuguese man-of-war), food is obtained by suction through the flask-like appendages which hang down beneath, each possessing an orifice and a sucker. The Acalephæ are of various forms and sizes; many of them are shaped somewhat like an umbrella when spread. While most of them are extremely small, the larger sometimes attain a length of three feet or more. The phosphorescence of the sea is in part caused by multitudes of minute Acalephæ. The larger acalephs subsist on small fish and other marine animals; they are propagated by eggs, etc., according to the process of alternate generation. The egg produces a brood totally different from the parent, and resembling Infusoria, which attach themselves to some stationary object and assume a polyp-like form, and by gemmation produce a progeny which in time attains to the original form, or, in other words, becomes like the grandmother. (See ALTERNATE GENERATION.) They possess the power, also, of multiplying by gemmation alone, little ones being almost ready formed from the substance of the parent, mostly from the walls of the peduncle or from the surface of the ovaries, and being very similar to their parents. These animals are classified according to the different powers of locomotion which are exhibited in them. They are grouped in three orders—the Ctenophoræ, Discophoræ, and Hydroids, ranking in the order named, the Hydroids being the lowest in development. In some instances the Hydroids closely approach the character of the polyps; but others are plainly acalephs, and there are many intermediate gradations.

Acalepha.

Acantha'ceæ [so named from *Acanthus*, one of its genera], a natural order of monopetalous exogenous plants, having irregular didynamous flowers, and particularly known by their calyx being imbricated in two broken whorls, and by their seed growing from hooks on the placenta. Several species of this order have beautiful flowers, like the *Thunbergia*. The U. S. have several genera.

Acanthas'pis [Gr. ἄκανθα, a "spine," and ἀσπις, a "shield"], a genus of buckler-headed fishes found by Dr. Newberry in the corniferous limestone of Ohio. It somewhat resembles *Cephalaspis*, the buckler or carapace bearing similar denticulated spines, but the cranial plates are covered with a peculiar vermicular ornamentation, and were not ankylosed together.



Acan'thophis [from the Gr. ἄκανθα, a "thorn," and ὄφις, a "serpent"], a genus of venomous serpents allied to the viper, and natives of Australia. They have a horny spine at the end of the tail. The genus includes the dreaded death adder, *Acanthophis antarctica*, one of the most venomous of known reptiles.

Acanthopteryg'ians [Gr. ἄκανθος, a "thorn," and πτέρυξ (gen. πτέρυγος), a "wing" or "fin"], one of the two primary divisions of the Osseous fishes in the system of Cuvier. This order, which includes the perch and mackerel, is characterized by the bony spines which are formed from part of the rays of their dorsal, anal, and ventral fins. This order is the most extensive of those generally recognized by naturalists among fishes.

Acanthu'rus[a] Chirur'gus, or **Sea-Surgeon,** owes its name to the sharply-pointed and keen-edged spine on the side of the tail, which cuts and wounds like a surgeon's lancet. The scales of this fish are very small, and the single spine on each side of the tail is movable and set in a longitudinal groove. Its food is of a vegetable nature. It is found on the Atlantic coasts of tropical America and Africa, and is tolerably plentiful in the Caribbean Sea.

[a] Literally "thorn-tailed," from the Gr. ἄκανθα, a "thorn," and οὐρά, a "tail."

Acan'thus [from the Gr. ἄκανθα, a "thorn"], the systematic name of a genus of herbaceous plants, natives of Southern Europe, belonging to the natural order Acanthaceæ. The most remarkable species of this genus are the *Acanthus mollis* and the *Acanthus spinosus*, which have large white flowers and shining leaves of a beautiful form. This foliage is said to have suggested to the architect Callimachus the first idea of the ornate and beautiful capital which forms the most striking feature in the Corinthian order of architecture.

Natural form of the leaf.

Leaves artistically modified.

A Capel'la, or A la Capel'la, in music, means "in the church style;" it is equivalent to *alla breve*, a time-signature which frequently appears in church music. It likewise denotes that the instruments are to play in unison with the voices, or that one part is to be played by a number of instruments.

Acapul'co, a seaport-town of Mexico, on the Pacific Ocean, and in the state of Guerrero, 190 miles S. S. W. of Mexico: lat. 16° 55′ N., lon. 99° 48′ W. The harbor is nearly landlocked, and is one of the best in the world. The climate is hot and unhealthy. It formerly commanded the whole trade between the Spanish dominions in America and those in the East Indies. Since the discovery of the California gold-mines it has again become one of the most important ports of Mexico. The harbor is so deep that large ships can anchor close to the granite rocks. The steamers which ply between Panama and San Francisco touch here regularly. The greater part of the town was destroyed by an earthquake in 1852. Pop. about 3000.

Acari'dæ or **Acar'ida** [for etymology see Acarus], a family of small animals, including the acarus or mite and other minute insects belonging to the order Arachnida. Their food consists of both animal and vegetable substances. Some of them are free and lead a wandering life, while others are parasitic, living on other animals. Those of the former class have their mouths furnished with distinct mandibles, and are often found in great numbers in old cheese, brown sugar, and dried fruit, and in the cabinets of entomologists. One of the most destructive of these is the *Acarus destructor*. Those of the latter class are possessed of a sucker, by which they adhere to the skins of animals, where they are supplied with nourishment.* A few species of the Acaridæ are aquatic, and have their legs furnished with hairs, by means of which they swim with facility. The Acaridæ are propagated by eggs, and are extremely prolific. When mature they usually have eight legs, the young or imperfectly developed animals having only six. It was an *Acarus* whose appearance under the electrical experiments of Mr. Crosse startled the public several years ago with the supposition that it was generated or created by the electrical fluid. From its discoverer it was called *Acarus Crossii*. (See Spontaneous Generation.)

Acar'ina [for etymology see Acarus], a sub-order of spider-like insects, inferior in rank to true spiders, including the ticks, the mites (Acaridæ), and other families, having the various articulations merged into or closely joined to the abdomen.

Acarna'nia, a district of ancient Greece, bounded on the N. by the Ambracian Gulf, on the E. by the river Achelous, and the S. and W. by the Ionian Sea. According to tradition, it was named from Acarnan, the son of Alcmæon. It is mostly occupied by well-wooded hills or mountains. Acarnania and Ætolia constitute a nomarchy or province of modern Greece, with an area of 3025 square miles. Pop. in 1870, 121,693.

Ac'arus [from the Gr. ἀκαρής, "that which cannot be cut on account of its smallness" (from *a*, negative, and *κείρω*, to "cut")], a genus of minute animals, including the common mite found in figs and other dry provisions (the *Acarus domesticus*), and many other species. (See Acaridæ.) The itch is caused by an acarus which was formerly known as the *Acarus scabiei*, but which is now usually called *Sarcoptes hominis*.

Ac'ca Laren'tia was the name of a woman to whose grave the ancient Romans brought sacrifices on the occasion of a festival, on the tenth day before the calends of January. According to a Roman legend, she married the rich Tarrutius, and upon her death left her whole property to the Roman people; while, according to another legend, she was the nurse and foster-mother of Romulus and Remus.

Accelerando, in music, signifies, with gradually increasing velocity of movement.

Accelera'tion [Lat. *accelera'tio*, from *ad*, "to" (implying "addition"), and *cel'ero*, *celera'tum*, to "hasten"], a continuous increase of the velocity or rate of motion of a moving body. The measure of velocity is, in general, the space through which that velocity, if unvarying, would carry a body in a unit of time (in mechanics, one second). When motion is uniform, the spaces passed over in successive units of time are equal. When it is accelerated or retarded, these spaces increase or diminish, and cannot be taken as measures of the velocity at either the beginning or the end of the period. In order, therefore, to compare the successive velocities of an accelerated or retarded body, the spaces must be taken which are passed over in consecutive equal but indefinitely small intervals of time. If these minute spaces increase, the velocity is accelerated; if they diminish, it is retarded. Their differences show whether retardation is uniform or otherwise. If they increase, it is increasing; if they diminish, it is diminishing. Thus, the differences of these differences, or the second differences, indicate the character of the variation. If the second differences are positive, the acceleration is increasing or the retardation is diminishing, and *vice versâ*. If the second differences are zero, the acceleration or retardation is uniform. The simplest case of a force producing a uniform acceleration is that afforded by the action of the earth on falling bodies. The increase of velocity in this case is proportional to the time, and nearly equal to 32.2 feet per second.

Acceleration of the Fixed Stars denotes the apparent greater diurnal motion of the stars than of the sun, the cause of which is that the sun's apparent yearly motion takes place (though much more slowly) in a direction contrary to that of its apparent daily motion. Compared with the sun, the stars thus seem to gain about three minutes fifty-six seconds each day, coming by that interval earlier each successive twenty-four hours, to the meridian.

Acceleration of the Moon, or Acceleration of the Moon's Mean Motion, is one of the most remarkable peculiarities of the lunar motions. It was noticed by Halley that when the ancient eclipses are compared with modern lunar observations, the moon is found to be moving faster now on her course round the earth than in former days. The explanation of this peculiarity was long sought for unsuccessfully by the leading professors of the Newtonian system of astronomy. Indeed, it may be said even now that the acceleration of the moon is a problem but partially solved. We owe to Laplace the first successful attempt to explain the difficulty. He showed that the moon's motion is accelerated through the slow process of diminution which the eccentricity of the earth's orbit is undergoing. Owing to this change, there results (on the whole) a slight diminution of the sun's influence upon the moon's motions. The influence of the earth being thus increased, the same effect accrues as would follow from a slight increase in the earth's mass; in other words, a slight decrease in the moon's period of revolution. But it has been recently shown that Laplace's explanation accounts for only about one-half of the moon's actual acceleration. The remaining half remains still unexplained.

Acceleration of the Planets. The motion of the planets in their orbits is variable, being quicker or slower according as the planet is at a less or a greater distance from the sun. Hence, in moving from the apogee to the perigee of the orbit, the motion of a planet is accelerated, and on the contrary, in moving from the perigee to the apogee, the motion is retarded. F. A. P. Barnard.

Ac'cent [Lat. *accen'tus*, from *ad*, "to" or "according to," and *ca'no*, *can'tum*, to "sing" or "sound"]. In English, accent usually denotes the greater stress which is laid on some one syllable of a word, as, for example, in *na'tion*, *protect'*, *ev'ident*, *for'midable*. In our language the accent is seldom placed farther from the end of a word than the pre-antepenultimate (as in *ex'quisitely*, *hos'pitable*, *for'midable*). Even this is comparatively rare, and the pronunciation of such words is attended with some difficulty to many speakers. The accent on the antepenultimate (as in *ed'ucate*, *ev'ident*, *mortal'ity*), on the penultimate (as in *devo'tion*, *na'tion*, etc.), and on the ultima (as in *exhort'*, *proceed'*), is of continual occurrence.

* For an account of the parasitic Acaridæ the reader is referred to Kuechenmeister's "Manual of Parasites," vol. ii.

In French, accent denotes not a *stress of voice*, but for the most part simply a *quality of sound;* thus, *e* with the acute accent (*é*) represents a sound nearly similar to the English *a* in *fate;* with the grave accent (*è*) it indicates a sound nearly like our *e* in *met*, and with the circumflex (*ê*) a sound similar to the last, but still more open. *A* with the circumflex (*â*) is pronounced like our *a* in *far* or *farther* (ä), while *a* without any accent approaches very nearly to our *a* in *fat* (a). The grave accent on the preposition *à* ("to") is merely used to distinguish this word from the verb *a* ("has"), which is always written without the accent.

In German, accent is essentially the same as in English; in Italian, Spanish, and most other European languages (including the modern Greek), it is similar, or very nearly similar, to that of our tongue.

With regard to the ancient Greek accent, there is a great diversity of opinion among scholars. The most probable theory seems to be that the acute accent of the Greeks caused the syllable on which it was placed to be sounded in a higher key than the other syllables, but without any greater stress or force of utterance, and that "when a high-tone ultima, followed by other words in close connection, dropped down to a lower key, it was written with a grave accent instead of the acute." (See on this subject an interesting paper read by Prof. Hadley before the American Philological Association, July 27, 1870.) The acute followed by a grave on the same long syllable combined to form the circumflex. They were at first probably written separately, as in the word σᾶμα, but afterwards the two were joined, as in σῶμα. The invention of the Greek signs of accent is due to Aristophanes of Byzantium, a celebrated grammarian, who lived and taught in Alexandria, and who flourished about 260 B. C. (or about 200 B. C., according to some writers).

Accent in music is analogous to accent in language. It consists of a stress or emphasis given to certain notes or parts of bars in a composition, and may be divided into two kinds—grammatical and rhetorical or æsthetic. The first kind of accent is perfectly regular in its occurrence, always falling on the first part of a bar. It is true that long or compound measures of time have, besides the chief accent in every bar, some subordinate accent, but these are only slightly marked. As a general rule, we may observe that the grammatical or regular accent must not be exaggerated. It should be marked only so far as to give a clear sense of rhythm. The æsthetical accent is irregular, and depends on taste and feeling, exactly as do the accent and emphasis used in oratory. In vocal music well adapted to words, the words serve as a guide to the right use of æsthetical accents.

Accen'tor [Lat. the "warbler"], a genus of warblers,

Accentor.

including the hedge-accentor or sparrow (*Accentor modularis*), a familiar and abundant European bird, five and a half inches long, brown above, steel-colored beneath. Its song is fine, but short. It has been introduced into the U. S. The *Accentor Alpinus* of the Alps is a larger bird.

Accep'tance, an engagement to pay a bill of exchange. (See Bill of Exchange, by Prof. T. W. Dwight, LL.D.)

Accep'tants, or **Constitu'tionists,** a name given in 1713 to the Jesuits in France who accepted the constitution or bull Unigenitus issued by Pope Clement XI. The Jansenists, who rejected the pope's bull, were called Appellants or Recusants, and appealed to a general council. They were imprisoned and persecuted, but after the death of Louis XIV., the regent, the duke of Orleans, prevailed on the greater part of the recusant bishops to accept the bull with certain modifications. The Appellants continued their resistance after the Unigenitus became national law (1730).

Acces'sary, or **Acces'sory** [from the Lat. *ad*, "to," and *cedo, cessum*, to "go"], in criminal law, a participant in a felony who is not the chief actor, and is not present at its commission, but yet in some way is connected with it, either before or after the fact (or act committed). An accessary before the fact is one who, though not present, procures, counsels, or commands another to commit it. An accessary after the fact is one who, knowing a felony to have been committed, receives, relieves, comforts, or assists the felon.

In offences below the grade of felony there are no accessaries. All implicated are regarded as principals. By the common law of England the same rule is applied to the case of treason. In manslaughter, as defined by common law, there can be no accessary before the fact.

Acces'sion [Lat. *accessio*, from *ad*, "to," and *cedo, cessum*, to "go"], in law, a species of title to property borrowed from the civil (or Roman) law, and defined to be the right to all which one's own property produces, whether that property be movable or immovable, and the right to that which is united to it by accession, either naturally or artificially. By this principle the increase of an animal belongs to its owner, or a building becomes the property of the man on whose soil it is erected. An important instance of the application of this doctrine is found in the manufacture by one person of materials belonging to another. The property in its manufactured state belongs, in general, to the owner of the materials. A leading exception to the principle is, that if the manufacturer, acting in good faith, without the consent of the owner, changes the identity of the materials, as if he converts grapes into wine or grain into whisky, he will become the owner of the manufactured article. This rule would not be applied in favor of a wilful wrong-doer. The word "accession" is also used to indicate the fact of succession in government, such as the "accession" of a new dynasty in monarchies, as in the case of the House of Hanover in England. T. W. Dwight.

Accessory, or **Accessary,** in painting, a term applied to everything introduced into a picture that is not an essential part. In an historical painting the human or animated figures are the principal objects, and all the others are accessories.

Ac'cidens, or **Per Accidens** (*i. e.* "by accident"), a Latin phrase used by the older philosophers to denote an effect not following from the nature or essence of the thing, but from some accidental quality. It is opposed to *per se:* thus, fire burns *per se;* heated iron burns *per accidens*.

Ac'cident [from the Lat. *ad*, "to," and *cado*, to "fall," to "happen"], in logic, is one of the predicables; in its strictest logical sense it is that which may be absent from or present in the subject, the essence of the species to which the subject belongs remaining the same. Thus, if it be predicated of a man that he is "walking," or that he is "a native of Paris," the first expresses what is termed a separable accident, the latter an inseparable; *i. e.* the individual may cease to walk, but cannot cease to be a native of Paris, but neither of these alters the species, man, to which the individual belongs. It is to be observed with regard to the accident, as well as the other predicables, that they exist only relatively to each other, so that the same quality may be accidental when predicated of the species which is a property when predicated of the individual. Thus, "malleability" is an accident of the subject "metal," because many metals are not malleable. But it is one of the properties of gold, iron, etc., as distinguishing these from the non-malleable metals.

Accident. This is an important topic in equity jurisprudence. It has been defined to be such an unforeseen event, misfortune, loss, act, or omission as is not the result of any negligence or misconduct in a party. It is, however, difficult to bring all the cases in which the court assumes jurisdiction within the bounds of a definition. Some of the leading cases of interference by the court are:—1. Where negotiable or other instruments have been lost, and there is no adequate remedy in a court of law. 2. Where a clause has been inadvertently omitted from or inserted in an instrument. The court in such a case makes the instrument conform to the intent of the parties. 3. Penalties and forfeitures. In this class of cases the court relieves against the penalty or forfeiture where the injury occasioned by the breach of duty is susceptible of complete

compensation, as in the case of an omission to pay rent on an appointed day. There would be no relief in case of a wilful wrong, nor where the forfeiture is in the nature of a statutory remedy for a breach of duty. 4. Cases of omission, through inadvertence or want of knowledge of facts, to defend an action. The court has power to allow the necessary steps still to be taken. It is a general rule that the court will not interfere in favor of a mere volunteer, such as a donee or devisee in a will. Thus, if a seal were accidentally omitted from a conveyance made without consideration, or a clause were omitted from a will, there would be no relief. It is a further rule that relief will not be granted as against a purchaser who has acquired legal rights in good faith and for a valuable consideration.

Accident, a post-township of Alleghany co., Md. Pop. 1006.

Acciden'tal Col'ors are colors depending on the hypersensibility of the retina of the eye for complementary colors. If we look for a short time steadily with one eye upon any bright-colored spot, as a wafer on a sheet of white paper, and immediately after turn the same eye to another part of the paper, a similar spot will be seen, but of a different color. If the wafer be red, the imaginary spot will be green; if blue, it will be changed into yellow; the color thus appearing being always what is termed the complementary color of that on which the eye was fixed.

Accidentals, in music, are those flats and sharps which are prefixed to the notes in the course of a movement, and are not indicated by the signature at the commencement.

Accidentals, in painting, are those fortuitous or chance effects, occurring from luminous rays falling on certain objects, by which they are brought into stronger light than they otherwise would be, and their shadows are consequently of greater intensity. This sort of effect is to be seen in almost every picture by Rembrandt, who used them to a very great extent. There are some fine instances of accidentals in Raphael's Transfiguration, and particularly in the celebrated picture, the *Notte* of Correggio, in which the light emanates from the infant Christ. With these effects may be classed such accidental lights as those from a forge or a candle, or some such object, of which the use is extremely important to the painter of still-life.

Accip'itres [from the Lat. *accip'io*, to "take"], the plural of the Latin *accip'iter*, the name given by Linnæus to an order of carnivorous birds, including the eagle, vulture, hawk, and owl. More recent ornithologists have named this order Raptores. This order comprises all the true birds of prey, though the shrikes and a few other birds, from their habits, almost deserve the latter title. As may be seen in the accompanying illustrations, the beaks

Head and Foot of the Osprey. Head and Foot of Peregrine Falcon. Head and Foot of American Sparrow-hawk.

and claws of the Accipitres are marvellously adapted, by their sharpness and curvature, to the predatory habits of these birds.

Acclama'tion [Lat. *acclama'tio*], a term used in public and deliberative assemblies. A motion or proposition is adopted by acclamation when the assent is so nearly unanimous that the counting of votes is omitted. The different modes of electing a pope are called scrutiny, acclamation, and inspiration.

Acclima'tion [from the word *climate*], the adaptation of a human being to a climate different from that to which he is accustomed. Such adaptation is accompanied by a change in the organism, assimilating it to those of natives of the country which the acclimatized person has adopted. Certain tropical climates, it would appear, can never be safely endured by any native of cold or temperate regions. The British troops in Bengal never become truly acclimated, but the ill-health and mortality increase with the length of stay in that climate. The same experience has been met with in West Africa and elsewhere. On the other hand, the French island of Réunion, which is very unhealthy even for planters and merchants and most others, has a healthy and hardy peasantry of French descent, whose immunity from disease is probably to be ascribed to their abstinence from alcoholic stimulants and from all excesses—an abstinence which is enforced by their utter poverty. This important subject has only of late received careful attention.

Acclimatiza'tion, the adapting an animal or plant to a foreign climate. Although many plants and animals have a remarkable capacity of adapting themselves to changes of climate, yet such changes are often attended with maladies called "diseases of acclimatization." Special associations (called "acclimatization societies") for acclimatizing animals, plants, etc. have been formed in many countries. Instead of "acclimatization," the French use the word "acclimatation."

The acclimatization of foreign field and singing birds in the U. S. has been attempted near most of our larger cities with considerable success. The "Acclimatization Society" of Cincinnati in 1873 imported many hundred pairs of German birds at great expense. The object is not only to naturalize foreign songsters, but to increase the number of birds destructive of insects injurious to vegetation. Similar societies exist at Sandusky, St. Louis, and other points, both in the Northern and Southern States. Among the birds imported are the blackbird (a singer), thrush, golden finch (very beautiful and a sweet singer), green-bird, bullfinch (easily tamed and trained), redbreast, starling (a fine singer), lark, greenfinch, goldfinch, knotpecker, the wagtail, the magpie, hedge-sparrow, titmouse, nightingale, redtail, German quail (a singer), and fence-sparrow.

Accolade, a ceremonious act by which, in former times, knighthood was conferred. It was an embrace and a gentle blow or "dub" on the shoulder of the new-made knight, made by the sovereign.

Accol'ti (Benedetto), an Italian writer and lawyer, born at Arezzo in 1415, became chancellor of the republic of Florence in 1459. He wrote a Latin history of the crusade which Godfrey of Bouillon conducted to Palestine. This was the basis of Tasso's great poem. Died in 1466.

Ac'comack, a county in the E. part of Virginia, bordering on Maryland. Area, 480 square miles. It is part of a peninsula, the "Eastern Shore," and is bounded on the E. by the Atlantic Ocean, and on the W. by Chesapeake Bay. The surface is level and the soil moderately fertile. Corn, oats, and wool are raised. Capital, Drummondtown or Accomack Court-house. Pop. 20,409.

Accomack Court-House, a post-village, the capital of Accomack co., Va., 95 miles E. by N. of Richmond.

Accommodation Paper. See Bill of Exchange.

Accom'plice [*ad-con-plicare*, to "fold up together"], one of several persons associated in a crime. In its broadest use it includes all who are connected with the offence, whether as principals or accessaries; but it is generally applied to those who are admitted to give evidence against their fellow-criminals.

Accord' [from the Fr. *accorder*, to "harmonize"], or **Accord and Satisfaction,** in law, an agreement between an injured party and the one who has caused the injury that the latter shall give, and the former receive, something in satisfaction of the wrong inflicted. The "accord" is an agreement as to the thing to be done, and the "satisfaction" is the performance of the agreement. This agreement, if executed, is a bar to any suit brought on the original cause of action. The subject is governed by well-settled rules, such as that the thing to be done must not be uncertain, that it must be advantageous to the injured party, and that the agreement must be fully carried into effect. Under these rules it would not be a valid accord to give the injured party something to which he was already entitled, as, for example, to pay a portion of a debt.

Accord, in music, is synonymous with concord, the relation of two sounds which are agreeable to the ear.

Accor'dion, a musical instrument, in which the tones are produced by the vibration of metallic springs moved by wind, which is applied by a bellows. It was invented by Damian, a Viennese, about 1829.

Account' [remotely from the Lat. *ad*, "together," and *compu'to*, to "reckon"], a computation or calculation; a statement of the receipts and payments of one who acts in a fiduciary relation, as an executor or a trustee, or a statement showing in detail the transactions between merchants or others who have dealt together. An account current is one that is open, running, and unsettled. An account stated is one which has been adjusted between the parties, and a balance struck. An account may also become stated without any express agreement, and by implication, as where one of two merchants who have dealt together draws

up a formal statement of their dealings and sends it to the other, and the latter receives it and retains it without objection for a reasonable time. He is thus presumed to assent to its correctness.

Account, or account render, is the name of a common-law action which lay against one who by virtue of his position or office ought to have rendered an account and refused to do so. This action is now almost obsolete. A court of equity has much more complete power to grant relief in all cases of mutual accounts, and in cases where the taking of an account is incidental to other matters over which that court has jurisdiction. Some of the instances in which an account may be taken on the one ground or the other are agency, general average, apportionment, contribution between sureties, waste, trusts, express or implied, including administration, guardianship, and partnership. In suits for an account both parties are deemed to be substantially plaintiffs for many purposes, and an affirmative decree may be made for the defendant, if a balance be found in his favor, as well as for the plaintiff. T. W. Dwight.

Accra, or **Ac'ra,** a small territory in Africa, on the Guinea coast, belongs for the most part to England. It is about lat. 5° 30′ N., lon. 0° 12′ W. The English portion has about 3000 inhabitants, chiefly negroes.

Accre'tion [from the Lat. *ad*, "to," and *cresco, cretum*, to "grow"], the gradual accumulation of soil along the banks of a river or the sea, formed by the washing of the water. In the case supposed the increase belongs to the owner of the adjacent land. If the increase be sudden, the alluvion formed upon the sea-shore or navigable river belongs to the state.

Ac'crington, a manufacturing town of England, in Lancashire, is situated in a deep valley between several hills, and at the junction of two railways, 13 miles E. of Preston and about 22 miles N. by W. of Manchester. It has increased rapidly in population and importance, and is considered the centre of the cotton-printing business. It has also extensive manufactures of cotton cloth, and coal-mines in which many of the inhabitants are employed. Among the public buildings is a fine Gothic church built in 1838. Pop. in 1851, 7481; in 1861, 19,688.

Accuba'tion [Lat. *accuba'tio*, from *ad*, "to," "upon," and *cu'bo*, to "lie"], the reclining posture in which the ancient Greeks and Romans took their meals. Two or three couches were spread around the dining-table, each of which was capable of containing three persons. The guests lay on their left sides, their heads or elbows being supported by pillows, the feet of the first being behind the back of the second, and those of the second behind the third. The middle place was generally deemed the most honorable.

Ac'cum (Friedrich), a German chemist, born at Bückeburg in 1769. Having removed to London in 1793, he became professor of chemistry in that city about 1802. He promoted the use of gas for illumination by a valuable work entitled a "Practical Treatise on Gas Light" (1815). He wrote other works. Died in Berlin in 1838.

Accu'mulated [from the Lat. *ad*, "to," "up," and *cu'mulo, cumula'tum*, to "heap"] **Force** is the power of a moving body to overcome resistance. When a force acts on a body so as to produce its motion, the force must be in excess of the resistance to the motion, and, as power is imparted to the body at each instant, this is termed accumulated force. Thus, if a strong man should pull on a rope attached to a ship at rest, but floating free in still water, his efforts at first would seem unavailing, because his strength would be so slight compared with the *vis inertiæ* (which is proportioned to the weight) of the ship. If, however, he continue to pull steadily, the force applied will gradually impart a slow motion to the vessel. This is an example of the accumulation of force, which, however, is less manifest in this instance, owing to the fact that not merely the *vis inertiæ* of the vessel, but also the weight and friction of the opposing water, are to be overcome. But let us suppose a mass of iron or lead of many thousand tons to be suspended by a huge chain or cable extending to an immense height.* In this case, as there would be no appreciable resistance from the air, the constant application of a very small force would at length, by accumulation, communicate a rapid motion and prodigious momentum to the huge mass in question—a momentum which a force a thousand times as great could not suddenly overcome, and indeed could only overcome at all by a continual application, and consequent accumulation, of force in an opposite direction.

* It is obvious that if the chain or cable were not very long, the weight soon after it began to move (acting like a pendulum) would necessarily rise considerably higher than the point at which it was first suspended; hence a great part of the force applied would be lost in overcoming the attraction of gravitation.

Accusative. See Declension, by J. Thomas.)

Aceph'ala ["without a head," from the Gr. *a*, priv., and *κεφαλή*, the "head"], a term applied to a class of mollusks called otherwise Conchifera or Lamellibranchiata. (See Conchology, by George W. Tryon, Jr.)

Aceph'ali [etymology the same as the preceding], a term applied in the early Christian Church to bishops exempt from the jurisdiction of their patriarchs.

Aceph'alocysts [from the Gr. *a*, priv., *κεφαλή*, "head," and *κύστις*, a "bladder"] are hydatids without head or visible organs, and were formerly considered to be parasitic animals, but more recent observations establish the fact that they are scolices or larvæ of cestoid worms, especially of the tape-worm. They are found in various parts of the body of man, as the liver, cavity of the abdomen, etc., and consist of simple sacs filled with a transparent liquid. These sacs are oval or approaching to spherical, and vary in size from the head of a pin to that of a child. They appear to increase by gemmation, developing smaller cysts between the laminæ of the parent, which are discharged from its inner or outer surface. They are composed of a homogeneous substance resembling albumen. (See T. S. Cobbold's "Entozoa," 1864, p. 259 *et seq.*)

Acer'ra (anc. *Acer'ræ*), a town of Italy, in the province of Caserta, 8 miles by railway N. E. of Naples. It has a cathedral and a seminary. The sluggish channels of the Lagni render the place unhealthy. Pop. in 1861, 10,971.

Ace'sius, a bishop of Constantinople, lived about 320–340 A. D. He favored the Novatian doctrine. Constantine said to him, "Place a ladder, O Acesius, and ascend alone into heaven." (Socrates i. 10.)

Acetab'ulum [a Latin word signifying a "vinegar cup or cruet"], a term applied to the suckers on the arms of the cuttle-fish and other dibranchiate cephalopods, which have been, hence, recently termed Acetabulifera. These suckers are called by Aristotle *κότυλοι* ("cups"), which has sometimes been erroneously translated "joints." In anatomy, acetabulum signifies the cavity of the hip-joint. In entomology, it is the socket on the trunk of an insect in which the leg is planted.

Aç'etal [from the Lat. *ace'tum*, "vinegar"], a colorless, inflammable liquid obtained by the action of spongy platinum upon the vapor of alcohol. It is convertible by slow combustion into *acetic acid*.

Aç'etate [Lat. *ace'tas, -atis*]. The acetates are a class of salts composed of acetic acid and various oxides. They are all soluble in water, and, for the most part, crystallize readily. Many of these are extensively used either in dyeing or for medical purposes. The following are among the most important: *Acetate of Aluminium.*—This salt exists only in solution, being decomposed by evaporation. It is largely used in dyeing and calico-printing as a mordant, and is prepared by precipitating alum with acetate of lead, sulphate of lead being thrown down, and a mixture of acetate of aluminium and sulphate of potassium remaining in solution. *Acetate of Ammonium.*—The neutral acetate is a white crystalline salt, readily soluble in water and alcohol, and evolving ammonia on evaporation, so that it is difficult to obtain it in its crystalline form. Its solution is known in pharmacy as Spir'itus Mindere'ri. *Acetate of Copper.*—Copper forms several acetates; the normal salt is known as crystallized verdigris. It forms dark, bluish-green prismatic crystals, which are efflorescent and very poisonous. There are three basic acetates of copper, named, respectively, the sesquibasic, the dibasic, and the tribasic. These are all contained in common verdigris, which is largely used both as a pigment and as a mordant in dyeing. It is obtained by submitting metallic copper to the joint action of air and acetic acid. *Aceto-arsenite of Copper.*—A beautiful but very poisonous green pigment, known in commerce as arsenic green, imperial green, Paris green, and Schweinfurt green. It is insoluble in water, and is prepared by boiling verdigris and arsenious acid together. *Acetate of Iron.*—Iron forms two acetates; the only one of importance, however, is the ferric acetate, which is generally prepared by mixing persulphate of iron with acetate of lead. It has not been obtained in the crystalline state, but forms a red-brown solution, which decomposes on ebullition. A very crude mixture of the ferrous and the ferric acetate, known as pyrolignite of iron, is largely used as a mordant in dyeing black. *Acetate of Lead.*—Lead forms a normal and several basic acetates. Normal acetate of lead (known as sugar of lead) is a white crystalline salt, having a sweet astringent taste. When oxide of lead is digested with a solution of normal acetate, the tribasic acetate is formed in long, silky needles. A solution of this salt is frequently used on account of its power of precipitating many vegetable substances, such as gum and coloring matters. It is used in medicine under the name of Goulard water or

Goulard extract (*liquor plumbi subacetatis*). *Acetate of Potassium* is a very deliquescent salt, and is obtained with difficulty in a crystallized state; it melts to a limpid liquid below redness. It exists in the juices of many plants, and is prepared artificially for medicinal purposes by neutralizing acetic acid with carbonate of potassium. *Acetate of Sodium.*—An efflorescent crystalline salt, prepared by saturating acetic acid with carbonate of sodium. On evaporation it separates into large transparent prisms. It is similar in its medical properties to the acetate of potassium.

Acet'ic Ac'id [Lat. *ac'idum acet'icum*] is the most common of the vegetable acids, and is the essential principle of vinegar. It is composed of carbon, oxygen, hydrogen, and water. It occurs in the juices of many plants, and in some animal secretions. It is produced by the decomposition and oxidation of many organic bodies. It is prepared from weak alcoholic liquids, as wine, cider, and beer, by oxidation, "acetous fermentation," and by the destructive distillation of wood, "pyroligneous acid."

The chemical formula of acetic acid is $HC_2H_3O_2$. Alcohol may be converted into acetic acid by bringing it into contact with spongy platinum, from which it absorbs oxygen. (See FERMENTATION.) Crystallizable or glacial acetic acid, the most concentrated form of acetic acid, is obtained by distilling dry acetates with concentrated sulphuric acid.

Acetic Anhydride, Anhydrous Acetic Acid, or **Oxide of Acetyl,** obtained by the action of oxychloride or chloride of phosphorus on acetate of potassium, a colorless, very mobile, strongly refracting liquid, possessing a powerful odor.

Acetic Ethers are acetates of the alcohol radicals, such as acetate of ethyl ($C_2H_5C_2H_3O_2$); acetate of methyl, "æther lignosus" ($CH_3C_2H_3O_2$), found in crude wood vinegar; acetate of amyl ($C_5H_{11}C_2H_3O_2$), made by distilling acetate of potassium, fusil oil, and sulphuric acid. (For other members of the group see WATTS's "Dictionary of Chemistry," i. 21.)

Ac'etone, or **Pyro-acetic Spirit,** a limpid, mobile liquid of agreeable odor and biting taste, like that of peppermint. It mixes with water, alcohol, and ether, and dissolves many camphors, fats, and resins. Acetone is the representative of a class of organic bodies, called ketones, which are derived from the aldehydes by the replacement of one atom of hydrogen by an alcohol radical.

Aldehyde.	Acetone.
C_2H_4O.	$C_2H_3(CH_3)O$.

Ac'etyl, Acetox'yl, or **O'thyl,** a radical not yet isolated, but supposed to exist in acetic acid and acetates.

Acetyl is C_2H_3O.

Acetic acid, $\left.\begin{matrix}C_2H_3O\\H\end{matrix}\right\}O$.

Acetate of potassium, $\left.\begin{matrix}C_2H_3O\\K\end{matrix}\right\}O$.

Acetic anhydride, $\left.\begin{matrix}C_2H_3O\\C_2H_3O\end{matrix}\right\}O$.

C. F. CHANDLER.

Achæ'an [an adjective derived from ACHAIA (which see)] **League,** a confederation of Grecian cities formed about 280 B. C. Previous to the invasion of Macedonia by the Gauls, the Achæans had performed an insignificant part in the history of Greece, but soon after that event four Achæan towns formed a league for mutual protection. Aratus of Sicyon induced his native town to join the league (251 B. C.), and was himself made strategos (general-in-chief) of the confederacy. Corinth joined the league in 243 B. C., and was soon followed by Epidaurus, Megara, and several other cities. Philopœmen, called the "last of the Greeks," became strategos of the league in 208 B. C. In 191 B. C. the confederacy included Sparta, Athens, and nearly all the cities of the Peloponnesus, and for fifty years maintained the cause of Grecian independence against the Ætolians and against the encroachments of Rome. The confederates, under Diæus, were defeated at Corinth by the Roman general Mummius, and Southern Greece was made a Roman province under the name of Achaia (146 B. C.). The Achæan confederacy may be said to furnish the most perfect example of the federative system which ancient Greece affords, and its history forms one of the most glorious chapters in the annals of ancient times.

Achæ'ans [Gr. Ἀχαιοί], one of the four races of inhabitants of ancient Greece. The name is often extended in the Homeric poems to the whole Greek people. The Achæans proper inhabited parts of Thessaly, and in the Peloponnesus they anciently occupied Argos, Laconia, and the neighboring regions, whence they were, for the most part, expelled by the Dorians, the exiles settling along the northern shore of the Peloponnesus, and founding there a new community. They remained an obscure people till the founding of the ACHÆAN LEAGUE (which see).

Acha'ia [Gr. Ἀχαΐα], a state of ancient Greece, in the N. part of the Peloponnesus, was bounded on the E. by Sicyonia, on the N. by the Bay of Corinth, and on the S. by Arcadia and Elis. It was about 65 miles long from E. to W. The surface was hilly or mountainous. (See ACHÆAN LEAGUE.) Achaia and Elis constitute a nomarchy or province of modern Greece. Area, 1908 square miles. Pop. in 1870, 149,561. In the days of the New Testament writers, Achaia signified the whole Peloponnesus.

Achard (LOUIS AMÉDÉE EUGÈNE), a French novelist, born in 1814, was contributor to the "Courrier de Paris" in 1845, and after the revolution of 1848 became a political writer in the camp of the royalists. He wrote, among other works, "Belle Rose" (5 vols., 1847), "L'eau qui dort" (1860), "Miss Tempête" (1861), "Histoire d'un homme" (1863), "Madame de Sarens" (1865). D. Mar. 28, 1875.

Acha'tes, a friend and companion of Æneas, was noted for his fidelity. The proverbial phrase *fidus Achates* is often applied to a man who is a devoted follower of his chief.

Acheen', an independent kingdom in the N. W. part of Sumatra, has an area of about 25,500 square miles. It was formerly much larger, but in recent times its power and extent have considerably decreased. The interior is entirely unknown. The E. coast consists of large fertile plains, while on the W. are high mountain-ridges. The chief productions are rice, cotton, tropical fruits, pepper, and vegetables. Horned cattle, horses, and goats are raised in large quantities and of an excellent breed. The inhabitants are Mohammedans, and are divided into Acheenese, Pedeerese, and Malays. The former are found all over the empire, and are again divided into three tribes. The Pedeerese are found in the region of Pedeer on the N. coast, which formerly was a powerful kingdom. They are of a much darker complexion than the Acheenese. The Malays come from the southern coasts of Sumatra, and prevail in some parts of the S. W. They are of small stature, dark complexion, more agile and ingenious than the neighboring tribes, but also sensual, treacherous, and proud. They are good sailors, very fond of cockfights, and addicted to the use of opium and betel. Their language is a Malay dialect. The estimates of the population range between 450,000 and 2,000,000. The sultan is nominally the highest authority, but in reality the government is in the hands of a shahbandar appointed by him. The sultan has generally very little authority, because he has not the means to make himself felt. In many kampongs (*i. e.* villages), especially those situated at a distance from the capital, and which have become wealthy through trade, he possesses no authority whatever. Each of the three subdivisions of the Acheenese proper has two chiefs, whose position is hereditary, and who bears the title panglima or tivwanku. The sultan must consult with these six chiefs on anything that he intends to undertake, and must ask for their consent, which they only give after consultation with the chiefs of the second grade. These six chiefs of the Acheenese elect the new sultan from the reigning family, and have the right to depose him if he acts contrary to the popular custom, or does anything injurious to the public welfare. Every village has its own chief, called panghulu, imam, or datu, and in a larger kampong a rajah. He must consult with the members of his community on every question, and report the result to his panglima.

The income of the sultan consists of 5 per cent. of the value of all goods imported into the capital, Acheen, and the duties levied on the goods imported in the provinces, as well as on the sale of pepper. In return, he must pay each of the panglimas five catti, gold (each at 480 Spanish dollars). The panglimas, however, deliver just as much as they please of the money raised in the sultan's name, and this explains the lowness of his finances. To improve his financial affairs he carries on trade, and his mercantile affairs are conducted by the shahbandar, who of course does not neglect his own interest.

Acheen was visited by the Portuguese in 1506, by the Dutch in 1595, and by the English in 1612. In 1659 the East India Company established a factory at the capital. In 1818 a long internal war was brought to a close by the interference of Sir Stamford Raffles in favor of the sultan Janhar, who in return granted the English valuable trading privileges to the exclusion of the other European nations. In 1824, England exchanged her possessions in Sumatra against Malacca, and the protectorate over Acheen was transferred to Holland, which, however, engaged not to destroy the independence of Acheen. This provision was revoked by a treaty of Feb. 5, 1871. In the beginning of 1873 a war arose between the Dutch and Acheen. In the memorial published by the Dutch government in April the treachery of the sultan is declared to be the cause. He is accused of having solicited the aid of the Dutch against some native tribes, and at the same time the aid of other European powers, especially Turkey, France, and Italy, against the Dutch. In con-

sequence of this, the Dutch governor was instructed to demand a satisfactory explanation and guarantees for the future conduct of the sultan, and only to declare war if these demands were not complied with. As they were refused, the governor declared war on Mar. 26, 1873. The first operations of the Dutch were not successful, but they were to be resumed in the fall on a large scale.

The city of Acheen, the capital of the above state, in lat. 5° 35′ N., lon. 95° 19′ E., is rapidly decaying. According to an old estimate, it had 30,000 inhabitants, which number, however, is at present by far too large. It is situated on a river, about one mile from the sea-shore. The harbor is guarded by a small fort with four or five cannons. Some coasting trade is carried on with Malacca, Singapore, and Penang.

Achelo'us [Gr. Ἀχελῷος], now **As'pro-Pot'amo,** the largest river of Greece, rises in Mount Pindus, flows nearly southward, forms the boundary between Acarnania and Ætolia, and enters the Ionian Sea after a course of about 100 miles.

A'chenbach (Andreas), a German landscape and marine painter of the Düsseldorf school, was born at Cassel in 1815. He obtained a medal of the first class in Paris in 1855.

Achenbach (Heinrich), a German statesman, born Nov. 23, 1829, became in 1858 *privatdocent*, and in 1860 professor at the University of Bonn, in 1866 chief councillor in the Prussian ministry of commerce, in 1872 secretary of state in the ministry of public worship, and on May 14, 1873, minister of commerce. He has also been since 1866 a member of the Prussian Diet. While professor in Bonn he published valuable works on the agrarian relations of the Germans in ancient times, on German and French mining laws, and founded an excellent periodical exclusively devoted to mining law.

Achenbach (Oswald), a landscape painter, a brother of Andreas, was born at Düsseldorf in 1827. In 1863 he became professor of painting in the academy of his native city.

Ache'nium [from the Gr. *a*, negative, and χαίνω, to "gap," to "open"], a term applied by botanists to a dry, hard, one-seeded, indehiscent fruit or pericarp, as that of the buttercup and the thistle.

A'chenwall (Gottfried), a distinguished German writer on statistics, born at Elbing in 1719, is reputed to have originated statistical tables. He became professor of philosophy at Göttingen about 1750. He first introduced the term "Staatswissenschaft," by which he proposed to include all the knowledge essential to statesmanship. Died in 1772.

Ach'eron [Gr. Ἀχέρων, gen. Ἀχέροντος], the ancient name of a river of Elis, an affluent of the Alpheus. It was also applied in mythology to a river of the infernal regions.

Acheron'tia [from *Ach'eron*, in the Greek mythology a river of the dead], or **Death's-head Moth,** is a genus of lepidopterous insects belonging to the family Sphingidæ. There is found in England and other European countries a species of this genus (the *Acheron'tia at'ropos*), having on the back of the thorax a remarkable representation of a human skull,

Death's-head Moth.

and it has hence received the name of death's-head moth. This is a very handsome insect, and is from four and a half to five and a half inches in expanse of wing. If disturbed or handled, it makes a peculiar squeaking noise, the only known example, it is said, of a lepidopterous insect having what may be called a voice. It is much dreaded by the ignorant and superstitious, who consider its appearance to be ominous of evil. It does not hesitate to attack beehives, devouring the honey and putting the bees to flight. Though possessing no weapons of defence that have yet been discovered, it appears to suffer no harm from its armed enemies. Its larva is a large caterpillar about five inches in length, with beautiful markings; the color is a kind of greenish-yellow, and the back is traversed by lines partly blue and partly white, speckled with black spots. The caterpillar feeds mostly on the leaves of the potato plant: and it retires deep into the earth, and changes into a chrysalis in the month of September. It emerges the following June or July, transformed into a perfect insect. This moth is seen most frequently in the mornings and evenings of autumn.

Acheru'sia. I. A lake in Epirus, into which the river Acheron flows. II. A cavern in Bithynia, near the city of Heraclea; through it Hercules is said to have dragged Cerberus up to the light of day.

A-Cheval [Fr., meaning "on horseback" or "astride"], as a military term, indicates the position or situation of a body of troops *astride*, as it were, of a river or road, etc., which separates or divides one portion from another.

Achill, åk'il, or **Eagle Island,** an island off the W. coast of Ireland, forming part of the county of Mayo. It is about 15 miles long by 12 miles broad. Area, 55 square miles. Pop. about 5000. On the coast is a sheer precipice 2200 feet high.

Achil'les [Gr. Ἀχιλλεύς], a famous Grecian warrior, the hero of Homer's "Iliad," was the son of Peleus, king of Thessaly, and the sea-nymph Thetis. From the name of his father, he was often called Peli'des. At the siege of Troy he was pre-eminent for courage, strength, and swiftness, but, having been offended by Agamemnon, he refused to fight. But when his friend Patroclus had been killed, he returned to the war to avenge his death. He slew Hector and many other Trojans. According to a poetic legend, his mother, by dipping him in the river Styx, had rendered him invulnerable except his heel, by which she held him. He was killed with an arrow by Paris, who shot him in the heel.

Achil'les' Ten'don [Lat. *ten'do Achil'lis*] connects the soleus and gastrocnemius muscles of the calf of the leg with the heel-bone. It is capable of resisting a force equal to 1000 pounds weight, and yet is sometimes ruptured by the contraction of these muscles in sudden extensions of the foot. The name was given in allusion to the death of Achilles, the Grecian hero, by a wound in the heel. Ancient surgeons regarded wounds or serious bruises of the Achilles tendon as fatal. In modern surgery, however, tenotomy, or the division of this or other tendons, is a not infrequent operation, especially in the treatment of club-foot. In that form of this affection called *Tal'ipes equi'nus* the tendo Achillis is unnaturally shortened, so that the heel in standing does not touch the ground.

Achil'li (Giovanni Giacinto), Dr., an Italian Protestant, formerly a Dominican friar, was born at Viterbo in 1803. He left the Catholic communion about 1839, and issued an Italian version of the New Testament, which is regarded, by some, as the best in that language. In 1850 he went to England, and became involved in a lawsuit (in 1852) which was brought against Dr. John Henry Newman for slander. The case was tried before Lord Campbell, and a verdict given for the plaintiff, Dr. Achilli. Dr. Achilli has also been professor of the Italian language and literature in the English College at Malta.

Achromat'ic ["without color," from *a*, priv., and χρῶμα, "color"], a term applied to lenses and telescopes through which objects appear colorless, or without the discoloration which arises from the unequal refrangibility of the rays of light. (See next article.)

Achro'matism [for etymology, see preceding article]. (See Aberration, Chromatic.) A prism of flint glass will cause a certain amount of refraction and of dispersion, and if a similarly-shaped prism of the same glass be placed behind it, in the reverse position, the refraction and dispersion in one direction by the first prism will be exactly neutralized by the refraction and dispersion in the opposite direction by the second prism, and as a result there will be no refraction and no color. But suppose a prism of *crown glass*, having the same dispersion as the one of flint glass, be placed behind the latter in the reverse position, the two dispersions, being opposite and equal, will neutralize each other, and the result will be white light; but the mean refractions being different, they will not neutralize each other, and the beam of light will pass through achromatic, or almost free from color, but refracted more or less. As a lens may be looked upon as a combination of prisms with curved surfaces, achromatic lenses may be produced in the same way as achromatic prisms. Absolute achromatism is perhaps unattainable by art, owing to the spectra from different dispersive media not having an exact proportionality to one another. This is called irrationality of dispersion. It may be remedied in some degree by introducing a third lens of plate glass in addition to the flint and crown glass lenses. An under-corrected lens is one in which the correcting lens of flint does not quite accomplish the purpose, and the violet ray will come to a focus a little within the red. In an over-corrected lens the error is of the opposite kind, and the order of colors will be inverted.

Achromatic Telescope. See Telescope.

Achtkarspe'len (the "eight parishes"), a town of

the Netherlands, in the province of Friesland. Pop. in 1867, 9285.

Achtyr'ka, a town of Russia, in the government of Kharkov, 69 miles N. E. of Kharkov, on the Vorskla River. Pop. in 1867, 17,411.

Aci, or **Aci Reale,** a town and seaport of Sicily, in the province of Catania, at the mouth of the river Aci, near the foot of Mt. Etna, and 7 miles by rail N. E. of Catania. It is built mostly of lava, and has many fine edifices. Here are mineral springs and the Cave of Polyphemus. Pop. in 1872, 35,787.

Ac'id [Lat. *ăcidus*, "sour"], in chemistry, a term applied to an important class of compounds. The various acids usually have the following properties: (1) solubility in water; (2) a sour taste; (3) the power of turning vegetable blues to red; (4) the power of decomposing carbonates, and displacing the carbonic acid with effervescence; (5) the power of neutralising more or less the alkalies, at the same time losing most of their own characteristic properties, forming salts. (See SALTS.) A great number of acids are compounds of oxygen with various elements. Others contain chlorine, iodine, or other elements, instead of oxygen. (See CHEMISTRY.) Various theories have been advanced to account for the peculiar properties of acids. That of Dulong, proposed in 1816, is now generally accepted. It is known as the binary or hydrogen theory of acids. All acids are considered *salts of hydrogen* (Gerhardt)—*i. e.* compounds of hydrogen with simple or compound acid radicals; thus:

Hydrochloric acid	H(Cl),
Hydriodic acid	H(I),
Hydrocyanic acid	H(CN) or H(Cy),
Nitric acid	$H(NO_3)$,
Sulphuric acid	$H_2(SO_4)$,
Phosphoric acid	$H_3(PO_4)$.

Salts, according to this theory, are produced by replacing the hydrogen by metals or basic radicals; thus, hydrochloric acid and potassic hydrate form potassic chloride and water: $HCl + KHO = KCl + H_2O$. Nitric acid and ammonic hydrate yield ammonic nitrate and water: $H(NO_3) + (NH_4)HO = (NH_4)(NO_3) + H_2O$. Sulphuric acid and calcic hydrate yield calcic sulphate and water: $H_2(SO_4) + CaH_2O_2 = Ca(SO_4) + 2H_2O$. Phosphoric acid and sodic hydrate yield sodic phosphate and water: $H_3(PO_4) + 2NaHO = Na_2H(PO_4) + 2H_2O$. Acids are monobasic, bibasic, tribasic, etc., according as they contain one, two, or three atoms of replaceable hydrogen. Acids may produce several classes of salts, according as they contain more or less atoms of hydrogen. Hydrochloric acid forms one salt with potassium, KCl. Sulphuric acid forms two—the *neutral*, $K_2(SO_4)$, in which both atoms of H are replaced by K; the *acid*, in which only one is replaced, $KH(SO_4)$. Phosphoric acid forms three classes, thus: $K_3(PO_4)$, $K_2H(PO_4)$, $KH_2(PO_4)$. An atom of a monatomic radical replaces one atom of hydrogen, as shown above in the case of K, (NH_4) and Na. An atom of a diatomic radical, as calcium, replaces two atoms of H, as shown above in the case of sulphuric acid and calcic hydrate. This is further illustrated by the following formulæ:

Acids.	Radicals.	Salts.
HCl	K′	K(Cl).
"	Ca″	$Ca(Cl_2)$.
"	Bi‴	$Bi(Cl_3)$.
$H_2(SO_4)$	K′	$K_2(SO_4)$.
"	K′	$KH(SO_4)$.
"	Ca″	$Ca(SO_4)$.
$H_3(PO_4)$	K′	$K_3(PO_4)$.
"	"	$K_2H(PO_4)$.
"	"	$KH_2(PO_4)$.
"	Ca″	$Ca_3(PO_4)_2$.
"	"	$Ca_2H_2(PO_4)_2$.
"	"	$CaH_4(PO_4)_2$.

Compound ethers are salts in which the hydrogen of the acid is replaced by the alcohol radicals. (See ETHER.)

Ethyl chloride $(C_2H_5)'Cl$; amyl nitrate $(C_5H_{11})'(NO_3)$; ethylene iodide $(C_2H_4)''I_2$.

Acids are of three types:

(1) The water type: water $= \left.\begin{matrix}H\\H\end{matrix}\right\}O$, $\left.\begin{matrix}H_2\\H_2\end{matrix}\right\}O_2$, $\left.\begin{matrix}H_3\\H_3\end{matrix}\right\}O_3$; nitric acid $\left.\begin{matrix}(NO_2)'\\H\end{matrix}\right\}O$; sulphuric acid $\left.\begin{matrix}(SO_2)''\\H_2\end{matrix}\right\}O_2$; phosphoric acid $\left.\begin{matrix}(PO)'''\\H_3\end{matrix}\right\}O_3$.

(2) The hydrochloric acid type: hydrochloric acid HCl; hydriodic acid HI; hydrocyanic acid H(CN).

(3) The ammonia type: ammonia $NH_3 = N\left\{\begin{matrix}H\\H\\H\end{matrix}\right.$; cyanic acid (carbamide) $N\left\{\begin{matrix}(CO)''\\H\end{matrix}\right.$; succinamide $N\left\{\begin{matrix}(C_4H_4O_2)''\\H\end{matrix}\right.$; sulphocyanic acid $N\left\{\begin{matrix}(CS)''\\H\end{matrix}\right.$.

(4) Intermediate acids are formed from two or more atoms of two different types. Sulphamic acid (SO_3H_2N) is derived from $\left.\begin{matrix}H_3N\\H_2O\end{matrix}\right\}$; chlorhydrosulphuric acid (SO_3HCl) from $\left.\begin{matrix}HCl\\H_2O\end{matrix}\right\}$. (See AMIC ACIDS.)

(See a very interesting paper on normal and derived acids by G. F. BARKER, in the "American Journal of Science" [2] xliv., 1867, p. 384.) C. F. CHANDLER.

Acidim'eter [from the Lat. *ac'idum*, an "acid," and the Gr. *μέτρον*, "measure"], an instrument for determining the strength of an acid by its saturating power. It usually consists of a glass tube graduated into a hundred equal parts, and containing an alkaline liquor of known strength, the proportion of which requisite to saturate a given quantity of any acid is the equivalent of that acid. (See CHEMICAL ANALYSIS and VOLUMETRIC ANALYSIS.)

Ack'land (Lady HARRIET CAROLINE FOX), a daughter of the earl of Ilchester and wife of Major John D. Ackland of the Twentieth regiment of foot in the British army, was born in 1750, and accompanied to America her husband, who was wounded and made prisoner at Saratoga Oct. 7, 1777. She attended upon her husband (who died in the following year) with great constancy and heroism. Died July 21, 1815.

Ack'ley, an incorporated town of Hardin co., Ia., at the junction of the Dubuque and Sioux City and Central R. Rs. of Iowa, 132 miles W. of Dubuque. It has a weekly newspaper. ED. INDEPENDENT.

Acknowl'edgment [from the English word *knowledge*], in law, the act by which one who has executed an instrument declares or acknowledges, before some authorized officer, that it is his act or deed. The term is also applied to the officer's certificate of this fact endorsed on the instrument. The general object of an acknowledgment is twofold: first, to comply with the recording acts, so that the instrument may be lawfully recorded; secondly, to give the instrument such authenticity that it may be put in evidence in courts of justice, without further proof of its execution. As a general rule, it is not necessary to the validity of the instrument, though the laws of some of the States provide that a wife's conveyance of real estate or release of dower is invalid unless on a private examination apart from her husband she acknowledges that she executed it freely and without fear or compulsion of her husband. This rule is borrowed in its substance from an English practice under a so-called statute of fines. The officers generally authorized to take acknowledgments are judges and clerks of courts, mayors, justices of the peace, commissioners of deeds, and notaries public.

Acknowledgments of conveyances of real estate should correspond in form with the requirements of the law of the State where the land is situated, though that law sometimes permits them to be valid if they conform to the law of the place where they are executed. T. W. DWIGHT.

Ac'land (HENRY WENTWORTH), M. D., D. C. L., F. R. S., born in 1815, was educated at Christ Church, Oxford, where he took his degree of M. D. in 1848. He was one of the founders of the University Museum, and became in 1858 regius professor of medicine. He accompanied the prince of Wales to America in 1860, and has published "The Plains of Troy" (1839) and a valuable "Memoir on the Visitation of Cholera in Oxford in 1854," besides numerous scientific and medical papers.

Acœme'tæ (*i. e.* the "sleepless"), [from the Gr. *α*, priv., and *κοιμάομαι*, to "fall asleep"], an order of monks, sometimes called Watchers, which was founded at Constantinople early in the fifth century. They performed divine service day and night, and were divided into three classes, each of which had its share of duty. They established many monasteries and were held in high estimation. Studius, a Roman noble and a member of this order, built a monastery called Studium, and the monks were styled Studitæ. Having afterwards favored the doctrines of Nestorius, their credit declined.

Ac'olyte [from the Gr. *ἀκόλουθος*, a "follower"], a functionary who, in the Roman Catholic Church, assists the priest in the performance of religious services. According to Roman Catholic authorities, acolytes formed the second of the inferior orders of clergy in the primitive Church, subdeacons being the first. It is now the fourth of the minor orders.

Aco'ma, a village of Valentia co., N. M., supposed by some to be *Acuco*, mentioned by the Spanish historians. It is inhabited by Indians, is built on a high sandstone rock,

and is reached by a spiral staircase cut in the rock. It has a church and a missionary station, but no priest.

Acoma, a township of McLeod co., Minn. Pop. 392.

Aconca'gua, the highest peak of the Andes, is in Chili, lat. 32° 38′ 30″ S., lon. 70° 0′ 30″ W. Its height is 22,478 feet above the level of the sea.

Aconca'gua, a province of Chili, is bounded on the N. by Coquimbo, on the E. by the Argentine Republic, on the S. by Santiago and Valparaiso, and on the W. by the Pacific. Area, 4932 square miles. This province is the most mountainous part of Chili, and contains the highest peak of the Chilian Andes, Aconcagua. The climate is very dry, and owing to the high mountain-ranges there is very little vegetation in this province. Pop. in 1863, 130,253. Chief town, San Felipe.

Ac'onite [Lat. *Aconi'tum*], a plant of the genus *Aconi'tum* and the order Ranunculaceæ. The Old World contains many species of this genus, some of them, particularly *Aconitum ferox* of India, very poisonous. The Atlantic U. S. have two native species. The *Aconitum Napellus*, or monkshood, a native of Europe, Asia, and the Rocky Mountains of the U. S., is the plant which yields the aconite used in medicine. This plant abounds in the deadly alkaloid aconitine, but when administered in suitable doses is useful in rheumatism, neuralgia, and in fevers. This remedy, in minute quantity, is a favorite with homœopathists, but was employed by physicians before the rise of homœopathy. The "winter aconite" (*Eranthis*) of Europe is of the same family, but is more nearly related to hellebore.

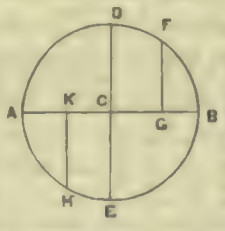
Aconitia. See Monkshood.

Ac'orus Cal'amus (sweet flag), a medicinal plant of the order Araceæ. Its aromatic stem (rhizoma) is used as a stomachic and tonic. It is a native of both continents, and is known as "sweet flag."

Acos'ta (Gabriel), a Jewish reformer, born in 1587 in Oporto, Portugal, was educated in the Catholic religion, but went to Holland, where he embraced the faith of his fathers, and changed his name to Uriel. He was condemned and persecuted as a heretic by the rabbis, and died by suicide in 1647. His autobiography was published in Latin and German in 1847.

Acotyled'onous Plants [from the Gr. α, priv., and κοτυληδών, a "seed-leaf"], plants without cotyledon or seed-lobes. The term is synonymous with Cryptogamous Plants (which see), for the latter plants are propagated by spores, and not by true seeds. A few seed-bearing plants, like the dodders, have, however, no cotyledons.

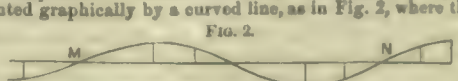
Acous'tics. The term acoustics is derived from the Greek ἀκουστικός, from ἀκούω, to "hear"—"belonging to the sense of hearing." Acoustics has for its object the study of the nature, the production, and the perception of sound.



Strictly speaking, sound is a sensation which is produced when vibrations of a certain character are excited in the auditory apparatus of the ear. These vibrations are generated by progressive tremors in the atmosphere, called sound-waves, the nature of which we shall briefly consider. Let it be premised that the particles of the air, and of all elastic media, are ordinarily maintained in a state of equilibrium and rest by mutually repellent forces. If any particle be disturbed from its position of equilibrium, it must be by an impulse received from some body foreign to the medium; and when so disturbed it is solicited to return by a force directly proportioned to the distance, or *amplitude*, of its displacement from that point. Also, the velocity with which it will be animated on reaching in its return the point of original rest will be directly proportioned to the extreme amplitude of its displacement; so that, in virtue of its inertia, it will make an equal and similar excursion in the opposite direction. When in its return from this it reaches once more the point of equilibrium, it will have passed over the entire range of its movement in both directions; and this is said to constitute one complete oscillation or double vibration.

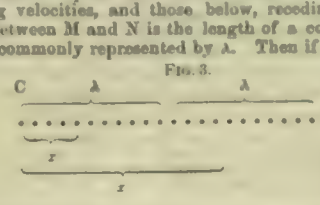
From the law of force above stated the following deductions are made by the help of the calculus. Put a to represent the extreme amplitude of displacement; V, the maximum velocity of the vibrating particle (the velocity with which the particle passes the point of equilibrium, expressed by the distance such velocity, continued uniformly, would carry a body in one second of time); T, the time of a complete double vibration; and π, the ratio of the circumference to the diameter of the circle. Then $V = 2\pi\frac{a}{T}$, and $T = 2\pi\frac{a}{V}$; from which last expression it appears that the time of vibration is constant, whatever be the amplitude of displacement, since a varies directly as V.

But in an elastic medium one particle cannot be displaced from the position of equilibrium without disturbing the equilibrium of its nearest neighbors. The neighboring particle towards which it is driven will begin, almost but not quite in the same instant, to move in the same direction; and this will disturb the next, and through it the third, and so on, the tremor being rapidly propagated throughout the medium. The distance to which this tremor will have reached when the particle first disturbed has completed one entire double vibration is the length of the sound-wave, or of one complete undulation.



The relation between vibration and undulation may be made more clear by the following illustration. Since VT is the distance accomplished in time, T, with velocity, V, and since $VT = 2\pi a$, it follows that if, with radius, $a = CA$ or CB, we describe a circle, ADBE, a particle p' will describe the circumference, ADBE, with velocity V continued uniform, in the same time, T, in which the vibrating particle p performs a complete double vibration on the diameter AB. If p' leaves D in the same instant in which p passes C, the two will be together at B, and again at A; and it is further provable that, at any intermediate instant, the line joining p and p', as FG or HK, will always be parallel to CD, and perpendicular to AB. Also, that if the arcs of revolution be reckoned from D, and the time from D to F, or from D to H, be called t, the distance $y = CG$ or CK, of p from the point of equilibrium, C, will always be representable by the formula $y = a \sin 2\pi\frac{t}{T}$; and the velocity, v, of the same particle will always be $v = V \cos 2\pi\frac{t}{T}$.

Fig. 1.



Now the rapidity of the propagation of the tremor through the elastic medium is, for all tremors producing the sensation of sound, vastly greater than the velocity v or V; and this velocity of propagation is uniform, although the several velocities of the particles of the medium which successively take up the tremor, diminish with the increase of distance from the origin, because of the diffusion of the exciting force through a constantly increasing number of particles. This diminution for moderate distances may be disregarded. If the foreign body which disturbs p be, for instance, the limb of a tuning-fork making 500 double vibrations per second, the time of describing CB will be but the 2000th part of a second. During this time the tremor in the air will advance more than six inches, while CA will hardly exceed $\frac{1}{10}$th of an inch. The velocity of propagation in this case, therefore, exceeds the mean velocity of vibration more than 240 times. But if we consider the movement of p through CB to be made up of an indefinite number of exceedingly minute elementary motions, these elementary motions will have all the different velocities corresponding to the possible values of FG between C and B; and each one of these velocities will be successively transmitted along the line of propagation, one behind the other; so that, when p reaches B and comes to rest, all these velocities will still be living in a row of particles extending over a distance of six inches, the largest being foremost, and the least, which is zero, being that of the particle p itself. As p returns towards C, it leaves its next neighbor towards the right partially unsupported, and that neighboring particle follows it. There occurs then a second series of propagated movements, all the molecules moving in the returning direction, though the tremor advances, forming the wave of dilatation, as the former was the wave of compression. Sound-waves may accordingly be represented graphically by a curved line, as in Fig. 2, where the

Fig. 2.

portion of the curve above the horizontal straight line represents the wave of compression, and the part below the wave of dilatation. The ordinates to the different parts of this curve represent the velocities animating the particles in the different parts of the wave; those above being advancing velocities, and those below, receding. The distance between M and N is the length of a complete undulation, commonly represented by λ. Then if x (Fig. 3) be

Fig. 3.

taken to represent any distance from the point of rest, C, of the disturbing or sounding body, the distance, y, of the particle at x from its place of equilibrium will be expressed by the formula

$$y = a \sin 2\pi \left(\frac{t}{T} - \frac{x}{\lambda}\right);$$

and the velocity animating that particle at the instant by the formula

$$v = V \cos 2\pi \left(\frac{t}{T} - \frac{x}{\lambda}\right).$$

For examples under the first formula, let $t = n\,T$; *i. e.* let p have made an exact number of complete oscillations; then by giving different values to x we ascertain the condition of corresponding points along the line. Thus if $x = 0$, we have $y = 0$; or p is at this moment in its position of equilibrium. Making x successively $= \frac{\lambda}{8}, \frac{\lambda}{4}, \frac{\lambda}{2}, \frac{3\lambda}{4}, \lambda, 2\frac{1}{8}\lambda$, and substituting these values, we have the corresponding values of y equal to $-a\,\frac{7}{10}, -a, 0, +a, 0$; positive signs indicating displacement to the right, and negative signs the reverse.

For examples under the second formula, let $t = n\,T$, as before, and put $x = \frac{\lambda}{6}, \frac{\lambda}{3}, \frac{2\lambda}{3}, \frac{7\lambda}{8}, \frac{5\lambda}{3}, \frac{\lambda}{2}, \frac{7\lambda}{4}$, successively. We shall then have $v = +\frac{1}{2}V, -\frac{1}{2}V, -\frac{1}{2}V, +\frac{7}{10}V, -\frac{1}{2}V$, V, 0, for the corresponding velocities; positive signs indicating movement towards the right, and negative signs the reverse. The signs of displacement and movement for the same particle are half the time alike and half the time unlike.

Velocity of the Propagation of the Sound-waves in the Air.—This has been the subject of a considerable number of experiments, of which we give below the most important. In 1822 a determination of this kind was undertaken by some members of the French Academy; the stations selected were at Montlhéry and Villejuif, the distance being 18622.27 mètres. Cannon were alternately discharged at the two stations at night, and the time which elapsed between the flash and the perception of the sound noted. On the first night twelve and seven shots were heard—on the second only one. The result was, that at a temperature of 0° C. sound travels with a velocity of 331.2 mètres per second. It is somewhat strange that to this important experiment only two nights were devoted.* We have besides this, the more careful experiments of Moll and Van Beek† in the following year, who obtained for their result at 0° C., 332.05 mètres per second; and finally we must add the experiments of Bravais and Martins,‡ who measured the velocity of sound in a slanting upward direction from the Lake of Brienz to a station on the Faulhorn, obtaining as result at 0° C. a velocity of 332.37. This last experiment is interesting as showing that sound travels with the same velocity in an upward direction as on a level, as is required by the formula of Laplace.

Recently several pieces of apparatus have been devised by which the velocity of sound can be measured when the distance travelled over is only a few feet; so that it is now possible to make this experiment in a small apartment. Suppose that we generate a sharp, short sound at the open extremity of a tube, the other end being closed by a membrane; the sound-impulse, reaching the closed end of the tube, would announce its arrival by giving the membrane a little push outward; and if we had fastened on it a pencil, this might be caused to make a mark on a sheet of paper at the same instant. Let us now imagine that we had, near each other, *two* such tubes, the second one being longer than the first, but bent so that both still terminated side by side, each with its membrane and pencil, and that finally our sheet of paper, instead of being stationary, were in motion. Then, under these circumstances, the sound-wave travelling through the shorter tube would make its mark first, and the paper would have a chance to move a few inches before receiving the pencil-mark due to the companion wave; and if we knew the rate of the paper's motion, it is evident that we could easily calculate the velocity with which the sound had travelled through our apparatus. This general explanation will give an idea of the principle involved in a number of new contrivances, with some of which it is even possible to experiment at various temperatures and on other gases than our atmosphere. A simple and cheap apparatus of this kind was, in 1866, devised by Dr. Ernst Neumann,‖ a school-teacher in Dresden; the difference in the paths of the sound-waves was about twenty feet, although the length of the apparatus was only three; the sound was generated by the discharge of a child's brass cannon. The paper was attached to a circular disk arranged with a handle, which enabled the experimenter to revolve it with a velocity of only one turn per second, which was roughly accomplished by watching a seconds pendulum, consisting of a ball attached to a string having a length such as to cause it to vibrate seconds. The mean of a number of experiments gave a result far more accurate than would have been expected. Using the same general idea, but causing the sound-waves to act on little gas-burners connected with the two membranes, in the same year Ivan Zoch¶ in Erlangen contrived a far more delicate instrument, with which he obtained results rivalling those of the French Academy in 1822, although in his case the difference of the paths was only three or four feet. With it he measured the velocity in various gases, and by driving a current of air through during the experiment was actually able to ascertain the change due to this cause. A somewhat similar idea was used in this fruitful year by Prof. Quincke** of Berlin, in a very beautiful contrivance, where, unlike the two preceding, the signal was given not to the eye, but to the ear, the two sounds being made to destroy each other, producing silence in a manner presently to be explained. With this instrument Dr. Seebeck†† has proved that in *small* tubes sound travels slower than in the open air, partly, as it would seem, owing to friction, and partly to loss of heat developed by the sound-wave itself through conduction by the walls of the tube. He has also shown that in *small* tubes the velocity is less in the case of deep notes than with those which are higher.

Laplace's formula for the velocity of sound in gases and vapors is

$$v = \sqrt{\frac{gh}{d}}\,K;$$

v = the number of mètres traversed by the sound-wave in a second of time; g = the accelerating force of gravity = 9.8088 mètres; h = the height of the mercury in the barometer reduced to the height it would have at 0° C.; d = the specific gravity of the gas, mercury at 0° being taken as unity; K = the quotient of the specific heat of the gas at a constant pressure, divided by its specific heat at a constant volume = 1.42. It is seen from this formula that the velocity is directly proportional to the square root of the pressure the gas is under, and inversely proportional to the square root of its specific gravity. It is evident also that the velocity is independent of the height of the barometer, for a change in the barometer affects not only h in the numerator, but also d in the denominator, in such a way that the value of the fraction remains constant. No term relating to the distance of the sounding body enters the formula; hence the velocity is independent of the distance—that is, of the amplitude of the sound-wave. The following is a convenient formula for calculating the velocity of sound in air at various temperatures:

$$v = 333.\ M\sqrt{1 + at};$$

a = coefficient of expansion of air for 1° C. = 0.003665; t = the temperature in degrees of the centigrade scale; M standing for mètres. It was also found experimentally that sound moves quicker with the wind and slower against it; the final velocity being in the one case equal to the sum, in the other equal to the difference, of the velocity of wind and that of the sound-wave itself. In gases, the velocity of sound, of course, as indicated by the formula, increases with the temperature; in air this increase is about two feet per second for each degree centigrade. The velocity of sound in oxygen gas at 0° C. is 1040 feet; in carbonic acid, 858 feet; in hydrogen, 4164 feet.

In 1827, Colladon and Sturm determined experimentally the velocity of sound in fresh water. The experiment was made on the Lake of Geneva, and it was found to be 4714 feet per second at a temperature of 15° C. Laplace has also given a formula for the velocity of sound in liquids:

$$v = \sqrt{\frac{g}{\lambda}};$$

g as before = 9.8088 mètres, and λ is the amount which a column of the liquid one mètre long shortens under a pressure equal to its own weight; it hence is necessary to determine the compressibility of the liquid in order to employ this formula, as the velocity is inversely proportional to

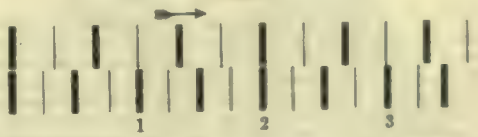
The Intensity of Sound varies inversely as the square of the distance of the sounding body from the ear; it is also proportional to the square of the amplitude of the sound-wave. Thus far, we can hardly be said to possess a phonometer, or instrument for the purpose of comparing the relative intensities of two sounds or sets of sound-waves; hence we must regard with interest a step recently taken in this direction by Prof. A. M. Mayer of Hoboken, who, by employing small vibrating flames and the principle of interference, succeeded in solving this problem in certain cases. For details we must refer the reader to the original article, published in the January number of the "American Journal of Science and Arts," 1873.

Reflection of Sound.—The waves of sound can be reflected like the waves of light, and obey the same law, the angle of incidence being equal to the angle of reflection; this can be proved indirectly with the aid of spherical or parabolic mirrors, though, from the circumstance that the sound-waves are large relatively to such reflecting surfaces as can be used, the experiments are far more difficult than with the almost infinitely shorter waves of light. The author has recently contrived a new method by which the reflection of sound can be studied, and the relative reflecting powers of different substances examined. A circular disk with open and closed sectors, or with sectors of different materials, is made to revolve rather slowly near a sounding-reed, in such a way that the sound is from time to time reinforced by reflection. The result is, that a sound resembling "the beats" is produced, these alternations of sound and comparative silence disappearing when the disk is made complete, or when its alternate sectors are composed of substances having the same power of reflection. The same apparatus can be used to determine the relative powers of different bodies for the transmission of sound. Echoes are cases of the reflection of sound, and the wonderful power of very long tubes in conveying sounds to a great distance is due to the same property.

Refraction of Sound.—Sound-waves can be refracted or bent out of their course by denser or rarer bodies in a manner corresponding to light; this can be demonstrated by the use of a large lens of carbonic acid enclosed in a thin membrane, when it will be found that the sound-waves from a watch will be concentrated just as a glass lens concentrates the rays of light. Recently, the refraction of sound has been directly studied with a prism, according to the method which has long been used in light. Prof. C. Hajech generated sound-waves in the interior of a box *b*, by the aid of a bell which was struck by clockwork; travelling along a tube *t*, they reached the prism *P*, and were refracted by it as indicated in Fig. 4. The amount by which they were bent out of their path was ascertained by moving the ear over the graduated circle *cc*, which was in an adjoining room, till the position of maximum intensity had been ascertained. The sides of the prism were made of thin membrane, of paper, or finally of sheets of mica. Experiments were performed on hydrogen, ammonia, illuminating gas, carbonic acid, and on sulphurous acid gas. Besides these gases, two

FIG. 4.



liquids were also employed—ordinary water and water saturated with common salt. Amongst other results it was found that the same prism refracted waves of different lengths (or different tones) alike. The results of these measurements corresponded with those indicated by the known velocities of sound in the substances employed, taken in connection with the explanation of refraction as given in the undulatory theory of sound.

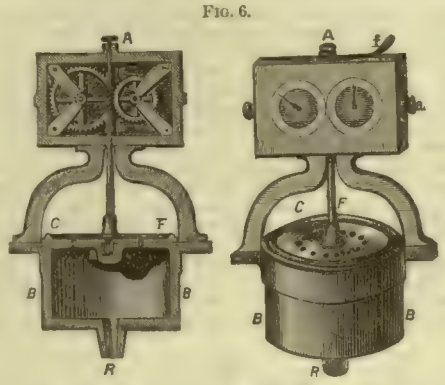
Sound-waves rendered Visible.—Quite recently this feat has been accomplished by the German physicist Toepler, who employed the snap of an electric spark for the generation of the sound-wave, and then illuminated it by the instantaneous light of a second spark. He was thus not only able to see with distinctness a simple sound-wave, but also to observe its reflection, refraction, and the interference of two sound-waves. (*Pogg. Ann.*, cxxxi., s. 180, 1867.)

Inflection of Sound-waves.—From the circumstance that the sound-waves are not minute relatively to the obstacles they encounter, it happens that they manifest this property of travelling around corners in a high degree. The corresponding experiments with light require some care, but the inflection of sound-waves is something that we with difficulty escape from, obstacles placed in their path casting but little acoustic shadow.

Interference of Sound-waves.—Thus far, we have occupied ourselves with single sets of waves, and have supposed the particles of air to be acted on by only one wave at a time. It will, however, more commonly happen that it is necessary to deal with particles which are at the same instant being acted on by more than a single wave. Let us take the simplest case, and suppose our particles acted on by two equal and similar sound-waves; now, it may happen under these circumstances that the two waves agree in their action, any particular layer of air being at the same moment subjected to a condensation or rarefaction from both these sources. When this happens the motion of its particles will be twice as great, and we shall hear a louder sound. But something else is equally likely to occur: it may happen that just at the moment when the layer ought to be condensed by one wave, its companion attempts to rarefy or expand it; these two motions will then neutralize each other, and instead of sound we shall have silence. This can be illustrated with two similar organ-pipes which give exactly the same note; sounding them both together may give a louder tone, or one which is quite faint. If closed organ-pipes are used, the silence, as far as the musical note is concerned, is quite complete, nothing but the hoarse *noise* which is always mingled with it being perceptible. We can combine both these experiments into a single one by employing organ-pipes which give slightly different tones; if now both sets of waves start fairly together, the condensations and rarefactions being in harmony, this state of things cannot long remain, owing to the inequality in their length, as is shown in Fig. 5, where condensation is marked heavily, rarefaction lightly. Already at 1 the condensation coincides with the rarefaction; farther on, at 2, the old state of things has returned; and the condition at 3 is the same with that at 1. Hence, in this experiment we must expect to have alternations of sound and silence, the tone rising and swelling to a maximum, then dying away again to repeat itself, etc. These alternations are called *beats*, and furnish even to the unmusical ear a very

FIG. 5.

accurate means of judging of the identity of musical tones. Having considered briefly these general properties of sound-waves, we pass on to some of their distinguishing characteristics. Among the most important of these is—



Length of Sound-waves.—The pitch of the note, other things being equal, depends on the length of the wave; long waves give low notes—short waves, those that are high. The longest waves, in the air at a temperature 0° C., which are capable of producing the sensation of sound, have a length of about 66 feet. The tone, from a musical point of view, is imperfect, and in order to remove this defect entirely it is necessary to shorten the wave to about 27½ feet. On the other hand, when the waves are reduced to a length of three or four tenths of an inch, they again become inaudible; to have a useful musical effect their length must be increased to about 3.2 inches. Instead of speaking of the *length* of the sound-waves, which evidently must vary with temperature, it is more customary to use the *number of vibrations* producing a given sound: thus, as sound travels at the rate of 1090 feet per second in the air at 0° C., it follows that a wave 66 feet long will execute in a second 16½ vibrations, and one which is 27½ feet long, forty vibrations, etc. We give below a table, arranged in octaves, of the number of vibrations of the notes used in music:

$16\frac{1}{2}$	33	66	132	264	528	1056	2112	4224
C	C	C	c	c	c	c	c	c
$C_{,}$	C′	C	c	c′	c″	c‴	c⁗	c⁗′
C″	C′	C	■	c′	c″	c‴	c⁗	c⁗′
C_2	C_1	C	■	c_1	c_2	c_3	c_4	c_5
c–3	c–2	c–1	c^0	c^1	c^2	c^3	c_4	c^5
ut–2	ut–1	ut_1	ut_2	ut_3	ut_4	ut_5	ut_6	ut_7

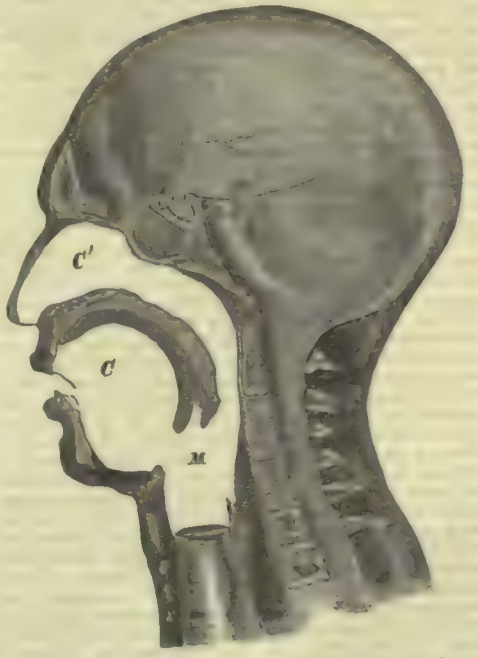
As will be seen, several modes of notation are employed, the last being the French—that preceding, the method proposed by Sondhaus for scientific purposes. In large organs C with $16\frac{1}{2}$ vibrations is reached, the effect being imperfect; the piano reaches a with 3520 vibrations, and sometimes c with 4224. The highest note employed in the orchestra is d_5, with 4752 vibrations (piccolo flute). The practical range in music is from 40 to 4000 vibrations, embracing seven octaves. The human ear is, however, able to reach eleven octaves; that is, the sensation of sound is produced by vibrations varying from $16\frac{1}{2}$ up to 38,000 in a second.

It is not difficult to measure the length of the sound-waves or the number of vibrations producing them; a very simple means is with the sirene of Cagniard de Latour. This instrument consists of a circular revolving disk C F (Fig. 6), which is provided with fifteen small apertures cut in its substance in a slanting direction; below this disk is a second one, which is stationary, and also provided with a similar set of holes. When air is driven through the apparatus by a wind-bellows the upper disk is set in rotation after the manner of a reaction mill, which has the effect of rapidly opening and closing the set of apertures, so that when a sufficient velocity of rotation has been attained, the pulses of air rushing through produce a low musical note, the pitch rising with the velocity or number

Fig. 6.

of vibrations communicated to the air in a second. Upon the axis is an endless screw, E H, which, acting on a toothed wheel, S, registers the number of turns made by it in a given time, say in fifteen seconds. In using this apparatus it is only necessary to raise the pitch of the note furnished by it till it is in unison with the note whose number of vibrations we wish to determine. If, then, this unison is maintained for fifteen seconds, we can, without calculation, read the required number of vibrations directly on the dial-plate of the sirene; then, by dividing the velocity of sound in the air by this number, we have the length of the wave. In the case of a tuning-fork the number of vibrations can be still more directly ascertained by attaching to one of its arms a small piece of fine wire or a minute portion of a feather, and causing this to act as a pen on a revolving cylinder. This latter is covered by a sheet of paper which has been smoked by burning camphor, and when set in revolution registers the vibrations made by the tuning-fork on the lampblack surface. Seconds marks are simultaneously impressed on the smoked paper by an electro-magnetic attachment; so that afterwards it is not difficult to obtain the desired result with a high degree of accuracy. There are also other methods of measuring the length of sound-waves, based on the principle of interference, and quite recently Prof. Mayer of Hoboken has succeeded in measuring wave-lengths directly in the air. (*American Journal of Science and Arts*, for Nov., 1872, p. 387.)

The Form of a Sound-wave.—In all that has preceded, and also in the formulas for the sound-wave, we have assumed that the particles of air swing backward and forward, obeying the law of the pendulum; and this is true for pure, simple tones, such as those furnished by tuning-forks. The ear is so constructed as to be able to take up these pendulum-like vibrations, which then produce appropriate sensations in the brain, but it is not capable of directly taking up vibrations which are executed according to laws different from that of the pendulum. Let us take a simple case, and suppose the air acted on by two pendulum-like sets of impulses, due to the joint action of two tuning-forks, one of which in a second executes twice as many vibrations as the other. The particles of air will then obey a new law, and will assume positions and velocities which are the *resultants* due to the action of the two original forces, and the form of the wave will be entirely altered. When this new kind of wave strikes upon the ear it is instantly analyzed into its two constituents, which independently affect their corresponding nerve-fibrils, and a peculiar sensation is produced, due to the presence of two distinct sensations; indeed, as Helmholtz, to whom we owe these interesting facts, has shown, it is possible after some practice to actually recognize the two original constituents. If we add a third, a fourth, or any number of new sets of impulses, the law changes with each, and also the resulting form of the wave, and consequently the final sensation. Conversely, if by any other means we generate waves having forms *not normal*, and present them to the ear, they will instantly be analyzed into a sufficient number of normal forms to meet the requirement, and a corresponding number of sensations will be produced. For example, reed-pipes, or a reed alone, furnish waves with an abnormal form, and the sound from them is analyzed, as Helmholtz has shown, by the ear into sixteen to twenty sets of normal waves or pure simple tones. We may add here that, as in this example, it is not necessary that these distinct sets of waves or notes should be independently generated, but merely that the original wave should have a form capable of being analyzed into these simple constituents. Even the form of the wave furnished by the sirene is not normal; along with its proper or fundamental note the octave is *virtually present* in an amount which is often somewhat embarrassing. These higher notes, which accompany the proper or fundamental tone, are called over-tones, or harmonicals, and it is their presence which determines the quality of the sound, or its *timbre* or *clang-tint*. In the case of tuning-forks the over-tones are absent, hence the hollow and somewhat poor character of the sounds they emit; with closed organ-pipes they are scarcely present to any extent, though more so with open pipes, where the first and second over-tones can be distinctly recognized—*i. e.* the octave and the twelfth. In reed-pipes they are present in great abundance and strength, so as quite to change the character of the fundamental note; the same is true of stringed instruments. It is the presence of these over-tones which enables us to distinguish between different instruments, even when sounding the same fundamental note, and finally which, as we shall see, enables us to recognize the voices of different persons under similar conditions. Our inability to distinguish at once the presence of particular over-tones is simply the result of want of practice, and is shared alike by the musical and unmusical. This can be corrected by practice, or by the use of the resonators contrived by Helmholtz. These instruments have usually the form of a hollow sphere, open at both ends of its diameter; one of these openings has a shape adapting it for insertion into the ear; the other aperture is larger, its size being determined by experiment. The size of this opening and the capacity of the sphere are so related that when the sphere is placed in connection with the ear the experimenter is rendered comparatively deaf to all notes but one, the strength of this latter being greatly exalted by the instrument. The analysis of which we have just spoken was to a great extent effected by the aid of these contrivances, a large number of these spheres being of course necessary for purposes of investigation. We may add here that Mr. R. Koenig, so celebrated for his beautiful acoustic apparatus, has pushed this matter one step farther, and by connecting these resonators with manometric capsules and small gas-flames has succeeded in rendering *visible* the phenomena of which we have been speaking, thus enabling a person who is deaf still to pursue these investigations.



Cause of Dissonance or Discord.—This peculiar effect, which sometimes attends the reception of two or more sets of sound-waves, has also recently been explained by the investigations of Helmholtz, which have thrown a flood of light on this obscure subject. It has for a long time been known that when two sets of sound-waves are simultaneously presented to the ear, the relation between their length being in some simple proportion, such as 1 : 2, 2 : 3, 3 : 4, or 4 : 5, an agreeable effect is produced, the sounds seeming to melt into each other, producing what is known as consonance; while, on the other hand, more complicated relations often generate discord. To account for this, many fanciful theories have been proposed, of which we will merely allude to that of Leibnitz, who imagined that the mind delighted in the

perception of simple mathematical relations, and was displeased by the reverse! It is hardly necessary to say that this is not the true explanation, which we must seek in certain relations of the nerves of sensation to external stimulating causes. The nerves of vision, touch, and hearing are endowed with the following property: when stimulated, the sensation produced is at the first instant at a maximum, and rapidly becomes less intense; if, however, the nerves are allowed to rest for small intervals of time, they quickly regain their former sensitiveness, and this process may be repeated indefinitely. If, now, we expose the eye, for example, to light, we obtain the maximum sensation; then the periodic withdrawal and return of the light may readily be so arranged as to produce in succession a long series of these maxima of sensation, which quickly become disagreeable, and even may be dangerous: it is the case of a flickering light, whose bad effects are so well known. The sensation of tickling is strictly analogous to the above, and is produced by corresponding causes. The nerves have, however, another well-known property: after stimulation the sensation produced is found to remain, or "persist," for a minute interval of time with undiminished strength; so that in the case of light and sound, if the successive stimulations follow each other at sufficiently rapid intervals, these evil effects are naturally abolished, and only continuous sensations are perceived. Discord is, then, as Helmholtz has ascertained, due to the presence of the beats, or to rapid alternations of sound and comparative silence, they corresponding to the flickerings of a flame. When from any cause these beats follow each other at the rate of about 33 in a second, the discord is at its maximum, becoming more tolerable with twice this number, and finally disappearing altogether as their number is increased to about 120 in a second. On the other hand, if the beats follow quite slowly —for example, at the rate of three to five in a second—the effect is not unpleasant, and can even be employed in music, suggesting as it does the idea of trilling. Discord is then due to the production of beats by the interference of the over-tones, which almost always accompany the fundamental notes, and, as has been shown by calculation, this can be entirely or partially avoided only by the use of such simple ratios as those above indicated. For further details we must refer the curious reader to the original work of Helmholtz ("Die Lehre von den Tonempfindungen," 1865).

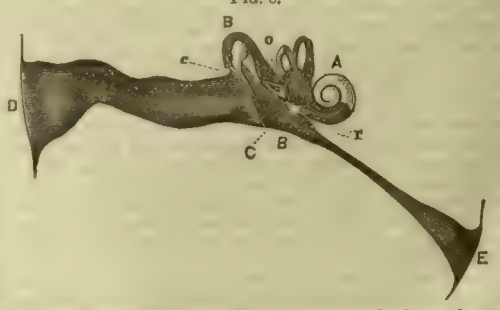
Effect of Communicating Motion to the Source of Sound or to the Ear.—In all the foregoing it has been tacitly assumed that during experiment the position of the source of sound and of the recipient ear remained invariable; when this ceases to be true, certain curious changes are produced, which recently have grown into importance, owing to their correspondence with certain optical phenomena by which it is possible to study the motion of the fixed stars towards or away from our planet. Let us suppose that the sounding body is stationary, and that the ear of the observer is moved with some rapidity towards it; then it will result that in a given time the observer will receive a larger number of impulses than at first, and that the pitch of the sound will be correspondingly elevated. The same effect will be produced by moving the sounding body towards a stationary ear. And from the same cause it is evident that motion of the ear away from the source of sound will lower the pitch of the note, etc. These ideas were first brought forward by Christian Doppler in 1842, and since then have been repeatedly subjected to the test of experiment. Dr. Ballat in Belgium, with the aid of a locomotive and a party of musicians, proved their correctness in a quantitative manner, and Dr. Mach has contrived an apparatus with a moving reed-pipe by which they can be studied in an ordinary room; and finally by the use of tuning-forks Prof. Mayer of Hoboken has succeeded in illustrating them before large audiences. (*American Journal of Science and Arts*, April, 1872, p. 267.)

The Voice.—As the human vocal organs are built essentially on the plan of a reed-pipe, it is desirable at the start to understand the construction and action of one of these instruments. A reed organ-pipe consists, then, of two parts, a vibrating tongue or reed, and a variously shaped pipe. When connected with a wind-bellows the reed is thrown into vibrations, and after the manner of a sirene permits the air to pass through in a series of puffs, which, linking themselves together, generate a musical tone. The waves furnished by the reed are not, however, normal in form, but, as previously explained, have a form such as would be generated by the joint action of a fundamental normal tone or wave, combined with a set of shorter waves or over-tones: in other words, practically it furnishes a fundamental note with a series of strong over-tones, the particular fundamental note and corresponding set of over-tones depending on the construction of the reed itself and the manner in which it is tuned. The function of the pipe is to strengthen any or all of these notes; thus, conical pipes strengthen all the over-tones up to a certain height, excluding those that are not much longer than the aperture of the pipe itself, while cylindrical pipes strengthen the odd over-tones, or those whose rates of vibration are related to each other as 1, 3, 5, etc. Hence, the pitch of the note is determined by the rate of the reed's vibrations—the quality, or clang-tint, of the sound by the shape and size of the pipe. In the human vocal organs the reed is supplied by two vibrating membranes at M (Fig. 7), called the vocal cords. For the production of sound it is necessary that they should be stretched, and that at the start the opening between them should be closed. Air is then forced through them from the lungs; they are set in vibration, and allow it an interrupted passage, exactly as in the case of a reed, as has been shown by experiments on the living and dissected larynx, or with the aid of artificial vocal cords made of sheet india-rubber. The pitch of the voice depends on the extent to which the membranes are stretched. Müller, by increasing the tensive force half an ounce up to eighteen ounces, raised the tone with one of his dissected preparations more than two octaves. The pitch depends also to some extent on the strength of the current of air employed, rising as the latter is increased. The human voice includes not quite four octaves, though no one single voice would be able to compass a scale of this extent. The pitch also, other things being equal, depends on the length of the vocal cords: that of men is about 18 millimètres, with women it is only 12. The clearness of the voice depends on the accurate closure of the slit between the cords, from time to time, while they are in operation. Theory and experiment alike point to the fact that when the vocal cords are set in action waves having an abnormal form are generated, corresponding to a fundamental note with a set of

FIG. 7.

over-tones. The function of the cavity of the mouth and nose *CC'* (Fig. 7) is to strengthen or weaken the fundamental tone and various sets of the over-tones; and in this action the size of the opening of the mouth also plays an important part; thus, the quality of the sound uttered, or its clang-tint, depends finally on the shape and size of the cavity of the mouth and nose. This cavity, then, corresponds to the pipe of a reed organ-pipe. The vocal cords retaining all the time the same tension, by altering the shape and size of the cavity of the mouth and its opening we can generate sounds having a different clang-tint, as, for example, Ah, O, etc. It is not even necessary to set the vocal cords into action if a complex sound consisting of many tones is supplied from some outward source; thus, we were recently informed by President Barnard of Columbia College that by taking advantage of the complex sounds or noise of a railroad car, and by varying suitably the cavities just referred to, he has succeeded in producing musical notes in rapid succession, such as the notes of any familiar melody, at pleasure.

The Vowel-sounds are the simplest which can be uttered by the human voice, and have frequently been made the



subject of investigation. In 1831, Willis in England found that by mingling certain tones produced by reed-pipes he could to some extent imitate the vowel-sounds. (*Pogg. Ann. Bd.*, xxiv., s. 397.) In this mode of working there is the obvious difficulty that reed-pipes furnish large sets of notes, so that it is not possible to obtain very accurate knowledge by such experiments. More recently, Helmholtz, with the aid of his resonators above described, succeeded in analyzing the vowel-sounds, although they present greater difficulties than most other sounds of equal complexity. This results from the circumstance that, from childhood upward, we all have been accustomed to regard the tones of the vowel-sounds as independent wholes, making no attempt to ascertain their musical components, since in the case of a vowel-sound the clang-tint is all important, and is indeed the only means by which we judge of its identity. Helmholtz ascertained that vowel-sounds are produced by the presence of a fundamental note mingled with its higher over-tones in various proportions; he even was able to prove that the intensity of the highest of these over-tones varies somewhat in different individuals, being greater in voices that are shrill than in those whose sound is softer. Having finished this labor, he undertook the artificial reconstruction of the vowel-sounds from pure constituents. These are best furnished by vibrating tuning-forks. One of these instruments, alone by itself, furnishes a tone which at a little distance is quite inaudible, but by causing it to vibrate directly in front of a hollow *metallic* cylinder of exactly the right capacity, its sound is greatly strengthened, and can be distinctly heard in a room of large dimensions. The cylinder is of course entirely closed with the exception of a circular opening at the end near the fork. When the fork is thus caused to vibrate in connection with a resonator, the sound is instantly extinguished if the aperture in the cylinder be closed, but as it is gradually opened the sound correspondingly gains in intensity; so that it is evidently in the power of the experimenter to regulate the loudness of the tone produced. A tuning-fork, however, soon ceases to vibrate, and accordingly must be provided with a contrivance to obviate this difficulty. By placing it between the arms of an electro-magnet having the form of a horseshoe, it can be caused to vibrate for any period of time, provided the magnetic attraction is intermittent, and always exercised at exactly the right moment. This is accomplished by breaking and re-establishing the electric current with the aid of another tuning-fork, which vibrates at exactly the same rate; and the second fork, being also provided with a similar electro-magnet, is able independently to maintain itself in vibration for any length of time, as is the case with the vibrating attachment so often found on electrical apparatus for medical purposes. It would not be possible with this arrangement to sustain in vibration a third fork whose rate was a *little* slower or faster than that of its two companions; but if its rate should be exactly twice, three, or four times as great, this end could easily be accomplished; for then, though the attractive impulses might be fewer than desirable, at least they would always be rightly timed. Hence, it is evident that a series of forks whose rates of vibration are as 1, 2, 3, etc. can be kept simultaneously in vibration by a contrivance of this nature. This was, then, the plan actually employed by Helmholtz; keys being connected by strings with the valves of the resonators, and being opened by the pressure of the fingers, the proper notes were obtained with the desired strength. Helmholtz's vowel-sound apparatus, as made by Mr. Koenig of Paris, consists of eight tuning-forks with their resonance-cylinders, the fork which establishes and regulates the current being on a separate stand. These forks give the following notes: Ut_2, Ut_3, Sol_3, Ut_4, Mi_4, Sol_4, Ut_5, Si_5. When all these forks are set in vibration, their resonance-cylinders remaining closed, only a low humming sound is heard, but by pressing one or more keys the corresponding notes are called forth with any desirable degree of strength. The German vowel-sound *u* can be approximately imitated by sounding the Ut_2 fork alone, or better by adding the two first over-tones—*i. e.* the octave and twelfth, Ut_3 and Sol_3. *O* is obtained with a weak Ut_2 and strong Ut_4; Ut_3, Sol_3, and Mi_4 mingling to a small extent. The German *a*, with Ut_5 and Mi_4 strong; Ut_3, Ut_4, Sol_4 having a moderate strength. In the same language the *æ* is given by Mi_5 and Sol_5 strong, with the notes Ut_4, Ut_5, Sol_4 weaker: and finally the *e* by the aid of Sol_5, Si_5, and Ut_6 strong; Ut_3 and Ut_4 being weaker.

Of course, since only pure musical notes are employed, they can only reproduce the musical constituents of the vowel-sounds; hence the effect resembles the sound of the vowels as sung rather than pronounced. Corresponding with these remarkable experiments, Helmholtz also found it possible to imitate with the same apparatus certain varieties of organ-pipes; at least to reproduce the musical constituents of their tones, though of course the noise with which they are often accompanied was absent; he in addition imitated the nasal tones of the clarionet by the use of a portion of the forks, while the joint action of the whole set gave the softer tones of the bugle-horn. For exciting the apparatus into action he used only two of Grove's cups, though other experimenters have since then found it somewhat difficult of manipulation, and lately an attempt has been made by Appun to replace it by a series of reeds provided with resonators, with which it has been found possible to reproduce some of the sounds in question (*u* and *a*).* We must here mention the remarkable results attained in the last century by Prof. v. Kempelen in Vienna with his speaking machine, which more recently has been greatly perfected by the two Fabers, uncle and nephew.† Some months ago the latter exhibited in Columbia College this wonderful apparatus, which is capable of uttering not only syllables, but words and sentences, with a certain mechanical precision. In it the human vocal organs are directly imitated by vibrating plates of ivory, and it is remarkable that it is operated on by only fourteen keys or stops, which give the five vowels and the nine consonants, *l, r, w, f, s, b, d, g, sch*. The other consonants are produced partly by combinations of the above, and partly by increasing the strength of the current of air from the bellows. For the purpose of causing the machine to speak French, an extra attachment is provided, whereby more nasal tones can be generated. Mr. Faber has also connected with it a singing attachment, in which, by means of quick changes in the form of the vocal cords, the musical scale can be executed.

Consonants.—These sounds are generally regarded not as constituted of notes having any particular musical relation to each other, as in the case of the vowel-sounds, but rather as consisting of different varieties of noise. Thus, as examples of explosive noise we have *p* and *b*, *t* and *d*, *k*, *g*, *q*; of frictional noise, *s*, *z*, *sch*, *l*, *f*, *v*, *m*, *n*, and *h*; of intermittent noise, *r*.‡ The mechanical mode by which the consonants are produced is to a considerable extent understood, but their actual acoustic elements resist all attempts at complete analysis. That they have an acoustic character cannot, however, be doubted, and some progress has been made towards ascertaining the natural pitch of their predominant notes. Thus, upon repeating (in German) the consonants *b*, *k*, *t*, *f*, *s*, it will be found that *b* is the deepest in tone, *s* the highest; and that, taken together in the above order, they constitute a series of perceptible musical gradations. For further information we must refer the reader to the original investigations of Dr. Oskar Wolf, who seems to have succeeded in actually determining the pitch of the predominating constituent in the case of most of the consonants. §

The Ear.—The sensation of sound is produced by the stimulation of certain nerve-fibrils in the interior of the ear, and this result is brought about by the *sound-waves* in the following manner: These waves first strike upon the external ear, and possibly are, to some slight extent, concentrated by it; afterwards they travel along the tube D (Fig. 8), and reach the tympanum or drum of the ear at

FIG. 8.

C. This consists of a thin membrane which closes the external passage, and which is capable of being set in vibration or of responding to an immense variety of waves or impulses. It may here be remarked that a catholicity of this kind has not thus far been observed in experiments on membranes artificially stretched, whose range is found to be far more limited. There is also some reason to believe that the tympanum is capable of a certain degree of "accommodation" to the sounds that are presented to it, following the well-known analogy of the eye in this respect. Attached to the inner side of the tympanum is a series of

* "Sprache und Ohr," by Dr. Oskar Wolf, page 11.

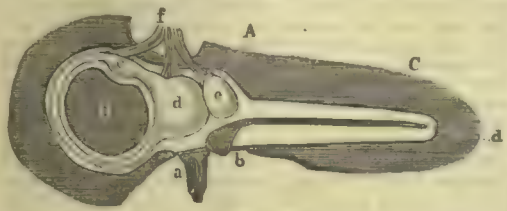
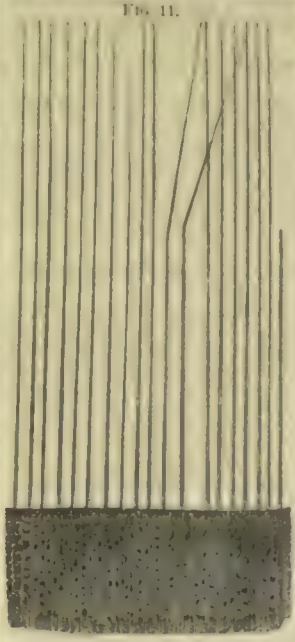
§ "Sprache und Ohr," Dr. Oskar Wolf, Braunschweig, 1871.



three small bones, called respectively the malleus, *c*, the incus, and the stapes, *o* (the hammer, the anvil, and the stirrup. See Figure 8). These bones are rather closely bound together, and transmit the vibrations of the tympanum finally to the stirrup, which is destined to communicate them to the inner ear. The portion we are now engaged with has a communication with the mouth by means of the Eustachian tube, E, which is closed except in the act of swallowing; its function is to preserve an equilibrium between the pressure of the air in the middle ear and that on the other side of the drum. While the middle ear is filled with air, the inner ear is filled with a liquid, and is completely enclosed for protection in solid bone. In Fig. 9 a sec-

FIG. 9.



tion of the inner ear is given. SSS are the semicircular canals cut open; V is the vestibule; *o* and *r* are the foramen ovale and the foramen rotundum; C is a section of the cochlea. We give in addition a *plan* of the ear, after Helmholtz (Fig. 10), the cochlea, for the sake of clearness, being supposed to be unrolled. A is the vestibule, C the cochlea, *a*

FIG. 10.

the foramen ovale, *b* the foramen rotundum, *f* the nerves of hearing. The sacs at *d* contain attached to their walls small crystals of carbonate of lime in contact with the nerves, and their function, as it appears, is to render us sensible of simple short sounds or shocks, which probably would not affect the vibratory apparatus presently to be described. They act as *drags* on the nerves when the latter vibrate with the water in which they are bathed, and thus produce sensation. This is the simplest portion of the apparatus for hearing, and is found in many of the lower animals, where the more complicated arrangements are entirely absent. These sacs contain also, in connection with the nerves, certain microscopic hairs, that are quite elastic and brittle, and probably capable of being set into vibration when the particular notes to which they are tuned are presented to them, just exactly as a tuning-fork can be set in vibration by the waves proceeding from a second fork of the same pitch. (See Fig. 11.) In the cochlea we also find a membrane (the organ of Corti) with a great number of fine microscopic cords stretched in it, which probably have the same function. The reader will find, by opening a piano and pressing the foot on the right-hand pedal, that if then the vowel-sounds, for example, are pronounced in a loud, clear voice over the strings, it will result that the strings which are capable of giving the notes of which they are built up will be set in vibration, and will echo back somewhat faintly the original sounds. And so it is probably in this portion of the ear; these microscopic strings, being thus set in vibration, stimulate the nerves connected with them and produce corresponding sensations. If the sound is compound or the form of the wave abnormal, this sound is analyzed into its constituents, since the cords (and rods) can only execute normal vibrations; which circumstance explains much that was said under the head "Form of the Wave;" and we see finally that the clang tint is the sensation produced by the simultaneous action of two or more of these strings upon their appropriate nerves. The cochlea contains about 3000 of these strings, and if, with Helmholtz, we suppose that 200 of them are useful for rendering us sensible of tones not used in music, there will remain for the musical tones proper 2800 for the seven octaves, or 400 for each octave, 33⅓ for each half tone. Now, according to the experiments of E. H. Weber, skilful musicians can distinguish $\frac{1}{33}$ of a half tone, which is a smaller quantity than corresponds to the number of these strings. It would appear, then, that in this case *two* of these strings are at the same time excited into action, and the musician by practised attention is able to notice which of them vibrates the more strongly.

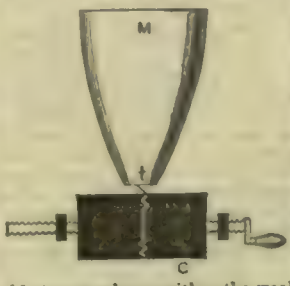


FIG. 11.

As rendering the above views more probable, we may mention the experiments of Von Hensen on the ears of certain minute forms of crabs, which he enclosed in an artificial ear corresponding to the labyrinth. The ears of these crustaceans are partially external, and consist of sets of hairs capable of vibration, connected with the nerves, as in the case we have just been considering. When different notes were sounded, Von Hensen was able with the microscope to notice that certain hairs responded, etc.* The functions of certain portions of the ear are still involved in much obscurity; this is the case, for example, with the three semicircular canals, concerning whose object and use we possess as yet no certain information. Among the fishes the myxine has one of these canals, the lamprey has two, the higher forms, three; and it appears that in birds of prey they become highly developed.

In closing this article it may be proper briefly to mention the results obtained with the *phonautograph* of Scott and Koenig. This may be regarded as a gigantic ear, endowed with the power of permanently registering the vibrations of its own tympanum. It consists of a parabolic mirror, M (see Fig. 12), of zinc, which concentrates the sound-waves, and causes them to set in vibration a thin membrane, *t*, which is provided with a "pen" attached to its centre. The vibrations are in this way finally inscribed on the surface of a revolving cylinder, C, which is covered with paper smoked by burning camphor. The figure gives a view of this apparatus seen from above. With this instrument Koenig succeeded in obtaining the autographic curves due to single notes, or to the joint action of several within the compass of an octave. Donders, however, was able, after much trouble, to obtain the complex curves due to the vowel-sounds. For *u* (German) it was a common sine curve, as it should be; this was also true for *ü* and *i*, the instrument being able to reproduce neither the weak over-tones of the first, nor the high over-tones of the second. The form of the curve altered with the pitch of the voice uttering the vowel, but changes in dialect produced only slight modifications. With diphthongs the duration of the sound and modifications due to change from one diphthong to another were rendered visible. Consonants spoken just before a vowel altered only the beginning of the curve, and pro-

FIG. 12.

duced only a corresponding modification when uttered immediately after the vowel.* The duration of *a* in the word *daag* = 42, in *dagen* = 37, in *dag* = 16 vibrations, each single vibration consuming $\frac{1}{73}\frac{1}{8}$ of a second, so that the actual durations were, 0.16, 0.142, 0.061 of a second of time. O. N. Rood.

Acquack'anonck, a township of Passaic co., N. J. Pop. 4368.

Acquavi'va, a town of Italy, in the province of Bari, 16 miles S. S. W. of Bari. Pop. in 1861, 6517.

Ac'qui, a town of Italy, in the province of Alessandria, on the Bormida, 21 miles by rail S. S. W. of Alessandria. Here are sulphurous springs, which are much frequented, and ruins of an old Roman aqueduct. Acqui has several fine buildings and silk-factories, and is a bishop's see. Pop. in 1861, 6824.

Acquin'ton, a township of King William co., Va. Pop. 2960.

Acquit'tal [from the Old Fr. *acquiter*, to "forsake"], in law, a release from a contract or other obligation; more usually employed in criminal practice, where it denotes a judicial deliverance from a charge of guilt, either by a verdict of not guilty by a jury upon a trial, termed "acquittal in fact," or by mere operation of law, as where one has been charged simply as accessary, and the principal is acquitted. An acquittal is a bar to any future prosecution for the same offence. In the U. S. this is secured by a constitutional provision that "no person shall be twice put in jeopardy for the same offence." The judicial construction of this clause prevents a second trial for the same offence after an acquittal.

A'cre [from the Ang.-Sax. *acer* or *æcer*, a "field," etymologically allied to the Lat. *ager* and Ger. *Acker*], a superficial dimension of land, is equal to 4840 square yards. The English acre is the same as that of the U. S. A French acre contains about one *arpent* and a half.

Acre, Ak'ka, or **St. Jean d'Acre** [Phœnician *Accho*, and called by the Greeks *Ptolema'is*], a city and seaport of Syria, is on the Mediterranean, 30 miles S. of Tyre, and 8 miles N. of Mount Carmel; lat. 32° 54′ N., lon. 35° 6′ E. The "key of Palestine," it has been the scene of many famous sieges and battles. It was taken by the Crusaders in 1104, and retaken by the Saracens in 1187. In 1191 it was recovered by the Crusaders (under Guido of Jerusalem, Philip of France, and Richard the Lion-hearted of England), and held by them till they were finally driven out of Palestine in 1291. Bonaparte besieged it for sixty days in 1799, but failed to take it. In 1840 it was bombarded and captured by the English fleet. Pop. variously estimated at from 20,000 to 50,000.

Acre'lius (Israel), a clergyman, born at Ostaker, Sweden, Dec. 25, 1714, was educated at Upsal, and was appointed in 1749 a provost to take charge of the Swedish congregations on the Delaware. After a sojourn in America of seven years, he returned to Sweden in 1756. He wrote a description of the Swedish colonies in America (1759). Died April 25, 1800.

Ac'robat [literally, "one who goes or moves upon his extremities (toes)," from ἄκρος, "extreme," and βάτης, "one who treads or goes"], a term applied to a rope-dancer or to a person who entertains the public by performances on the tight rope or slack rope, and by gymnastic feats of agility, such as vaulting and tumbling.

Acrob'ates (i. e. the "acrobat"), a genus of Australian marsupials, includes the "pigmy acrobat," "dwarf phalanger" or "opossum mouse" (*Acrobates pygmæus*), which in its character and habits resembles the flying squirrel. It is two inches long, and its tail is of about the same length.

Acrocerau'nia [from ἄκρον, a "peak" or "promontory," and κεραυνός, "thunder"], the ancient name of a chain of mountains on the western coast of Greece, and extending into the sea by a bold promontory; so called because violent thunder-storms are said to be frequent in that region. The modern name is Chimara. The Acroceraunian promontory is Cape Linguetta; lat. 40° 27′ N., lon. 19° 18′ E.

Ac'ro-Corin'thus, a steep rocky hill near the city of Corinth, in Greece, is about 2000 feet high. On this hill stood the acropolis or citadel of Corinth. The view from the top is very extensive and beautiful.

Acrog'enous [from the Gr. ἄκρον, "summit," and γένω, to "be born"], a name applied to certain cryptogamous plants (acrogens), as ferns and mosses, in which the stem increases by the coherence of the bases of the leaves and by elongation at the summit, and not in diameter by the addition of fresh matter to their outside, as in exogens, or to their inside, as in endogens.

Acro'lein, Acryl'ic-Al'dehyde, $C_3H_4O = C(CH_2)''H$ (COH), an intolerably pungent body produced by the dehydration of glycerine. It is always produced when neutral fats containing glycerine are subjected to destructive distillation, and is the chief cause of the offensiveness of that operation.

Acron'ycal [from the Gr. ἄκρος, "extreme," and νύξ, "night"]. A star or planet is said to be acronycal when it is opposite to the sun, or passes the meridian at midnight. It rises acronycally when it rises as the sun sets, and sets acronycally when it sets as the sun rises.

Acrop'olis [from the Gr. ἄκρον, a "peak" or "summit," and πόλις, "city"], the name given to the citadel of an ancient Grecian city, usually built on the peak or top of a hill. The Acropolis of Athens was especially celebrated, and was adorned with the temple of Minerva or Athena, called the Parthenon, and the Erechtheum, the ruins of which still excite the admiration of all travellers.

Acros'tic [Gr. ἀκρόστιχον, from ἄκρος, "extreme," and στίχος, "order," "line," "verse"], a term applied to a poem so contrived that the first, last, or other series of letters of the lines shall form some name or phrase. Sir John Davies wrote twenty-four hymns to Astræa, each of which is an acrostic on Elizabetha Regina (Queen Elizabeth). On a somewhat similar principle, in the poetry of the Hebrews the initial letters of the verses were made to correspond to the letters of the alphabet in their proper order. The 119th Psalm affords perhaps the most remarkable example of this. Every line in the first division of the psalm begins with א (aleph), and in the second division with ב (beth), and so on.

Acs, a village of Hungary, in the county of Komorn, on the right bank of the Danube, has a beautiful palace of the prince of Liechtenstein, and in the Hungarian revolution was the scene of several battles, of which that of Aug. 3, 1849, was the most important. Pop. in 1869, 3933.

Act [Lat. *ac'tus* (from *a'go, ac'tum*, to "do")], in dramatic literature, is a division of a drama; it is again subdivided into scenes. The Greek dramas of the old model were naturally divided into separate portions by the choric odes (or stasima), which occur at intervals, during which the stage was left to the sole occupation of the chorus. Nevertheless, the Greek writers do not notice this division in express terms; nor do we know the origin of the famous rule of Horace, that every dramatic piece should be restrained within the limits of five acts, neither more nor less. The division into acts must be in great measure arbitrary,† although rules have been laid down by various writers to define the story or plot which should be contained in each of them. Thus, Vossius gives it as a rule that the first act should present the intrigue, the second develop it, the third be filled with incidents forming its knot or complication, the fourth prepare the means of unravelling it, which is finally accomplished in the fifth.

Act, a term applied in legal and political language to a law or statute which is approved and ordained by the legislature, as an act of Parliament, an act of Congress. The proposed law is called a bill until it has passed through the first, second, and third readings, and has been approved by both houses of Parliament (or Congress) and signed by the executive.

Act, in the English universities, is an exercise performed by students before they receive a degree. The student who is said "to keep the act," and is called the respondent, chooses certain propositions, which he defends by syllogisms. Several other students, called "opponents," who are nominated by the proctor, try to refute his arguments.

Act of Settlement, in Great Britain, is the title of the statute 12 and 13 of William III., c. 2, by which the crown was limited to the House of Hanover, and all Roman Catholics were excluded from the throne.

Ac'ta Diur'na ("Daily Acts"), the name of an official gazette or journal published by authority in ancient Rome. It contained brief notices of the transactions of public assemblies, legal tribunals, etc. Julius Cæsar was the first to order that the Acta Diurna should be drawn up in regular form and published.

Ac'ta Erudito'rum ("Acts of the Learned") was a literary journal founded at Leipsic in Germany in 1682 by Otto Mencke and others. It had a high reputation, and was continued until 1782.

* F. C. Donders, "Zur Klangfarbe der Vocale;" Pogg. "Ann." 1864, cxxiii., s. 527, 528.

† "Sakoontalá" (a drama by Kâlidâsa), perhaps the most exquisite production of the poetic genius of the Hindoos, was divided into *seven* acts.

Ac'ta Mar'tyrum ("Acts of the Martyrs"), a collection of the lives of Christian martyrs. The most noted is that of Ruinart, Paris, 1689, commemorating the martyrs of the first four centuries.

Ac'ta Sancto'rum ("Acts of the Saints"), a collection of the lives of Christian saints of all ages. The most extensive collection is that of the Jesuit Bollandists, which begins with January and follows the calendar. The first volume appeared in 1643; the fifty-fourth, which comes down to Oct. 14, in 1793; the fifty-fifth in 1845; the sixtieth, which comes down to Oct. 29, in 1867.

Actæ'on [Ἀκταίων], in Greek mythology, a grandson of Cadmus, was a famous hunter. It is said that he was changed into a stag and killed by his own hounds because he had seen Diana bathing.

Ac'tian Games, games celebrated at Actium, in Greece, in honor of Apollo. They were restored by Augustus to commemorate his victory over Antony at Actium (31 B. C.).

Actin'ia [from the Gr. ἀκτίς or ἀκτίν, a "ray"], a genus or sub-order of radiated marine animals, of the class Zoophyta, and order Actinoida, often called sea-anemones. They are generally attached to rocks or shells, are of a soft, gelatinous texture, and have numerous tentacula, by which they seize their prey. Some species of *Actinia* are very beautiful, and resemble flowers. Among the most remarkable genera of the order Actinoida is the Bunodes (which see).

Actinia.

Ac'tinism [from the Gr. ἀκτίν or ἀκτίς, a "ray"]. The effects produced by the rays of the sun are of three kinds, illumination, warming, and chemical change. The first two of these are obvious enough, and are always perceived wherever the solar rays penetrate. The chemical changes produced by light occur only under certain conditions, and are not obvious to common observation. Certain salts have very long been known to undergo decomposition in the sunlight, or even in the diffuse light of day; and among these the salts of silver are especially remarkable. To this property, the so-called indelible inks, of which silver nitrate is the basis, owe the permanency of the traces left by them. The chloride, bromide, and iodide of silver are more sensitive still.

When a beam of compound light is dispersed by the prism, the most energetic action upon silver salts is found in the violet rays of the spectrum; but this effect, as shown by Stokes, extends very far into the darkness beyond the violet. Stokes made the additional remarkable discovery that these non-luminous chemical rays become luminous when certain substances are presented to them. Such substances among others are solution of quinine sulphate, infusion of horse-chestnut bark, glass tinted yellow by oxide of uranium, and fluor spar. This phenomenon was named by its discoverer, *fluorescence*. (See Fluorescence.) The heating effects of the spectrum, on the contrary, are found to be more remarkable in the red than anywhere else among the luminous rays; while the maximum heating effect is entirely outside the spectrum and in the dark. This discovery, made long ago by Sir William Herschel, is a counterpart to the more recent one of Stokes just mentioned: and both taken together show that the sunlight, as dispersed by the prism, spreads through a wide space, in which the rays exciting vision occupy only the middle part.

The luminous, heating, and chemical effects of light being so broadly different, it was natural, in the earlier stages of this investigation, to ascribe them to agencies or forces essentially differing from each other in physical character. It was common, therefore, to say that the sunlight is made up of three independent species of rays, the colorific, the calorific, and the chemical. Instead of the word chemical, Dr. Draper, of New York, proposed, in 1842, to substitute the term *tithonic* to distinguish the rays of the class last mentioned; this term being derived, by a fancied analogy, from the beautiful myth of Tithonus and Aurora. Sir John Herschel, a little later, suggested the term *actinic*, which ultimately prevailed. To the three kinds of rays above mentioned, Dr. Draper, in 1844, proposed to add a fourth, under the name phosphorogenic rays; that is to say, rays which cause certain substances, which have been acted upon by them, to continue, for some time afterwards, to *phosphoresce*, or to give light in the dark. Dr. Draper believed it to have been established by his experiments, that these rays, though imparting to material bodies the light producing power, are themselves totally distinct from light. The more recent labors of this eminent investigator have led him, however, to the conclusion—which is the doctrine now generally received—that, physically considered, the sunlight is homogeneous, the variety of effects produced by it being consequences of the different degrees of rapidity with which the vibrations of the luminiferous ether are performed, and being especially dependent on the nature of the surface and of the substance upon which the rays are received.

Tyndall has recently made some interesting additions to our knowledge of the actinic properties of light, in experiments upon the vapors of a variety of volatile compounds which when highly rarefied are instantly decomposed by it. In the course of these experiments he has incidentally demonstrated the cause of the blueness of the sky, or of distant mountains seen through a large body of intervening air. This tint is owing to the presence in the air of exceedingly minute particles of precipitated vapor.

The actinic properties of light have formed the basis of an art having an almost endless variety of useful applications. (For particulars in regard to this, see Photography, and also Light, Chemical Effects of.)

F. A. P. Barnard.

Actinom'eter [from the Gr. ἀκτίν, a "ray," and μέτρον, a "measure"], an instrument for measuring the actinic or chemical rays of light. (See Actinism.) Several methods of doing this have been proposed; thus, a sensitive surface of chloride of silver is found to darken, when exposed to the light, in proportion to the intensity of the light and the duration of exposure; and since this darkening is produced entirely by the actinic rays, the depth of tint produced by exposure for a few (say five) minutes will give an approximate idea of the intensity of the actinism present. The difficulty in this case is to prepare chloride of silver paper which shall always have the same degree of sensitiveness. Dr. Draper employed for the above purpose the reaction originally observed by Gay-Lussac and Thénard, that chlorine and hydrogen, when mixed in equal volumes, do not combine in the dark, while they unite to form hydrochloric acid when exposed to the actinic rays of light. Draper discovered the important law that this action varies in direct proportion to the actinic intensity of the light and to the time of the exposure. Other actinometers have been proposed, based upon other chemical reactions; thus, a solution of chloride of gold and oxalic acid will remain clear in the dark, but precipitates gold when exposed to actinic rays.

Ac'tion [from the Lat. *ago, actum*, to "perform," to "move"], in law, means a proceeding before a court of justice by one person against another to obtain redress for the infringement of a right, in the manner prescribed by law. This definition would exclude such proceedings as mandamus and prohibition. The word is not properly applied to courts of equity, but the corresponding proceeding is there termed a suit. Actions are distinguished into civil and criminal. A civil action is instituted for the enforcement of a private right or the redress of a similar wrong. In reference to the place in which they are to be brought, they are either local or transitory. Civil actions are either real, personal, or mixed. Criminal actions are prosecuted in the name of the state against some person charged with the commission of a crime. The distinction between real and personal actions refers to the point whether the recovery of land is sought, or damages by way of compensation, or specific personal property. An action is local when by a rule of law it must be brought in a particular locality, such as a county. Actions not so localized are termed transitory.

The number of actions under these rules is quite considerable. The distinctions between them are sometimes subtle and perplexing. There is a marked tendency in this country to modify or to do away with them, and to establish a single form of civil action, embracing proceedings both in law and in equity. The New York code of procedure assumes to give a definition sufficiently comprehensive to include both an action at law and a suit in equity. It abolishes all the old forms of action, and recognizes but one action, termed a "civil action." The rule of this code has been extensively followed in the Western States, and has had much influence upon legal opinion in England.

T. W. Dwight.

Action, a series of events forming the subject of an epic: thus, the adventures of Æneas form the action of the "Æneid." Epic action should have three qualifications: It should be but one, should be entire, and should be great.

Action, in oratory, signifies gesture, or the adaptation of the countenance and gesture of the speaker to his subject and sentiments. This *sermo corporis* ("language of the body"), as Cicero calls it, is a very important part of oratory. Demosthenes said that action was "the beginning, the middle, and the end of the orator's office or art."

Action, in painting and sculpture, is the state of the subject as imagined in the artist's mind at the moment chosen for representation.

Action, in mechanics, denotes the effort which a power or body exerts upon another body. It is an axiom in mechanics that action and reaction are always equal. Thus, if an anvil be struck with a hammer, the resistance of the former to the latter is exactly equal to the force with which the hammer acts upon the anvil.

Actions for Pianos are mechanical devices by which the impulse given the key is transmitted to a hammer which strikes the string. The action also regulates the motion of the hammer after the stroke, preventing any reaction or rebounding. Actions made by different makers differ somewhat in the details of their construction. They have been brought to a high degree of perfection.

Ac'tium [Gr. Ἄκτιον], (now called **A'zio**), a promontory and town of ancient Greece, in Acarnania, near the entrance of the Ambracian Gulf. Here occurred the great naval battle of Actium (31 B. C.), between Octavius Cæsar and Mark Antony; the former gained a decisive victory.

Active Voice. See Grammar.

Ac'ton, a piece of defensive armor, formerly worn in the shape of a shirt with short sleeves. It was made of leather, to which pieces of iron were sewed.

Acton, a post-township of York co., Me. Pop. 1008.

Acton, a post-township of Middlesex co., Mass., on the Fitchburg, the Nashua Acton and Boston, the Hudson branch, and the Lowell and Framingham R. Rs. It has valuable stone-quarries, and South Acton is an important manufacturing village. Total pop. 1593.

Acton, a township of Meeker co., Minn. Pop. 486.

Acton (Lord John Emeric Edward Dalberg), born in 1834, was elected to Parliament for Carlow in Ireland in 1859. He belonged to the liberal Catholic party, in whose interest he founded in 1861 the "Home and Foreign Review." In 1865 he was returned to Parliament, and in 1869 created a baron.

Ac'tor (fem. **Ac'tress**), a stage-player, or performer of dramas. Actors are supposed to have originated in ancient Greece. By the ancient Romans they were regarded as a disreputable class. After the fall of the Roman empire the dramatic art and profession was abandoned or lost for several centuries. The first actors in England were servants of the nobility, and performed for the diversion of their masters. In the Middle Ages the monks exhibited a species of drama called mysteries or miracle plays, the subject of which was usually some miracle or marvellous event in the history of the Church.

Acts of the Apostles, the fifth book of the New Testament. (See Apostles, Acts of.)

Ac'upuncture [Lat. *acupunctu'ra*, from *a'cus*, a "needle," and *pun'go, punc'tum*, to "prick"], or **Acupunctura'tion,** a term applied to the surgical operation of puncturing a diseased part with needles. This method is extensively used in Japan and China for the cure of many diseases, and has been successfully applied in the treatment of rheumatism. Steel needles are made use of, about three inches long, and set in handles. The surgeon, by a rotary movement, passes one or more to the desired depth in the tissues, and leaves them there from a few minutes to an hour. Their insertion is accompanied by no pain except the first prick—a fact of which the quacks of the sixteenth century did not fail to take advantage. According to Cardan, they travelled from place to place practising acupuncture, and before inserting the needle they rubbed it with a peculiar kind of magnet, either believing or pretending that this made the operation painless. The relief to pain afforded by this simple operation is sometimes astonishing, and the wounds are so minute as to be harmless if skilfully made.

Acush'net, a post-township of Bristol co., Mass., has manufactures of lumber, boxes, cigars, and boots and shoes, but is chiefly agricultural. Pop. 1132.

Acute' [Lat. *acu'tus*, from *ac'uo, acu'tum*, to "sharpen," to "point" (literally, "pointed," hence "sharp," "severe")], a term applied to diseases having severe or violent symptoms, attended with danger, and terminating favorably or otherwise within a few days.

Ac'worth, a post-township of Sullivan co., N. H. Gigantic crystals of beryl occur here. There are manufactures of wooden ware, woollens, boots and shoes, etc. Pop. 1050.

Ad, a Latin preposition signifying "to," "at," "by," "on," "towards," "near," "with," etc. In compound words the *d* is usually changed to correspond with the following letter; thus, *ad* becomes *ac* before *c*, *al* before *l*, *ap* before *p*, etc.

Ada, a town of Hungary, in the county of Bacs, on the river Theiss, 30 miles S. of Szegedin. Pop. in 1869, 9344.

A'da, a county in the S. W. part of Idaho, includes Boisée Valley. It is intersected by the Boisée River, and bounded on the S. by the Lewis (or Snake) River. The surface is mountainous. Gold is found in this county. Grain, potatoes, and butter are produced. Pop. 2675. Capital, Boisée City.

Ada, a post-village of Kent co., Mich., in a township of its own name. Pop. of township, 1427.

Ada, a post-village of Hardin co., O., on the Pittsburg Fort Wayne and Chicago R. R., 57 miles W. of Crestline. It has a college, the North-western Ohio Normal School, three churches, numerous manufactories, and one weekly newspaper. Bent L. Thompson, Ed. "Record."

Adagio, ä-dä'je-o [composed of *ad*, "at," and *agio*, "ease," "leisure"], an Italian musical term, signifies a slow movement or measure of time.

Adair', a county in the central part of Iowa. Area, 576 square miles. It is drained by Middle River and by affluents of Nodaway River. The surface is undulating or nearly level. Grain, wool, hay, and butter are produced. Pop. 3982. Capital, Fontanelle.

Adair, a county in the S. part of Kentucky. Area, 450 square miles. It is traversed by Green River. The soil is moderately fertile and extensively covered with forests. It contains abundant water-power. Cattle, grain, tobacco, and wool are produced. Pop. 11,065. Capital, Columbia.

Adair, a county in the N. N. E. part of Missouri. Area, 570 square miles. It is intersected by Chariton River, and by the North Fork of Salt River. The surface is undulating and the soil generally fertile. Cattle, grain, tobacco, and wool are produced. It is intersected by the St. Louis Kansas City and Northern R. R. Pop. 11,448. Capital, Kirksville.

Adair, a township of Camden co., Mo. Pop. 637.

Adair (James), a trader who resided among the North American Indians for forty years, mostly among the Chickasaws. He was the author of a work on the American Indians (1775), in which he attempted to show the resemblance between their customs and those of the Jews.

Adair (John), an American general, born in South Carolina in 1759. He commanded a body of Kentuckians at the battle of New Orleans in 1815, and was governor of Kentucky from 1820 to 1824. He was U. S. Senator (1805–06) and member of Congress (1831–33). Died May 19, 1840.

Adair (Sir Robert), born in London May 24, 1763. He became a Whig member of Parliament in 1802, ambassador to Vienna in 1806, and represented Great Britain at Constantinople from 1809 to 1811. Died Oct. 3, 1855.

Adal', a narrow tract of Eastern Africa, bordering on the Red Sea, and extending from Massowa to the Strait of Bab-el-Mandeb. It is inhabited by nomadic tribes of Donakila (or Danakil), and is considered a part of Abyssinia by some geographers.

A'dalbert (Heinrich Wilhelm), a Prussian prince, a cousin-german of William I., born in Berlin Oct. 29, 1811. He entered the army in his youth, and obtained the rank of lieutenant-general. He became in 1848 admiral and commander-in-chief of the navy. Died June 6, 1873.

Ada'lia, or **Satalich** (anc. *Attalia*), a seaport of Turkey in Asia, in Anatolia, on the gulf of the same name, 175 miles S. E. of Smyrna, in lat. 36° 52′ 2″ N., lon. 30° 45′ E. It is built on the slope of a hill, has narrow, dirty streets, and a small but good harbor. Tropical fruits are exported hence. Pop. estimated at 13,000, of whom about 3000 are Greeks.

Ad'am [Heb. אָדָם, *i. e.* "man"], the first man (see Gen. i., ii., and iii.), is supposed to have been created, according to the Hebrew chronology, 4004 B. C., and according to the Greek chronology, 5411 B. C., though some writers contend that his date should be placed much earlier. He was originally placed, with Eve his wife, in the garden of Eden, whence they were expelled for voluntary disobedience to the Divine command.

Adam (Adolphe Charles), a celebrated French composer, born July 24, 1803, published numerous popular operas and ballets, of which the most celebrated are "Le postillon de Longjumeau," which was played for the first time in 1836, and gained great applause; "Le roi d'Yvetot" (1842), "Richard in Palestine" (1849), and "La jolie fille de Gand" (1839). Died May 3, 1856.

Adam (Albrecht), a German painter of battles, born

at Nördlingen April 16, 1786, entered the service of Eugène de Beauharnais, with whom he witnessed the Russian campaign of 1812. Died Aug. 28, 1862.

Adam (Lambert Sigisbert), an eminent French sculptor, born at Nancy in 1700. Some of his works adorn the garden of Versailles. He became professor in the Royal Academy at Paris in 1744. Died in 1759.—Nicolas Sébastien, a skilful sculptor, a brother of the preceding, was born at Nancy in 1705. Among his works is "Prometheus Bound." Died in 1778.

Adam (Robert), the most celebrated British architect of the eighteenth century, was born in 1728, went to Italy in 1754, and from Italy to Dalmatia, where he visited the ruins of the palace of the emperor Diocletian, on which he published "The Ruins of the Palace of the Emperor Diocletian at Spalatro" (1764). Among his most prominent works are the university building and St. George's church in Edinburgh, the buildings known as the Adelphi in London, besides many private residences. He died in 1792, and was buried in Westminster Abbey.

Ad'amant [Lat. *ad'amas;* Gr. ἀδάμας, "that cannot be subdued or broken," from *a*, negative, and δαμάω, to "subdue"], the ancient name of the diamond, is also a word used to denote a substance of extraordinary hardness and strength or durability.

Ad'amites, an heretical sect who are said to have sprung up in the second century, who rejected marriage, and appeared in public naked. This name was also assumed by a sect of fanatics who arose in Bohemia in the fifteenth century and advocated a community of wives. They still exist in Bohemia, and are said to be guilty of great excesses, though outwardly discreet.

Ad'ams, a county of the W. part of Illinois. Area, 760 square miles. It is bounded on the W. by the Mississippi River, which separates it from Missouri. The surface is undulating; the soil is exceedingly fertile. The county is intersected by the Chicago Burlington and Quincy R. R. Cattle, grain, tobacco, and wool are produced. Cooperage, flour, metallic wares, etc. are among the manufactures. Pop. 56,362. Capital, Corning.

Adams, a county of Indiana, bordering on Ohio. Area, 324 square miles. It is watered by the Wabash and St. Mary's rivers, is well timbered and nearly level, and the soil is productive. Grain, wool, hay, and dairy produce are the staples. It is intersected by the Cincinnati Richmond and Fort Wayne R. R. Pop. 11,382. Capital, Decatur.

Adams, a county of the S. W. of Iowa. Area, 432 square miles. It is drained by the Nodaway River and other streams. Coal is mined here. Grain, hay, wool, and butter are produced. Pop. 4614. Capital, Quincy.

Adams, a county in the S. W. of Mississippi, has an area of about 440 square miles. It is bounded on the W. by the Mississippi River, and on the S. by the Homochitto. The surface is nearly level; the staple products are maize, cotton, cattle, and wool. Pop. 19,084. Capital, Natchez.

Adams, a county in the S. central part of Nebraska, intersected by the Little Blue River. It is traversed by the Burlington and Missouri River R. R. Grain and hay are raised. Pop. 19. Capital, Juniata.

Adams, a county in the S. part of Ohio, has an area of 500 square miles. It is bounded on the S. by the Ohio River, and drained by Brush Creek. The surface is hilly. Iron, building-stone, cattle, grain, tobacco, wool, and flour are produced. Pop. 20,750. Capital, West Union.

Adams, a county of Pennsylvania, bordering on Maryland, has an area of about 530 square miles. It is drained by the Conewago Creek and the head-streams of the Monocacy River. The South Mountain range extends along the north-western boundary. Copper and marble are found. The surface is uneven. Cattle, grain, wool, and hay are produced, and carriages, leather, lime, flour, saddlery, etc. are manufactured. Pop. 30,315. Capital, Gettysburg.

Adams, a county of Wisconsin, bounded on the W. by the Wisconsin River, has an area of about 650 square miles. The surface is mostly covered with forests, which furnish valuable lumber. Grain, wool, hay, and butter are produced. Pop. 6601. Capital, Friendship.

Adams, a township of La Salle co., Ill. Pop. 1662.

Adams, a township of Allen co., Ind. Pop. 2388.

Adams, a township of Carroll co., Ind. Pop. 1149.

Adams, a township of Cass co., Ind. Pop. 807.

Adams, a post-township of Decatur co., Ind. Pop. 2162.

Adams, a township of Hamilton co., Ind. Pop. 2178.

Adams, a township of Madison co., Ind. Pop. 1564.

Adams, a township of Morgan co., Ind. Pop. 1207.

Adams, a township of Parke co., Ind. Pop. 3286.

Adams, a township of Ripley co., Ind. Pop. 2703.

Adams, a township of Dallas co., Ia. Pop. 1015.

Adams, a township of Delaware co., Ia. Pop. 730.

Adams, a township of Keokuk co., Ia. Pop. 866.

Adams, a township of Mahaska co., Ia. Pop. 875.

Adams, a township of Wapello co., Ia. Pop. 1363.

Adams, a post-township of Berkshire co., Mass., contains several large manufacturing villages, among which are North and South Adams. The Pittsfield and North Adams and the Troy and Boston R. Rs. terminate at North Adams. Adams has extensive manufactures of cotton and woollen goods, prints, ginghams, warp, twine, cassimeres, paper, nitro-glycerine, boots and shoes, etc. It has two national banks and three savings banks. Here is Mount Greylock, 3600 feet high, the highest point in Massachusetts. North Adams is also the western terminus of the Hoosac Tunnel. It has two weekly newspapers and one quarterly. Adams has an abundant supply of water from water-works. It has fourteen churches and four large hotels. It also contains a natural bridge, and the "Sand Springs," a well-known place of summer resort. A considerable number of Chinese are employed in the boot and shoe factories. Pop. 12,090.

J. T. Robinson, Ed. "Transcript."

Adams, a township of Hillsdale co., Mich. Pop. 1797.

Adams, a township of Houghton co., Mich. Pop. 670.

Adams, a post-township of Mower co., Minn. Pop. 576.

Adams, a township of De Kalb co., Mo. Pop. 879.

Adams, a post-village and township of Jefferson co., N. Y., on the Rome Watertown and Ogdensburg R. R., 156 miles W. N. W. of Albany. Adams village is the seat of Hungerford Collegiate Institute; it also contains two banks, one weekly newspaper, a foundry, a malt-house, two tanneries, a cabinet-shop, a sash-and-blind factory, saw and grist mills, and two carriage manufactories. There are eight churches in the town. Pop. 1352; of Adams township, 3348.

Hatch & Allen,
Pubs. "Jefferson County Journal."

Adams, a township of Champaign co., O. Pop. 1238.

Adams, a township of Clinton co., O. Pop. 883.

Adams, a township of Coshocton co., O. Pop. 1113.

Adams, a township of Darke co., O. Pop. 2291.

Adams, a township of Defiance co., O. Pop. 1220.

Adams, a township of Guernsey co., O. Pop. 762.

Adams, a township of Lucas co., O. Pop. 959.

Adams, a township of Monroe co., O. Pop. 1201.

Adams, a township of Muskingum co., O. Pop. 727.

Adams, a post-township of Seneca co., O. Pop. 1537.

Adams, a township of Washington co., O. Pop. 1786.

Adams, a township of Butler co., Pa. Pop. 973.

Adams, a township of Cambria co., Pa. Pop. 836.

Adams, a township of Adams co., Wis. Pop. 425.

Adams, a township of Green co., Wis. Pop. 1007.

Adams (Charles Baker), an American naturalist, born at Dorchester, Mass., Jan. 11, 1814. He graduated at Amherst College in 1834, served as tutor in the same institution during the years 1836–37, was professor of chemistry and natural history in Middlebury College 1838–47, when he became professor of zoology and astronomy in Amherst College, which post he held till his death, which occurred at St. Thomas, West Indies, Jan. 19, 1853. He was a man of comprehensive grasp, with great capacity also for details. He wrote reports upon the geological survey of Vermont, also "Contributions to Conchology," and, in connection with Prof. Gray of Brooklyn, prepared an elementary treatise upon geology, which has had much favor.

Adams (Charles Francis), LL. D., D. C. L., an American diplomatist, the son of John Quincy Adams, was born in Boston Aug. 18, 1807. He graduated at Harvard in 1825, studied law, and was admitted to the bar in 1828. In 1848 he was nominated for the office of Vice-President by the Freesoilers, who supported Mr. Van Buren for the presidency. He published the "Life and Works of John Adams" (10 vols., 1850–56). Having joined the Republican party, he was elected a member of Congress in 1858, and again in 1860. In the spring of 1861 he was appointed minister to England, the duties of which position were, during the American civil war, very arduous and critical. He performed these duties with much ability and prudence, and returned home in 1868. In 1871 he was appointed one of the arbitrators on the Alabama claims.

Adams (Daniel), M. D., was born at Townsend, Mass., Sept. 29, 1773, and graduated at Dartmouth in 1797. He was prominent in New Hampshire politics, and was widely known as an educator, editor, and physician, and as the author of an excellent arithmetic and other school-books. Died at Keene, N. H., June 8, 1864.

Adams (Hannah), born at Medfield, Mass., in 1755, was one of the first women of America to engage in literary pursuits. She was a person of great excellence of character, and possessed real merit as a writer. She wrote a "View of all Religions" (1784), "History of New England" (1799), "Evidences of the Christian Religion" (1804), "History of the Jews" (1812), "Letters on the Gospels," an "Autobiography," and other works. Died at Brookline, Mass., Nov. 15, 1831. She was the first person whose remains were buried at Mount Auburn.

Adams (Henry A.), U. S. N., born in 1833 in Pennsylvania, graduated at the Naval Academy in 1851, became a passed midshipman in 1854, a master in 1855, a lieutenant in 1856, a lieutenant-commander in 1862, a commander in 1866. While attached to the sloop-of-war Levant in 1856 he took part in the engagement with the Barrier Forts at the mouth of the Canton River, China. He served on board the Brooklyn at the passage of Forts St. Philip and Jackson and the capture of New Orleans in 1862, and participated afterwards, while attached to the North Atlantic blockading squadron, in both attacks on Fort Fisher. Of his services at Fort Fisher, Admiral Porter, in his official despatch of Jan. 28, 1865, writes: "I recommend the promotion of Lieutenant-Commander H. A. Adams, without whose aid we should have been brought to a stand-still more than once. He volunteered for anything and everything." Foxhall A. Parker, U. S. N.

Adams (Isaac), born in 1803 at Rochester, N. H., invented in 1828 the well-known Adams printing-press, which he further improved in 1834. This press is now in very general use.

Adams (Rev. Jasper), D. D., was born at Medway, Mass., in 1793, graduated at Brown University in 1815, was professor of mathematics there (1819–24), was president of Charleston College, S. C., in 1824 and again in 1827–36, of Geneva College in 1825–27. He was (1838–40) a professor of geography, ethics, etc. at West Point. Died Oct. 25, 1841.

Adams (John), the second President of the United States, was born in Braintree, Mass., on the 19th of Oct., 1735, O. S. He graduated at Harvard College in 1755, studied law, and was admitted to the bar in 1758. For this profession he was well fitted by a clear, sonorous voice, a ready fluency of speech, and a quick conception. In 1764 he married Abigail Smith, a woman of superior intelligence. His attention was drawn to political affairs by the passage of the Stamp Act in 1765, and he offered on that subject a series of resolutions which were very popular. He removed to Boston in 1768, became one of the most courageous and prominent advocates of the popular cause, and was chosen a member of the General Court (the legislature) in 1770.

He was one of the delegates that represented Massachusetts in the first Continental Congress, which met in Sept., 1774. In a letter written at this crisis he declared: "The die is now cast; I have passed the Rubicon. Sink or swim, live or die, survive or perish with my country, is my unalterable determination." He distinguished himself in Congress by his capacity for business and for debate, and advocated the movement for independence when the majority of the members were inclined to temporize and to petition the king. In May, 1776, he moved and carried a resolution in Congress that the Colonies should assume the duty of self-government. In June a resolution that the United States "are and of right ought to be free and independent" was moved by Richard Henry Lee, seconded by Mr. Adams, and adopted by a small majority. Mr. Adams was a member of the committee of five appointed June 11 to prepare a declaration of independence, in support of which he made an eloquent speech about July 2. He was the chairman of the board of war appointed in June, 1776, and was sent as commissioner to France in 1778, but returned in July, 1779. Having been appointed as minister to negotiate a treaty of peace and commerce with Great Britain, he went to Europe early in 1780. Conjointly with Franklin and Jay he negotiated a treaty, the preliminary articles of which were signed Nov. 30, 1782. He was employed as minister to the court of St. James from 1785 to 1788, and during that service wrote his "Defence of the American Constitutions" (1787). In 1789 he became Vice-President of the United States, and about that time identified himself with the Federal party, by which he was re-elected to the office of Vice-President in 1792.

In 1796, Mr. Adams was chosen President of the United States, receiving seventy-one electoral votes, while his competitor, Thomas Jefferson, received sixty-eight votes. He sympathized with the anti-Gallican party, and pursued the policy of neutrality between France and England. Involved in a quarrel with the French Directory, which interfered with the maritime interests of the Americans, he sent Mr. Murray as minister to France early in 1799, in order to avert a war. This act gave much offence to the Federalists, and broke the unity of that party. Among the unpopular measures for which Mr. Adams was held responsible were the Alien law and the Sedition law. In 1800 he was the Federal candidate for the office of President, but he was not cordially supported by Gen. Hamilton, the favorite leader of his party. Receiving sixty-five electoral votes, he was defeated by Thomas Jefferson, who received seventy-three votes.

Mr. Adams then retired from public life to his large estate at Quincy, Mass., and gave his attention partly to agriculture. The general neglect and odium which he experienced were at last compensated by the election of his son John Quincy to the presidency of the United States. He died on the 4th of July, 1826, on the same day with Thomas Jefferson. It is a curious coincidence that three Presidents of the United States (Monroe being the third) have died on that anniversary. J. Thomas.

Adams (John), LL.D., eminent as a classical teacher, was born in Canterbury, Conn., Sept. 18, 1772, and graduated at Yale College in 1795. After presiding over Plainfield Academy, and Bacon Academy in Colchester, Conn., he was made principal of Phillips Academy, Andover, Mass., May, 1810, resigned that position after great success in 1833, and died April 24, 1863. Prof. Thomas C. Upham and many other distinguished scholars and philanthropists were among his pupils at Andover.

Adams (John Couch), an English astronomer, born in Cornwall June 5, 1819, was educated at Cambridge. In 1841 he began to search for the causes of the irregularities in the motion of Uranus. He ascertained that they were caused by the attraction of a planet then unknown, and thus partakes with Leverrier the honor of the discovery of Neptune, for which he received the Copley medal in 1848. He became Lowndean professor of astronomy at Cambridge in 1858.

Adams (John Quincy), the sixth President of the United States, was born in Braintree, Mass., on the 11th of July, 1767. He was eldest son of President John Adams and his wife, Abigail Smith, who was descended from the family of Quincy. In 1778 he was placed at a school in Paris, and in 1780 passed to the University of Leyden. He returned home in 1785, and finished his education at Harvard College, where he graduated in 1788, after which he studied law with Theophilus Parsons, and was admitted to the bar in 1791. Having gained distinction by some political essays, he was appointed minister to The Hague in 1794. In 1797 he married Louisa Catherine Johnson of Maryland, and in the same year was sent as minister to Berlin, from which he was recalled in 1801, when the Republicans obtained power.

He was elected a Senator of the U. S. by the Federalists in 1803, but voted for Jefferson's embargo in 1807, and thus separated himself from the Federal party, and lost his seat in the Senate in 1808. Before this date he had distinguished himself as a public speaker, and had been appointed professor of rhetoric at Harvard College (1805). In 1809 he was sent as minister to Russia. He was one of the commissioners that negotiated the treaty of peace with Great Britain, signed Dec. 24, 1814, and he was appointed minister to the court of St. James in 1815. In 1817 he became secretary of state in the cabinet of Monroe, in which position he remained eight years. In 1824 four candidates for the presidency were presented—John Q. Adams, Andrew Jackson, Henry Clay, and William H. Crawford—all of whom professed to be Democrats. Mr. Adams received eighty-four electoral votes, Jackson ninety-nine, Crawford forty-one, and Clay thirty-seven. As neither had the requisite majority, the election devolved on the House of Representatives, which chose Mr. Adams. This result was due to the influence of Henry Clay, and when Mr. Adams nominated him as secretary of state, the friends of Jackson accused Adams and Clay of "bargain and corruption," but the charge is not generally credited. His administration was opposed by a powerful party, formed by a coalition of the Jacksonians with the friends of Crawford. This party had a majority of the members of Congress, and, uniting on General Jackson as their candidate, triumphed in the election of 1828, when Mr. Adams received only eighty-three electoral votes out of two hundred and sixty-one, which was the whole number.

In 1830 he was chosen by the voters of his native district to represent them in Congress, in which he distinguished himself by his application to business, his assertion of the right of petition, and his resolute opposition to what he considered to be the encroachments of the slave-power. "With unwavering firmness," says W. H. Seward, "against a bitter and unscrupulous opposition, exasperated to the highest pitch by his pertinacity—amidst a perfect tempest of vituperation and abuse—he persevered in presenting these petitions [against slavery] one by one, to the

amount sometimes of two hundred in a day." He continued to represent the same district in Congress for seventeen years, during which he maintained a position independent of party. He was seized with paralysis in the Capitol on the 21st of Feb., 1848, and died on the 23d of that month. In religion he was a Unitarian. He left many writings in prose and verse, which have been published; also a voluminous diary of his public life. He had an only surviving son, Charles Francis Adams, noticed above. J. THOMAS.

Adams (JOHN QUINCY), a grandson of the preceding, and son of Charles Francis Adams, noticed above, was born at Boston, Mass., Sept. 22, 1833, graduated at Harvard in 1853. He was the Democratic candidate for governor of Massachusetts in 1867 and 1868, but was both times defeated. He was also a candidate for the vice-presidency in 1872, on the ticket with Charles O'Conor.

Adams (JOHN R.), D. D., born in Plainfield, Conn., graduated at Yale College in 1821, was three years a teacher in Phillips Academy, Andover, Mass., was Presbyterian and Congregational minister in various towns of New Hampshire, New York, Massachusetts, and Maine; was chaplain during the civil war in the 5th Maine and 121st New York regiments. For his services he received public acknowledgments from the governor of Maine. Died April 26, 1866, at Northampton, Mass., aged sixty-four.

Adams (JULIUS W.). See APPENDIX.

Adams (NEHEMIAH), D. D., an American theologian, was born at Salem, Mass., Feb. 19, 1806, graduated at Harvard in 1826, and at Andover Theological Seminary in 1829. He first settled at Cambridge in 1829, and in 1834 became pastor of the Essex street church in Boston. He resigned his pastorate in 1870. He published several theological and other works, and a "South-side View of Slavery" (1854), which was severely condemned by the opponents of slavery. He has had a high reputation for scholarship and pulpit eloquence.

Adams (SAMUEL), a celebrated American patriot and orator, born in Boston Sept. 27, 1722, was a second cousin of President John Adams. He graduated at Harvard College in 1740, and became a merchant, but was not successful in that business, which he soon abandoned. In 1765 he was chosen to represent Boston in the General Court of Massachusetts, in which he distinguished himself by his courage, energy, and oratorical talents, and acquired great influence. Before the Revolution he was an unflinching advocate of the popular cause, and took such an active part in political meetings that he was one of the two leading patriots who were excepted from a general pardon offered in 1775. He was a member of the first Continental Congress, which met in Sept., 1774, and he signed the Declaration of Independence in 1776. He remained in Congress about eight years, was afterwards elected to the senate of Massachusetts, and was a member of the State convention which ratified the Federal Constitution in 1788. His political affinities connected him with the Republican (or Jeffersonian) party. He was elected governor of Massachusetts in 1794, was re-elected twice, and retired to private life in 1797. Having survived his only son, he died in Oct., 1803. In religion he was a decided Calvinist. In the letters and other writings of John Adams occur several passages which express a high opinion of the talents and merits of Samuel Adams, in whose productions he says may be found "specimens of a nervous simplicity of reasoning and eloquence that have never been rivalled in America." (See W. V. WELLS'S "Life and Public Services of Samuel Adams," 3 vols. 8vo, 1865.)

Adams (SETH), a brother of Isaac Adams, the inventor, was born at Rochester, N. H., April 13, 1807, has been for many years associated with his brother in the manufacture of the Adams printing-press, and since 1849 has been extensively engaged in sugar-refining in Boston, Mass. He has given considerable sums of money to Bowdoin College.

Adams (WILLIAM), D.D., LL.D., a son of John Adams (principal of Phillips Academy, Andover), a distinguished Presbyterian divine, born in Colchester, Conn., Jan. 25, 1807, graduated at Yale College 1827, and at Andover Theological Seminary 1830. He was ordained at Brighton, Mass., Feb., 1831, settled over the Central Presbyterian church in New York City, Nov., 1834, and over the newly-formed Madison Square Presbyterian church, Feb., 1853. An acknowledged leader in the New School branch of the Presbyterian Church, he took a prominent part in the reunion of the two branches in 1870. He has published many sermons, addresses, and articles in reviews, besides the following volumes: "The Three Gardens—Eden, Gethsemane, and Paradise, or Man's Ruin, Redemption, and Restoration," 1856; "Thanksgiving: Memories of the Day, and Helps to the Habit," 1867; "Conversations of Jesus Christ with Representative Men," 1868. In 1873 he was chosen president and professor of sacred rhetoric in the Union Theological Seminary, N. Y.

Adams (WILLIAM T.), a popular American writer, known under the pseudonym of OLIVER OPTIC, born in Medway, Mass., July 30, 1822, has published numerous works for children. Among these may be named "The Riverdale Series" and "Young America Series." His journal, entitled "Our Boys and Girls," founded in 1867 as a weekly, and subsequently published as a monthly, has obtained a large circulation.

Adams Centre, a post-village of Adams township, Jefferson co., N. Y.

Adam's Creek, a twp. of Craven co., N. C. P. 1352.

Ad'amson (JOHN), an English author, born in 1787. He wrote a "Memoir of Camoens" (1820) and "The History, Antiquities, and Literature of Portugal" (2 vols., 1842–46). Died in 1855.

Adam's Peak, a mountain in Ceylon in lat. 6° 52′ N., lon. 80° 32′ E., which has a height of about 7000 feet. It is considered by the Booddhists as the holy centre of the world. A temple is situated on the highest portion of the peak, under which the footprints of Booddha and Sripadam (*i. e.* "luck") are said to be seen. Booddha is said to have left those traces upon his last visit to the earth. The Brahmans and Mohammedans also consider it a holy mountain—the former, because they consider Booddha as an avatar (incarnation) of Vishnoo; the latter, because they ascribe the footprints to Adam, who is said to have here mourned for 1000 years his expulsion from Paradise, standing on one foot.

Ad'amsthal, a village of Moravia, Austria, 9 miles N. of Brünn. In the neighborhood is the curious calcareous cavern Regerskala, which belongs to the large system of caverns which is found to the N. of Brünn. Adamsthal is growing considerably, and is much visited by tourists.

Ad'amstown, a post-borough of Lancaster co., Pa. Pop. 431.

Adamsville, a twp. of Marlboro' co., S. C. Pop. 1467.

Ada'na, a city of Asia Minor, on the river Sihoon, about 20 miles from the sea and 18 miles E. of Tarsus. It has some trade in grain, wine, cotton, etc. Here are interesting ancient remains. Pop. estimated at 25,000.

Adanson (MICHEL), a celebrated French naturalist, born at Aix April 7, 1727, was educated at the college of Plessis. He went to Senegal in 1748 to explore the natural history of that region, in which he passed five years in his arduous and dangerous enterprise, and collected an immense number of animals and plants. He published, after his return, a "Natural History of Senegal" (1757), and "The Families of Plants" (1763), in which he opposed the artificial system of Linnæus. In 1759 he was elected a member of the Academy of Sciences. He expended the labor of several years on an encyclopædia entitled "The Universal Order of Nature," which he left in manuscript, perhaps unfinished. A part of his mature life was passed in extreme poverty, but he afterwards received a pension from the state. He was a man of noble but eccentric character, and was regarded as a naturalist of the first order by Cuvier, who composed a eulogy on him. Died Aug. 3, 1806.

Adanso'nia, a genus of plants of the natural order Sterculiaceæ, was named in honor of the great naturalist, M. Adanson. The *Adanso'nia digita'ta*, or baobab, is found in tropical Africa, and is one of the largest trees in the world. It does not grow very high, but its trunk is often more than twenty feet in diameter. The fruit of the baobab is called monkey bread. By a loose and vague over-estimate, some of these trees have been said to be 5000 years old.

Adansonia.

A'dar, the name of the sixth month in the civil year of the Jews, which included part of February and March.

Ad'da (anc. *Ad'dua*), a river of Northern Italy, rises in the Valtellina, among the Rhætian Alps, and enters Lake Como, which is an expansion of this river. After issuing from that lake it flows nearly southward through Lombardy, and empties itself into the Po 7 miles above Cremona. Length of river and lake, about 130 miles.

Ad'dax, the *O'ryx* (or *Ad'dax*) *nasomacula'tus* of the naturalists, is a large antelope found in Nubia, Kordofân, and other parts of Northern or North Central Africa. Its broad spreading hoofs enable the animal to obtain a firm foothold upon the dry and yielding sand. Its horns, which are from three to four feet long, are beautifully twisted into a spiral, having two turns and a half. The general color of the addax is a milk-white, but there is a black patch of hair on the forehead, and it has a dark brown mane, with more or less of reddish-brown mixed with gray on the head, shoulders, and part of the back.

Addax.

Ad'der, a common name of the viper, or of any venomous serpent belonging to the family Viperidæ. The name is popularly applied to several non-venomous snakes.

Ad'dington, a county of Canada, in the S. E. part of Ontario, bordering on Lake Ontario, has an area of 576 square miles. It is drained by the Napanee River, and contains several small lakes. Among the staple productions are lumber and wool. Capital, Bath. Pop. in 1871, 21,312.

Ad'dison, a county in the W. part of Vermont. Area, 750 square miles. It is bounded on the W. by Lake Champlain, and drained by Otter Creek. The surface in the E. is mountainous, but the soil near the lake is level and fertile. Quarries of white and variegated marble are worked in this county, which is intersected by the Rutland and Burlington R. R. Cattle, grain, wool, and hay are produced, and lumber, cooperage, saddlery, carriages, etc. are manufactured. Capital, Middlebury. Pop. 23,484.

Addison, a post-township of Du Page co., Ill. Pop. 1613. It is the seat of a teachers' seminary.

Addison, a township of Shelby co., Ind. Pop. 2677.

Addison, a township of Washington co., Me. P. 1201.

Addison, a township of Oakland co., Mich. Pop. 1063.

Addison, a post-village and township of Steuben co., N. Y. The village contains many important manufacturing establishments, and is in a highly flourishing condition. It has one weekly paper. Pop. 2218.

G. H. Hollis, Ed. "Advertiser."

Addison, a post-township of Gallia co., O. Pop. 1340.

Addison, a post-township of Somerset co., Pa. Pop. 1456.

Addison, a post-township of Addison co., Vt. P. 911.

Addison, a post-township of Washington co., Wis. Pop. 1833.

Ad'dison (Joseph), an English humorist, moralist, and author of great merit and celebrity, was born at Milston, near Amesbury, in Wiltshire, on the 1st of May, 1672. He was a son of Lancelot Addison. In 1687 he entered Queen's College, Oxford, from which he passed to Magdalen College in 1689. He became a good classical scholar, and as a writer of Latin verse probably excelled all his contemporaries. At an early age he enjoyed the friendship and patronage of Dryden, Lord Somers, and Montagu (Lord Halifax), the last of whom persuaded him to enlist as a Whig in the civil service of the state. Having in 1699 received a pension of £300, he visited France and Italy, and wrote a charming "Letter from Italy," in verse, addressed to Lord Halifax (1701). He lost his pension on the death of William III. (1702), and returned home in 1703. His next work was "The Campaign," a poem on the battle of Blenheim (1704), which was greatly admired, and was rewarded with the office of commissioner of appeals. He afterwards produced his interesting "Travels in Italy," and "Rosamond," an opera. He was appointed under-secretary of state in 1706, and was elected to Parliament in 1708. His diffidence disqualified him for public speaking, but this defect was compensated by his success as a political writer. He became in 1709 secretary to Lord Wharton, lord lieutenant of Ireland, and contributed to the "Tatler," of which his friend Richard Steele was the editor.

On the 1st of Mar., 1711, Addison and Steele began to issue daily "The Spectator," the most elegant and famous periodical and miscellany that ever appeared in England. Addison wrote the best of the essays, which form an epoch in literary history and have exerted a powerful and salutary moral influence. Among his literary merits are grace and propriety of diction, elegant taste, genial philosophy, and inimitable humor. "As an observer of life, of manners, of all the shades of human character," says Macaulay, "he stands in the first class."

"The Spectator" ceased to appear daily in Dec., 1712, but was revived as a tri-weekly paper in 1714. Among his other works are the tragedy of "Cato" (1713), which was received with great applause, an ingenious "Dialogue on Medals," and a series of able political papers called "The Freeholder" (1715). In 1716 he married the proud and uncongenial countess-dowager of Warwick, and early in 1717 was appointed secretary of state. He resigned this office in 1718, and died June 17, 1719, leaving only one child, a daughter. His marriage appears not to have been happy. Addison was greatly distinguished for his wit and colloquial powers. Lady Mary Montagu, who had conversed with the most eminent wits, pronounced him "the best company in the world." "His humanity," says Macaulay, "is without a parallel in literary history. The highest proof of human virtue is to possess boundless power without abusing it. No kind of power is more formidable than the power of making men ridiculous; and that power Addison possessed in boundless measure. But it would be difficult, if not impossible, to find, in all the volumes which he has left us, a single taunt which can be called ungenerous or unkind." "Whoever wishes," says Dr. Johnson, "to attain an English style, familiar but not coarse, and elegant but not ostentatious, must give his days and nights to the volumes of Addison. . . . He not only made the proper use of wit himself, but taught it to others. He has restored virtue to its dignity, and taught innocence not to be ashamed. This is an elevation of literary character 'above all Greek, above all Roman fame.'" (See Johnson's "Lives of the Poets;" Macaulay, "Critical and Historical Essays;" Aiken, "The Life of Addison," 1843.) J. Thomas.

Addison's Disease [named from its discoverer, the late Dr. Addison of Guy's Hospital, London], or **Supra-renal Melasma,** a rather rare disease, the most obvious symptom of which is a gray-black or bronze color of the skin, gradually coming on. The chief lesion discovered after death is a cheesy degeneration of the supra-renal capsules, the result of a peculiar chronic inflammation. Patients usually suffer from extreme debility, depression of spirits, pain in the epigastrium and back, often accompanied by dyspepsia, vomiting, diarrhœa, and grave nervous symptoms. No remedy is known, and the disease, though careful nursing is extremely useful, is probably never cured.

A'del, a post-village, the capital of Dallas co., Ia., 25 miles W. of Des Moines. One of the best water-privileges in the State is to be found here. It is the centre of two projected railroads. The surrounding country is rolling and highly productive. There are two weekly newspapers. Pop. 711; of Adel township, 1563.

J. E. Williams, Ed. "Gazette."

Ad'elaide, a city, the capital of South Australia, is situated on both sides of the river Torrens, 8 miles from its entrance into the Gulf of St. Vincent. It was founded in 1836. The streets are wide and rectangular. It is the seat of an Anglican and a Roman Catholic bishop, and contains a government-house, an assay-office, a theatre, extensive manufactures, and several banks. Pop. in 1871, 27,208. Port Adelaide, situated about 6 miles N. N. W. of the city, is the centre of the commerce of the colony. The harbor admits vessels drawing eighteen feet of water. It has a heavy trade in copper, grain, and wool. Adelaide is connected by railways with Dry Creek, Victor Harbor, Gawlertown, Kapunda, and Kooringa.

Adel'phia [*i. e.* "brotherhood;" from the Gr. ἀδελφός, a "brother"], a collection of the stamens of a flower into a bundle. Linnæus employed this term for those plants in which the stamens, instead of growing singly, combine into one or more parcels or brotherhoods; thus, Monadelphia signified stamens all connected into one parcel; Diadelphia, into two parcels, and so on.

Adelphia.

A'delsberg, a market-town of Carniola, Austria. A short distance from the town is the Adelsberg Grotto, which is one of the most peculiar caverns of the world. It consists of five different parts, and is full of beautiful formations, which are partly suspended from the ceiling (stalactites), in part hang down upon the wall like draperies (incrustations), and part arise from the ground in the form of obelisks or columns (stalagmites).

A'delung (Friedrich), a German philologist, born at Stettin Feb. 25, 1768, became a resident of St. Petersburg, and preceptor to the grand duke, who was afterwards the emperor Nicholas. He wrote on the Sanscrit language and literature. Died Jan. 30, 1843.

Adelung (Johann Christoph), an eminent philologist, an uncle of the preceding, born in Pomerania Aug. 8, 1732. His reputation is founded chiefly on his "Attempt at a Complete Grammatico-Critical Dictionary of the German Language" ("Versuch eines vollstandigen grammatisch-kritischen Wörterbuches der Hochdeutschen Mundart," 1774–86). This is considered to be superior to Dr. Johnson's Dictionary in definitions and etymology. Among his other works is one on language, entitled "Mithridates oder allgemeine Sprachen-Kunde." Died at Dresden Sept. 10, 1806.

A'den, a seaport of Arabia, in Yemen, is on the Gulf of Aden, at Cape Aden, in lat. 12° 46′ 15″ N., lon. 45° 10′ E. It was a magnificent emporium in the Middle Ages, and, being favorably situated near the entrance of the Red Sea, was the chief mart of the products of Asia. From these advantages, and its climate, rendered cool and delightful by the sea-breeze (although the rugged volcanic hills with which it is surrounded, without a particle of vegetation, make it anything but attractive in appearance), it was named, after the Oriental manner, Aden (*i. e.* "Eden"). The British obtained possession of it in 1839, since which time the population and trade of the place have rapidly increased. It has a good harbor, a dry and healthy climate, and one of the most important and advantageous positions on the route from Europe to India, whether by the railway from Alexandria to Suez, or by the Suez Canal and the Red Sea. Aden resembles Gibraltar in its position on a rocky promontory and in its military importance; it has been strongly fortified by the British. Its area is about 19 square miles. The exports in 1871–72 were £885,919, and imports £1,404,169. The population, which in 1838 was not over 1000, is variously estimated at from 20,000 to 50,000.

Aden, Cape, a rocky promontory at the S. extremity of Arabia, adjoining the town of Aden, rises to the height of 1776 feet. It is joined to the mainland by a low sandy isthmus less than a mile wide.

Aden, Gulf of, that part of the sea lying between Arabia and Adel, and extending from the Strait of Bab-el-Mandeb to the Indian Ocean or Arabian Sea. On some maps this is marked as the Arabian Gulf. Length, about 500 miles.

Adept' [Lat. *adeptus*, from *ad*, "for," and *aptus*, "fitted"], a term applied to a person who is skilful or well versed in any art or science; formerly applied especially to an alchemist who was supposed to have discovered the secret of turning base metal into gold, or to have found the philosopher's stone.

A'dernò, a town of Sicily, at the foot of Mount Etna, 17 miles N. W. of Catania. Pop. in 1861, 12,877.

A'dersbach Rocks, a remarkable group of high and detached sandstone rocks, near the village of Adersbach, in the N. E. part of Bohemia. They present fantastic forms, and occupy an area of several miles in extent. One of the pinnacles is over 200 feet high.

Adet (Pierre Auguste), a French chemist and politician, born at Nevers in 1763. He was sent by the French Directory as ambassador to the United States in 1795, but he suspended his functions in 1797, for the alleged reason that the American government had violated its neutrality. Died in 1832.

Adhe'sion [Lat. *adhæ'sio*, from *ad*, "to," and *hæ'reo*, *hæ'sum*, to "stick"], the attractive force which causes the smooth surfaces of two substances to adhere together, or which causes a fluid and solid to unite. The amount of adhesion between solid surfaces is measured best by the adhesion balance of J. J. von Prechtl. Capillary attraction is an instance and particular manifestation of adhesion.

Adhesion, a term used in botany to denote the union of contiguous parts, as when the petals adhere and form a monopetalous corolla; the calyx often adheres to the ovary, and then seems as if it grew from the apex of it. This tendency causes great diversity of appearance in the organs of plants.

Adiaph'orites [from the Gr. ἀδιάφορος, "indifferent"], a name given to Melanchthon, and those who agreed with him in submitting, in things indifferent, to an imperial edict. When Charles V. in 1548 issued an edict called the Interim, relating to disputed religious doctrines, the Protestants became involved in a controversy in which this name originated.

Ad'ige [Lat. *Ath'esis*], a river in Italy, rises among the Alps in the Tyrol, where it is called the Etsch. Flowing southward, it passes by Trent, and enters Lombardy. After passing by Verona, it flows nearly south-eastward, and falls into the Gulf of Venice about 13 miles N. E. of Adria. It is a rapid stream, about 220 miles long. It is navigable from its mouth to Trent, but the velocity of the current impedes navigation.

Ad'ipocere [Lat. *adipoce'ra*, from *ad'eps* (gen. *ad'ipis*), "fat," and *ce'ra*, "wax"], a substance which results from the decomposition of animal bodies, and resembles spermaceti, or a mixture of wax and fat. Human bodies buried in wet ground are often reduced to this condition.

Ad'ipose [Lat. *adipo'sus*, from *ad'eps* (gen. *ad'ipis*), "fat"], of the nature of fat, fatty. Adipose tissue is an animal membrane which contains the fatty matter. It presents an aggregation of very small spherical pouches or vesicles filled with fat or oil. This tissue is organized and vital, but the fat is not.

Adiron'dac Mountains, a group of mountains, the highest in the State of New York, occupy parts of the counties of Hamilton, Essex, Franklin, and Clinton, and are in the N. E. part of the State. The highest summit, Mount Marcy, which is in Essex county, is 5,350 feet above the level of the sea. These mountains, being of primitive formation, are remarkable for grand and picturesque scenery. They are covered with forests of maple, ash, beech, pine, hemlock, cedar, and other trees, and abound in game. A number of lakes occur among the Adirondacs, which are also drained by the Saranac and Ausable rivers. The Adirondacs are a favorite resort for summer recreation. The waters abound in trout, and deer and other game is to be found in the forests. Iron ore and lumber are obtained here.

Adirondac, a former village of Newcomb township, Essex co., N. Y., about 1800 feet above the level of the sea, and 100 miles N. N. W. of Albany. Here are rich beds of magnetic iron-ore, and several iron-works, now abandoned. The village was near Lake Sandford, which is 11 miles long and is navigable.

Ad'it [Lat. *ad'itus*, from *ad*, "to," and *e'o*, *i'tum*, to "go"], a horizontal passage and entrance into a mine, designed partly to drain water from it. Adits occur chiefly in mountainous regions, and are sometimes several miles long.

Adja'cent Angle, an angle contiguous to another, so that one side is common to both angles.

Ad'jective [Lat. *adjectivum*, from *ad*, "to," and *jacio*, *jactum*, to "cast," to "put"], in grammar, the name of a class of words which are joined to nouns, in order to qualify the general ideas expressed by the nouns.

Adjourn'ment, a term applied to the postponement of the proceedings of the U. S. Congress, or of either house of the British Parliament, from one time to another specified time. It differs from prorogation, which is an act of royal authority, whereas the power of adjournment is vested in each house respectively.

Ad'jutant [Lat. *adju'tans*, from *adju'to*, to "assist"], the title of a military officer who assists the superior officer of an army, regiment, etc. He carries orders from the chief to the subordinate officers, and collects the reports which are made by the latter to the former. He inspects escorts and guards, keeps the journal or account-book of the regiment or division, and acts as secretary to his chief. In the U. S. a regimental adjutant ranks as first lieutenant.

Ad'jutant (*Cico'nia ar'gala*), an East Indian bird, allied to the stork, is called argala by the natives. It is about five feet high, has long legs and an enormous bill, and can swallow a cat or a small leg of mutton with the greatest facility. It is very useful as a scavenger, cleansing the streets and public squares of various offal and dead animals. The famous marabou feathers are obtained from the adjutant and a kindred species, the marabou (marabout) of Africa.

Adjutant-General, the principal organ of the commander of an army in publishing orders. The same organ of the commander of a division, brigade, geographical division, or department is styled assistant adjutant-general. The laws of the U. S., however, provide for but one adjutant general, with the rank of brigadier-general (colonel after vacation of office by present incumbent), made by regulations chief of a bureau of the war department, and charged with the recruiting service, records, returns, etc.; two assistant adjutants-general, with the rank of colonel; four with the rank of lieutenant colonel; and thirteen with the rank of major. The bureau duties of adjutants-general and assistants are—publishing orders in writing; making up written instructions, and transmitting them; reception of reports and returns; disposing of them; forming tables showing the state and position of corps; regulating details of service; corresponding with the administrative departments relative to the wants of troops; corresponding with the corps, detachments, or individual officers serving under the orders of the same commander; and the method-

ical arrangement and care of the records and papers of his office. The active duties of adjutants-general consist in establishing camps; visiting guards and outposts; mustering and inspecting troops; inspecting guards and detachments; forming parades and lines of battle; the conduct and control of deserters and prisoners; making reconnaissances; and in general discharging such other active duties as may be assigned them.

ADJUTANT-GENERAL of a State. See MILITIA.

Ad La'tus (*i. e.* "at the side," implying readiness to assist), a term applied to persons sent, as aids, with an ambassador, especially when the latter is unable to speak the language of the court to which he is ordered. In Austria the term is applied to generals who are given as aids to the commandant of an army corps or province.

Ad'ler (GEORG J.), Ph. D., a German philologist, born at Leipsic in 1821, came to the U. S. in 1833. He was for some time professor of German in the University of New York. He wrote several German and Latin school manuals, and an excellent German and English dictionary. Died in New York Aug. 24, 1868.

Ad'lerberg (VLADIMIR FEODOROVITCH), COUNT, a Russian general and minister of state, born in 1793, served in the campaigns of 1812–14, was major-general in the Turkish campaign of 1828, and was made lieutenant-general in 1833. He also held the positions of general director of the mails, minister of the imperial house, and chancellor of the Russian orders. Of his sons, Alexander and Nicholas are both lieutenants-general and adjutants-general to the emperor. Nicholas was appointed governor-general of Finland in 1866.

Ad'lercreutz (CARL JOHAN), COUNT, a Swedish general, born April 27, 1757, served against Russia in 1788, and in the Finnish war of 1808. On Mar. 13, 1809, in consequence of several unpopular actions of the king, Gustavus IV., he arrested the king in the name of the people, which act gained him great popularity. Died Aug. 21, 1815.

Ad'ler Sal'vius (JOHAN), a celebrated Swedish ambassador and diplomatist, was born in Strengnäs, Sweden, in 1590, and died at Stockholm in 1652. He was sent by Gustavus Adolphus on various missions of importance, and during the Thirty Years' war he enjoyed the fullest confidence of that monarch. After the conclusion of peace he returned to Sweden, and was created a councillor and baron. Throughout his life a firm friendship existed between him and the celebrated chancellor Oxenstiern.

Ad'lersparre (GEORGE), COUNT, a Swedish officer and statesman, born Mar. 28, 1760, took part in the wars of 1788 and 1808 against Russia, and in the deposition of Gustavus IV. He received many indications of favor from the new king, but was dissatisfied with the result of the revolution, because he had not gained as much influence as he desired. He published from 1830–33 a number of secret documents, as well as his correspondence with Charles XIII. and others, in consequence of which he was sentenced to pay a fine. He nevertheless continued to publish these documents. Died Sept. 23, 1835.

Ad Lib'itum (*i. e.* "at (or according to) pleasure"), often employed by physicians in giving directions about taking some harmless medicine; also used in music to indicate that a certain part may be played according to the taste of the performer.

Adme'tus [Gr. Ἄδμητος], son of Pheres, who was the mythical founder and first king of Pheræ in Thessaly. He was one of the Argonauts, and took a part in the Calydonian Hunt. He won the hand of Alcestis by coming to the suit in a chariot drawn by boars and lions, that being a condition imposed by the bride's father, Pelias. The god Apollo procured from the Fates a grant that Admetus might be exempt from death if his father, mother, or wife should die for him. The touching story of Alcestis and her devotion, death, and restoration to life is the subject of one of the most celebrated tragedies of Euripides.

Administra'tion [from the Lat. *ad*, "for," and *ministro, ministratum*, to "be a servant"]. This word literally signifies "management" or the conduct of business. It is often used to indicate the action of the executive department of government, as distinguished from the legislative and judicial. It sometimes is employed with reference to trust funds, but its technical meaning is the management or disposition, according to law, of the personal estate of an intestate or of a testator having no executor. The common-law distinction between heirs on the one hand and executors and administrators on the other, should be noted. When an owner of real estate died, his estate devolved upon his heirs, who were persons related to him by blood; when an owner of personal property died, leaving a testament or will, that branch of his estate devolved upon his executors, if such were named; if there were none, then upon administrators appointed by a court of justice. Administration in this sense was in England under the control of the ecclesiastical courts until 1857, when it devolved upon a newly-created court of probate. In the U. S. it is generally vested in special tribunals termed probate, or orphans', or surrogates' courts. By such a court administration is conferred on the person or persons entitled to it by the local rules of law. It is in general committed first to the widow or husband, then to the children, and then to the other next of kin, in a prescribed order. The court has power of selection among the next of kin in equal degree. These provisions are substantially copied from early English statutes. The person thus entrusted with the administration is called an administrator. The court grants him "letters of administration" as evidence of his authority. He represents the deceased. He must make an inventory of the personal estate, collect the assets, and convert the property into cash, pay the debts, render an account, and distribute the balance in his hands among the persons entitled to it. He is a trustee, and under the control of a court of equity as well as of the probate court.

When the deceased leaves a will, but there is no executor, the person to whom administration is granted is termed an administrator "with the will annexed" (*cum testamento annexo*). In this case the will is to guide the administrator in his duties. Should an administrator die before his duties are fulfilled, another is appointed to perform the residue of his functions, called "administrator *de bonis non*."

While an administrator exercises full control over the personal estate of the deceased, his authority is confined to it unless it is insufficient to pay debts; in which case the probate court generally has by statute the right to direct him to sell enough of the real estate to satisfy them.

Letters of administration confer no power to bring actions in foreign states. Where there are assets in another state or country, a subordinate or ancillary administrator is appointed, who acts under the direction of the foreign court, and remits according to its order any funds which he may receive to the principal administrator. T. W. DWIGHT.

Ad'miral [Fr. *amiral*], the title of a naval officer of the highest rank, derived from the Arabic *amir* or *emir*, "commander." The English word was formerly *amiral*, as in Milton's "Paradise Lost." Vice-admiral is the title of the officer next in rank to the admiral; and a rear-admiral is the third in the scale.

The grades of rear-admiral and commodore in the U. S. navy were first established by act of July 16, 1862, which provides that the number of each grade shall not exceed 9 rear-admirals, 18 commodores, 36 captains, 72 commanders, 144 lieutenant-commanders, 144 lieutenants, 144 masters, and 144 ensigns. Squadrons would be commanded by rear-admirals, and the individual vessels thus: First rates by commodores; second rates by captains; third rates by commanders; fourth rates by lieutenant-commanders. By act of Congress of Dec. 21, 1864, the President was authorized to appoint from the rear-admirals one vice-admiral, who shall be the ranking officer in the navy of the U. S., and whose relative rank with officers of the army shall be that of lieutenant-general in the army. This grade was created for and bestowed upon Rear-Admiral Farragut. By act of July 25, 1866, it was provided that the number of officers of each grade on the active list should be 1 admiral, 1 vice-admiral, 10 rear-admirals, 25 commodores, 50 captains, 90 commanders, 180 lieutenant-commanders, 180 lieutenants, 160 masters, 160 ensigns, and in other grades the number now allowed by law. The rank of admiral thus created was bestowed upon Vice-Admiral David Farragut. It is now (1874) held by David D. Porter. A law was passed at the 3d session of the 42d U. S. Congress abolishing the grades of admiral and vice-admiral in the navy. It provides that vacancies occurring in the grades of admiral and vice-admiral shall not be filled by promotion or in any manner, and that when the offices of said grades shall become vacant, the grades shall cease to exist. REVISED BY J. G. BARNARD, *U. S. Army*.

Ad'miralty [from the word *admiral*], the tribunal which has cognizance of maritime causes. This court was established in England about the time of Edward III., and was at first held before the lord high admiral or his deputy. At present, admiralty jurisdiction is there exercised by the judge of the admiralty, who holds an instance or a prize court by means of separate commissions; the former being the ordinary admiralty court, and the latter being a special tribunal instituted in time of war to take cognizance of matters pertaining to prizes. In the U. S. exclusive admiralty and maritime jurisdiction is by the Constitution delegated to the Federal courts.

It was for a long time an unsettled question whether the word as there used had the limited sense employed in the early English statutes of 13 and 15 Rich. II., restricting

admiralty jurisdiction, or whether it had a wider signification. The latter view has finally prevailed, principally owing to the arguments of Mr. Justice Story; and the word embraces not only cases occurring on tide-waters, but on navigable streams above tide water, including the great lakes. It rests with Congress to determine upon what court the jurisdiction shall be conferred. It has accordingly vested it in the first instance in the district court. No distinction is taken here between the instance and the prize court.

Admiralty jurisdiction is either civil or criminal. Its civil jurisdiction embraces cases of maritime contracts (such as affreightment, repairs of ships, bottomry bonds, pilotage, seamen's wages, and salvage), general average, collisions, and maritime trespasses in general. The principles and course of practice of the court in civil cases are in the main derived from the Roman or civil law.

Admiralty, the office of lord high admiral of England; also the department of the navy or the commissioners who control the navy. The chief minister of marine in Great Britain is styled first lord of the admiralty.

Admiralty Islands, a cluster of islands in the Pacific, N. E. of Papua. The largest is nearly 60 miles long, and is in lat. 2° S., lon. 147° E.

Admis'sions [from the Lat. *admitto, admissum,* to "send to," to "suffer one to enter"], in the law of evidence, are acknowledgments or concessions by a person of the existence of certain facts. When they relate to the matter in dispute, they are admissible in evidence against the party making them. They may be made either by a party to an action or by some one identified with him, as by a partner. The admissions of an agent will affect his principal. Those made by a predecessor in interest will affect his successor. Thus, the admissions of an ancestor will charge an heir. In form, an admission may be either direct or implied from conduct, or in some instances even from silence. The effect of an admission is usually only to raise a presumption against the party, which he may rebut; but some admissions are regarded as of so high a character that the law will not allow them to be contradicted. (See Estoppel, by Prof. T. W. Dwight, LL.D.)

Ado'be, the name of the sun-dried bricks of which houses are built in Mexico, Arizona, California, and Central America. The adobe brick is made of sandy loam, and the houses are usually only one story high.

Adol'phus (or **A'dolph**) of Nassau was elected emperor of Germany in 1292, as successor to Rudolph of Hapsburg. In 1298 the German princes transferred the imperial crown to Albert, but Adolphus refused to abdicate. A war ensued between these rivals, and Adolphus was killed in battle in July, 1298.

Adol'phus Fred'erick, duke of Holstein-Gottorp and king of Sweden, was born May 14, 1710. He was elected bishop of Lubeck in 1727, crown-prince of Sweden July 3, 1743, and became king on April 5, 1751. The Swedish nobles continued their arrogance under him to the utmost, so that at last he threatened to resign. In consequence of this the parliament revoked the restrictions of the royal prerogatives. Died Feb. 12, 1771.

Adol'phus (John), an English historian and lawyer, born in 1766. He was noted for eloquence, and practised with great success in criminal causes. His defence of Thistlewood, accused of treason, in 1820, was highly commended. His principal work is a "History of England from the Accession of George III." (7 vols., 1805–45). Died July 16, 1845.

Ad'onai [an ancient plural of Heb. אָדוֹן, "Lord," with suffix denoting a pronoun of the first person; cf. Fr. *monsieur*], a term applied in the Hebrew Scriptures to God. Owing to the veneration of the Hebrews for the most sacred name of the Deity, Jehovah (or Yahveh) was not pronounced in reading the Scriptures; but Adonai was read instead of it wherever it occurred. When the Hebrew text came to be vocalized, the proper pointing of Adonai, אֲדֹנָי, was given to יְהוָה (? Jehovah), so that the true pronunciation of the latter name has been lost. (See Jehovah.)

Adon'ic Verse is composed of a dactyl and a spondee (or of a dactyl and a trochee). It is specially adapted to lively poetry, but is seldom used alone, being generally combined with other metres. The beautiful and well-known Latin hymn, however, commencing with

> "Plaudite cœli,
> Rideat æther," etc.,

affords an instance in which this metre runs through the whole piece.

Ado'nis [Gr. Ἄδωνις], a youth who was celebrated in ancient poetic legends as a model of youthful beauty and a favorite of Venus. Addicted to the pleasures of the chase, he was killed by a wild boar. An annual festival in honor of Adonis, called Adonia, was celebrated in Asia Minor and other countries bordering on the Mediterranean. He was called Thammuz by the Hebrew writers. Adonis was also the name of a river which rose in Mount Lebanon, and flowed through Phœnicia into the sea.

Adonis, a genus of herbaceous plants, of the natural order Ranunculaceæ, natives of Europe. Several species of this genus are cultivated for the beauty of their flowers.

Ad'onists, a name given to some biblical critics who maintain that the Hebrew points usually annexed to the consonants of the word Jehovah are not the proper points belonging to that word.

Adop'tian Con'troversy, The, originated in Spain near the end of the eighth century. Felix, bishop of Urgel, and Elipandus, archbishop of Toledo, advanced the doctrine that Christ was by nature and generation the Son of God only as regards his divine nature, but as to his human nature he was merely the Son of God by adoption. Those who espoused these views were called Adoptianists (in Lat. *Adoptiani*). They have been called the Nestorians of the West. No particular notice was taken of them so long as they confined the propagation of their opinions to Mohammedan territory, but when they undertook to spread the new doctrine in the Frankish empire, Charlemagne promptly put a stop to it by convening two synods, one at Ratisbon (792), another at Frankfort (794), both of which condemned Adoptianism as heresy. Elipandus, who still adhered to his views, died in 799. Felix recanted at the Council of Aix-la-Chapelle in 799, and died in 816.

Adop'tion [from the Lat. *ad,* "to," "for," and *optio,* a "choice"], in law, is the taking a child of other parents as one's own. The practice, which was common in ancient Rome, was recognized by the civil law, and is found in countries and states where that law and its modifications still prevail. In some other states the matter is regulated by statute. The parents, guardians, next of kin, or other legal representative of the child, must in general give consent after notification of the intent to adopt. Adopted children do not, in most countries, inherit property coming from collateral relatives of the adoptive parents. Adoption is usually authorized by a probate court or other established authority after due notice. The adoption of an adult person is known in the civil law as adrogation.

Ador'no (Antonio), a doge of Genoa, was driven out and re-established three times in succession. It was by his persuasion that the Genoese agreed to the treaty, signed Oct. 26, 1396, which rendered them subjects of Charles VI. of France. The violence of the Genoese, however, soon undid what Adorno had advised them to do.

Adour, a river of South-western France, rises in the Pyrenees and flows north-westward. After passing by Dax, it pursues a S. W. direction, and enters the Bay of Biscay a few miles below Bayonne, which is on its bank. Length, about 200 miles. It is navigable to Dax.

Adowah, or **Adon,** the capital of the Abyssinian province of Tigre, is situated in a well-cultivated and populous plain near the ruins of Axoom, the former capital of Abyssinia. It is the most important commercial town of Abyssinia. Pop. about 5000.

A'dra (anc. *Abde'ra*), a seaport of Spain, in Andalusia, 46 miles S. E. of Granada. Here are extensive lead-mines. Pop. about 7400.

Adrain' (Robert), LL.D., born at Carrickfergus, Ireland, Sept. 30, 1775, served as an officer in the rebellion of 1798, was badly wounded, escaped to the U. S., was professor of mathematics in Rutgers College 1810–13, Columbia College (1813–25), and the University of Pennsylvania (1827–34). Died at New Brunswick, N. J., Aug. 10, 1843.

Adramy'ti (the ancient *Adramyt'tium*), a seaport of Asia Minor, on the Gulf of Adramyti, 83 miles N. of Smyrna. It exports olives, wool, and gall-nuts. Pop. about 8000.

Adraste'a [Gr. Ἀδράστεια, perhaps from a, negative, and δράσσω, to "escape," because her punishments were certain], a Greek surname or epithet for the goddess Nemesis, who administered retribution for iniquity. Also, a nymph of Crete, to whom, with Ida and the Curetes, Rhea entrusted the infant Zeus in the Dictæan grotto.

Adras'tus [Gr. Ἄδραστος], a king of Argos and a contemporary of Theseus, was the father-in-law of Polynices. He commanded the famous expedition called the war of the "Seven against Thebes," the object of which was to restore Polynices to the throne of Thebes. This enterprise, which was not successful, was a favorite theme of ancient epic and tragic poets.

A'dria, or **Ha'dria,** an ancient town of Italy, situated between the Po and the Adige, in the province of Rovigo, 13 miles E. of Rovigo. It was in ancient times a

seaport on the Adriatic, but it is now 14 miles from that sea. Pop. 12,803.

A'drian, the county-seat of Lenawee co., Mich., is a flourishing city, distinguished for the elegance of its public and private buildings. Its streets are wide and lined by shade trees. It is situated on rolling ground, and is intersected by the S. branch of the river Raisin, which, besides affording perfect drainage, furnishes water-power. The city is divided into four wards, which are represented by two aldermen each in the city council, of which body the mayor is chairman. It possesses a handsome central public school building costing $100,000, built of brick and sandstone. There are also four branch school buildings in the different wards. The total valuation of school property is not less than $250,000. The schools are controlled by a board of six trustees, two of whom are elected annually. The annual expenditures for education, including interest and payment of bonds, amount to about $25,000. Adrian possesses a well-organized paid fire department employing two steam fire-engines, one hook-and-ladder truck, and a mounted Babcock fire-extinguisher; total valuation of apparatus, horses, and real estate, $50,000. Manufactures are railroad lanterns, car trimmings, locks, and all kinds of brass and malleable iron work, employing 100 men and $250,000 working capital. The Adrian Car and Manufacturing Company manufactures railway and street cars, employing from 200 to 300 men and $300,000 actual capital. The leading car-shops of the Lake Shore and Michigan Southern R. R. are also located here. Adrian is situated on the main line of the Lake Shore and Michigan Southern R. R., 30 miles W. of Toledo and 74 miles S. and W. of Detroit, between which cities and Chicago it is the principal passenger point. Another railroad, connecting with the Grand Trunk at Grand Trunk Junction, and having St. Louis as its objective point, is rapidly being constructed. The city has a national bank, two daily and weekly, and two exclusively weekly papers, one in the German language. Among its other industries are 3 large foundries and 1 machine-shop, 1 paper-mill, manufacturing both printing and wrapping paper, and employing 30 hands and $75,000 capital; 1 woollen mill, 2 steam sash and blind and turning establishments, and numerous wagon and blacksmiths' shops. It has 5 large hotels, and several minor ones. Its mineral spring and hotel is much frequented. The Masonic Temple, a prominent building, cost $100,000. The opera-house, which is handsomely frescoed and is capable of seating 1500 persons, cost in its erection and equipment $30,000. Adrian College, a leading Methodist institution, is healthfully located on the western boundary of the city. On Monument Square is a beautiful marble shaft surmounting a freestone base, on the different panels of which are the names of those soldiers from Adrian who lost their lives in the civil war. Surveys have been made for a system of water-works to cost $100,000. A street railway from the dépôt to the college is projected. Pop. 8438; of Adrian township, exclusive of part of the city, 1451.

APPLEGATE & FEE, PUBS. "TIMES AND EXPOSITOR."

Adrian, a township of Monroe co., Wis. Pop. 603.

Adrian, emperor of Rome. See HADRIAN.

A'drian [Lat. *Adrianus*] **I.,** a native of Rome, was elected pope in 722. His dominions were invaded by the king of the Longobards, against whom Adrian was defended by Charlemagne. Under this pontiff Rome enjoyed more than usual prosperity. Died in 795.

Adrian IV. (NICHOLAS BREAKSPEAR), the only Englishman who ever attained the dignity of pope, was born near St. Albans. He became cardinal-bishop of Albano in 1146, and was chosen pope in 1154. He was a strenuous asserter of papal supremacy. Died in 1159.

Adrian VI., a native of Utrecht, and a preceptor of the emperor Charles V., succeeded Leo X. in 1521. He favored reform, and was honest and virtuous. Died in 1523.

Adriano'ple [anciently *Adrianopolis;* Turk. *Edreneh*], a large city of European Turkey, on the river Maritza (the ancient Hebrus), 130 miles W. N. W. of Constantinople. The name is derived from the Roman emperor Hadrian, who founded a city here. It was the capital of the Ottoman empire from 1366 until 1453. Here is the famous mosque of the sultan Selim, which is said to be the finest Moslem temple extant, and has four lofty minarets. Among the other public structures are a palace, the bazaar of Ali Pasha, and an aqueduct by which the city is supplied with water. Here are extensive manufactures of silk, cotton, and woollen stuffs. Among the exports are opium, leather, wool, and attar of roses. Adrianople is the residence of the governor-general of the vilayet Edreneh, and of a Greek bishop. Pop. estimated at from 100,000 to 150,000.

Adriat'ic Sea [Lat. *Mare Adriaticum*], a portion of the Mediterranean, lying between Italy on the one hand and Illyria and Albania on the other. The name was derived from the town of Adria. It is about 500 miles long from N. W. to S. E., and has a mean width of about 100 miles. The N. W. part of it is called the Gulf of Venice, and at the S. E. end it is connected by the Strait of Otranto with the Ionian Sea. The N. E. coast is rocky, and begirt with a great number of islands. The depth and extent of the Adriatic have been greatly diminished by deposits of sand and mud and by the formation of alluvial tracts along the shore. The encroachment of the land is most remarkable on the W. and N. W. coasts of the Gulf of Venice.

Adul'tery [Lat. *adulterium*], criminal sexual intercourse between a married person and one of the opposite sex, whether married or single. This act has been punished by the laws of some nations with great rigor—among the ancients often with death. In the English law the act is not treated as a temporal crime, but left to the cognizance of the spiritual courts. A civil action for damages may by common law be brought by a husband against one who has committed adultery with his wife. This is called an action "for criminal conversation." It is also a ground of divorce—at first partial, but now, by statute, total. In some of the States of this country adultery has been made a crime, while in others the English law in its substance still prevails, and only the civil proceedings are allowed.

Advancement [Old Fr.], in law, is a provision of money or other property, made by a parent for a child in advance or anticipation of the estate or distributive share to which such child would be entitled on the parent's death. An expenditure for the education and maintenance of a child is not regarded as an advancement. It must be made with a view to a portion or settlement in life. The parent's intent is the main subject of inquiry. In the English law of real estate it only applies in case of several female heirs, who take the interest called coparcenary. In the American law of descent the subject is of general application. The effect of an advancement is to reduce the child's share to that extent, estimating the value as of the time of the receipt. An advancement differs from a debt in that the latter can be recovered by action, while the former can only be deducted from a distributive share. It is at the option of the person advanced to bring in to the general distribution the amount received or not. In the English law the act of bringing it in is termed hotchpot. The doctrine strictly applies only to cases of intestacy. There is a cognate doctrine termed "ademption," applicable to the case of property left by will. In this country the subject is often governed by statute, sometimes establishing distinct rules for real and personal estate. The word "advancement" is also used in the law of trusts to indicate that a purchase of land made in the name of a wife or child or other person as to whom the purchaser stands in the place of a parent shall actually belong to such person, and shall not, by the fiction of a resulting trust, revert beneficially to the purchaser. T. W. DWIGHT.

Advancement of Science. The British Association for the Advancement of Science was founded in 1831 by Sir David Brewster, Sir John Herschel, Sir Humphry Davy, and others. The American Association for the Advancement of Science was formed in 1847.

Ad'vent [Lat. *adven'tus,* from *ad,* "to," and *ve'nio, ven'tum,* to "come," referring to the coming of Christ], a term applied by the Church to the period of four weeks preceding Christmas. The Catholics, and some Protestants, observe Advent by abstaining from public amusements and nuptial festivities. The Greek Church lengthens the period to six weeks.

Ad'ventists, a body of Christians found chiefly in the U. S., whose distinctive characteristic is a belief in the speedy advent or second coming of the Lord Jesus Christ. In 1833, William Miller of Massachusetts was led by the study of the prophecies of the Bible to the belief that the second advent and the final judgment would occur in 1843. He had at one time about 50,000 followers; and notwithstanding the failure of this and other predictions fixing a definite date, there are, it is believed, about 20,000 members of the Adventist churches, who at present do not presume to foretell the period of the second advent, but live in expectation of that event. They generally practice adult immersion, believe in the necessity of a change of heart and a godly life, in the ultimate annihilation of the wicked, and in the sleep of the dead until the final judgment.—There is a separate organization of Seventh-Day Adventists, which in 1872 had 40 ministers, 46 licentiates, 204 churches, and 4801 members.

Ad'verb [Lat. *adverbium,* from *ad,* "to," and *verbum,* a "word"], one of the parts of speech in grammar. Adverbs are in all languages indeclinable (though sometimes subject to the change of form known as comparison), and are used

to express modifications of verbs, adjectives, or other adverbs, as to place, time, cause, manner, intensity, certainty, conditionality, quality, quantity, etc. The function of an adverb is often performed by sentences or parts of sentences. Most English adverbs are formed by adding the suffix *ly* to an adjective or its root, though many are not thus formed.

Adverse Possession. See Disseizin.

Ad'vocate [from the Lat. *ad*, "to," and *voco, vocatum*, to "call"], a word which in the ecclesiastical and civil law courts corresponds to counsellor or counsel in common law courts. The term by which the members of the bar in Scotland (following the civil law) is known is the Faculty of Advocates. In a popular sense, the word denotes a defender or protector generally, especially one who pleads for his client in open court.

Advocate, Lord, is in Scotland the title of an important public functionary, the public prosecutor of criminals and the senior counsel for the Crown in civil causes. He is sometimes styled king's (or queen's) advocate, and is the first law-officer of the Crown for Scotland.

Advocate of the Church [Lat. *advocatus ecclesiæ*], in the Middle Ages a canon or a layman, often a prince or baron, who assumed the protection of a bishop's see, a monastery, or a particular church. Sometimes the office was hereditary, when it appears to have implied the duty of defending the Church's rights by force of arms. Oftener, perhaps, it was held by an *advocatus causarum*, a person appointed by a prince to defend the Church temporalities in secular courts of law. They often administered justice in the name of the Church. They collected tithes and other revenues, and were frequently priests who enjoyed lucrative benefices. The people suffered so severely from their oppressions that Pope Urban III., in 1186, undertook to reform the abuse; but so great was the opposition of the Church and nobles that it was not for many years that the evil was modified.

Advocates, Faculty of, is the title of the associated members of the legal profession in Scotland. This society was formed in 1532.

Advocates' Library, the largest library of Scotland, belongs to the Faculty of Advocates, and is located in Edinburgh. It was founded in 1682 by Sir George Mackenzie, and contains about 200,000 volumes. It ranks as the fourth library in the number of volumes in Great Britain.

Advoca'tus Diab'oli (*i. e.* the "devil's advocate"), a phrase applied in the Roman Catholic Church to a person whose business is to magnify the faults or detract from the merit of those who are proposed to be canonized as saints. He is opposed by an *advocatus Dei*, or "God's advocate." An *advocatus diaboli* nearly prevented the canonization of Saint Charles Borromeo in 1610.

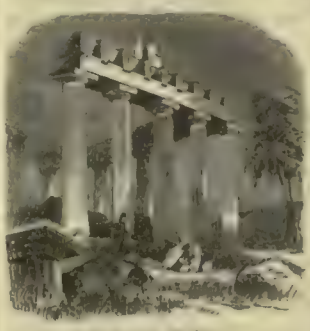
Advow'son, in English law, the right of presentation to an ecclesiastical benefice or a vacant living in the Church. The lord of a manor by building a church acquired the right of nominating the minister, and as long as this right continues annexed to a manor it is called an advowson appendant. Most of the benefices of the English Church are presentative advowsons, which are regarded as property, and are bought and sold. Of nearly 12,000 church benefices, about one-half belong to the Crown, the bishops and other higher clergy, the universities, etc.; the remainder are in the gift of private persons. In most cases, however, the bishop has a right to reject the appointee if he chooses.

Ad'ytum [Gr. ἄδυτον, "inaccessible"], the innermost shrine of a temple or sacred building, accessible only to certain priests and others duly initiated. Of a similar character was the "holy of holies" in the Temple of Jerusalem. The adytum, or cella, was the place where the deity worshipped was believed to be especially present. Some writers have called the innermost recesses of the human spirit the "adytum."

Æchmal'otarch [from the Gr. αἰχμάλωτος (from αἰχμή, the "point of a spear," and ἁλόω, to "be taken"), "taken with the spear," and ἄρχω, to "rule"], the title of the governor of the captive Jews residing in Chaldæa, Assyria, and the adjacent countries. He was called by the Jews themselves *roschgaluth*, "chief of the captivity."

Æ'dile [Lat. *ædi'lis*, from *æ'des*, a "temple" or "building"], a Roman magistrate who superintended the temples and other public buildings, the public games and spectacles, and performed various other duties. Two curule ædiles were annually elected. There were also "plebeian ædiles." Colonies and other towns had ædiles. This office was one of dignity and honor, though reckoned as a minor magistracy. (See Schubert, "De Romanorum Ædilibus," 1828.)

Aë'don [Gr. Ἀηδών], in Greek mythology, a daughter of Pandareus of Ephesus. According to the Odyssey, she was the wife of Zethus, king of Thebes. Envious of Niobe, her brother Amphion's wife, she attempted to slay the eldest son of the latter, but by mistake killed her own child, Itylus. Zeus changed her into a nightingale, whose sad notes are the expression of Aëdon's woe. There are other and different traditions as to Aëdon's crime and suffering, but in all she is transformed into the nightingale.



Ægе'an Sea [Lat. *Ægæ'um Ma're*; Gr. Αἰγαῖον πέλαγος, perhaps from αἴγες, a "squall," though other etymologies have been given], or **Grecian Archipelago,** the name given by the ancients to that part of the Mediterranean between Asia Minor and Greece. Its length from N. to S. is about 400 miles, and its breadth about 200. It is very deep, and encloses numerous islands, several of which are of volcanic origin, while others are composed of white marble. Many of them rise to the height of 1600 feet.

Ægid'ius Colon'na, an eminent schoolman, born at Rome in 1247 of an illustrious stock. He was the pupil of Aquinas and Bonaventura, and became an Augustinian hermit. In 1292 he became prior-general of his order. He went to France, where Philip the Bold made him tutor for his son, afterwards Philip the Fair. In 1296 he became archbishop of Bourges. For many years he taught with applause in the University of Paris, and was called *Doctor Fundatissimus* and *princeps theologorum*. Died Dec. 22, 1316. He left a great number of writings, most of which are now in MS.

Ægi'na [Gr. Αἴγινα], **Egina,** or **Engia,** an island of Greece, in the Gulf of Ægina (*Saron'icus Si'nus*), 16 miles S. S. W. of Athens. It is 8 miles long, and nearly the same in width. It is of an irregularly triangular shape. Area, 41 square miles. The western half is a fertile plain; the remainder is diversified by mountains, hills, and valleys, which produce almonds, wine, olive oil, etc. This island is celebrated for its architectural remains. (See Æginetan Sculptures.) Pop. 6000. At the N. W. end of the island is the modern town of Egina. Mount St. Elias, the highest point of the island, is in lat. 37° 42′ N., lon. 23° 30′ E. The island is difficult to approach.

Ægina, Gulf of (the ancient *Saron'icus Si'nus*), is a portion of the Ægean Sea lying between Attica and the Morea. It contains the islands of Ægina and Salamis.

Ægine'tan Sculptures. The small island of Ægina contains very interesting remains of ancient sculpture. On an eminence in the eastern part of the island stand the ruins of a temple, usually called the temple of Jupiter Panhellenius, but now believed to have been a temple of Athena. Among these ruins a series of statues, sixteen in number, were excavated by a company of Germans, Danes, and Englishmen in 1811, and are now in the Glyptothek at Munich. The various figures that have been discovered seem true to nature, as in the old Greek style, with the structure of bones, muscles, and even veins, distinctly marked; but the faces have that unpleasant, forced smile which is characteristic of all sculpture before the time of Phidias. (See Müller, "Ægineticorum Liber," 1817.)

Ruins in Ægina.

Ægi'ra [Gr. Αἴγειρα], one of the twelve cities of the ancient Achæan confederation in Greece. It probably stood near the sea and on the river Crius, though its site is not well known at present. It was chiefly famous for its temples of Zeus, Apollo, Artemis, and Aphrodite Urania (the "heavenly Venus," a goddess who was especially worshipped here), as well as of other divinities. This town is called *Hyperesia* by Homer.

Ægis'thus [Gr. Αἴγισθος], in classic mythology, a son of Thyestes, and an adopted son of Atreus. He seduced Clytemnestra while Agamemnon was absent, and was her accomplice in the murder of that king. He was killed by Orestes.

Æ'gium [Gr. Αἴγιον; now *Vostitza*], a city of ancient Greece, belonged to the Achæan League, and after Sicyon was the chief city in that confederation, of which it was long the capital. It had a good harbor to the W. of the river Selinus. Remains of its ancient buildings are yet to be seen. The modern town is a place of some importance. It is surrounded by gardens. On Aug. 26, 1817, it was visited by an earthquake which destroyed two-thirds of the houses.

Æ'gle* Mar'melos, the scientific name of a remarkable fruit tree growing in the central and southern parts of India, and belonging to the natural order Aurantiaceæ. It sometimes attains the size of a large apple tree, which in shape it may be said to resemble, being broad and spreading, rather than high. The fruit is always of a somewhat irregular form, and when mature varies in size from five to eight or nine inches in diameter. At the season when it is fully ripe there are no leaves on the trees, which, with their naked branches supporting here and there a fruit of such

Ægle Marmelos.

magnitude, present a singular and striking appearance. It is popularly known in India as the bêl or bael (sometimes incorrectly written *bhel*) fruit. It has a hard but rather thin shell or rind, resembling in consistency the shell of a squash, and contains a soft, yellowish pulp of a peculiar flavor, esteemed delicious by many, and abounding in a bland, transparent mucilage (with which the seed-cavities in particular are filled), which, it is said, renders this fruit singularly beneficial in dysentery and other complaints attended with irritation of the bowels. The seeds are situated in a small cavity which they do not nearly fill, the remaining space being occupied by the transparent mucilage already described. The half-ripe fruit, dried, has recently been introduced into the British pharmacopœia under the name of *Bela;* it is mildly astringent, and is said to be very efficacious in cases of diarrhœa and dysentery. The ripe fruit is an excellent aperient, being very gentle and for the most part effectual in its operation. If the culture of this valuable fruit could be successfully introduced into the West India Islands and the southern parts of North America, it might richly repay the expense and labor incurred in making the experiment.

Ægospot'ami [Gr. Αἰγὸς ποταμοί], a small river and a town in the Thracian Chersonese, where the Spartan Lysander defeated the Athenian fleet in 405 B. C. This victory ended the Peloponnesian war. A large aërolite fell near this place about 465 B. C.

Ægyp'tus [Gr. Αἴγυπτος], a son of Belus and a brother of Danaus, became king of Arabia, and conquered the country which derived from him the name of Egypt. According to a legend, he had fifty sons, who were murdered (except one) by the daughters of Danaus. (See DANAIDES.)

Æ'lia Capitoli'na, a name given to the colony which was planted by the emperor Hadrian at Jerusalem; this title it retained until the time of the Christian emperors.

Aelst, or **Aalst, van** (EVERT), a skilful Dutch painter, born at Delft in 1602. His subjects were dead game, golden and silver vessels, etc. Died in 1658.—His nephew WILLIAM, born in 1620, painted flowers, fruits, and still-life with wonderful success. Died in 1679.

Aeltre, or **Aaltere,** a large trading village in the Belgian province of East Flanders, 13 miles W. of Ghent. Pop. in 1866, 6520.

Æne'as [Gr. Αἰνείας], the hero of Virgil's "Æneid," was, according to tradition, the son of Anchises and the goddess Venus. He was one of the most valiant defenders of Troy against the Greeks. According to Virgil, he, after many adventures and disasters, settled in Italy, and married Lavinia, the daughter of King Latinus. The origin of the Roman state is traditionally ascribed to him and his heirs.

Æne'id [Lat. *Æne'is*] is the title of Virgil's great epic, the most celebrated and beautiful poem in the Latin language. It is regarded as an imitation of Homer's "Iliad" and "Odyssey," and, in the opinion of most critics, is inferior to them in originality and sublimity.

Æo'lia [Gr. Αἰολία], or **Æ'olis** [Gr. Αἰολίς], a region of Asia Minor, so called from the Æolians, who settled there and founded several cities on different parts of the coast. It was more especially in Lesbos, and along the neighboring shores of the Gulf of Elea, that they finally concentrated their principal colonies, and formed a federal union, called the Æolian League, consisting of twelve states and several inferior towns. The soil of this country is very fertile.

Æo'lian Harp, a simple musical instrument, the sounds of which are produced by the vibration of strings moved by wind. It is formed by stretching strings of catgut, tuned in unison, across a wooden box, which is placed in an open window. Athanasius Kircher (1602–80) was the inventor.

Æo'lians [so named from *Æ'olus*, a son of Hellen], one of the primitive tribes of the ancient Greeks. They were the dominant race of Thessaly and Bœotia. They founded on the western coast of Asia Minor many states or cities, among which were Smyrna and Mitylene. The Æolic dialect was harsh, and approached the character of the Doric. It preserved the digamma for a long time. The fragments of Alcæus and Sappho present the typical Æolic language. (See ÆOLIA.)

Æol'ipile, or **Æol'ipyle** [from the Lat. *Æ'olus*, the "god of the winds," and *pi'la*, a "ball"], a hollow metallic ball, having a small orifice with which a curved tube is connected. When filled with water and heated, steam passes out violently. It was thought by the ancients to illustrate the origin of the winds; hence the name.

Æ'olus [Gr. Αἴολος], in Greek mythology, the god who controlled the winds and reigned in the Æolian Islands. (For an account of his actions and kingdom, see VIRGIL'S "Æneid," book i., 51–63.)

Æ'on [Gr. αἰών], a Greek word signifying an age, a period of time; also eternity. The Gnostics used the word æons in a peculiar sense, as distinct entities or virtues that emanated from God before time began.

Æra'rians [Lat. *ærarii*], a class of inhabitants of ancient Rome who did not belong to any of the tribes or centuries, and who had no civic rights except the protection of the state. Any citizen, no matter how high his rank,

* *Ægle* [Gr. Αἴγλη, "splendor" or "glorious beauty"], the name of one of the Hesperides, was probably applied to this tree as meriting a place in the fabled garden which, according to the poets, was assigned to the care of those celebrated nymphs.

for bad conduct might be degraded to the rank of an ærarian by the censors, but the punishment was not in all cases a lifelong one. The Cærites seem to have been ærarians: at any rate, the disfranchisement of a citizen was sometimes called "*in Cæritum tabulas referri*," or "being placed in the list of Cærites." Persons declared infamous became ærarians. This class is also believed to have included a large number of small retail merchants, who came to Rome from the provinces without authority, and were received into no tribe. Ærarians paid a heavy tax, but were exempt from military duty.

Æra'rium, the public treasury in the temple of Saturn at Rome, in which money and the public accounts and archives were kept. Besides the regular treasure, there was an *ærarium sacrum*, or reserve, and later a military treasury. The funds belonging to the *populus*, or patricians, was called *publicum*, and kept in a separate treasury, though in the same building.

A'ërated Bread [from the Lat. *aër*, "air"], an unfermented bread, the ingredients of which are wheat flour, salt, carbonic acid, and water. The carbonic acid is thoroughly mixed with the flour and water in air-tight vessels by means of machinery especially adapted to this purpose, so that it is as light as the best fermented bread.

A'ërated Waters are extensively used to allay thirst in feverish conditions. The most common of these is *carbonic acid water*, incorrectly called soda-water, for it seldom contains soda. It is prepared by placing chalk or marble in a vessel with water and sulphuric acid, when the carbonic acid is evolved in the form of gas. The latter is afterwards forced into water under pressure, so that the water dissolves about five times its own volume of the gas. It forms a brisk, sparkling liquid, with a pungent but pleasant taste. The use of leaden reservoirs for aërated water is not without danger of poisonous effects. When copper lined with silver or tin is used, it requires, for safety, to have the lining renewed at least as often as once in two years. Carbonic acid water is, when iced, a most refreshing drink in sea-sickness and in many cases of disease. The effervescing draughts called *soda powders* and *seidlitz powders* are other forms of aërated beverages. In the former, bicarbonate of soda and tartaric acid are added to water in a tumbler, and a refreshing draught instantaneously prepared. *Seidlitz powders* contain tartrate of soda and potassa and bicarbonate of soda in one paper, and tartaric acid in the other; and when both are added to water, effervescence ensues, and the liquid is then taken. A more agreeable and useful *purgative* aërated water is the effervescing solution of citrate of magnesia in carbonic acid water, the invention of an American pharmacist. Aërated waters are also produced naturally. Water, as it comes from a spring, tastes differently from the same water after being boiled; and this is due to the unboiled water containing the gases oxygen, nitrogen, and carbonic acid—especially the latter—dissolved in it. Rain water has a mawkish taste, chiefly because of the impurities dissolved in it; but when that rain water trickles down through the earth, it is filtered and purified, and absorbs more or less air and gas. When it is dashed from ledge to ledge of rock, it becomes still more thoroughly aërated. Many spring waters are aërated in a peculiar way, which confers upon them important medicinal properties; these will be noticed under the head of MINERAL WATERS, by C. F. CHANDLER.

Aë'rial Perspec'tive, in painting, is the art of giving due gradation to the strength of light and shade and the colors of objects, according to their distances; or the laws which regulate the apparent distances of bodies, as modified by the variations in the transparency of the air or in the brightness of the light.

Æ'rians, an heretical sect founded in the fourth century by Ærius, a native of Pontus. They were Homoiousians (*i. e.* they maintained that the Son was similar to the Father in essence, but not identical with him).

Aërodynam'ics [Lat. *aërodinami'ca*, from the Gr. ἀήρ, "air," and δύναμις, "power"], the dynamics of the air, and of gaseous bodies generally; the phenomena exhibited by gaseous bodies, whether at rest or in motion under the action of *forces*. These phenomena are seldom treated independently; but are in part common to all fluids, gaseous or liquid. As peculiar to *gases*, they present themselves in innumerable special forms: *e.g.* the transmission of sound; the movements of projectiles; of the pendulum; of railway trains, etc. Also in pneumatics, in the application of the force of the wind as a mechanical power, and to navigation, etc.

Aeröe, ä'rö-eh, or **Arroe,** a Danish island in the Baltic, 10 miles S. of Funen, is 14 miles long and about 5 miles wide. It is fertile and well cultivated. Pop. about 12,400.

Aërolites. See METEORITE, by PROF. J. L. SMITH.

Aërom'eter [from the Gr. ἀήρ, "air," and μέτρον, "a measure"], an instrument formerly used to make the necessary corrections in pneumatic experiments to ascertain the mean bulk of gases.

Aëronau'tics [from the Gr. ἀήρ, "air," and ναυτης, a "sailor"]. The credit of the invention of the balloon (1783) is conceded to Stephen and Joseph Montgolfier, sons of a paper-maker at Annonay, near Lyons, France; but the principles on which a balloon could be constructed were already pretty generally known to scientific men. The Jesuit Francis Lana of Brescia in 1670 projected a balloon which, though impracticable of construction, was founded upon the fundamental principle established by Archimedes that a body will float upon or be suspended in a fluid denser than itself. Curiously, the Jesuit anticipated recent visionary schemes of application to offensive warlike purposes, in the prediction that "no walls or fortifications could then protect cities, which might be completely subdued or destroyed, without having the power to make any sort of resistance, by a mere handful of daring assailants, who should rain down fire and conflagration from the region of the clouds."

The Montgolfier balloon by which, June 5, 1783, the first public ascent was made, was a spherical bag consisting of pieces of linen, merely buttoned together, suspended from cross poles; two men kindled a fire under it, and kept feeding the flames with small bundles of chopped straw; the loose bag gradually swelled, assuming a graceful form, and in the space of five minutes it was completely distended, and made such an effort to escape, that eight men were required to hold it down. On a signal being given, the stays were slipped, and the balloon instantly rose with an accelerating motion till it reached some height, when its velocity continued uniform, and carried it to an elevation of more than a mile; but its buoyant force being soon spent, it remained suspended only ten minutes, and fell gently in a vineyard, at the distance of about a mile and a half from the place of its ascension.

The substitution of hydrogen (the lightest of all gases, generated by the application of dilute sulphuric acid to iron filings) for smoke (or the heated products of combustion) was soon after tried by M. Charles of Paris with ultimate success. But hydrogen is troublesome to make, and, moreover, expensive. Coal gas (carburetted hydrogen), easily obtained from gas-works, has almost superseded it in modern times, though much heavier (about two-fifths the density of air). The balloon itself is made of varnished silk or calico or rubber cloth, and enveloped in a netting to which the suspending cords of the car are attached.

The balloon offered to scientific men a ready method of exploring, for scientific purposes, the higher regions of the atmosphere. Of the earlier ascents perhaps the most noteworthy are those made by Biot and Gay-Lussac. The latter (Sept. 15, 1804), ascended to the height of 23,040 feet or nearly four and a half miles above the level of the sea. But this feat was surpassed by Messrs. Glaisher and Coxwell in an ascent from Wolverhampton in 1862. The precise elevation they reached could only be guessed, but it could scarcely be less than 35,000 feet, and might possibly extend to 37,000 feet, or seven miles, a height much exceeding that of any mountain on our globe.

Mr. Glaisher, who is the greatest authority on the phenomena of balloon ascension, having ascended higher than any other and always for scientific purposes, has given the following table for the diminution of density of the air:

At the height of	1 mile	the barometer reading is		24.7 in.
"	2 miles	"	"	20.3 "
"	3 "	"	"	16.7 "
"	4 "	"	"	13.7 "
"	5 "	"	"	11.4 "
"	10 "	"	"	4.2 "
"	15 "	"	"	1.6 "
"	20 "	"	"	1.0 " less.

Concerning temperature the result of all his mid-day experiments is thus expressed:

"The change from the ground to 1000 feet high was 4° 5′ with a cloudy sky, and 6° 2′ with a clear sky. At 10,000 feet high it was 2° 2′ with a cloudy sky, and 2° with a clear sky. At 20,000 feet high the decline of temperature was

1° 1′ with a cloudy sky, and 1° 2′ with a clear sky. At 30,000 feet the whole decline of temperature was found to be 62°. Within the first 1000 feet the average space passed through for 1° was 223 feet with a cloudy sky, and 162 feet with a clear sky. At 10,000 feet the space passed through for a like decline was 455 feet for the former, and 417 feet for the latter; and above 20,000 feet high the space with both states of the sky was 1000 feet nearly for a decline of 1°. As regards the law just indicated, it is far more natural and far more consistent than that of a uniform rate of decrease."

One of the most important determinations to be made, especially in connection with aërial *navigation*, is that of the atmospheric currents. So long as, without power of self-propulsion, the balloon is committed to the air to be borne as it lists, it is scarcely correct to talk of navigation. That there is some degree of certainty in air-currents may be indicated by a curious fact mentioned by M. Flammarion (a distinguished French aëronaut)—namely, that the traces of his various voyages are all represented by lines which had a tendency to curve in one and the same general direction. "Thus," says he, "on the 23d of June, 1867, the balloon started with a north wind directly towards the south-south-west, and, after a while, due south-west, when we descended. A similar result was observed in every excursion, and the fact led me to believe that above the soil of France the currents of the atmosphere are constantly deviated circularly, and in a south-west-north-east-south direction."

On the 12th of Jan. 1864, Mr. Glaisher left the earth, where a south-east wind was prevailing. At a height of 1300 feet, he was surprised to enter a warm current, 3000 feet in thickness, which was flowing from the south-west, that is, in the direction of the Gulf Stream itself. At the elevation in question the temperature, according to the usual calculation, should have been 4° or 5° lower than that at the ground, whereas it was 3½° higher. In the region above, cold reigned, for finely-powdered snow was falling into this atmospheric river. Here, therefore, was a stream of heated air previously unsuspected, which, if its course is steady, as it appears to be during winter, constitutes a prodigious accession to our resources, and adds another to the many meteorological blessings the world enjoys.

"The meeting with this south-west current" (writes Mr. Glaisher) "is of the highest importance, for it goes far to explain why England possesses a winter temperature so much higher than our northern latitudes. Our high winter temperature has hitherto been mostly referred to the influence of the Gulf Stream. Without doubting the influence of this natural agent, it is necessary to add the effect of a parallel atmospheric current to the oceanic current coming from the same regions—a true aërial Gulf Stream."

It is the result of meteorological observations made at the Smithsonian Institute and elsewhere that in the temperate zones of our continent the resultant direction of all the winds is from the west. During the time of sailing vessels the average length of a voyage from America to England was scarcely more than one-half of that in the opposite direction. All thunder-storms come to us from the west. The higher clouds are perpetually seen moving eastward.

From the published letters of Prof. Henry to Mr. Wise, the aëronaut, concerning his proposed aërial voyage across the Atlantic, the following extracts are made:

"All the observations that have been made on the motion of the atmosphere, as well as the deductions from theoretical considerations, lead to the conclusion that the resultant motion of the air around the whole earth, within the temperate zones, especially about the middle of them, is from west to east, and therefore, provided a balloon can be sustained at a sufficient height and for a sufficient length of time, it would, under ordinary circumstances, be wafted across the Atlantic. But the question is, Can the balloon be sustained at a sufficient height and for a sufficient length of time to make the journey? This is a question that can be determined only by actual experiment. . . . I had no doubt of the fact that, if your balloon can be sustained in the air sufficiently long, a voyage might be made across the Atlantic; but this is the point which, it would appear to me, from my partial knowledge of what has been accomplished in the art of ballooning, is yet to be satisfactorily established. No one, however, has had more experience in the art than yourself, and you ought not to venture on the hazardous journey without the fullest assurance that the balloon can be sustained at the requisite elevation for, say, ten days." (*New York Times*, July 11, 1873.)

In the above (as is believed) is found the sole basis for the notion of reaching by balloon the European continent from ours. Some attempts have been made to apply mathematical analysis to the determination of the general direction of the winds, but the imperfect knowledge of the recondite data and the difficulty of defining them analytically are insuperable obstacles.

A determinate current—a "gulf stream"—might afford *some* slight basis of calculation for an aërial voyage, but scarcely enough to form the basis of balloon *navigation*. Self-propulsion has been aimed at by hundreds of inventors, few of whom have possessed knowledge of the real data or difficulties of the problem. (See FLYING, ARTIFICIAL.)

An exhaustive mathematical investigation of M. Gustave Lambert ("De la Locomotion Mécanique dans l'air et dans l'eau," Paris, 1864) is presumed to be an exponent of the scientific basis upon which M. de Lôme founds his project. A pamphlet of nearly 100 large and closely-printed octavo pages cannot here be summarized. We must content ourselves with a statement of a practical result, premising that the idea of a *flying* machine is pronounced impracticable; that while the aërial ship must be *self-sustaining*, spherical or spheroidal forms (such as now in ordinary use) are inapplicable. Self-sustenation being attained, the problem is asserted to be *identical with the naval problem;* hence the balloons should have forms analogous to those of very sharp-built ships. Their length should be ten to twelve times their greatest transverse dimensions. The feebleness of *tonnage* compared with the volume of air displaced, imposes enormous dimensions. Thus for the driving screw (or helix) 15, 20, or even 25 mètres of radius may be necessary. The figures suggested for the very smallest type are as follows: Cross-section, 200 square mètres (about 46 feet diameter); length, 120 mètres (400 feet); tonnage, about 15 tons; speed, 40 mètres per second (88 miles per hour); engine, 360 horse-power, driving a screw of 4 arms of 15 mètres radius at a rate of 45 revolutions per minute. The carcass of the balloon, or rigid framework, "is arranged upon the tubular principle of Stevenson." The covering to consist of an exterior-gummed envelope, made very smooth, and an interior envelope (containing hydrogen) divided into air-tight compartments. As the total weight diminishes by the consumption of the fuel, air is admitted into these compartments in place of the hydrogen. The screw shaft extends from end to end, traversing, through packing boxes, the partitions; by which mutual points of support are obtained. It is believed that such a structure need not weigh more than 5 tons; and hence 10 tons will be allowed for the navigators, the engine, the water, and the fuel. The author admits that if ordinary marine engines are taken as types the allowance is greatly inadequate; but he thinks a high-pressure cylinder engine of 60 horse-power *can be* made to weigh only 6 tons, by which a speed of 20 to 25 mètres per second (44 to 55 miles per hour, equal to that of a "gale of wind") may be had. There will remain 4 tons (of tonnage) to spare, of which one ton is assigned to navigators and water and three tons to fuel, by which a run of 50 hours' duration may be made. The author supposes that, for ordinary voyages, 55 miles per hour will (except in cases of strong head-winds) allow supply stations to be reached in much less than 50 hours; generally in 10 hours. Furthermore, with the apparatus as just described, it would be *possible* to go, *with fair wind*, from Paris to New York. This assertion (in the author's language) "is neither hazardous, utopian, nor rash; it is a solution which the reader may verify with the figures before him." The author anticipates that ultimately engines of very high pressure, of 400 horse-power, and weighing but 5 or 6 tons, may be counted upon, and even that a "steam-turbine" can be realized, by which the weight of cylinders, cranks, and connecting rods will be dispensed with; and finally that if gun (or explosive) powders can be substituted for steam, a speed of 100 mètres per second (220 miles per hour) may be realized, and 24 hours' fuel-supply carried. A more recent investigation has been communicated to the French Academy by M. Duroy de Bruignac, in view of the results of which, he asks, "Is it not permitted to affirm that aërial navigation is possible with motors already known?" but it is doubtful whether he has placed the matter on any more certain basis than M. Lambert, whose results have just been quoted. The nearest approach to a *practical* solution has been made by the celebrated French naval constructor, M. Dupuy de Lome, of whose "Aërostat Dirigeable" an end view is given p. 50, and a brief description under head FLYING-MACHINE.

Mr. Glaisher, whose aëronautic experience has been already alluded to, expresses no such hopes. He tells us that he has attempted no improvement in the management of the balloon, that he found it was wholly at the mercy of the winds, and that he saw no probability of any method of steering it ever being discovered. (*British Quarterly Rev.*) But Mr. Glaisher's field of thought and observation has been, as regards aërial navigation, quite diverse from our author's, and the problem is not to be decided by an *ipse dixit* of this kind.

At the commencement of the French Revolutionary war, about ten years after the production of the Montgolfier

balloons, an Aërostatic Institute was formed by command of the French Directory (at the suggestion of Guyton de Morveau) in the École Polytechnique, and under its superintendence reconnoitring war balloons were constructed by a M. Couté, and supplied to each republican army in the field. The army of the Rhine and Moselle was provided with two—viz., the "Hercule" and "Intrépide;" another named the "Céleste" was prepared for the use of the army of the Sambre and Meuse; the "Entreprenant" for the army of the North; and a fifth was destined for the army of Italy. That attached to the army of the Sambre and Meuse, under Gen. Jourdan, was first used May, 1794, by Col. Coutelle, at Maubeuge, before Mayence, in reconnoitring the enemy's works. This balloon, which was 27 feet in diameter, and took at first fifty hours to inflate, was retained to the earth by two ropes, and the aëronauts communicated their observations by throwing out weighted letters to the general beneath. After this method of reconnoitring had been successfully practised four or five days, a seventeen-pounder gun was brought down to a neighboring ravine, and (being thus masked) suddenly opened fire upon the balloon. Several shots were fired without effect, and the machine was then hauled down; but the next day the gun was forced to retire and the reconnoissances were then carried on as before. After two or three weeks, the balloon was removed to Charleroi, distant from Maubeuge about 36 miles. To save the expense and trouble of another inflation, it accompanied the troops at a sufficient height to allow the cavalry and baggage wagons to pass beneath, ten men marching on either side of the road, and each man holding a separate rope attached to the balloon, which was thus retained at its proper elevation. After making one observation on the way, the balloon arrived before Charleroi at sunset, and the captain had time before close of day, to reconnoitre the place with a general officer. Next day they made a second observation in the plain of Tumet, and at the battle of Fleurus, which took place on the following day, June 17, 1794, the balloon was employed for about eight hours, hovering in rear of the army at an altitude of 1300 feet. (*Prof. Paper, R. E.*, vol. xii.)

This notable instance of the successful employment of a reconnoitring balloon is thus commented upon in the French history, "La Guerre de la Révolution de France:" "Ce fut à cette bataille (Fleurus), que l'on fit, pour la première fois, l'essai d'un aërostat, avec le secours duquel le Général Jourdan put être parfaitement instruit des dispositions et des mouvemens d'ennemi; ainsi, cette découverte regardée jusqu' alors comme un objet de pure curiosité, dut être, dès cet instant, rangé parmi les inventions utiles." (*Idem.*)

We hear too of balloons at a battle near Liege and in the sieges of Mayence and Ehrenbreitstein in 1799. That we hear no longer of them during the Napoleonic wars is evidence that no adequate results were obtained from them.

An attempt was, however, made to revive them in the African campaign of 1830, but there was no opportunity for making use of them. The Austrians are said to have employed reconnoitring balloons before Venice in 1849, and the Russians in observing from Sebastopol. The French again made use of them in the late Italian campaign of 1859, but this time the service was in charge of civilian aëronauts, the MM. Godard. Ascents were made from Milan, Gargonzola, Castenedolo, and the Castiglione Hills; and, according to the *Times* Paris correspondent (in the letter dated 11th of Jan., 1862), they proved great failures, as judged from a military point of view. (*Idem.*)

The balloon was tried for our service in the recent civil war. Ascents were made from our lines on the north of the Potomac, during the fall of 1861, with no material results. It formed a part of our equipage and *impedimenta* during the Virginia peninsula campaign, including the siege of Yorktown and the operations before Richmond. The writer is not aware of a single official report recording any material service rendered by the balloon, but numerous newspaper paragraphs concerning it have been quoted, like the following referring to the battle of the "Seven Pines," or "Fair Oaks," of June 1, 1862: "During the whole of the engagement on Sunday morning, Prof. Lowe's balloon hovered over the Federal lines at an altitude of about 2000 feet, and maintained successful communication with Gen. McClellan at his head-quarters. It is asserted that every movement of the Confederates armies was distinctly visible, and instantaneously reported." (*Times*, June 17, 1862.)

The balloons in use were of two sizes—the smaller of about 30 feet diameter containing 1300 cubic feet, and the larger of double this capacity. The latter size I believe are found preferable. While encamped before Richmond, Capt. F. Beaumont, R. E., spent some time in our camp (part of which as a guest of the writer) and paid particular attention to our balloons. I avail myself of his labors (*vide Prof. Papers R. E.*, vol. xii.) for a description:

"The balloons were made of the best and finest description of silk, double sewn and prepared with the greatest care; the summit of the balloon containing the gas valve being made of either three or four folds of cloth, to ensure sufficient strength in that part subject to the greatest strain. The varnish, on which the success of the apparatus much depends, was a secret of Mr. Lowe's, the chief aëronaut, his balloons kept in their gas a fortnight or more, and their doing so he laid to the fact of the varnish being particularly good; there was always a small amount of leakage, still at the end of a fortnight sufficient gas remained in the balloon to enable him to make an ascent without its being replenished. In balloons for military purposes this is an important point, as they must be kept ready to ascend at any moment. I have little doubt, however, that many well prepared varnishes could be found to answer the purpose as well; the network covering the bag was gathered in, in the usual manner, and ended in a series of cords attached to a ring, hanging about level with the tail of the balloon, and from this hung the wickerwork car, the ring being about level with a person's chest when standing upright in the car. The string for working the valve passed through the centre of the balloon, and coming out at the tail was loosely tied to the ring, to which were fastened the guys, three in number; thus the car, though swayed about by the motion of the balloon, hung always nearly vertically beneath it.

"The gas generators, two in number, were nothing more than large tanks of wood, acid proof inside, and of sufficient strength to resist the expansive action of the gas; they were provided with suitable stop-cocks for regulating the admission of the gas, and with man-hole covers for introducing the necessary materials. The gas used was hydrogen, and indeed for practical purposes, all things considered, there is none other that is nearly so suitable; its low specific gravity makes it a *sine qua non* for a military aëronaut, as independently of the ease with which it is produced, when a balloon is attached to the earth it is of the first importance that it should offer as little resistance to the air as possible, as its stability depends upon this point. The hydrogen was generated by using dilute sulphuric acid and iron; any old iron, such as bits of the tires of wheels, old shot broken up, etc., was used; so that it was necessary to provide only the sulphuric acid, which in large quantities is cheap, and with proper precautions very easy to carry.

"The gas generated passed through a leathern tube into a lime purifier, and thence in a similar manner into a second, the action of the lime simply absorbing the carbonic acid and other extraneous gases, and sending the hydrogen quite, or very nearly pure, into the balloon. On leaving the generator its temperature was high, even the leathern pipe being so hot that the hand could hardly bear to touch it, but after passing the second purifier it was delivered, barely warm, into the balloon. The whole of the apparatus was so simple that nothing more remains to be said about it.

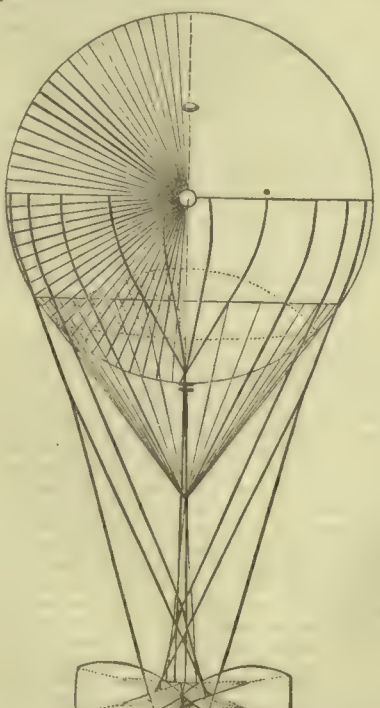
"In using it the balloon is unpacked and laid in well-ordered folds on a carpet spread on the ground to receive it; the tail is then placed ready for connection with the last purifier, properly charged with lime and water, and the connection by leather pipes between the purifier and the generator having been established, the latter is charged; care must be taken not to complete the communication between the last purifier and the tail of the balloon until a clear stream of hydrogen is obtained, so as to avoid getting foul air into the machine. Under ordinary circumstances, in three hours from the time of the machine being halted, it can be prepared for an ascent; but this, should circumstances require it, might be shortened by employing two generators and making a suitable alteration in the purifying arrangement. Such alteration, however, would rarely be necessary, as the balloon, when inflated, can, unless in very windy weather, be very readily carried; twenty-five or thirty men lay hold of cords attached to the ring and march along, allowing the machine to rise only sufficiently to clear any obstacle that there may be in the way.

"Each generator required four horses to draw it, and each balloon, with the tools, etc., four horses. The sulphuric acid it is essential to keep in a carriage to itself, but two horses will draw a sufficient quantity of concentrated acid to last for a long time. The undermentioned is a *resumé* of the balloon corps and apparatus with General McClellan's army:

"*Balloon Corps.*

1 chief aëronaut, 1 captain, assistant do., 50 non-commissioned officers and privates,	requiring 2 instructed men.

"*Apparatus.*



2 generators, drawn by	4 horses each.	
2 balloons, "	" 4 horses each	(including tools, spare ropes, etc.).
1 acid cart, "	" 2 horses.	

"When the machine is inflated it is kept to the ground by a series of sand-bags which are hooked on to the network, so that they can be disengaged at a moment's notice; thus confined, with the sentry to guard it, the machine remains unhurt in any weather short of a very violent wind storm, in which case it should be hauled down altogether.

"When it is required for an ascent, the captain and some thirty of his men get round the balloon and carry it to the appointed place; the weight to be lifted having been put into the car, the ballast is so adapted, that including a couple of bags of sand, which it is not safe to go up without, there should be a buoyancy of, say, 20 or 30 pounds; the three guy ropes having been attached the men leave go of the car together and seize the ropes, one of which is led through a snatch-block attached to a tree, or some securely fixed object; the ropes are then paid out, and the machine rises to the required height; the motion of the guy ropes is regulated by the aëronaut through the captain on the ground. Of course, on the proper manipulation of the ropes the convenience and safety of the aëronaut depend."

The following extract gives an idea of what *could be seen*.

"During the battle of Hanover Court-house, which was the first engagement of importance before Richmond, I happened to be close to the balloon when the firing began. The wind was rather high, but I was anxious to see, if possible, what was going on, and I went up with the father of the aëronaut. The balloon was, however, short of gas, and as the wind was high, we were obliged to come down. I then went up by myself, the diminished weight giving increased steadiness, but it was not considered safe to go higher than 500 feet on account of the unsettled state of the weather. The balloon was very unsteady, so much so that it was difficult to fix my sight on any particular object; at that altitude I could see nothing of the fight. It turned out afterwards that the distance was, I think, over twelve miles, which, from 1000 feet, and on a clear day, would in a country of that nature have rendered the action invisible."

Aërostat of De Lome. (See p. 48 and FLYING-MACHINE.)

With some considerable experience at Yorktown and before Richmond, the writer can only say that, while no means of obtaining information in war should be neglected, the slight amount obtained by the balloon did not compensate for the enormous expense and incumbrance which it involved. An ascent of 1000 feet was the *maximum* aimed at—probably the maximum *practicable;* for the weight of the rope becomes a limiting element to higher ascensions by captive balloons. In reality I doubt whether more than 600 or 700 feet were ever attained; a very slight wind sufficing to carry the balloon off at a large angle with the vertical through the point of attachment. With modern firearms three miles' distance from the enemy is about a minimum for so large an object, for though the hitting *of the balloon* may involve no great risk to the observer (since it would descend slowly) its injury should be guarded against. The view at three miles' distance from 600 feet height is anything but a "bird's eye" one; but at least it surmounts all *adjacent* obstacles. But suppose the enemy's position lies in a wooded country and extends for several miles. How much of it will be exposed by such a view? If a fortification or a line of battle, with a *clear front*, is the object, there will be improved vision; but to make out anything really specific and useful, a telescope (not a mere binocular) of high power and (hence) small field is indispensable. Now the motion of the balloon renders the use even of the opera-glass difficult; of the telescope absolutely impracticable. Only *once* in all his ascents (before Yorktown) did the use of a telescope appear practicable, and of so little service had it always proved it had been left behind. Descending to obtain one and reascending, a breeze had disturbed the dead calm in which *only* it can be used. *Some* information was obtained from it before Yorktown—much more from the trenches. Before Richmond it rendered no service worthy of record. The count of Paris confirms, in his "History of the Civil War," these views of the writer. (See, for military uses of the balloon, articles by Capt. BEAUMONT and Lieut. GROVER, "Prof. Papers R. E.," vol. xii.)

We hear of no use of the balloon for reconnoitring purposes during the recent Franco-German war; but it at least proved itself to have *a* use. During the German siege upwards of fifty of these aërial packets sailed from the beleaguered metropolis with despatches for the outer world. They conveyed about two and a half millions of letters, representing a total weight of about ten tons. Most of them took out a number of pigeons, which were intended to act as postmen from the provinces. One called *Le Général Faidherbe* was furnished with four shepherd's dogs, which it was hoped would break through the Prussian lines, carrying with them precious communications concealed under their collars. The greater number of these balloons were under the management of seamen, sometimes solitary ones, whose nautical training, it was naturally supposed, would qualify them more especially for the duties of aërial navigation. More than one fell into the hands of the enemy, having dropped down right amongst the Prussians. In some of these cases the crews were generally made prisoners, but in others they effected their escape; and more than once their despatches were preserved in a very remarkable way—in one instance being secreted in a dung-cart, and in another being rescued by a forester, and conveyed to Buffet, the aëronaut of the "Archimède," who had been sent out in search of them, and had traversed the hostile lines on his errand. Many of these postal vessels were carried to a considerable distance, some landing in Belgium, Holland, or Bavaria; whilst one, "La Ville d'Orléans," was swept into Norway, and came to anchor about 600 miles north of Christiania. A few, unhappily, never landed at all. *Le Jacquard*, which left the Orléans railway station on the 28th November, with a bold sailor for its sole occupant, disappeared like many a gallant ship. It was last observed above Rochelle, and probably foundered at sea, as some of its papers were picked up in the Channel. "Le Jules Favre" (the second of that name), which set out two days subsequently, has arrived nowhere as yet; and one of the last of these mail-balloons, the "Richard Wallace," is missing, as much as if it had sailed off the planet into infinite space. So long as these machines continued to be launched by day, they were exposed to a fusillade whilst traversing the girdle of the Prussian guns, the bullets whistling round them even at an elevation of 900 or 1000 mètres. To avoid this peril it became necessary to start them by night, although the disadvantages of nocturnal expeditions, in which no light could be carried, and consequently the barometer could not be duly read, were held by many to outweigh all the dangers attaching to German projectiles. (*British Quarterly*, Oct., 1871.)

Another event so exceptional as the siege of Paris may again justify the use of balloons for similar services, and in open countries they *may* perhaps occasionally serve usefully for military reconnoissances. To science they do not appear (as now constructed) capable of adding much to the little (*something* indeed), they have already given, even though Sir John Leslie ("Encyc. Brit.") directs us to "a skilful and judicious application of balloons for a more essential improvement of the infant science of meteorology." When the "balloon of the future"—that in short which M. Lambert confidently predicts, shall have appeared, then, indeed, science, commerce, social and business intercourse, and the art of war, may all hail it as an important adjunct; till then we must *wait*.

J. G. BARNARD, *U. S. Army*.

A'ërophytes, or **Aë'rial Plants** [from the Gr. ἀήρ, the "atmosphere," and φυτόν, a "plant"], are plants which grow in air only, as distinguished from *terrestrial* plants, or

those which grow in earth, and *hydrophytes*, or those which live under water. The epiphytal orchids and many lichens are aërial plants, deriving sustenance from the air and its vapors. They are to be distinguished from parasites, like mistletoe, which feed on, and not merely grow on, trees, etc.

Aërostat'ic Press, a machine used to extract the coloring-matter from dyewoods and other substances by atmospheric pressure. For this purpose a vessel is divided by a horizontal partition pierced with small holes. Upon this the substance containing the coloring-matter is laid, and a cover, also perforated, is placed upon it. The liquid which is to dissolve the coloring-matter is then poured on the top, and the air being drawn from the under part of the vessel by an air-pump, the liquid is forced through the substance by the pressure of the atmosphere.

Aërostat'ics. See AËRODYNAMICS.

Æs'chines [*Αἰσχίνης*], a celebrated Greek orator, born at Athens 387 B. C., was the greatest rival of Demosthenes. He served with distinction at the battle of Mantinea (362 B. C.), and was in early life an opponent of Philip of Macedon. Having been sent with other negotiators on an embassy to the Macedonian court in 347 B. C., he afterwards became a friend of Philip and an adversary of Demosthenes, who accused Æschines of receiving a bribe from the king of Macedon. He made a famous oration against Ctesiphon, because the latter proposed to reward Demosthenes with a golden crown, but he was defeated in his contest by the matchless eloquence of his rival, and was exiled in 330 B. C. He then retired to Rhodes, where he taught rhetoric with applause. Three of his orations are still extant; they have been edited by Franke (1860) and others. Died in 314 B. C.

Æs'chylus [Gr. *Αἰσχύλος*], an excellent Athenian tragic poet, born at Eleusis, in Attica, in 525 B. C. He was the most ancient of the three great tragic poets of Greece. He fought with distinction at the battle of Marathon (490 B. C.), and again at the battle of Salamis. In 484 he gained his first prize in tragedy. He composed, it is said, about seventy tragedies, and gained thirteen prizes, but he was defeated by Sophocles in 468 B. C., soon after which he went to Syracuse, where he was honored by King Hiero. He died at Gela, in Sicily, in 456 B. C. According to a commonly received tradition, he was killed by a falling tortoise which an eagle dropped. Only seven of his tragedies are extant—viz., "Prometheus Bound," "The Seven against Thebes," "The Persians," "Agamemnon," "The Female Suppliants," "Choëphori," and "Eumenides." His "Oresteia," which is certainly one of the most powerful works of art which the human mind ever created, is the only complete trilogy which has been left to us. It consists of the three tragedies, "Agamemnon," "Choëphori," and "Eumenides," and shows in the most striking manner how the Greek tragedies which we possess must be considered only as parts of greater compositions—as acts of dramas rather than as dramas. Its idea is to show the redeeming influence of the state in the life of mankind.

Æscula'pius [Gr. *Ἀσκληπιός*], in classic mythology, the god of medicine, was a son of Apollo. The poets feigned that he raised the dead to life—that he thus offended Pluto, who complained to Jupiter, who killed Æsculapius with a thunderbolt. He was afterwards worshipped as a god, and a temple was erected to him at Epidaurus. According to Homer, he had two sons, Machaon and Podalirius. His descendants were called Asclepiadæ.

Æs'culin, or **Esculin** ($C_{21}H_{24}O_{13}$), a crystalline fluorescent glucoside obtained from the bark of the horse-chestnut and other trees of the genera *Æsculus* and *Pavia*. It possesses a bitter taste, and is converted by boiling hydrochloric or dilute sulphuric acid into glucose and a bitter crystalline substance called æsculetin, $C_9H_6O_4$: $C_{21}H_{24}O_{13} + 3H_2O = 2C_6H_{12}O_6 + C_9H_6O_4$.

Æsir, ä'sir (the Norse plural of *As* or *Asa*, a word of uncertain derivation, but probably allied to the Sanscrit *as*, to "be," and applied as a name to the gods as "beings," *par excellence*), the general name of the beneficent deities of the Norsemen. The principal Æsir are Balder, Frey, Freyia, Frigga, Heimdall, Odin, Thor, Tyr, Vali, and Vidar, which will be noticed under their respective heads.

Æ'sop [Lat. *Æso'pus;* Gr. *Αἴσωπος*], a celebrated fabulist, born about 620 B. C., is supposed to have been a native of Phrygia. He was a slave in his youth at Athens, but afterwards obtained his freedom in consideration of his wit. A statue executed by Lysippus was erected to Æsop by the Athenians. Many of the fables which in popular collections are ascribed to Æsop are spurious.

Æso'pus (CLODIUS), a famous Roman tragic actor, was a friend of Cicero, and flourished about 75 B. C. His action was grave, dignified, and impassioned. He retired from the stage in 55 B. C.

Æstiva'tion [from the Lat. *æ'stivo, æstivā'tum*, to "spend the summer," to "retire for the summer season"], a botanical term, used to denote the manner in which the parts of a flower are folded in the bud before it has opened. The various forms of æstivation are called *valvate, imbricated, contorted, induplicate, reduplicate*, etc.

Esthet'ics [Gr. *αἰσθητικός*, "fitted for perception"]. The word and its cognates were applied by the Greeks in relation to the philosophy of perception. In modern philosophy the term is used to denote the scientific classification of the faculties through which we apprehend the beautiful and the sublime, and which give us the experience of the resulting emotions. It involves also the statement and discussion of the laws which should preside over and condition all forms of artistic production, the application of these general laws to the special branches of the fine arts in respect to criticism, and the history of the development of these laws in practice. The principles of æsthetics were in ancient times discussed by Plato, Plotinus, and St. Augustine; and in their application to poetry by Aristotle and Horace; and in relation to eloquence by Quintilian, and to style by Longinus. The term was first used in its modern sense in the eighteenth century by Alexander Gottlieb Baumgarten, professor of philosophy at Frankfort-on-the-Oder. He taught that there is in the mind a power or faculty for the appreciation of the beautiful—a power whose existence is not dependent on that of the intellect, though the latter may be necessary in order properly to direct and develop the æsthetic faculty. Psychologists have classed the operations of the mind under three general heads—namely, the Intellect, the Sensibilities, and the Will. The proper object of the first is Truth; of the second, Beauty in its various forms, including harmony; and of the third, Good or Virtue. Æsthetics would consequently come under the second division, relating as it does to objects or qualities which appeal at once to the sensibilities, without any direct reference to the intellectual power.

There may be said to be two distinct schools, which differ radically respecting the true principles of æsthetic development and culture. The one, starting with the standard works of art, or with the most perfect models which nature offers us, and selecting from each what appears most pleasing or graceful, seeks, by means of these, either by direct imitation or indirect suggestion, to create a new work, which shall combine as many as possible of the elements of the original models. It is obvious that the merits of such a work cannot in any case rise above the aggregate of the merits of the productions after which it has been copied. The other school, recognizing the fact that it is possible for transcendent genius to create forms of beauty which shall not only excel in their combined effect, but in their individual elements, everything that has ever been seen in nature or in art, seeks to cultivate the faculty of ideal conception, using the works of nature or the models of the great masters simply to improve the art of expression; or, in other words, the power to translate, as it were, our ideal conceptions into forms which can be understood and appreciated by the common mind. Those of this school would say that such works as the Apollo Belvedere, or Dannecker's celebrated statue of Christ, could never, in the first instance, be formed from actual nature—that, in fact, the very power of selecting the most beautiful forms, or the most beautiful elements of any particular form, implies the existence of an ideal faculty; for if the mind has not some standard in itself, but is wholly dependent on what it sees for its conception of beauty, why should it not copy the faulty as well as the beautiful? It is, in fact, by trying what it sees by the ideal standard in itself, that it knows how to select the one and reject the other.

Æsthetics cannot yet be considered a complete and systematically developed science, though several of the best minds of the last and present century have done much to investigate and explain its principles. Among the most important works on this subject are the following: FRIEDRICH THEODOR VISCHER'S "Aesthetik, oder die Wissenschaft des Schönen" ("Æsthetics, or the Science of the Beautiful"), which is perhaps the best and most complete work on æsthetics that has yet appeared; HEGEL'S "Aesthetik," contained in his complete works, published after his death; COUSIN'S "Le Vrai, le Beau et le Bon" ("The True, the Beautiful, and the Good"); WEISSE'S "System der Aesthetik," 2 vols., Leipsic, 1830; JOUFFROY'S "Cours d'Esthétique," Paris, 1842; RUGE'S "Neue Vorschule der Aesthetik," 1837; ZIMMERMANN, "Geschichte der Aesthetik," Vienna, 1858; and DEUBEL, "Handbuch der Aesthetik," 1873. (See ALISON, "On Taste," 1784; BURKE, "The Sublime and Beautiful," 1756; BASCOM, "Æsthetics," 1862; H. N. DAY, "The Science of Æsthetics;" and especially KANT, "Kritik der Urtheilskraft.")

REVISED BY M. B. ANDERSON.

Æthiops. See ETHIOPS MINERAL.

Aë'tians, the followers of Aëtius, who was in the fourth century a deacon, and afterwards a bishop. He was an Arian, but was considered a heretic by both orthodox and Arians. His doctrine and followers were condemned in 359 A. D.

Aë'tius, sometimes incorrectly written ÆTIUS, an eminent Roman general, born in Mœsia before 400 A. D. As commander of the Roman army in Gaul, he gained important victories over the Visigoths, Huns, and other barbarians about 425–430 A. D. Aëtius and Theodoric commanded the army which in 451 checked the victorious hordes of Attila the Hun, and defeated him in a great battle at Châlons. He was suspected of treachery by the emperor Valentinian III., who killed him with his own hand in 454 A. D.

Æt'na, a township of Logan co., Ill. Pop. 920.

Ætna, a township of Mecosta co., Mich. Pop. 335.

Ætna, Mount. See ETNA.

Æto'lia [Gr. Αἰτωλία], a state or country of ancient Greece, was bounded on the N. by Thessaly, on the E. by Locris and Doris, on the S. by the Gulf of Corinth, and on the W. by the river Achelous. It was intersected by the river Evenus, the modern Phidaris or Fidaris. The surface is partly mountainous, the scenery magnificent, and the climate delightful. The range of Mount Pindus extends along the northern part. The ancient Ætolians were a warlike, barbarous, and rude people in the age of Pericles. Ætolia now forms, conjointly with Acarnania, a nomarchy of the kingdom of Greece. (See ACARNANIA.)

Affec'ted, or **Adfec'ted,** a term used in algebra: applied to an equation, it signifies that two or more several powers of the unknown quantity enter into the equation; as, $x^3 - ax^2 + bx - c = 0$, in which there are three different powers of x.

Affet'to, or **Affetuo'so,** in music, a term prefixed to a movement, showing that it is to be performed in a smooth, tender, and affecting manner.

Affida'vit [Late Lat. from *ad*, "to," *fides*, "faith," *dedit*, "he gave" (*i. e.* "he made oath")], an oath in writing made before some person who has authority to administer an oath; a statement in writing signed by the party making it, and sworn to before some authorized officer, who appends and signs an official statement to that effect, termed a "jurat." By an extension of its original meaning it is made to include also cases where an affirmation, authorized by law, is taken instead of an oath. An affidavit is made *ex parte* and without cross-examination. It is much used in making various motions in court, and in proving conveyances executed before subscribing witnesses, so as to have them recorded. An affidavit is called *extra-judicial* when, though taken before an officer authorized to administer oaths, it is not itself required or authorized by law.

Affin'ity [from the Lat. *ad*, "to," "on," and *fi'nis*, "boundary"], in law, is the relationship contracted by marriage between a man and his wife's kindred, and between a wife and her husband's kindred. Affinity is used in contradistinction from consanguinity, which expresses relations that originate in the blood.

Affinity, a term used in biology to denote that the relation which organisms bear to one another is very close, and depends on some essential correspondence between important organs. The term is used in contradistinction to analogy, in which the points of resemblance are of less importance. Thus the foliage of *Lath'yrus nisso'lia* resembles that of grass, but there is no real affinity between the dicotyledonous *Lathyrus* and the monocotyledonous grass.

Affinity, Chemical, the attractive force which unites two or more chemical substances so as to form a compound which differs from either of them; or the mutual propensity which certain kinds of matter have to combine with each other exclusively or in preference to any other connection. "This term," says Liebig, "is decidedly fallacious if it be intended to convey the meaning that such substances are related to each other." This force or propensity acts only at insensible distances—that is, only when the two bodies are in contact. The action of affinity is often modified and increased by heat and light, as in the case of potash and sand, which will only unite when raised to a red or white heat; and the gases chlorine and hydrogen will not combine unless they are exposed to the light. Many surprising changes in the properties of matter are produced by affinity, as when the poisonous chlorine unites with sodium to form common table-salt. The poisonous prussic acid is composed of carbon, hydrogen, and nitrogen, neither of which is noxious by itself. Elements differ greatly in the strength and range of their affinities. Oxygen has an affinity for nearly all the other elements.

Affirma'tion [Lat. *affirma'tio*, from *ad*, "to," and *fir'mo*, *firma'tum*, to "make firm," to "bind"], in law, a declaration made by a witness as a substitute for an oath in a court of justice. This formula is used by Quakers and others who have conscientious scruples against oaths. In the U. S. the use of affirmations instead of oaths has become very common, experience seeming to have shown that the value of evidence and the force of obligations are not diminished thereby.

Affla'tus [from the Lat. *ad*, "to," "upon," and *flo*, *fla'tum*, to "blow"], a term sometimes used to signify inspiration or the gift of prophecy, especially in reference to those who uttered oracles at Delphi.

Affre (DENIS AUGUSTE), archbishop of Paris, was born at St.-Rome-de-Tarn in 1793. He became vicar-general at Paris in 1834, and archbishop in 1840. During the insurrection of June, 1848, he made a generous effort to end the carnage by a personal appeal to the insurgents, but while he was speaking to them hostilities were renewed between the insurgents and the military, and he was mortally wounded by a ball. He left an "Essay on the Egyptian Hieroglyphics" (1834), and other works.

Afghanistan' is the Persian name of the country of the Afghans, which is called by the natives *Wilajet* (*i. e.* the "mother country"). It is situated between lat. 29° and 36° N. and lon. 62° and 72° E., forming a small quadrilateral, which historically, geographically, and linguistically forms the connecting link between India and Western Asia. It is bounded on the N. by Bokhara, on the E. by British India, on the S. by Beloochistan, and on the W. by Persia. The area is estimated (Behm and Wagner, "Bevölkerung der Erde," Gotha, 1872) at 250,900 square miles. The ground rises towards the N. E. to 6000 feet above the sea-level, and descends gradually towards the S. W. to 1600 feet. In the N. are the wild snow-covered mountains of Hindoo-Koosh, and farther on the ancient Paropamisus, which is divided at present into the Kohi-Baba—from which the Helmund descends—and Ghur Mountains. The boundary between the Indian and Persian systems is formed by the desolate mountain-range of Takht-i-Suleiman. The depression in the S. W., in which Lake Hamoon is situated, is exactly opposite in character to the N. and E., which, in consequence of the mountainous nature of the country, have no large rivers. Besides the Helmund, the Cabul is the only river of any consequence which flows through the eastern mountains towards the Indus.

In consequence of the difference in the height and directions of the mountains, great contrasts are found in the climates of the different parts. In the sheltered valleys all kinds of tropical fruits, tobacco, and cotton are grown, while in the northern plateaus snow-storms are of frequent occurrence. The same contrasts are found in the animal kingdom. Bears, wolves, and foxes are found, together with lions, tigers, and camels. The mountains are rich in valuable minerals and metals (iron, lead, gold, sulphur).

The population is estimated (Behm and Wagner, "Bevölkerung der Erde," Gotha, 1872) at 4,000,000. The large majority of the inhabitants are Afghans, who belong to the Indo-European race, and are divided into an eastern and a western group. Besides the Afghans, there are also remains of the original Iranian inhabitants (Tadshiks) and Indian tribes, who, like the Afghans, belong to the Sunnite Mohammedans; the Turanian Hezareh and the Turkish Kazzilbash, who, like the Persians, are Shiitic Mohammedans. The proud and powerful race of the Afghans rules over all these. The Afghans are divided into many tribes, who recently have become united under one ruler, but seem to be opposed to a real union, although they do not lack a national pride. For trade and industry the Afghan has no taste; his element is war. The chief cities are Cabul, Kandahar, Balkh, Herat, Peshawer, and Ghuzni. (For the language of the Afghans, see AFGHAN LANGUAGE.)

History.—Herodotus was acquainted with Afghanistan. He calls the inhabitants Pactyans. The warlike tribes who rule the country at present first entered the country at the time of the Persian-Mongolian rule, and did not begin to act together until the middle of the eighteenth century, when, under Ahmed-Shah (1747–73), the founder of the Durani or Abdali dynasty, they threw off the rule of the Persians, whom they had always hated on account of their religion. Bloody civil wars devastated the country, until with the death of Kamram the Durani monarchy, which had existed for seventy-six years, totally collapsed in 1829. With the exception of Herat the country passed into the hands of the Baraksai. Three brothers divided the country, of whom Dost Mohammed was the most powerful. The perpetual war, however, did not cease. In the W., Persia tried to capture Herat; in the E., Dost Mohammed was at war with Lahore; and on Oct. 1, 1838, the British governor-general of India, Lord Auckland, under various

pretexts, declared war against Afghanistan. In the spring of 1839 the Anglo-Indian army advanced with great losses through the pass of Bolan to Kandahar, and in August took possession of the deserted city of Cabul for the British protegée, Shud Shah, the lawful heir to the throne. Dost Mohammed was compelled to surrender to the British, but his son Akbar raised a revolution throughout the country; in consequence of which the British were compelled to leave the country in Jan., 1842. Hunger, cold, and the fanatic Ghildshees completely destroyed the retreating army. Generals Nott and Pollock, however, again invaded the country, dispersed the disorderly troops of Akbar, destroyed Ghuzni and Cabul, and quickly retreated. The British now thought that they had completely humbled the Afghans, and that there was no risk in releasing Dost Mohammed. This energetic prince quickly restored his power in Cabul, and as early as 1846, conjointly with the SIKHS (which see), again commenced operations against the British. The defeat of his allies (1849) forced him to relinquish all hopes in this direction. On the other hand, he extended the empire in the N. as far as Balkh (1850), and brought the southern tribes under his rule by the capture of Kandahar. To gain Herat and to settle his western boundaries, he concluded an offensive and defensive alliance with the British, and was led into a war with Persia (1856–57), which had violated its treaties with England. The hostilities were, however, soon ended by a treaty, according to which Herat, which had been occupied by the Persians in Oct., 1856, was given to Ahmed Khan, a Baraksai chief. Dost Mohammed renewed his alliance with the British, and he and his heirs were recognized as sovereigns. The country enjoyed several years of quiet, until, in 1860, Ahmed Khan had a little difficulty with the son of Dost Mohammed, Afzul Khan of Kunduz, about some border districts. This was soon settled. But when Ahmed Khan, at the instigation of the Persians, advanced in 1862 at the head of a large body of troops towards Farrah and Kandahar, Dost Mohammed marched against him, having formed the plan not only to extend the northern part of the Afghan empire in the E. to Balkh, but in the W. even to Chardjuy. He repelled the enemy beyond the boundary and enclosed Herat, which surrendered after a long siege on May 26, 1863, shortly after Ahmed Khan had died within its walls. But Dost Mohammed also died on May 29, before he had entered the city. His death put an end to the prospect of a speedy consolidation of the Afghan empire.

The Persian government, as soon as it heard of the defeat of its faithful ally, Ahmed Khan, and the death of Dost Mohammed, sent an envoy to Shere Ali, the son and heir of Dost Mohammed, who in opposition to the policy of his father wished to remain at peace with Persia, and effected a reconciliation. In other respects, Shere Ali was not so fortunate. Immediately after the death of Dost Mohammed disturbances arose in every quarter. Afzul Khan, the brother of Shere Ali and the governor of Balkh, refused to make the customary signs of submission, and proceeded immediately to actual hostilities. He soon captured Cabul and Kandahar, and was recognized by the governor-general of India not as sovereign of Afghanistan, as he desired, but as ruler of Cabul and Kandahar. He died, however, soon after this recognition. The civil wars were only ended in Jan., 1869, when Shere Ali defeated his half-brother Azeem and his nephew Abdul Rhaman Khan at Ghuzni so decisively that they were compelled to seek refuge in the British territory. In July, 1869, new difficulties arose on the frontiers of Turkistan. But the chief danger for Afghanistan does not lie so much with the native tribes of Asia as with Russia on the one hand and England on the other, both of whom are desirous of obtaining Herat. Shere Ali chiefly owes his success to subsidies in money and arms furnished by England, which hoped to find in him a trustworthy ally to check the Russian advance in Central Asia. Lord Mayo gave Shere Ali a grand reception in British India, and held a conference at Umballah in Mar., 1869. Shere Ali was formally recognized as sovereign of Afghanistan by England—an act which created a great sensation both in Persia and Russia. In 1871, Afghanistan was again the seat of civil war, Mehemed Yakub, a son of Shere Ali, having revolted. In May the rebels took possession of the important city of Herat, but a reconciliation was very suddenly brought about by English influence, as Yakub is less devoted to English interests than his father. But, while England assists Shere Ali, Russia favors the pretensions of his rival, Abdul Rahman, and pays him a yearly subsidy. In 1872, in consequence of the advance of the Russian forces towards Afghanistan, Earl Granville on Oct. 8 despatched a note to the British ambassador at St. Petersburg to demand assurances from the Russian government that it would not encroach upon the country which Afghanistan claimed as her own. These demands were conceded in 1873, and thus dispelled the fears which were entertained as to an Oriental war between Russia and Great Britain. (See EYRE, "The Military Operations at Cabul," 1843; KAYE, "History of the War in Afghanistan," 1851; MOHAN LAL, "The Life of Dost Mohammed Khan," 1846; BELLEW, "Journal of a Political Mission to Afghanistan," 1862; VAMBÉRY, "Centralasien," 1873; and the accounts of travels by Connolly, Burnes, Masson, Ferrier, Bellew, Vambéry, and others.) A. J. SCHEM.

Afghan Language and Literature (*Pushtu, Pushtô*, or *Puxtu*). The Afghan language is, like all mountain languages, a harsh, guttural tongue—so much so that Mohammed is reported to have said that the "Pushtu is the language of hell." It has until recently been classed by all the leading authorities, as Dorn, Lassen, and F. Müller, under the Iranian group of languages of the Indo-European family. But Dr. Ernst Trumpp ("Grammar of the Pashtô Language, or Language of the Afghans, compared with the Iranian and North-Indian Vernaculars," 1873), who is at present considered the highest authority on the Pashtô language, and Prof. M. Haug of Munich, entirely disagree with those who hold this opinion. While Dr. Trumpp wishes to give it an intermediate position between the Iranian and Indian groups, Dr. Haug makes it a separate branch of the great Indo-European family.

The Afghan language has thirty-nine sounds, ten of which are confined to words which have been introduced from the Arabic; it is written with Arabic characters. It is not until very lately that we meet with any literary attempts, and then only imitations of Persian models, partly of a romantic-epical and partly of a lyrical form. One of the earliest, and at the same time most learned, poets is Abdurrahman, from the district of Peshawer, a learned Suffee. Others are—Mirza Khan Ansari, a poet of the first half of the seventeenth century; Khushhal Khan Khattak, his contemporary, who took up his abode in India; but especially Ahmed Shah Abdali, the founder of the Durani dynasty. Historical and religious documents are also not wanting, but none are older than the fifteenth century. The former works on the Afghan language, as the "Grammar" (1840) and the "Chrestomathy" (1847) by Dorn, a "Grammar of the Pukhtu," "Dictionary of the Pukhtu," and the anthology, "Gulshan-i-rôh" ("Selections from the Poetry of the Afghans," 3 vols., 1860–61), by Raverty, and Müller's "Die Conjugation des Afghanverbums" (1867), have been entirely superseded by the new work of Prof. Trumpp, which has already been referred to. A. J. SCHEM.

Afium', or **Afium-Kara-Hissar** ("black castle of opium"), a city of Asia Minor, in Anatolia, 53 miles S. E. of Kutaieh. It is on a mountain-side, is the residence of a pasha, and has a large trade in opium, whence its name. Here are numerous mosques, a citadel, and manufactures of carpets, arms, saddlery, etc. Pop. estimated at 50,000.

Afrago'la, an Italian town, in the province of Naples, noted for its manufactures of straw bonnets. Pop. in 1861, 16,129.

Afrancesa'dos, a name given to those Spaniards who supported the French cause, or recognized Joseph Bonaparte as king, in 1808–13. They were proscribed or treated with severity by Ferdinand VII. after he was restored to the throne.

Af'rica [called also *Libya* (Gr. Λιβύη) by the ancients, who appear, however, to have been acquainted with the northern and north-western portions only], the third in point of size of the great divisions of the globe. The ancient Romans at first applied the name *Africa* only to that part of the continent with which they were best acquainted, the part about Carthage. This became the Roman province of Africa; and when, in later times, the name came to be applied to the whole continent (previously called *Libya*, though that name was often very loosely employed to designate the north-eastern part of the continent), the province of Africa was often called Africa Propria, Africa Vera, or Africa Provincia. This province may be roughly stated to have occupied the old Carthaginian home territories, and was sometimes known as Zeugitana. Its present native name, *Ifrikiah*, is obviously connected with that now given to the whole continent. Some of the ancient geographers reckoned Africa as a part of Europe. In form the continent of Africa somewhat resembles an imperfect triangle, having its base towards the north and its apex towards the south. Its whole length from Cape Blanco on the N. (lat. 37° 20′ N., lon. 9° 48′ E.) to Cape Agulhas (lat. 34° 49′ 8″ S., lon. 20° 0′ 7″ E.) is 5100 miles; and its greatest breadth from E. to W. (i. e. from Cape Guardafui at the entrance of the Red Sea at Bab-el-Mandeb (lat. 11° 50′ N., lon. 51° 21′ E.) to Cape Verde on the Atlantic (lat. 14° 44′ N., lon. 17° 32′ W.) is more than 4500 miles. Behm and Wagner ("Bevölkerung der Erde," Gotha, 1872) estimate the area at 11,600,000

square miles. Africa is bounded on the N. by the Mediterranean, on the E. by the Red Sea and Indian Ocean, on the S. by the Southern Ocean, and on the W. by the Atlantic. It presents the appearance of a vast peninsula, united to the adjacent Asiatic continent at its north-east extremity, between the Red Sea and the Mediterranean, by the Isthmus of Suez, a narrow strip of land. Its coast-line is 16,200 miles in length, and is nowhere deeply indented with bays or gulfs, except the Gulf of Guinea on the western coast. The other principal indentations are—the Gulf of Sidra, on the northern, the Bights of Benin and Biafra, on the western, and Sofala and Delagoa Bays, on the eastern coast; Capes Spartel and Bianco, on the N., Cape Verde, on the N. W., Cape Agulhas, on the S., and Cape Guardafui, on the E., are its more prominent projections. Among the few islands which, from their proximity, may be considered to belong to this continent, are the Bissagos, in Senegambia, near the mouth of the Rio Grande; Fernando Po, in the Bight of Biafra; Prince's Island and the islands of St. Thomas and Annobon, in the Gulf of Guinea; the Querimba and Bazaruta Islands, and the islands of Zanzibar and Pemba, on the eastern coast. The Canary and Cape Verd Islands, near the north-western coast, are farther off than the others; Madagascar, the Comoro Islands, and Socotra are off the eastern coast, Madagascar being separated from the mainland by the Mozambique Channel, which is 250 miles broad in its narrowest part.

Political Divisions.—In 1872 the area and population of the political divisions of Africa were, according to Behm and Wagner, as follows:

Countries.	Square Miles.	Population.
Morocco	259,600	2,750,000
Algeria	258,300	2,921,246
Tunis	45,700	2,000,000
Tripoli, with Barca and Fezzan	344,400	750,000
Egypt	659,000	8,000,000
Desert of Sahara	2,436,000	4,000,000
Mohammedan countries of Central Soudan	631,000	38,800,000
French Senegambia	96,500	209,162
Liberia	10,000	718,000
Dahomey	4,000	180,000
British possessions in Western Soudan	17,100	577,313
Portuguese possessions in Western Soudan	35,900	8,500
Other territory in Western Soudan	658,000	36,807,000
Abyssinia	158,000	3,000,000
Other territory in Eastern Africa	1,341,000	26,700,000
Portuguese possessions in Southern Africa—*a*. Eastern coast	383,000	300,000
b. Western coast	313,000	9,000,000
Cape Colony	221,300	682,600
Natal	17,800	269,362
Orange Free State	42,400	37,000
Transvaal Republic	114,300	120,000
Other territory in Southern Africa	934,000	5,591,000
Territory on the equator	1,522,000	43,000,000
Cape Verd Islands	1,650	67,347
St. Thomas and Principé	450	19,295
Fernando Po and Annobon	490	5,596
Ascension	38	
St. Helena	47	6,860
Tristan d'Acunha	45	53
Socotra	1,700	3,000
Abd-el-Kuri	60	100
Zanzibar	600	380,000
Madagascar	228,500	5,000,000
Comoro (with Mayotte)	1,070	64,600
Arco, etc.	150	
Reunion	970	209,737
Mauritius and dependencies	700	322,900
Other islands	420	19,639
Total, inclusive of the desert of Kalahari	11,600,000	192,520,000

Mountains, Table-lands, etc.—The entire southern half of Africa consists of an immense plateau, which descends in the S. W. and E. in terraces to narrow coast-countries, and which has only lately become known. The interior consists of a plateau running from S. to N., and in some parts is not more than from 2000 to 3000 feet high. It is generally very level, and is partly open desert (Kalahari) and partly wooded, rich in water, fertile, densely populated, and well cultivated. On the eastern border of the central basin, beyond the coasts of Mozambique and Zanzibar, is the territory of the great lakes, while under the equator and nearer to the E. coast are found a series of high mountain-ranges (Mountains of the Moon) with high, snow-clad peaks (Kilimandjaro, 18,000 feet). In Central Africa we meet with the plateau of Soudan, beyond the Niger, as the N. W. extremity of the South African plateau, and the alpine region of Abyssinia as the N. E. extremity. In the N. are found the Atlas Mountains, with the plain of Beled-el-Jerid, which forms the stepping-stone to the desert.

Deserts.—The great deserts of Africa are the Sahara and those of Nubia and Libya, situated N. of the Soudan and Abyssinia, the two together constituting the largest desert in the world. The Sahara is upwards of 3500 miles in length, and nearly 1400 miles in its greatest breadth, running almost across the whole breadth of Northern Africa between the parallels of 15° and 35° N. lat. Its entire area has been estimated at 1,500,000 square miles—a space equal to nearly twice the surface of the Mediterranean. The attempt to furnish water along the routes across this vast desert by means of artesian wells appears to be a success. In South Africa, about the tropic, is the desert Kalahari.

Rivers and Lakes.—The rivers of Africa, although many of them are large, have, until a very recent period, afforded no certain inlet to its central regions, and the trade of Europeans has thus been confined to narrow districts along the coast. The Nile is the only river in Northern Africa flowing into the Mediterranean; it is also the longest river in Africa, having a course of probably not less than 4000 miles. There are no other rivers of any magnitude, so far as known, in Northern or North-western Africa. The most considerable in Eastern Africa are the Zambezi (or Quillimane) and the Juba. The former rises in the interior, and enters the Mozambique Channel by several mouths. It is said to have a course of 900 miles, and to be navigable during the rains for 200 or 300 miles from the sea. The Juba, rising in Abyssinia, falls into the Indian Ocean at the town of Juba, on the coast of Zanguebar, in lat. 0° 15′ S., lon. 43° 39′ E. It is said to be likewise navigable for boats to a great distance from the sea. The other principal rivers of Eastern Africa are the Hawash, in Abyssinia; the Atbara (with its affluent, the Takatze); the Bahr-el-Abiad, or White Nile, and the Bahr-el-Azrek, or Blue Nile; the last three are branches or affluents of the Nile. The principal rivers of Western Africa, beginning at its northern limit and proceeding south, are the Senegal, Gambia, Casamanza, Cacheo, the Jeba (or Geba), the Rio Grande, the Nunez, the Sierra Leone, the Adiri (or Volta), the Quorra or Joliba (Niger), the Zaire (or Congo, one of the largest in Africa), the Coanza, and the Gariep (or Orange) rivers.

Among the largest lakes of Africa that have been fully explored is Lake Tchad (Chad, or more correctly, according to Barth, Tsad). It is situated nearly in the centre of the continent, in the territory of Bornu, in lat. about 13° N. and lon. 15° E. It is about 220 miles long, and, at its widest part, about 140 miles broad; and receives two rivers—the Yeou, from the west, and the Shary, from the south. The other known lakes of Africa are the Debo, in Soudan, in the same latitude as Tchad, and under the fifth meridian of W. lon., traversed by the Niger; the lake of Dembea, in Abyssinia, traversed by the Bahr-el-Azrek; and Lake Nyassa, in South-east Africa, about which little is known. It was seen in 1859 by Livingstone, according to whom it is 50 miles long. Among the other large lakes are the Victoria Nyanza, discovered by Capt. Speke in 1858 (supposed by him to be the principal source of the Nile), lying under the equator; the Albert Nyanza, W. of Victoria Nyanza, first seen by Sir Samuel Baker in 1864; and the Tanganyika, S. of Albert Nyanza. Lakes are also met with in the ranges of Mount Atlas, the largest of which is called Lowdeah. Another large lake was discovered in Southern Africa by Dr. Livingstone, in 1849. It is called by the natives N'gami (the Ng is pronounced like the Spanish Ñ), the "Great Water;" it is said to be about 70 miles in length, and is both the source and recipient of several fine streams. Among the former is the Zouga, which flows from the lake, first in a N. E. and then in a S. S. E. course. It is described by Dr. Livingstone as a beautiful stream; the banks are covered with gigantic trees, including a species of Adansonia, some individuals of which measured from seventy to seventy-six feet in circumference. The water of the river is soft, cold, and remarkably clear. It rises and falls periodically, the cause of which is unknown.

Geology.—The geology of Africa is known as yet only from a few cursory observations made at points distant from each other. The part passed over by Dr. Livingstone presents a variety of schists, shales, sandstone, and tufa, overlying granitic and trap rocks. In one place, towards the eastern side of the continent, coal is found under the sandstone. The lofty barrier of limestone along the western boundary of Egypt reappears in the rugged hills of the Sahara; it sometimes contains marine shells. Limestone is also found along the lower skirts of the Atlas Mountains. The strata occupying the surface over the desert of Sahara are very modern, showing that the sea covered this area at a very recent date. The high table-lands of the interior of Africa apparently include representatives of all the older geological formations, and show that the nucleus of the continent is of very ancient date. In Southern Africa the geological structure has been determined with considerable accuracy, and triassic strata have been found there in great

force. They have furnished some remarkable fossil reptiles, which have been grouped by Owen into a new family (Dicynodontia), which, with beaks much like those of turtles, have immense canine teeth implanted in the upper jaws.

Of the precious metals, gold has long been found in Africa. Probably the richest gold-mine is at Nataku in Western Africa, the gold occurring in lumps, grains, and spangles. Gold-dust is found on the Barra, on the W. coast. Iron occurs in Morocco, Algeria, and Abyssinia, and in the mountains of Central and South Africa. Copper and lead are also found in Southern Africa. Large diamond-fields have recently been discovered in great abundance near the Vaal River. Of other minerals, salt, manganese, and different nitrates have been found in large quantities.

Climate.—The climate of Africa, as far as its continental character prevails, and particularly in the rainy zone, is entirely uniform, and in consequence of the position of the continent (four-fifths in the tropics), of the large extent of the Sahara within the hot zone, of the extensive table-lands of Southern Africa, and of the deficient water-supply and the limited area of the forests, it is exceedingly dry and hot. The interior of Africa is in all probability the hottest region on the globe, but exhibits great contrasts of temperature. While the days often reach a temperature of 120° to 125° Fahrenheit, the nights sometimes have only 55°. The region of the tropical or summer rains extends from lat. 16° to 21° N. North of the equator the rainy season lasts from April to October, in the S. from October to April. In the extreme northern and southern parts of Africa the four seasons of the temperate zone are found.

Vegetation.—In those regions where dampness and heat are combined, especially in the valleys of the large rivers, the vegetation is exceedingly luxuriant and rich in peculiar forms. Among the more prominent plants are the baobab, the shiah butter tree, the dragon tree, the date and fan palms, the oil-palm, various species of aloes, numerous spices and drugs, dyewoods, and timber trees, and the coffee and india-rubber tree. Among the productions are cotton, indigo, bananas, wheat, corn, rice, European and tropical fruits. Dourra and teff are grains resembling millet. Wide areas abound in thorny leguminous trees and shrubs. Gourds, heaths, geraniums, and amaryllids are characteristic plants of the S.

Zoology.—The animal life is distinguished by large and clumsy forms. The elephant and rhinoceros and the hippopotamus (which is peculiar to this continent) are found here. Among the Carnivora the lion, leopard, hyæna, ichneumon, and civet are met with. Throughout Africa the graceful family of the antelopes, in over sixty species, is found, sometimes in herds of 100,000. The camel, the Barbary horse, and the ass are the beasts of burden mostly used in Africa. Numerous genera of apes and monkeys are found. The zebra, quagga, and dauw, and the giraffe, the tallest existing mammal, in Central and Southern Africa, are peculiar to the continent. Among the birds the ostrich is the most remarkable. Numberless flocks of parrots and bright-colored, noisy birds enliven the forests. Among reptiles, the crocodile is found in all the large rivers and lakes of Africa. Various species of serpents and lizards are also met with. Among insects, the termites, with their cone-like habitations, are most destructive. They attack and demolish everything, except metals and stones, that comes in their reach. Besides the termites, locusts cause great destruction of property. They travel about in large swarms, and woe to the fields that they alight upon; not a vestige of green remains after they have left. But they are also used as food by many of the native tribes.

Population.—The population is estimated by Behm and Wagner ("Bevölkerung der Erde," Gotha, 1872) at 192,520,000. The densest population is found in the Soudan, on the Gulf of Guinea, from the Senegal to Lower Guinea, also on several other parts of the coast, on large rivers (as the Nile), and, according to recent reports, in some parts of the interior of Southern Africa. To the N. of the Soudan, inclusive of Abyssinia and the territory of the Nile, the Caucasian race (with both dark and light-colored representatives) predominates, comprising the Berbers, Abyssinians, Egyptian Copts, and the Turks. The rest of the continent S. of these countries is inhabited by the Ethiopian or negro race. In the extreme S. are the Cafirs, the Bushmen, and the Hottentots. European colonists are found almost all along the coast, especially in Cape Colony, Algeria, and the islands.

Approximate Religious Statistics.—Mohammedanism and Fetishism are the prevailing religions of Africa, except in Abyssinia, where a corrupt form of Christianity exists; in Madagascar, where the conversion of the queen (1869) and the prominent men of the country has secured the Christianization of the island; in the republic of Liberia, the government of which is under the controlling influence of the Protestant denominations of the U. S.; and in the colonies of the European nations. Human sacrifices are offered among some of the negro nations, but rarely, except on great occasions. The number of Mohammedans in Africa is from 60,000,000 to 100,000,000. The Jews are numerous in Morocco, Algeria, and Abyssinia; their aggregate number in all Africa is from 700,000 to 800,000. The estimates of the Roman Catholic population greatly vary (from 1,000,000 to 4,000,000), as it is doubtful how large a portion of the Portuguese colonies may be set down as nominally Catholic. The Protestant population before the conversion of Madagascar was estimated at about 700,000; it exceeded in 1873 that of the Roman Catholic. In Abyssynia and Egypt about 3,500,000 are connected with the Abyssinian and Coptic churches.

Languages.—Recent discoveries have shown that a scientific classification of the African tribes can be made neither by distinction of color nor of languages. Many tribes have changed their original language for another, or have mixed it considerably with other languages, while some of the darkest races, as the Wolof on the Senegal, are decidedly related to the Caucasian race. Prof. F. Müller ("Linguistiche Ethnographie," in Behm, "Geogr. Jahrb.," 1868) divides the languages into five large families: I. The languages of the African negroes, in twelve groups: the Teda, Maba, Bornu, Bagrimma, Houssa, Logone, Wandala, Wolof, and Mande languages, the Mena languages, the languages of the Nile, the languages of the Niger, those of Sierra Leone, and those of the Gold Coast. II. The languages of the Central Africans, in two groups: Fulah and Nuba languages. III. The language of the Hottentots, in four groups: Nama, Kora, dialect of the Cape, and the language of the Bushmen. IV. The Cafir languages, in three groups: the eastern group, comprising the true Cafir languages, the languages of Zambesi and of Zanzibar; the central group, comprising the Setchuana and Tekesa; and the western group, comprising the Bunda, Herera, Londa, Congo, Mpongwe, Dikele, Isubu, and Fernando Po. V. The Caucasians of Africa, in two groups: the Hamitic languages, comprising the Egyptians, the Bedja, Somauli, Dankali, and Galla; the Semitic languages, comprising the Ethiopic (Geez), Tigre, Amharic, and Arabic.

Commerce.—The commerce of Africa, owing to the barbarous state of the country and to the large dimensions of the slave-trade, has never been of any great importance. But in recent times, since the civilized nations have adopted measures to suppress this inhuman traffic, a great progress has been made. The principal articles of export are gums, timber, wax, ivory, palm oil, gold, hides, feathers, etc. A considerable inland trade is carried on with iron goods, clothing, salt, beads, and small shells called cowries, which are also used as a circulating medium. The Maria Theresa dollar, which circulates in Abyssinia, along the shores of the Red Sea, and some parts of the Soudan, is the only coin used in Africa, with the exception of the European colonies.

History of Discovery.—The peninsular form of Africa is supposed to have been known to the ancients, and it is even supposed by some that the Phœnicians circumnavigated this continent long before the earliest historical records. In modern times Africa has been the object of many researches and explorations. In 1446, Cape Verde was doubled by the Portuguese. In 1486, Bartholomew Diaz discovered the Cape of Good Hope, and in 1498, Vasco da Gama doubled it. Since the middle of the sixteenth century other nations, especially Englishmen, Frenchmen, and Germans, have also taken part in the exploration of Africa. In 1788 the foundation of the African Association of London gave new life to the exploration of this continent. Among the more prominent travellers in the last ten years of the eighteenth and in the nineteenth century are Hornemann (to Mursuk and on the Niger); Lander (on the Niger); Mungo Park (1795–97 and 1805–06) on the W. coast; Burckhardt in the region of the Nile; Denham, Clapperton, and Oudney to Bornu (1822–24); Clapperton in 1825 through Upper Guinea to Sokota; in 1849, Richardson, Barth, and Overweg from Tripoli to the Niger and Benue, who were followed by Vogel in 1853. Barth alone returned in 1855; Vogel was murdered by order of the sultan of Wadai, and Richardson and Overweg died on the way. Equal in importance to these travels in the N. of Africa are those of Livingstone in the S. In 1849 he reached Lake N'gami from the S., in 1851 the Liambye, and during the years 1852–56 he travelled from the Liambye to Loanda on the W. coast, and thence through the continent to the mouth of the Zambezi, when he discovered the Victoria Falls, which are said to exceed in beauty the Falls of Niagara. From 1858–64, Dr. Living-stone, together with his brother Charles, explored the lakes Nyassa and Shirwa, and three times traversed for a great distance the upper course of the Shire. In 1865 he set out on a new journey to reach the equator and to find the sources of the Nile. Dec.

6, 1866, the men belonging to his expedition returned and reported him murdered by the natives. But subsequent explorations and two letters—one dated Dec. 14, 1867, and the other in 1869—showed these reports to be untrue. In 1870, Henry Stanley, in the employ of the "New York Herald," set out to discover Livingstone, and was so fortunate as to find him in 1872. Upon his return, Mr. Stanley brought with him the journal and several letters of Dr. Livingstone, which throw an important light upon the regions of Central Africa. Livingstone awaited the supplies which were sent him by Stanley in Ujiji, and then set out again. In 1857–59, Burton and Speke discovered the lakes Tanganyika and Victoria Nyanza or Ukerewe, and in 1860–63, together with Grant, Speke discovered the passage of the Nile from the Victoria Nyanza. In 1864, Baker discovered Lake Albert Nyanza, and ascertained that it is connected with Lake Victoria Nyanza. In 1869, Baker undertook a new expedition up the Nile to suppress the slave-trade and to extend the Egyptian domain, and on his return, June, 1873, reported to have been entirely successful. Other explorers are the Dutch lady Tinne, Carlo Piaggia, and the two brothers Poncet, Petherick (on the Bahr-el-Gazal) and Du Chaillu (in equatorial Africa). Among the German explorers are especially to be named Dr. G. Schweinfurth, Heuglin, Kinzelbach, Munzinger, Steudner, Baron von der Decken, Krapf, Karl Mauch, who discovered large gold-fields in Southern Africa, and Gerhard Rohlfs, who explored Morocco, Algeria, Tripoli, and the countries of the Soudan. At the close of 1872 a new society for the exploration of Africa was formed in Germany, which began its operations by sending out an expedition for the exploration of the Congo, under Dr. Güssfeldt. Gerhard Rohlfs had also set out again for these regions. In South-eastern Africa, Karl Mauch had continued his explorations in 1872, and had discovered, in lat. 20° 15′ S. and lon. 26° 30′ E., the ruins of an ancient city, which he thought to be Ophir, together with the ruins of the queen of Sheba's palace, and a temple built by her in imitation of that of Solomon.

Literature.—Compare, besides the works of the explorers already mentioned, Petermann and Hassenstein, "Innerafrika nach dem Stande der geogr. Kenntnisse in den Jahren 1861–63" (1863); Vivien de St.-Martin, "Le Nord de l'Afrique dans l'antiquité" (1863). On the countries of the Nile, see the works of Rüppel, Russegger, Werner, and Knoblecher; also Klöden, "Das Stromsystem des oberen Nil" (1856); Beke, "The Sources of the Nile" (1860). For the Soudan compare the works of Lander and Caillié; also Mage, "Voyage dans le Soudan occidental" (1868), and Horton, "Physical and Medical Climate and Meteorology of the West Coast of Africa" (1867). On Eastern Africa compare Guillain, "Documents sur l'histoire, la géographie, et le commerce de l'Afrique orientale" (1856), and Krapf, "Reisen in Ostafrika" (1858). Central and South Africa is described in Burton, "The Lake Regions of Central Africa" (1860); Andersson, "Travels in South-west Africa;" L. Magyar, "Travels in Southern Africa;" Fritsch, "Drei Jahre in Südafrika" (1869); and "Die Eingebornen Südafrikas" (1872).

A. J. Schem.

African Association, a society formed in London in 1788 to assist enterprising men in their attempts to explore Africa. It was united with the Royal Geographical Society in 1831.

African Company. A company by this name was incorporated in Great Britain in 1754 for the purpose of promoting trade with Africa. It was obliged to support all English fortifications between Cape Blanco and the Cape of Good Hope, in return for which it received an annual salary of £13,000. It was deprived of its charter in 1821.

African Methodist Episcopal Church, The, was organized in 1816 by colored Methodists, who had been down to that date under the care of the Methodist Episcopal Church. They elected Rev. Richard Allen their first bishop in 1816. Their doctrines are substantially the same as those of the parent Church. They report (1872) 620 ministers and 200,000 members. They have four high academies, one university, and two weekly journals. (See Methodism, by Rev. Abel Stevens, A. M., LL.D.)

African Methodist Episcopal Zion Church, The, was formed in 1820 by a secession of African Methodists from a congregation of the Methodist Episcopal Church in New York City. They held their first annual conference in 1821; it was composed of 22 preachers, and reported 1426 church members. In 1838 the conference elected Rev. Christopher Rush its first bishop, with the title of superintendent. Its superintendents are elected quadrennially by the general conference. They report (in 1872) 700 ministers and 164,000 church members. Their doctrines and ecclesiastical system are mostly copied from those of the Methodist Episcopal Church. (See Methodism, by Rev. Abel Stevens, A. M., LL.D.)

Africa'nus (Sextus Julius), a Christian writer eminent for his learning, died about 232 A. D. He wrote a general chronology of the world from the creation to 221 A. D., in which he fixes the date of the creation at 5499 B. C.

Af'ton, a post-township of Washington co., Minn. It is the seat of an academy. Pop. 825.

Afton, a post-village and township of Chenango co., N. Y., on the Albany and Susquehanna R. R., 28 miles E. N. E. of Binghamton. It has six churches, a spoke factory, a sash-and-blind factory, and other shops, and a fine suspension bridge across the Susquehanna, which intersects the township. The bridge has 362 feet span. Pop. of township, 1931.

Afton, a township of De Kalb co., Ill. Pop. 873.

Afton, a township of Cherokée co., Ia. Pop. 263.

Afton, a township of Howard co., Ia. Pop. 474.

Afton, a post-village, capital of Union co., Ia., on the Burlington and Missouri River R. R., 180 miles W. of Burlington and 50 miles S. W. of Des Moines. It has two weekly papers, a fine court-house, and is the centre of an extensive country trade. Pop. 961.

J. F. Bishop, Ed. of "Afton News."

Afze'lius (Arvid August), a Swedish poet and historical writer, born May 6, 1785. He published, besides other works, a "Legendary History of the Swedes." Died Sept. 25, 1871.

A'ga, a Turkish title, signifying "lord," is given to a superior military commander, and to others as an honorary title.

Ag'ades, Ag'adez, or **Ag'des,** a city of Central Africa, capital of the kingdom of Asben, is in an oasis of the Sahara; lat. 16° 30′ N., lon. 8° 12′ E. It formerly had a population of about 50,000, which is now greatly reduced. It is visited by merchants from Soudan, and others from Northern Africa. Pop. about 7000.

Agalmat'olite [from the Gr. ἄγαλμα, "image," and λίθος, "stone"], a name applied to a number of soft, fine-grained minerals which the Chinese carve into images. They are hydrated, aluminous, or magnesian silicates, as pyrophyllite, biharite, pinite, talc, etc.

Ag'ama, the name of a lizard, employed by Cuvier to designate the first section of the iguanian sauria, or Agamidæ, which section is characterized by the absence of palatal teeth. The agamoid lizards include several genera, which are numerous in species. They are distributed over the warmer parts of America, Africa, Asia, and Australia. Most of them have a lax skin, which they can inflate with air. One of the most remarkable animals of this family is the Chlamydosaurus (which see).

Agamem'non [Gr. Ἀγαμέμνων], the son of Atreus, king of Mycenæ, was a brother of Menelaus. He had the chief command of the Greeks at the siege of Troy, where he quarrelled with Achilles. He, as well as his brother, was often called Atri'des (*i. e.* "son or descendant of Atreus"). After his return from Troy to his own kingdom he was murdered by his wife Clytemnestra and Ægisthus. He was the father of Orestes, Electra, and Iphigenia.

Agamen'ticus, Mount, in York co., Me., is about 4 miles from the ocean, above the level of which it rises 673 feet. It is an important landmark for seamen; lat. 43° 13.4′ N., lon. 70° 41.2′ W. It is in York township.

Ag'ami (the *Peo'phia* of the naturalists), a genus of South American birds, called trumpeters from a peculiar sound which they utter. The *Peo'phia crep'itans* is equal in size to a large pheasant, but has longer legs and neck. It can be perfectly domesticated.

Ag'apæ [from the Gr. ἀγάπη, "brotherly love"], love-feasts, or feasts of charity, in use among the early Christians. After the celebration of the communion, the oblations which had been made in the church, consisting of meat and bread, which the rich had brought from their houses, were consumed at a common feast.

Agapem'one [from the Gr. ἀγάπη, "love," and μονή, "abode"], a community of fanatics and free-lovers formed in 1846 at Charlynch, in Somersetshire, England, by Henry J. Prince, who was previously a clergyman of the Anglican Church. His disciples, known as "Lampeter Brethren," or "Family of Love," hold their property in common, live in splendid style, and pass their time in voluptuous ease. Mr. Prince makes extravagant pretensions as an apostle or reformer in religion, and it is said that he is styled "God incarnate" by his followers, who are sometimes called Princeites.

Agape'tæ [from the Gr. ἀγαπήτος, "beloved"], the title given to the virgins and widows who among the primitive

Christians devoted their time to the service of bishops and ministers.

Agape'tus I. was elected pope of Rome in 535. Died in 536 A. D.

Agapetus II. became pope in 946, died in 955 or 956

A'gardh (Karl Adolph), a Swedish naturalist, born in Scania Jan. 23, 1785, was ordained a priest in 1816. He wrote, besides other works, "Species of Sea-weeds" ("Species Algarum," 1820–28) and "Systematic Arrangement of Sea-weeds" ("Systema Algarum," 1824). He became bishop of Karlstad in 1834. Died Jan. 28, 1859, and was succeeded by his son, T. G. Agardh, an equally distinguished algologist.

Ag'aric [Lat. *Agar'icus*, from the Gr. ἀγαρικόν], a genus of fungi; the species of which are very numerous. True agarics have radiant gills, while *Boleti* have tubes beneath the cap or pileus. The *Agaricus campestris* or common mushroom and some others are delicate articles of food; the *Agaricus muscarius* and other species are dangerous poisons; many of the deliquescent species are called toad-stools; numerous small ephemeral species appear to be harmless. The *Agaricus olearius* is remarkable for being phosphorescent. The common mushroom is frequently cultivated, both in the open garden and in sheds. The term *agaric* is also applied to various *Polypori* and other fungi which grow on the trunks of trees. From some of these "punk," "touchwood," or "amadou" is prepared.

Aga'sias of Eph'esus, a Greek sculptor, who is supposed to have lived about 400 B. C. Among his works is a fine statue called "The Gladiator" or "Borghese Fighter," which is now in the Louvre.

Ag'assiz (Louis John Rudolf), M. D., Ph. D., LL.D., an eminent Swiss naturalist and geologist, born in the parish of Motier, near Lake Neuchâtel, May 28, 1807, was the son of a Protestant minister. He studied the medical sciences at Zurich, Heidelberg, and Munich, where he graduated. His first work was a Latin description of the fishes which Martius and Spix brought from Brazil, published in 1829–31. He devoted much time to the study of fossil fishes, and was appointed professor of natural history at Neuchâtel in 1832. During a visit to Paris he formed friendships with Cuvier and Humboldt. His reputation was increased by a great work in French, entitled "Researches on Fossil Fishes" (5 vols., 1832–42, with more than 300 plates), in which he made important improvements in the classification of fishes. Having passed many summers among the Alps in researches on glaciers, he propounded some new and interesting ideas on geology and the agency of glaciers in his "Études sur les Glaciers" (1840) and his "Système Glaciaire" (1847), which are among his principal works.

In 1846 he crossed the Atlantic on a scientific excursion to the U. S., in which he soon resolved to fix his permanent residence. He accepted, about the beginning of 1848, a chair of zoology and geology at Harvard; he explored the natural history of the U. S. at different times, and gave a new impulse to the study of nature in this country. He rejected the Darwinian theory of organic development. In 1865 he conducted an expedition to Brazil, and explored the lower Amazon and its tributaries, in which it is stated that he discovered more than 1800 new species of fishes. He became in 1868 a non-resident professor of natural history at Cornell University, Ithaca, N. Y. Early in Dec., 1871, he accompanied the Hassler expedition, under Prof. Pierce, to the South Atlantic and Pacific oceans and the western coast of America. Among his important works are "Outlines of Comparative Physiology" (1848); a "Journey to Brazil" (chiefly written by his wife, 1868); and "Contributions to the Natural History of the United States," an expensive work which is to extend to ten vols. 4to, of which the first four volumes appeared 1857–62. Probably no one except Hugh Miller did more to popularize science in our time than Agassiz, and no other teacher trained so many young and rising naturalists. Yet it may be observed that some of his favorite opinions (*e. g.* of the absolute immutability of species) are not now held by many living naturalists. More, however, than almost any other leader in modern science, Agassiz insisted upon a theistic view of creation, as opposed to the idea of the self-evolution of uncreated nature. "He is not merely," says Mr. Whipple, "a scientific thinker; he is a scientific force; and no small portion of the immense influence he exerts is due to the energy, intensity, and geniality which distinguish the nature of the man. In personal intercourse he inspires as well as performs, communicates not only knowledge, but the love of knowledge." He died at Cambridge, Mass., Dec. 14, 1873.

Agassiz, Mount, a remarkable mountain-peak of Arizona, is an extinct volcano, about 70 miles N. E. of Prescott. It is 10,000 feet or more above the level of the sea, and belongs to the range or group of San Francisco Mountains. As a place of summer resort it has every attraction—scenery, water, climate, elevation, and proximity to one of the greatest natural curiosities in North America, the Great Cañon of the Colorado.

Ag'ate [from *Achates*, a river of Sicily, where they were first found], a mineral much used for ornamental purposes, is a variety of quartz marked with veins or layers, which are different in color and often concentric. This structure is due to the mode of formation, in successive layers on the walls of cavities, usually in volcanic rocks. Agates are found in all countries, and are much used for ornaments and utensils, such as seals, ring and pin stones, vases, cups, mortars, etc. Many of the polished agates are very beautiful, and their preparation has created an important industry at Oberstein in Germany. Here great skill is displayed in cutting and polishing agates, and still more in *coloring* them. A large part of the Oberstein agates come originally from South America.

Ag'atha, Saint, a Sicilian virgin and martyr, who was put to death in 251 A. D.

Agathar'cus [Ἀγαθάρχος], a Greek painter who lived about 480 B. C., is regarded as the inventor of scene painting, or the first who applied the laws of perspective to the art of painting.—Another painter of this name lived about sixty years later, and was patronized by Alcibiades.

Aga'thias, surnamed Asianus, a Greek historian and poet, born at Myrina, in Asia Minor; became a resident of Constantinople about 554 A. D.; wrote a history of contemporary events, which is extant. Died about 580.

Agath'ocles [Gr. Ἀγαθοκλῆς], a tyrant of Syracuse, born in Sicily, was originally a potter. He raised himself by his talents to a high military rank, and also distinguished himself as an orator. Having massacred a large number of the prominent and respectable men of Syracuse, he obtained the supreme power in 317 B. C. He afterwards waged war against the Carthaginians, over whom he gained several victories in Africa, but was subsequently defeated by them. In 306 B. C. a peace was made, which secured to both parties their former possessions. Died in 289 B. C. His death is ascribed to a poisoned toothpick, given to him at the instigation of his grandson Archagathus.

Ag'athon, or **Ag'atho** [Ἀγάθων], a tragic poet, born at Athens about 450 B. C., was a friend of Plato and Euripides. He gained a prize for one of his tragedies in 416 or 417 B. C. Plato expressed a high opinion of his works, of which only small fragments are extant. D. about 400 B. C.

Agave [from the Gr. ἀγανός, "illustrious," "noble"], a genus of plants of the order Amaryllidaceæ; mostly natives of tropical America. The most remarkable species of this genus is the *Agave Americana*, the maguay of the Mexicans, etc., commonly called American aloe, or century plant. The latter name originated in an incorrect opinion that it bears no flowers until it has attained the age of one hundred years. This age, or near it, is sometimes attained in temperate climates, but in hotter regions it often blossoms when less than ten years old. When this takes place, a bud rises from the crown of thick and fleshy spiny-toothed leaves, which lengthens at first at the rate of a foot or two a day into a scape from 20 to 30 feet high, bearing a panicle of greenish-yellow flowers, sometimes as many as 4000 in number. After flowering and maturing seed, the plant dies. Just when the flower-stalk is ready to appear, the Mexicans cut away the bud and scoop out the centre; into this a sweet sap, which would have supported the rapid growth, is abundantly poured. This is evaporated into syrup or sugar, or fermented into a kind of beer or cider, called *pulque*, the favorite beverage in Mexico. From the pulque a strong ardent spirit (mescal) is obtained by distillation. The leaves yield strong and useful fibres (pita thread, sisal hemp). Other species are cultivated among tender succulent plants. A small one is a native of Virginia, Illinois, etc.

Ag'awam, a post-village of Hampden co., Mass., on the W. side of the Connecticut River, in a fertile township of its own name, 98 miles W. S. W. of Boston. It has manufactures of paper and woollens. Pop. of township, 2001.

Agde (anc. *Ag'atha*), a town of France, department of Hérault, on the river Hérault and Canal du Midi, 2 miles from the Mediterranean, and 18 miles by rail E. of Bézières. It is mostly built of black basalt, and is popularly called the Black Town. Here is a college, also a school of navigation. Pop. in 1866, 9586. It has an active trade in wine, oil, silk, grain, etc. Its harbor is in lat. 43° 17′ N., lon. 3° 28′ E., and is accessible to ships of 200 tons.

Age [Lat. *ætas*], a word used in various significations: 1, it denotes the whole duration of the life of a man or other creature; 2, a certain period or division of human life, which, according to Shakspeare, is divided into seven ages; 3, the time when a person is authorized by law to act for himself, and is released from the control of his parents

or guardians. According to the laws of England and the U. S., a person becomes of age when he or she is twenty-one years old. Before this age one cannot vote or make a valid will. A citizen of the U. S. cannot be a Senator before the age of thirty, nor President before the age of thirty-five. In Great Britain men are eligible to Parliament at twenty-one. The natural divisions of human life are infancy, childhood, boyhood (or girlhood), adolescence, manhood (or womanhood), and old age. The age of puberty is fourteen or fifteen. The sixty-third year is called the grand climacteric. Some trees are believed to live to an age of 4000 years or more. The average life of a horse is from twenty-five to thirty years; of an elephant, probably about two hundred; of a dog, from twelve to fifteen. Fishes are remarkable for longevity, and a carp (it is said) has been known to live two hundred years.

AGE, in chronology and history, is sometimes used as synonymous with century, and sometimes also with a generation. Writers differ in respect to the period included under what is called the *Middle Ages*, but they are commonly understood to begin about the time of Charlemagne, and to extend to the fifteenth century.

AGE, in literature, is a period usually bearing the name of some powerful person who flourished during that time. Among the most memorable of these are the age of Pericles, the Augustan age, the age of Leo X., and the age of Elizabeth (or Elizabethan age).

In geology, an AGE is the second great division of time—*e. g.* the *Devonian Age*, the time in which the Devonian system of rocks was deposited—or intervals in the life-history of the globe marked by the prevalence of certain forms of animal or vegetable life; *e. g.* the *Age of Mammals* = the Tertiary; the *Age of Reptiles* = the combined Triassic, Jurassic, and Cretaceous Ages of geological time.

AGE is a term used to designate the successive epochs or stages of civilization in universal history or mythology. The Greek and Roman poets imagined a series of four ages—the Golden, the Silver, the Brazen, and the Iron. An ancient and widespread tradition commemorates the pristine innocence, peace, and happiness of the primeval Golden Age, under the reign of Saturn. The other three were regarded as successive degrees of declension from that primitive state. The *pre-historic* ages in modern anthropology are usually called the older and newer stone ages (palæolithic and neolithic ages) and the age of bronze.

Agen, å'zhåN' (anc. *Agin'num*), a town of France, capital of the department of Lot-et-Garonne, on the right bank of the Garonne, 85 miles by rail S. E. of Bordeaux. It is pleasantly situated in a fertile country, and has an active trade in brandy, prunes, leather, wine, madder, and other articles. Here is a public library; also manufactures of serge, cotton prints, and linen goods. Joseph Scaliger was born in the vicinity of Agen. Pop. in 1866, 18,222.

A'gency, a post-village of Wapello co., Ia., in a township of its own name. Pop. 630; of township, 1223.

Agency, a township of Osage co., Kan. Pop. 1865.

Agen'da [from *a'go, ac'tum*, to "act" or "do"], a Latin word signifying "to be done," or "what ought to be done," has been applied by theologians to practical duties as distinguished from the *credenda* ("to be believed"), or doctrines that must be accepted as articles of faith.

Agénois, å'zhå'nwå', a former district of France, in Guienne, had an area of about 1080 square miles. It is now comprised in the department of Lot-et-Garonne.

Age'nor [Gr. Ἀγήνωρ], in classic mythology, a king of Phœnicia and a son of Neptune, was the father of Cadmus, Phœnix, and Europa.

A'gent [from the Lat. *ago*, to "act"], in law, one who acts for another. This is an extensive topic, and must be treated with a brevity scarcely admitting even a sketch of its rules. Many of its principles closely resemble the corresponding topic in the Roman law (*mandat*), so that they are of quite general application in the jurisprudence of civilized countries. Agency may be created by express words or by implication. There are cases in which an express authority in writing is necessary by statutory law. It is a general rule that when an act is to be done under seal the agent's authority must be of the same grade. Should a person act as agent without authority, the subsequent ratification of the act will make it valid and binding on the person for whom it was done, in the same manner as if he had originally directed it. An agency is often implied from the course of business. A wife who sells goods in her husband's shop, or receives payment of a debt due him with his knowledge and without objection, may be deemed to be his agent, and may bind him in subsequent transactions of a similar kind. An agency is in general revocable either by the principal's own act, executed with sufficient notoriety, or by some event which renders the performance of the act impracticable. Thus, the death of the principal, in general, causes an instantaneous revocation. There is a class of powers, termed "powers coupled with an interest," which in their nature are irrevocable. There must be in this case an interest on the part of the agent in the property over which the power is to be exercised. An illustration is the pledge of goods for a debt, with a power to sell in default of payment. The leading points in agency are the relations of principals to third persons, those of the agent to third persons, and the mutual relations between the principal and agent.

I. *The Relations of the Principal to Third Persons.*—It is a rule that when an agent acts within the scope of his employment he may bind his principal. This is on the principle of identity. There is another class of cases where the agent is not acting within the scope of his employment, but the principal has given him the *appearance* of authority, and the third person with whom he deals has no adequate means of distinguishing between his apparent and actual authority. In this case the principal is liable under a rule that where one of two innocent persons must suffer, that one should sustain the loss who has put it in the power of the wrong-doer to commit the wrong. It is in substance the doctrine of ESTOPPEL IN PAIS (which see). Under this doctrine usage has great effect upon the power of agents to bind their principals. There is a large number of agents who have known and recognized functions, such as factors, brokers, and cashiers of banks. It is the well-settled rule that these persons, acting within the usage of their business, may bind their principals, notwithstanding instructions to the contrary, unless these restrictions are brought to the knowledge of the persons with whom they deal. It is a general rule that when a power is conferred upon an agent, he has by implication such incidental authority as is necessary to carry his power into effect. An authority created by writing must be followed, and an act in excess of it is unauthorized and not binding on the principal. The mode of execution deserves notice. The agent should purport to bind his principal. This rule is particularly applicable to sealed instruments. Should an agent have a so-called power of attorney to execute a conveyance of land, the deed should purport to be the act of the principal by the agent, and should be subscribed in that manner; otherwise it would be at most the agent's deed, and not that of the principal. Where there is no technical rule in the way, a principal may be liable even though undiscovered, as he must be deemed to be identified with the agent. On the general principles of the law of contracts, the principal can take advantage of a contract made in his behalf with a third person, and enforce it by action in his own name, even though he were not at the time disclosed, subject to the qualification that the rights of the other party to the contract are not prejudiced. A principal is liable for the fraudulent or wrongful acts of his agent acting within his employment. He cannot take the benefit of the agent's acts and avoid their burdens. So complete is the identification of these parties that notice to an agent on the subject of his employment is legally notice to the principal, although it be not in fact communicated. This rule often operates with great severity upon innocent principals, imputing legal fraud when none has been in fact committed.

II. *The Relations of the Agent to Third Persons.*—If the agent having power to bind his principal does so expressly, he is not liable. But if he exceeds his authority, or, acting within it, fails to disclose his principal, he becomes personally responsible. In the case first supposed he is deemed to have entered into an implied contract that he has the necessary authority, and is liable accordingly. In the other case, the third person, on discovering the principal, has an election either to charge the agent or the principal. This doctrine may perhaps be qualified if the agent contracts in writing, on account of the rule that parol evidence is inadmissible to alter a written instrument. The agent, in turn, may have a right of action upon a contract made in his own name with a third person, though in fact made for the benefit of his principal. It is a general rule that an action does not lie against an agent to test the right of the principal to a fund, but the action should be brought against the principal himself. But in the case of duress of goods (see DURESS), if payment is made to an agent under protest, an action may be brought against him to recover back the money. This doctrine assumes much importance in its application to duties collected upon imports; so that a law of Congress regulates the mode in which the protest should be made.

III. *The Relation of Principal and Agent as between Themselves.*—The rules governing this relation are quite different. The agent is bound to obey the instructions of the principal. If in violating them he binds the principal to third persons, he is personally liable to make compen-

sation for his breach of duty. His relation is a fiduciary one. He is subject to the rule that he cannot deal in his principal's affairs for his own benefit. When directed to sell, he cannot become a purchaser; when ordered to buy, he cannot become a seller. This rule springs from the relation, and is applied with as much rigor to agents who act gratuitously as to those who receive compensation. An agent having discretion to exercise cannot delegate his authority; he cannot substitute another in his place. Where the business requires it, he may employ subordinates in the execution of his duties. It is not uncommon to insert a clause in a written delegation of agency (power of attorney) allowing substitution; this is valid. An agent should keep separate accounts, and distinguish his principal's money from his own; otherwise he might become personally responsible for its loss. The measure of his liability ordinarily is reasonable care, which is determined by that diligence which prudent men usually exercise in the conduct of their own affairs. For his services he is in general entitled to a reasonable compensation. He is sometimes paid by commissions; this is usual in the case of a broker. He has earned his commissions when he has brought the purchaser and seller together. He cannot be deprived of them by a failure on the part of his employer, through wantonness or caprice, to enter into the contract which he has succeeded in negotiating for him.

The law of agency underlies, to a considerable extent, the law of partnership. The rules whereby one partner can bind his associates by contracts within the scope of their business are but applications of the doctrines of agency to this special branch of the law. (For information of a more special nature concerning particular cases of agency, consult ATTORNEY, BROKER, FACTOR, PARTNERSHIP, etc.)

T. W. DWIGHT.

Agesila'us [Ἀγησίλαος] **II.,** a celebrated Spartan general and king, was a son of King Archidamus II. He began to reign at the death of his brother Agis in 399 B. C., two years after which war was renewed between the Spartans and the king of Persia. Agesilaus commanded the army which invaded Asia Minor, and gained several victories, but in the mean time the Athenians, Thebans, and other Greek peoples had formed a coalition against Sparta, to defend which the king was recalled by the ephori in 394 or 395 B. C. He maintained his reputation in this war, which was ended by a treaty of peace in 378. Sparta was again involved in a war with the Thebans, who under Epaminondas gained a decisive victory at the great battle of Leuctra, 371 B. C., at which, however, Agesilaus was not present. He afterwards defended the city of Sparta with success when it was besieged by Epaminondas. He died about 360 B. C., aged 84 years.

Agglu'tinaté [from the Lat. *ad*, "to," and *glu'tino*, *glutina'tum*, to "glue" or "cement"] **Languages,** a term applied, in comparative philology, to languages which are in a certain state of development intermediate between those which are strictly monosyllabic like the Chinese, and those which are inflectional like the Greek or Latin. Examples of languages in the agglutinated state are found among the Indian languages of America and the Turanian languages of Asia. In the Aryan languages conjugation and declension are doubtless the result of *glueing on* pronouns to verbs and nouns; but in them these terminations have coalesced, so as to form practically a single word, and the primitive parts have therefore, in a greater or less degree, lost their original and independent force. In the Turanian languages, however, the declension and conjugation can still be taken to pieces, and the affixes are seen to be distinct from the roots to which they are appended, as in Turkish, etc. (See MAX MÜLLER'S "Lectures on the Science of Language," first series, lect. viii.)

Agh'mat, a fortified town of Morocco, on the N. declivity of Mount Atlas, 24 miles S. of Morocco. Pop. about 6000.

Aghrim, or **Aughrim,** awg'rim or awн'rim, a parish of Galway, Ireland, 13 miles N. E. of Loughrea. Here the army of William III. gained a decisive victory over that of James II., July 12, 1691.

Agincourt, ȧ'zhȧn'koor', or **Azincourt,** ȧ'zȧn'koor', a village of France, in the department of Pas de Calais, 18 miles E. of Montreuil, and 10 miles N. W. of St.-Pol. Near this place the English king, Henry V., who had about 15,000 men, gained a complete victory over the French army of about 60,000 on the 25th of Oct., 1415.

A'gio [in Italian, *aggio*, a word originally signifying "ease," "convenience," "accommodation"] was used in Italy to denote the difference between the real and nominal values of money, or the percentage difference between the values of the current and standard money of a place. The premium or discount on foreign bills of exchange is sometimes called *agio*.

Agis IV., of Sparta, born about 264 B. C., was a wise and meritorious ruler. He began to reign conjointly with Leonidas in 244 B. C., when Sparta was in a degenerate condition. He attempted to restore the old Spartan institutions and to reform the corrupted morals of the people. He also proposed to improve the condition of the poorer citizens by an agrarian law. Condemned by the ephori on a charge of subverting the laws, he was strangled in 240 B. C.

Agnadello, ȧn-yȧ-del'lo, a village of Northern Italy, 10 miles E. of Lodi. Here the French duke of Vendôme defeated Prince Eugène Aug. 16, 1705, and Louis XII. of France the Venetians May 14, 1509. Pop. about 1600.

Agnano, ȧn-yȧ'no, a lake of Italy, 3 miles W. of Naples, is about half a mile in diameter. It occupies the crater of an extinct volcano, and is near the Grotto del Cane, from which noxious gases arise.

Ag'nate [from the Lat. *ad*, "to," and *nas'cor*, *natus*, to "be born"]. In Roman law, *agnates* are those who descend through males from a common ancestor, in opposition to *cognates*—*i. e.* all the descendants of a common ancestor, whether through males or females. Thus, in France, by Salic law, the hereditary crown passed by right of *agnation*, females being excluded.

Ag'nes Cit'y, a township of Lyon co., Kan. Pop. 143.

Ag'nes, SAINT, a Roman virgin, who is said to have suffered martyrdom under Diocletian, in 303 A. D.

Agne'si (MARIA GAETANA), an Italian woman of extraordinary learning and intellect, was born at Milan Mar. 16, 1718. About the age of twelve she could converse in Greek, Latin, and other languages on abstruse subjects of philosophy and mathematics. During the illness of her father, who was a professor of mathematics at Bologna, she lectured in his place. She published a work called "Analytical Institutions" (1748), which displays mathematical genius of a high order. Died Jan. 9, 1799.

Agnes Sorel, mistress of King Charles VII. of France, was born 1409, became in 1431 lady of honor to the duchess of Anjou, and so fascinated the king by her beauty that he appointed her lady of honor to the queen. She exercised a most beneficial influence over the king, whom she stimulated to action against the English, who then invaded France. She died Feb. 9, 1450, as it is supposed, by poison administered by the dauphin.

Ag'ni, or **Ag'nis** [etymologically related to the Latin *ig'nis*], in Hindoo mythology, the god of fire. He was a deity of great importance among the early Aryans, but after the rise of the gods of the Hindoo triad he sank into a very subordinate position. He is sometimes represented with two faces, three legs, and seven arms, with his head surrounded by flames, and is generally painted of a deepred color. By some he has been made to correspond to the Vulcan of classic mythology, but he does not anywhere appear as an artificer, like that deity. His principal characters are those of a purifier and bearer of incense to heaven, thus being made a mediator between man and the gods. His two faces are supposed to be a type of fire in its two characters—beneficent (or creative) and destructive—and his seven arms to indicate the seven prismatic colors.

Agnoë'tæ [from the Gr. ἀγνοεῖν, to "be ignorant"], in ecclesiastical history, the name of a sect in the sixth century who maintained that Christ in his human nature was ignorant of many things, particularly of the day of judgment. Another and earlier sect of this name denied the omniscience of God.

A'gnolo, d' (BACCIO), a distinguished Italian architect and sculptor in wood, was born at Florence in 1460. He is said to have been the first who ornamented the windows of palaces with frontons or frontispieces. Died in 1543.

Agno'men [from the Lat. *ad*, "to," and *no'men*, a "name"]. Besides the prænomen, nomen, and cognomen, the ancient Romans sometimes had a fourth name (*agnomen*), which was derived from some illustrious action or remarkable event. Thus, two Scipios had the name Africanus given them on account of their victories over the Carthaginians in Africa. The younger of these celebrated generals had a second agnomen—viz. Æmilianus—because he was the son of L. Paulus Æmilius, and adopted into the family of the Scipios. Fabius *Cunctator* (*i. e.* "Fabius the delayer") was so called because by his cautious policy and prudent delays he, and he alone, of all the Roman generals, was able to oppose Hannibal successfully when that general was at the height of his victorious career.

Agnone, ȧn-yo'nȧ, a town of Italy, in the province of Campobasso, 20 miles N. W. of Campobasso. Copper-ware is made here. Pop. in 1861, 9255.

Ag'nus De'i, the name applied to the fifth and last section of the Roman Catholic mass, beginning with the

words "Agnus Dei, qui tollis peccata mundi" (*i. e.* "Lamb of God, who takest away the sins of the world"). It is also applied to the figure of a lamb bearing a cross, which is stamped on a compound of balsam, chrism, and wax, or on silver, and often worn by Roman Catholics.

Agon'ic [from the Gr. α, "without," γωνία, an "angle"] **Line** is the name applied to the line which joins all the places at which the magnetic needle points due north and south. The plane of the *magnetic meridian* of a place, which is the vertical plane passing through the two poles of a magnetic needle freely suspended at that place, does not, generally speaking, coincide with that of the geographical meridian, a vertical plane passing through the place and the north and south terrestrial poles. The angle formed by these planes is termed the *magnetic declination*. At certain places these planes coincide, and such places are called places of *no declination*. The line which joins all these places is termed the *line of no declination*, or the *agonic line*. A line of this kind passes through the eastern part of South America to Hudson's Bay, thence towards the North Pole to the White Sea; passing southward, it cuts Arabia, and, after traversing the Indian Ocean and the eastern portion of Australia, goes through or near the South Pole to join itself again. It is not fixed in position, but is at present moving slowly westward on our continent. There is a second agonic line which has been observed near China and Japan.

Agonis'tici, an ascetic sect of Christians who lived in Northern Africa in the fourth century. They renounced labor and matrimony. Their name, derived from the Greek ἀγωνιστης (*agonis'tes*), a "wrestler," appears to have been given in allusion to their wrestling with "the world, the flesh, and the devil."

Agos'ta, or **Augus'ta,** a seaport of Sicily, in the province of Catania, and on the Mediterranean, 14 miles N. of Syracuse. It has a good harbor, defended by two forts, and exports salt, olive oil, wine, and honey. In 1693 it was nearly destroyed by an earthquake. Pop. in 1861, 9223.

Agoua'ra (*Procyon cancrivorus*), the crab-eating raccoon of South America, is larger than the common raccoon, has a shorter tail, and more variable colors. It is commonly of a blackish-gray, with six rings around the tail. In habits it resembles the common raccoon.

Agouti, ä-goo'tee (*Dasyproc'ta*), a genus of rodent mammals related to the porcupines. The common agouti (*Dasyprocta agouti*) is a native of Brazil, Paraguay, Guiana, and the neighboring countries. Formerly, in these districts it existed in great numbers, but from its frequent ravages on the sugar-cane, potatoes, and yams, it has in many parts been hunted out and almost exterminated. It is between the size of a hare and a rabbit, has long hind legs, round ears, bright black eyes, and a short, stumpy tail, which, as well as the rump and thighs, is covered with long, coarse, bristly hair, whence the name *Dasyprocta* (from the Gr. δασύς, "rough," and πρωκτός, "tail" or "hinder parts"). The agouti is an omnivorous animal, eating almost all kinds of vegetables, fruits, roots, meats, etc. Its habits are all quick and active, and even while eating it continually turns its head from side to side, in order to guard against danger. The animal is easily domesticated, but as it is specially fond of using its teeth on all kinds of furniture, it is but little valued as a pet. It gnaws with great rapidity, taking but a few minutes to cut its way through an ordinary door. Add to this that its playfulness and all its amusing qualities seem to be lost in its domestic state. In some countries its flesh is eaten, but a prejudice generally prevails against it.

Black Agouti.

There are several other species, such as the black agouti (*Dasyprocta cristata*), whose range is nearly the same with that of the common agouti, but is perhaps more limited. The agoutis are said to have been the largest mammals inhabiting the West India Islands at the time of their discovery.

A'gra, or **Akbarâbâd',** a city of Hindostan, in the North-west Provinces, and capital of the division of the same name, is on the right bank of the river Jumna, 134 miles by rail S. S. E. of Delhi, and 754 miles by rail N. N. E. of Bombay; lat. 27° 11′ N., lon. 78° E. It was the capital of the Mogul and Mohammedan emperors of India from 1504 to 1647, and was once a large and splendid city, but a great part of it is now in a ruinous state. The houses are mostly built of red sandstone. Here are several magnificent edifices, the most celebrated of which is the Tâj Mahal, a mausoleum erected by the emperor Shah Jehan (1627–66) in honor of his favorite queen. This edifice, the finest in India, and perhaps in the world, is built of white marble, surmounted with a dome seventy feet in diameter, and adorned internally with exquisite mosaics of cornelian, lapis lazuli, and jasper. It cost above £3,000,000. Among the articles exported from Agra are cotton, sugar, salt, and indigo. Many houses in Agra were destroyed by the Sepoys during the mutiny of 1857. At that time the population was 125,262.

Ag'ram, or **Zag'rab,** a royal free city of Croatia, and the capital of that country, on the left bank of the Save, 172 miles S. of Vienna. It is the seat of a Roman Catholic archbishop, and has two gymnasia, two Realschulen, two normal schools, two theological seminaries, besides many other institutions of learning. Six annual fairs are held here. Pop. in 1869, 19,857.

Agra'rian Law [Lat. *lex agra'ria,* from *a'ger,* a "field"]. This term originated in the ancient republic of Rome, and signified a law enacted to distribute or regulate the public land, *ager publicus.* Such laws were opposed by the patricians, who had appropriated to their own use the lands acquired by conquest, and who had long enjoyed the privilege of occupying them as tenants, on the condition of paying to the state a tithe of the produce. The consul Spurius Cassius first proposed to divide a portion of public land among the poor citizens, but the measure was defeated by the aristocrats. In 367 B. C. an agrarian law was originated by Licinius Stolo, ordaining that no man should possess more than 500 *jugera* (330 acres) of the public domain, and that such public land as any man occupied in excess of 500 *jugera* should be distributed among the poor citizens. Tiberius Gracchus was the author of an important agrarian law. These and later agrarian laws were never executed. In Sparta the attempt of King Agis IV. to enforce an agrarian law led to his murder by the ephori (240 B. C.).

Agreement. See CONTRACT, by PROF. T. W. DWIGHT.

Agric'ola (CNEIUS JULIUS), a Roman general and statesman, born at Forum Julii (Fréjus), in Gaul, June 13, 37 A. D. He was appointed governor of Aquitania by Vespasian in 73, and became consul in 77. About a year later he was sent as governor to Britain, which he conquered, and governed with much ability and moderation. By a wise and humane policy he promoted the civilization and prosperity of the natives. He erected a chain of forts from the Clyde to the Frith of Forth. He was recalled about 85 A. D. by Domitian, who was jealous of him. Died Aug. 23, 93 A. D. He was the father-in-law of the historian Tacitus, who wrote a Life of Agricola.

Agricola (JOHANN), originally SCHNEIDER or SCHNITTER, a German theologian, born at Eisleben April 10, 1492, studied at Wittenberg, and became a friend of Luther, with whom he was afterwards involved in a doctrinal controversy. He obtained a chair at Wittenberg in 1536. Agricola and his followers were called Antinomians (opposers of the law), because they maintained that a Christian is not bound to obey the Mosaic law. He wrote many theological works, and published a valuable collection of German proverbs. Died in Berlin Sept. 22, 1566.

Agricultural Chemistry is the study of the chemical relations of those substances which compose the products of the farm. Since the chemistry of these substances is most intimately connected with their physical, geological, and physiological aspects, the term agricultural chemistry, as commonly understood, embraces a wide range of natural science in its applications to vegetable and animal production. The object of agriculture is to develop from seed and soil the largest possible value of useful plants and useful animals at the smallest cost. Nothing is plainer than that the farmer should accurately understand the nature of those materials and agencies which build up his crops and increase his herds. He should know whence the materials of his crops may be drawn, what ones are placed at his disposal naturally in surplus, and what must be provided by his own care. He should know how to control or work in harmony with the energies whose action is essential to his success. Agricultural chemistry inquires, first of all, what the plant and animal are made of. It finds that both, when living, consist largely of water, to the extent of forty to ninety per cent., which is indispensable to their existence as a vehicle for the process of circulation or transfer of nutriment. The dry plant or animal may be divided into matter volatile by heat, ninety to ninety-nine per cent., and one to ten per cent. of ash. The volatile or combustible matter is either organized—*i. e.* possesses a structure, or is a tissue of organs, inimitable by the art of man, through whose mechanism the principle of vitality operates—or else it consists of substances which are the direct results of chemical changes in the organized matter. Muscle-fibre and wood-fibre are of the former, sugar and urea are of the latter kind. The volatile matters are thence termed organic; they consist of carbon compounds, most of which are highly complex in their atomic constitution.

The most important organic matters of our staple field-crops are few in number—being, 1. The amyloids, compounds of carbon with hydrogen and oxygen, the last two being in the proportions in which they exist in water—viz., cellulose or wood-fibre, starch, the sugars and the gums; 2. The pectoids, also compounds of carbon, hydrogen, and oxygen, comprising pectose—the hard pulp of fruits and roots—and pectine, pectosic and pectic acids—the gummy or gelatinous matters of ripe and cooked fruits; 3. The fats and fixed oils; 4. The organic acids, oxalic, malic, citric, and tartaric; 5. The albuminoids, albumen, casein, fibrin, and their analogues, which, besides carbon, hydrogen, and oxygen, contain fifteen to eighteen per cent. of nitrogen, with one-half to one per cent. of sulphur. The ash of the plant consists of phosphates, sulphates, chlorides, silicates, and carbonates of potassium, sodium, calcium, magnesium, and iron.

The growth of a plant is the development of a germ or seed when acted upon by the solar ray, with access of water, air, and soil. The organic matters above enumerated as constituents of crops are exclusively generated and organized by the plant. Carbonic acid gas supplies carbon, water furnishes hydrogen and oxygen, while nitrogen is derived partially from minute quantities of ammonia mingled with the air. Nitrogen is, however, chiefly obtained from the nitrates of the soil. All the ash-elements come exclusively from the soil. The agriculturist cannot aid the nourishment of his crops except through the soil, and there he can only influence the supplies of water, of nitrogen, and of ash-elements. Carbon, the most abundant ingredient of all crops, making up forty-four to forty-eight per cent. of the dry matter, is furnished so fully by the atmospheric carbonic acid that additional supplies from the soil are not directly advantageous. The atmosphere contains, it is true, but a very small proportion of this gas—one-twenty-five hundredth of its bulk—but this is considerably in excess of the wants of the most luxuriant growth.

The fertility of the soil depends, chemically—1, upon the presence in it of all the ash-elements and of nitrates in proper quantity; and 2, on their occurrence there in such states of combination as give a constant and regulated supply. Numerous experiments have demonstrated that a soil destitute of any one of the following substances—viz., phosphoric acid, sulphuric acid, potash, lime, magnesia, oxide of iron—is absolutely barren by virtue of such deficiency. It is also certain that a soil which contains the usual amount of potash, but only in the form of feldspar, or of phosphoric acid, but only as apatite, or of magnesia, but only as serpentine, is infertile, because these substances do not yield their elements to the solvent agencies of the soil or plant rapidly enough to serve as plant-food. Alumina is an abundant element of soils, but it is always absent from agricultural plants; and recent investigations also appear to show that silica, which is present in many plants, is an accidental ingredient, and in no manner essential to their growth or perfection. Soda likewise appears to be unessential to most of the vegetative processes; for, although it is perhaps never entirely absent from cultivated plants, it often occurs in them in extremely minute quantity, so that the soda which is indispensable to the blood and milk of animals must be obtained, in part at least, directly from mineral sources.

Nitrates and ammonia-salts—which are the natural supplies of nitrogen to crops—rarely are, and never need be, present in the soil in more than the minutest proportion. It is only requisite that they be generated or gathered there as rapidly as crops remove them. The process of nitrification, whereby inert or inassimilable nitrogen existing in the soil or in the air is converted into nitric acid, is one of the utmost agricultural importance, though still largely involved in mystery.

The great bulk of any soil is chemically indifferent in the nourishment of the present crop. The weight of an average loamy soil is about 4,000,000 pounds per acre for each foot of depth. A crop of grain of thirty-three bushels removes but 140 pounds of ash-elements—viz., forty pounds in the seed and 100 pounds in the straw. A hay-crop of two tons carries off but 260 pounds of ash-ingredients. These quantities, if assumed to come from two feet of depth, are respectively but 1-30,000th and 1-57,000th of the entire mass of soil. Hellriegel's experiments give results which warrant us in concluding that 55 pounds of potash, 17 of soda, 17 of magnesia, 23 of lime, 55 of phosphoric acid, 11 of sulphuric acid, 8 of chlorine, and 54 of nitrogen (in the form of nitrates), are all that need be present, in soluble condition, in 1,000,000 pounds of soil, in order to establish there a fertility equal to the production of 33 bushels of barley-grain and 2000 pounds of straw per acre. In other words, the 140 pounds of ash-elements may be taken from 1,000,000 pounds of a soil in which but 186 pounds exist in soluble condition, and in which, therefore, the proportion of real plant-food—nitrogen, but not water, included—is but 1-4000th. Good soil, in the practical sense, however, yields, and may contain, a larger proportion of immediately available plant-food than one part in 4000, but rarely more perhaps than ten times that amount.

As cropping removes these substances from the soil, they are replaced more or less rapidly and completely by weathering, whereby, under the influence of moisture, carbonic acid and oxygen, aided by heat and by the alternations of heat and cold, the rock-dust of the soil is gradually fluxed into soluble pabulum, and charged with nitrates.

The soil is endowed with absorptive qualities which enable it to retain in a state of comparative insolubility certain ash-elements, especially those which are in general the least abundant—viz., phosphoric acid and potash—even when applied to it from external sources in the most soluble form and in large quantity. This absorption of plant-food by the soil is accompanied by a corresponding liberation of other substances, especially of lime and sulphuric acid. The impalpable matter of the soil, consisting largely of aluminous and ferruginous silicates, is mainly the seat of these absorptions; sand, silica, carbonate of lime, humus, and even pure clay (kaolinite), being destitute of the power in question.

Soils may be fully supplied with all the nutritive elements in proper quantity and form, and yet be infertile. This may happen on account of faults in physical condition, whereby they are rendered uncongenial to plants. A certain medium porosity, admitting of access and efflux of water, and a quality of being suitably warmed by the sun and of carrying heat through the cool of the night, are no less indispensable to high productive power than an appropriate chemical condition.

Manures improve the soil by supplying one or several of those ingredients required by plants which are deficient either by reason of yearly removal of crops or from original poverty of composition. Practice has taught that phosphates and nitrogen in assimilable form are most commonly the substances which strikingly benefit land, and chemical analysis shows that of these the former is ordinarily the least abundant ingredient of soils, and the latter is one which is not only not abundant, but one which rapidly wastes by solution in rain-water, being daily carried off in immense quantities, through springs and rivers, into the sea.

The action of fertilizers is not, however, fully explained by their affording a direct supply of lacking nutritive elements; manures operate indirectly to feed crops, by their chemical effects upon the soil. It has been abundantly demonstrated that common salt, gypsum, and other saline matters may react on the soil to convert potash and magnesia, for instance, into soluble forms, and thus to give the same result as would follow an immediate application of the last-named substances.

Certain manures which are used in large doses, such as stable-dung, peat, marl, and lime, also influence the fertility of the soil, by amending its texture or otherwise modifying its physical characters.

It is theoretically possible to produce a maximum crop of any given kind, continuously and perpetually, upon the same plat of land. In practice, however, it is far easier, and therefore far cheaper, to alternate or rotate crops. A hoed crop implies surface-tillage, several times repeated during the growing season, thus effectually exposing the upper soil to the oxidising influence of the air. A field put into grass or clover is to some extent under opposite conditions. In the one case, organic matters waste rapidly; in the other, they accumulate in the soil. In the first instance, the surface-soil tends to lose that porosity and attractiveness for moisture due to the presence of humus, which is a quality of the utmost significance in climates subject to drouth. In the second instance, the soil gains in these respects. On the other hand, the lower soil, which under hoed crops is yearly broken up by repeated ploughing, may settle down to injurious compactness in a pasture or meadow. Deep-rooted crops affect the soil very differently from those whose radiation is confined to near the surface. The reasons for rotation thus become, to some extent, apparent. Agricultural chemistry is competent to show, further, that some plants, while occupying the soil, enrich it, and, though yielding the farmer a large and valuable harvest, yet actually manure the land for a subsequent crop. Clover has long been known as a plant of this kind. A good clover-crop, when made into hay, removes from the soil twice or thrice the ash elements and nitrogen that are contained in a good wheat-crop, and yet the good clover-crop will develop in a soil where the good wheat-crop can only be raised by help of manure. More than this, the good clover-crop not only grows on the unaided soil, but likewise fertilizes that soil, so that it can

subsequently make the good wheat-crop. The enriching effects of clover are absolute in respect of nitrogen. The clover plant is able, in a given time and on a given surface, to assimilate nitrogen much more rapidly, or to a much greater amount, than the wheat plant can. It therefore flourishes better on a limited supply, or gives a full crop where wheat would make perhaps but half a crop; and, besides, leaves in the soil where it has grown more nitrogen in its roots and stubble than an entire wheat-crop contains. In respect of ash-elements, the clover plant can add nothing to the soil in the way of quantity, but it strongly influences their quality. It transmutes the insoluble matters into soluble, and collects largely, by its deep-penetrating roots, from stores of food which the wheat plant can scarcely reach. When its roots decay, these substances remain where a succeeding wheat-crop can at once utilize them. This enriching process has again its narrow limits. If we keep land in clover, it becomes "clover-sick," probably from exhaustion of the deep-lying plant-food, and this disease is hard to cure, because of the inaccessibility of the subsoil to fertilizing applications.

By judicious rotation of crops a soil of moderate quality may be made to yield fair harvests without loss of productive power. In order thus to economize in the fullest degree the resources of soil and crop, the farmer needs an accurate knowledge of their nature, such as can only be obtained by encouraging the study of agricultural chemistry.

In studying the utilization of vegetable products for obtaining the various animal matters which are employed as food, etc., agricultural chemistry enters into a higher and more difficult field. Here it has been obliged, by numerous experiments, to test much of the empirical knowledge which agricultural practice had too vaguely supplied, and also finds itself under the necessity of investigating the most purely scientific questions of physiology. Although many useful practical results have been obtained, this department of our knowledge is extremely incomplete, and, save in technical details, is too closely allied to the general subject of animal nutrition to require notice in these pages.

Of useful books on agricultural chemistry, those of Liebig and Boussingault take pre-eminence; the former by their brilliant suggestiveness, the latter by their accurate experimental study of many points of the highest practical interest. In Germany, Wolff, Heiden, Knop, and Mayer have recently published excellent systematic treatises. Great Britain has produced no extended work since J. F. W. Johnston's "Lectures," which are still valuable, though far behind the time. In the United States, two books by S. W. Johnson have been received with favor. (See Liebig, "Agricultural Chemistry," 1841; "Modern Agriculture," 1859; "Natural Laws of Husbandry," 1863, etc.; Boussingault, "Economie Rurale," 1851; "Mémoires de Chimie Agricole," 1854; "Agronomie, Chimie Agricole," etc., 1860–68; Wolff, "Naturgesetzliche Grundlagen des Ackerbaues," 1856; "Landwirthschaftliche Fütterungslehre," 1861; Heiden, "Düngerlehre," 1868; Knop, "Lehrbuch der Agricultur Chemie," 1868; Mayer, "Agricultur Chemie," 1871; Johnston, "Lectures on Agricultural Chemistry and Geology," 1847; Johnson, "How Crops Grow," 1868; "How Crops Feed," 1870.)

S. W. Johnson.

Agricultural Geology—geology applied to agriculture—embraces whatever can be learned in regard to the nature of the substructure of any district with reference to drainage and water-supply, the origin, physical structure, and mineral constituents of soils, the distribution and properties of mineral fertilizers, etc. It is chiefly valuable as teaching the probable resources of a district in soil, subsoil, mineral manures, etc. To the farmer it is often desirable that he should know the results likely to be obtained from deep ploughing and deep draining. These depend greatly on the nature of the rock, the dip and compactness of the strata, and the form of the surface in reference to the stratification. In a majority of cases, the subsoil is derived from the underlying rock, and the soil is derived from the subsoil; so that for the most part the soil indicates the rock. Thus in any estimate of the fertility of land the nature of the underlying rock comes into consideration, for both the depth and texture of the soil depend, to a considerable extent, on the rock beneath, and the productiveness is dependent on these. Thus, soils formed from rocks which abound in phosphates are often of extraordinary fertility. Even the fossils and shells that are found in, and are characteristic of, rocks increase the value of the land where they occur.

Agricultural Schools. See Scientific Schools.

Agricultural System, a theory of political economy invented by F. Quesnay (physician to Louis XV.), who taught that those only increase the wealth of a country who develop the resources of the earth, such as the products of the vegetable and mineral kingdoms.

Agriculture [Lat. *agricultu'ra*, from *a'ger*, gen. *a'gri*, a "field" or "land," and *co'lo, cultum*, to "till;" literally, the "tillage (or cultivation) of land"] is the art of increasing and assuring, by human effort and care, the production and growth of such material substances as contribute to the sustenance or enjoyment of our race, whether directly or through the nourishment of such animals as minister to the comfort and well-being of mankind. Its origin and progress are nearly identical with those of civilization. The absolute savage gathers and consumes the seeds, nuts, roots, etc. that gratify his appetite or renew his wasted strength; he may collect and save them in seasons of plenty to minister to his needs in time of want, but he never thinks of planting or tilling with intent to increase his stores. Save under the immediate pressure of hunger or cold, he has no habit of working—no days or hours set apart for industry. Were it otherwise, he would cease to be a savage.

The barbarian is primarily a careless, nomadic cattle-breeder or shepherd. Having captured and domesticated certain animals, he spares a part of them for weeks, or months, or years, that they may be available in time of greater need. Some of them—the horse and the dog, for instance—he values and preserves, though, unless sorely pressed by hunger, he rejects them as food. Some rarely found, like the beaver, otter, mink, etc., he prizes for their fur, whereby he may defend himself against cold, and sometimes increase his personal attractions. The breeding and rearing of the horse, cow, sheep, camel, reindeer, ass, hog, etc. form the earliest and rudest department of barbarian industry. Poorly and scantily fed or sheltered, these animals increase slowly, and thousands of them are often swept off by the unusual severity of winter. Land is lightly valued by the ruder herdsmen: if one locality does not serve, they seek and find another. A great dearth or famine has sometimes set in motion tribe after tribe, until a hunt for food became a migration, then an irruption, overturning dynasties and subjugating races more polished but less warlike than their conquerors.

Though the origin of agriculture is lost in the darkness which shrouds pre-historic times, it can hardly be doubted that men first sowed seeds in the annually-inundated lower valleys of the Nile and other great rivers, which, cradled in distant mountains, are swelled by melting snows more slowly and equably than others. These valleys are often more or less extensively seeded by grains or nuts brought down by the floods; and when such seeding failed or proved inadequate, observation would soon teach those whose subsistence depended on the process to supplement or eke out Nature's niggard, capricious bounty by human providence and industry. Nature had presented a pattern whereon man might profitably improve. After a time the sower strewed his seeds over the face of the stilled and slowly-receding flood, knowing that the softened soil beneath would retain and cover the germs which the sun would speedily quicken: hence the Hebrew proverb, "Cast thy bread upon the waters, and thou shalt find it after many days." Such seeding required no animal or mechanical power, no implement but the human hand and arm, while the annual inundation supplied in abundance the elements of growth. Such was probably the infancy of agriculture.

But the area naturally inundated is small and limited, while, under favoring circumstances, population tends ever to increase. To cultivate more acres was indispensable; and the most facile, rather than the most fertile, were first selected for such use. But here the earth required breaking up and pulverizing; so the aid of strong, docile animals was soon invoked, and rude implements devised to render their muscular strength serviceable. The yoke and the plough were thus called into existence—both rude, as the yoke still measurably is; the original plough being a forked stick or tree-top, with one prong left five or six feet long for a beam, and the other shortened to a foot or two, and sharpened, to serve as a coulter and share. Asia, Africa—nay, even Spain and Portugal—have made but moderate improvements thereon to this day; while Western Europe and the United States have left the primitive plough almost out of sight. Yet it was not till the beginning of the eighteenth century that Jethro Tull persuaded a few British farmers that iron was the true, chief material for ploughs; and only the enlightened cultivators of the present century have substituted steel for iron.

The ruling classes in most nations of antiquity wronged themselves by degrading labor. In the Brahminical hierarchy, which has so long petrified a large portion of the human race, priests rank above soldiers, and soldiers form a caste which looks down on the tillers of the soil. Nearly all the ancient kingdoms of Semitic origin or genius, the Hebrews excepted, concurred substantially in this mistaken estimate. Greece should have been more enlightened, but her ruling caste also, in the days of her glory, was a

caste of warriors, while her soil was tilled mainly by slaves. Rome, in the days of her republican vigor, was a community of cultivators, every citizen being allotted land (usually about six acres), which he was expected to till with his own hands, as was done by some of her greatest warriors and wisest statesmen. But wars of conquest soon filled the republic with slaves captured in battle, and rural labor, as well as household service, was devolved on them, rendering tillage menial and (in the general regard) degrading. Agriculture drooped and withered under this burden, and Italy, naturally the garden of Europe, drew a great part of her bread for ages at first from Sicily, then from Egypt and other distant regions, which ignorance, neglect, and wretched husbandry could not render sterile or unfruitful. Feudalism in the West, Islamism in the East, planted themselves on the ruins of the mighty but corroded fabric of Roman power; and it was not till the Crusades had somewhat shattered the claims of feudalism that any substantial progress in agriculture was made since the ages of Moses and Homer. The average serf of Western Europe, at the date of the Norman conquest, and for generations thereafter, was nowise more fortunate, and was barely more efficient, than the Hebrew cultivator of the age of Samson or of David.

The law given by Moses, the book of Job, and the paintings still fresh and vivid in the Egyptian temples, together carry us back nearly or quite five thousand years, and show us that the plough has been in use for more than that number of years. Moses ordained that the soil should lie fallow every seventh year—a rude but tolerably certain mode of restoring, by rest and atmospheric influences, its exhausted fertility. Isaac, the son of Abraham, is said to have reaped a hundred-fold in one instance—a wondrous product if the crop were the most prolific known to Western Asia in that age. Indeed, historians agree that a yield of five bushels per acre of wheat was the full average of antiquity, if not beyond it. Rye, barley, and oats did better, though not much. Even middling husbandry, with modern implements and methods, yields at least twice as much per acre, and thrice as much per bushel of seed, as did that of Europe and Asia from ten to forty centuries ago. In the production of the grape, the olive, the apple, fig, etc., as also in the rearing of cattle, the ancients stood more nearly on a plane with us, save that their stock was inadequately and capriciously fed and sheltered in winter, whence great losses were from time to time encountered. A very few eminent breeders kept choice animals, but the great majority thought no more of blood in cattle than of grafting their apple trees or underdraining their marshes. In Greece, agriculture scarcely attracted the notice of the intellectual, powerful, and cultivated minority, who were intent on war and politics, art and music; and no work of noticeable ability survives to attest Greek devotion to, or interest in, the improvement of the soil. Rome was less sterile in this respect; her writers on agriculture proffered suggestions which, though more than two thousand years old, may still be pondered with profit by practical farmers. The original allotment of land to each Roman citizen ranging from two up to six acres, the advantage of thorough over shiftless cultivation is especially insisted on by them, while the advisability of early planting, tilling, harvesting, etc. is forcibly commended. Slavery having degraded labor, while luxury enervated the richer classes, Roman agriculture sank into decay, and Italy was for centuries largely supplied with bread-grain from abroad. The Northern barbarians who overturned and divided the Roman empire were but rude cultivators, and despised the arts of peace, as only befitting serfs and slaves. Of course they did nothing to improve the wretched methods of cultivation which they found in vogue in Greece, Gaul, Iberia, and Italy. But the Saracens, who soon wrested a great part of Southern Europe from the grasp of their degenerate offspring, introduced irrigation and kindred arts from Northern Africa, and made the Spanish peninsula flourish as it had never done till then. The fact that their revenue in Spain amounted in the tenth century to $30,000,000 (equal to twenty times that amount in our day) indicates an efficiency and a thrift in cultivation, as well as manufactures, unknown to their modern successors.

So long as Europe bent to the yoke of feudalism, agricultural improvement was scarcely possible. The tillers of the soil were mainly tenants at will, bound to rush to arms at the call of their lord, and liable to be dispossessed at his nod. They usually paid their rents in kind, and one who grew unusually large crops would have been promptly required to increase his quota of rent. Leases for fixed terms, or for two or more lives, gradually replaced the older methods, the landlords at length discovering that their own true interest required that the tenant should be incited to improve his processes, enlarge his fields, and increase his crops.

The condition of the masses under the feudal system precluded efficient cultivation. Sunk in the grossest ignorance, grovelling in superstitious fear of a haughty priesthood, taking the law from the mouths of their landlords or feudal masters, they had neither means nor will to improve their holdings and methods. Wheat they seldom ate, their scanty crops of this grain were required by their masters; rye, barley, and oats afforded their meat and their drink—beer or mead being their only luxury. Even the aristocracy of most European countries, but especially of England, knew few edibles but these, esculent vegetables being as yet few and poor. Says "The British Cyclopædia," "It was not till the end of the reign of Henry VIII. that any salads, any carrots, or other edible roots were produced in England. The little of these vegetables that was used was formerly imported from Holland and Flanders." Butcher's meat had been and was abundant and cheap, only because most of the country was uncultivated, lay in common, and was ranged over by cattle that received little care and less fodder. The invention of printing, the discovery of America, the dayspring of inquiry and mental freedom inaugurated by Martin Luther, rung the knell of feudalism. The New World supplied some excellent edibles to the Old—Indian corn and the potato foremost among them. No other grain but rice yields food for man so bounteously as the maize; no other root is so generally acceptable as the potato, though several others yield a larger bulk or weight per acre. Even if the maize were already known to China and the far East, its value to Europe was not lessened. And even tobacco, though making a heavy draft upon the soil, has largely contributed to enhance the gains of the husbandman, since many communities pay as much annually for this seductive narcotic as for bread.

Modern agriculture dates from the invention of printing, and the consequent multiplication of books and of readers. "The Book of Husbandry," the first English work of decided merit devoted to tillage, was first published in the reign of Henry VIII. (1534), and is attributed to a judge named Fitzherbert. It is eminently practical in its inculcations, and nearly as minute in its descriptions as its lineal successor, Mr. Stephens's "Book of the Farm." It was soon followed by several others of like purpose, which are often judicious, though sometimes fantastic, in their recommendations. The introduction of red clover and the turnip into Great Britain, about 1645, probably did more for her farmers than all the books ever printed had thus far done. It is said that Lord Bacon, having assiduously collected all the works treating of agriculture known in his day, after dipping into them sufficiently to form an opinion of their contents, at length consigned them to the flames, saying that they laid down rules arbitrarily and with no regard to principles. We presume this sweeping criticism contemplated the writings of German and French, as well as British, writers on the art of cultivating the soil.

Jethro Tull, a gentleman farmer of Berkshire, whose "Horse-hoeing Husbandry" appeared in 1731, seems to have been the first author who contemplated the farmer's calling with the eye of genius. He had for thirty years been drilling in his crops with decided advantage, and he tells others how to profit by his example. He insisted on the advisability of repeated ploughings before seeding, and of sowing in drills so wide apart as to admit of cultivation with a horse-hoe. Underdraining being as yet unknown, he laid his land in ridges, with shallow ditches intervening; he sowed but three pecks of seed to the acre; he hoed his wheat in the fall, and again in the spring; and, making the ridges of this year on the ground allotted to the ditches of last year, he grew thirteen crops of wheat in succession on the same field, and maintained that the soil was nowise exhausted thereby. He thus anticipated the Loisweden practice of our day, which consists in marking off a (drained) field into strips three feet in width, cultivating these in alternate years, and tilling the fallow spaces between the strips of grain. It is claimed for this practice that the crop is as large as when all the ground is sown, and that wheat after wheat may thus be grown *ad infinitum!* Tull sowed turnip seed in the same drills or ridges, at depths of one, two, and four inches respectively, calculating that the lowest would germinate in spite of any but the severest drouth, and that, the young plants appearing at different times, a part of them must at all events escape the fly. British agriculture owes very much to the turnip, which grows luxuriantly in its moist, cool climate, yet is there left in the ground, scarcely touched by frost, until gnawed away gradually by sheep, which are thus fattened more cheaply than they otherwise could be.

The breeding of choice sheep and cattle received signal attention in Great Britain during the last century, and the improvements thus effected have been maintained and extended. The Durham and Alderney breeds of cattle, the Leicester, Cotswold, and other excellent breeds of long or

coarse-woolled sheep, are among the trophies of that century. The Merino was brought from its native Spain by George III. in 1788, but experience proved it unsuited to the British isles, where mutton is of more consequence than wool.

The high price of grain, caused by the persistent wars between France and England for twenty-five years prior to 1815, stimulated the progress of British agriculture. Scotland participated fully in this improvement, whereby millions of acres were reclaimed from heath and bog or rugged pasture, and made largely productive of grain and roots. Underdraining was greatly promoted by an act of Parliament providing that money should be advanced from the public treasury to defray its cost, upon the security of a first mortgage on the property thus reclaimed.

The progress of agriculture since 1800 has been so rapid that its recent triumphs outweigh all that preceded them. The use of dissolved bones as a fertilizer is hardly yet seventy years old, yet it has increased the annual grain-harvest of Great Britain by millions of bushels. For a generation the farmers of this and other countries saw cargo after cargo of bones taken from their shores to fertilize British fields, without even asking what this should suggest to them; but now they use all the bones attainable (mainly in the shape of superphosphate), and look around for more. Guano—whereby the fields of Peru and Chili were fertilized long before Columbus dreamed of a shorter passage westward to China and Japan—first found its way to Great Britain in 1841: its annual application already costs that country millions of dollars, and is still increasing. Lastly, the employment of steam in the direct service of agriculture, not only in threshing and winnowing, but in ploughing and tilling as well, is among the great and beneficent improvements of boundless scope and promise for which mankind are indebted to the intelligent and energetic cultivators and mechanicians of Great Britain.

American agriculture, like that of continental Europe, has too generally been content to follow and to copy where it might have pointed and led the way. Wrestling with giant forests, with stumps and roots, and often with a rocky or a sandy soil, with his capital absorbed in the purchase of his generally superabundant acres, the average American cultivator has been content to do as his grandfather did, heedless of all suggestions of improvement. Underdraining, deep-ploughing, the use of commercial fertilizers, etc., he instinctively dislikes, and resists so long as resistance is possible. Thus far the substantial triumphs of American agriculture have mainly been the trophies of mechanical genius. Thus, the cotton-gin of Eli Whitney has done more to diffuse comfort and plenty throughout the civilized world than any single achievement of an American farmer. Our people were among the first to reduce the weight and lessen the draft of the plough, and they have been among the foremost in its gradual transmutation from a rude implement, constructed mainly of wood, to one far more effective, whereof barely the handles are of wood, while the land-side, as well as the share, and nearly or quite all besides, are made of polished and excellent steel. In axes, scythes, hoes, spades, and nearly every other instrument of manual effort on a farm, our country may boast a decided superiority. In the profitable substitution of animal for manual exertion, however, have our most signal triumphs been won. By ploughing instead of hoeing Indian corn we have immensely increased the area cultivated, while reducing the cost of the product. Under our prompting the sickle has been superseded by the cradle in cutting all the smaller grains, and this again by the reaper, which cuts acres more rapidly than roods could be cut with the cradle. The mower (always akin to, and sometimes identical with, the reaper) has so reduced the cost and fatigue involved in our hay-harvest that cattle are kept far more cheaply in our old States, estimating their cost in hours of labor, than they could be prior to the last twenty or thirty years. Horse-rakes, hay-tedders, with fanning-mills and kindred devices for separating grain from chaff, threshers of many diverse patterns, corn-huskers, potato-diggers, etc., have immensely economized our labor and increased the bulk and value of our annual harvests. Underdraining, subsoiling, irrigation, etc. have as yet been naturalized among us entirely by the efforts of an enlightened but nowise numerous minority, but their benefits are so signal and indubitable that the many cannot long hesitate to adopt them.

In the use of steam in ploughing we are deplorably backward, owing in good part to our recent great and exhausting civil war. But for this a thousand portable steam-engines would doubtless have been tearing up our fields ere this, as is the case already in Great Britain, and must soon be here. As it is, we may fairly boast of *one* step in advance of our great rival. On the plantation of Mr. Effingham Lawrence, fifty miles below New Orleans, on the west bank of the Mississippi, the largest steam-engines yet constructed by Messrs. John Fowler & Co., the British makers of steam-ploughs and other cultivating machinery, are steadily and profitably employed, not merely in ploughing that glutinous, leathery clay to a depth of twenty-six to twenty-eight inches, but similar engines, worked entirely by blacks till recently slaves, are lifting and pulverizing to a depth of fully two feet the spaces which separate the rows of growing cane; and doing the work so thoroughly, when the cane is about one foot high, that it needs no further tilling till matured—the plants pushing their roots quickly into the mellow earth, and thence drawing sustenance for a growth so luxuriant as to smother and choke out all future weeds. So far as is known to this writer, no earlier cultivation of growing crops by steam has been seen on this planet.

And this is a hint by which thousands must profit. But few years can elapse before the vast prairies of the West and South-west will be cultivated largely, if not mainly, by steam—the same locomotive being employed to plough, seed, till, harvest, thresh, winnow, and perhaps transport the grain to the nearest steamboat wharf or railroad station. Working on untired through day and night, consuming nothing when idle, and thoroughly pulverizing fifty acres per day to a depth unattainable by horse-power, the steam-engine will prove here, as elsewhere, the mightiest friend and most useful servant ever vouchsafed to human genius at the call of an urgent need.

Early History of Agriculture.—As the Greeks and Romans appear to have arrived at as great a degree of perfection in legislation as the moderns, so they may be said to have attained great excellence in the art of agriculture. Till within the present century very little difference existed between the most approved agriculture of climates analogous to that of Italy and the agriculture of the Romans as described by Cato, Columella, and other ancient writers. The chief superiority of the moderns consists in their machinery, and especially in their knowledge of the sciences connected with this pursuit; the last, though extremely important, being of very recent date, and as yet by no means generally diffused. By science are not only acquired more enlightened and greatly improved methods of treating the soil, but superior breeds both of plants and animals have been originated; by improved machinery a more perfect tillage has been produced, and also a more complete separation of the produce of the soil from the refuse of the plants and other impurities.

In Great Britain the history of agriculture begins with the Roman Conquest. Julius Cæsar found the inhabitants in a state of semi-barbarism, but Agricola left them in possession of all the arts of civilization known to the Romans. Agriculture declined with the invasion of the Saxons, but was preserved through the dark ages after the establishment of Christianity by the intelligence of the members of religious establishments, who gradually became possessed of the greater part of the landed property in the country. The culture of the land will be found to have depended in every country principally on its climate and civilization, though partly, also, on its government and population. In the warmer climates, where nature produces fruits in the greatest abundance for the food both of men and animals, and where very little care is required to procure shelter or clothing, agriculture has made little progress, because it is comparatively unnecessary for the prosperity of the inhabitants. On the other hand, in climates of a directly opposite character agriculture has made equally slight progress, owing to the almost insurmountable obstacles opposed to it. It is therefore only in intermediate climates, where the soil admits of labor by man throughout a great part of the year, that agriculture is calculated to attain the highest degree of perfection.

Literature of Agriculture.—The literature of agriculture begins with the works of the Romans, of which COLUMELLA'S work, "De Re Rustica," may be considered the most comprehensive and valuable. VIRGIL'S "Georgics," a poem unequalled of its kind in any language, may be said to teach, with all the attractions of the most exquisite poetry, everything that was then known of the art of agriculture. In the dawn of modern agriculture, the principal writers were—Crescentius in Italy, Herrera in Spain, Olivier de Serres in France, Hereshbachius in Germany, and Fitzherbert in England. (For the recent literature of scientific agriculture, the reader is referred to the bibliography at the end of AGRICULTURAL CHEMISTRY.) At the beginning of the present century the most comprehensive author on agriculture in Italy was Fillippo Re; in France, Tessier; in Germany, Mayer; and in England, Marshall. About the best work from which a general idea may be obtained of the agriculture of France and corresponding climates is "Maison, Rustique du xix^{e} siècle, ou Encyclopédie d'Agriculture pratique," complete in one volume, 8vo.; and the

corresponding British works are Loudon's "Encyclopedia of Agriculture;" Stephens's "Book of the Farm;" Morton's "Cyclopedia of Agriculture;" and Wilson's "British Farming." Horace Greeley.

Agriculture, Department of, was established by Congress in 1862 in Washington, D. C. By means of annual and monthly reports it diffuses information deemed advantageous to the agricultural interests of the country. It purchases and propagates seeds and plants, which are distributed to the people of the U. S. It is under the commissioner of agriculture, who is appointed by the President and confirmed by the Senate. It has a fine building, which stands W. of the grounds of the Smithsonian Institution. Connected with it are a museum, chemical laboratory, propagating gardens, and a library. Its monthly reports of the prospects of the staple crops are especially valuable. At the propagating gardens plants received by exchange from foreign governments and botanic gardens are tested with a view to introducing new and useful plants into this country.

Agrigen'tum (now *Girgen'ti*), an ancient city of Sicily, situated on the slope of a mountain on the S. coast of the island. It was founded about 582 B. C., and once had about 200,000 inhabitants. Here are magnificent ruins, among which are the temple of Concord (said to be the most perfect extant structure of the early Greek architecture), and the temple of Olympian Jupiter, about 350 feet long. (See Girgenti.)

Ag'rimony [Lat. *Agrimo'nia*], a genus of herbaceous plants of the natural order Rosaceæ. The *Agrimonia Eupatoria*, a native of Europe and the U. S., has been used in medicine. Several species grow in the Southern U. S.

Agrippa, King. See Herod Agrippa.

Agrip'pa (Henry Cornelius), of Nettesheim, German physician, philosopher, and astrologer, was born at Cologne Sept. 14, 1486. He cultivated many departments of knowledge, and engaged in various pursuits in many countries of Europe. He acquired fame by his talents and his supposed skill in occult science, but he was regarded as an impostor and heretic by some of his contemporaries. He lectured on theology at Cologne and other places, and practised medicine in France. Among his works is a satire "On the Vanity of the Sciences" (in Latin, 1530). Died Feb. 18, 1535.

Agrip'pa (Marcus Vipsanius), an eminent Roman statesman and general, born in 63 B. C. He became in his youth a friend of Octavius (afterwards the emperor Augustus), to whom he rendered important military services, especially at the battle of Actium, where he commanded the fleet, in 31 B. C. Agrippa and Mæcenas were the principal ministers and advisers of Augustus after he had obtained the supreme power. He married Julia, the daughter of Augustus, about 21 B. C., and had several sons, two of whom were adopted by the emperor. Died in 12 B. C.

Agrippi'na I., a Roman lady, the daughter of M. Vipsanius Agrippa and his wife Julia, was married to the famous Germanicus. Her virtue is highly commended. Died about 32 A. D.

Agrippina II., a daughter of the preceding, was born about 14 A. D. She was the mother of the emperor Nero, and was notorious for her profligacy and her crimes. Her third husband was the emperor Claudius, whom she killed by poison. She was put to death by her son Nero in 60 A. D.

Ag'telek, or **Bar'adla,** the name of one of the largest and most remarkable stalactitic caverns of Europe, is in the county of Gömör, in Hungary. Here is a labyrinth of caverns, one of which is 96 feet high, 90 feet wide, and extends about 900 feet in a direct line.

A'gua, Volcan' de (*i. e.* "volcano of water"), a mountain of Central America, in the state of Guatemala, situated about 25 miles S. W. of Guatemala; so called from the fact that it sometimes pours forth torrents of water. The old town of Guatemala has been twice destroyed by it. Its crater is 15,000 feet above the sea-level.

A'guas Calien'tes (*i. e.* "warm springs"), a state of Mexico, is bounded on the N. by Zacatecas, on the E. by Guanajuato, on the S. by Lake Chapala, and on the W. by Xalisco. Area, 2217 square miles. The surface is partly level and partly hilly, and in the N. are branches of the Sierra Nevada. The soil is very fertile, but poor in minerals. Pop. in 1868, 140,630.

Aguas Calientes, a town of Mexico, the capital of the state of its own name, is on a plain or table-land 6000 feet above the level of the sea, and 250 miles N. W. of the city of Mexico. It has numerous churches and three convents, and is surrounded by gardens and orchards of olives, pears, figs, etc. Hot springs occur in the vicinity. Pop. about 39,000.

A'gue [probably from the Fr. *aqu*, an old form of *aigu*, "sharp," in allusion to the violence of the disease], is the common name for the Intermittent Fever [which see].

Aguilar' de la Fronte'ra, a town of Spain, on the Cabra, 22 miles S. S. E. of Cordova, is noted for the whiteness of its houses and the cleanness of its streets. It has several fine public squares, a town-hall, and a dismantled Moorish castle. Pop. 11,836.

Aguilar (Grace), a Jewish authoress of Spanish extraction, was born at Hackney, near London, June 2, 1816. Among her numerous works are "Women of Israel," "Home Scenes and Heart Studies," and "Home Influence, a Tale." She died at Frankfort Sept. 16, 1847.

Agulhas, Cape, the most southern point of Africa, is about 100 miles E. of the Cape of Good Hope. A lighthouse was erected on it in 1849; lat. of lighthouse, 34° 49′ 8″ S., lon. 20° 0′ 7″ E.

Agusti'na, called the "Maid of Saragossa," died at Cueta, Spain, in 1857. She greatly distinguished herself during the siege of Saragossa by the French in 1809, and as a reward for her services was made a lieutenant in the Spanish army, and received numerous decorations. Byron extols her in "Childe Harold," canto i., stanzas 54, 55, 56.

Agyn'ians [from the Gr. *a*, neg., and γυνη, a "woman"], a Gnostic sect of the seventh century who condemned marriage and the use of certain kinds of meat.

A'hab [Heb. *Achab*], eighth king of Israel, who reigned B. C. 915–895. His wife was Jezebel, daughter of Ethbaal, the usurping king of Tyre. He dwelt at Jezreel, which he adorned with splendid buildings. The story of his weakness, his idolatry, and the stern opposition of the prophet Elijah is related in the first book of Kings. Ahab was killed in battle with Benhadad, king of Damascus.

Ahan'ta, a negro kingdom in Upper Guinea, which was formerly independent, but was conquered by Ashantee. It is one of the healthiest, richest, and most civilized districts on the coast, having a fertile and well-cultivated soil. The chief productions are sugar-cane, rice, and timber. The chief articles of export are palm oil, ivory, and gold. In 1683, Frederick William, the great elector, attempted to start a colony here, but in 1718 Prussia sold all her possessions on the Gold Coast to the West India Company in Amsterdam. The Dutch took possession of several other districts in this neighborhood, but in 1872 ceded all their possessions on the Gold Coast to Great Britain.

Ahasue'rus, the name of one Median and two Persian kings mentioned in the Old Testament. The Ahasuerus of Esther was probably Xerxes, the invader of Greece, who reigned from 486 to 465 B. C. He invaded Greece in 480, and is supposed to have married Esther the year after.

A'haz [Heb. *Achaz*, "possessor"], twelfth king of Judah after its secession from Israel, reigned B. C. 740–726. His reign was greatly disturbed by the attacks of Rezin, king of Damascus, and Pekah, king of Israel, as well as those of the Edomites and Philistines. Ahaz called to his aid the powerful Tiglath-Pileser, king of Assyria, who overthrew the enemies of Judah, but made Ahaz his vassal, and carried off rich treasures from the temple and palaces of Jerusalem. Ahaz was an idolater. A statement in 2 Kings xvi. 2 as to his accession would make his son and successor, Hezekiah, to have been born when he was eleven years old, but this must be a transcriber's error or the date of a viceroyship.

Ahazi'ah, ninth king of Israel, succeeded his father Ahab, and ruled under the direction of Jezebel, his mother, B. C. 895–894.—Also the name of the sixth king of Judah, B. C. 884–883. A famous error of some transcriber (2 Chron. xxi. 5, 20) makes him younger than his own son.

Ahith'ophel [Heb. *Achithophel*, "foolish"], a Hebrew politician and councillor of David. He took the side of Absalom in his rebellion, but, foreseeing the failure of the enterprise, went home and hanged himself.

Ahl'feld (Johann Friedrich), an eminent German preacher, born Nov. 1, 1810, became in 1847 clergyman in Halle, and in 1851 in Leipsic, and gained in both places the reputation of an excellent pulpit orator. He published several collections of sermons, all of which have had a large sale.

Ahl'quist (August Engelbert), a celebrated Finnish philologist, born Aug. 7, 1826, not only made the Finnish language his especial study, but also made it his object to raise it to the rank of a written language, and to create a national Finnish literature. For this purpose he travelled under the greatest difficulties through Northern Russia and Siberia to acquaint himself with the tribes of the Uralian-Altaic race living there. At present he is professor of Finnish language and literature in the University of Helsingfors. His chief works are "An Attempt at a Moksha-

Mordwinian Grammar" (1862), a "Grammar of the Wotish Language," and a description of his travels in Siberia (1853–58). He has also written many poems in the Finnish language, and made several translations from the German of Schiller.

Ahl'wardt (THEODORE WILHELM), a German Orientalist, born July 4, 1828, became in 1861 librarian and professor of Oriental languages at the University of Greifswalde. He published "Chalef el Ahmars Qasside" (1859), besides several historical works.

Ah'med IV., sometimes called **Abd'ul-Hâmid,** a Turkish sultan, born in 1725, succeeded to the throne in 1773. His reign is chiefly notable on account of the two disastrous wars with Russia, in which Turkey lost the Crimea, a portion of Circassia, with some other territories, and a number of important fortresses. Died in 1789.

Ah'medâbâd' (*i. e.* "the abode of Ahmed"), a city of British India, in the presidency of Bombay, is on the river Subbermuttee, 16 miles by rail N. N. W. of Surat; lat. 23° 1' N., lon. 72° 48' E. It was formerly a large and magnificent capital, but is now much decayed. Here are several beautiful mosques and other remains of its ancient splendor. It was founded by Ahmed Shah in 1412. Pop. estimated at 130,000.

Ah'mednug'gur (*i. e.* the "fort of Ahmed"), a city and fortress of British India, in the presidency of Bombay, on the Seena, 162 miles by rail E. of Bombay. It was taken by General Wellesley in Aug., 1803, and the fortress is now held by a British garrison. Pop. about 20,000.

Ah'medpoor'-Barra (*i. e.* "great Ahmedpoor"), a town of Hindostan, situated in a fertile tract 30 miles S. W. of Bhawlpoor. It has manufactures of matchlocks, gunpowder, cotton, and silk stuffs. Pop. about 20,000.

Ah'mood, a town of British India, in the presidency of Bombay, 12 miles N. by W. of Baroach. Pop. about 13,000.

Ahn (JOHANN FRANZ), a German writer and author of a new method of learning foreign languages, born at Aix-la-Chapelle Dec. 15, 1796, published a "Practical Course for the Quick and Easy Acquisition of the French Language" (167th ed. 1870), and other similar works, which have found an immense circulation. His method has been imitated by many other writers. Died Aug. 21, 1865.

Ah'napee, a post-village of Kewaunee co., Wis., in a township of its own name. Pop. of township, 1544.

Ah'rens (HEINRICH), an eminent German, born July 14, 1808, lectured in Paris in 1833 on the history of German philosophy since the time of Kant, and became in 1834 professor of philosophy in Brussels, in 1850 professor of abstract law and political economy at Graz, in 1859 of practical philosophy and political science at Leipsic, and in 1863 was elected representative of the university in the first chamber of Saxony. His principal works are "Cours de droit naturel" (6th ed. 1869; German ed. 1846); "Philosophie des Rechts" (1851–52; 6th ed. 1870); "Juristische Encycl." (1855–57), which has been translated into several foreign languages.

Ah'riman, the principle of evil among the ancient Persians. (See ORMUZD.)

Ai, the native name of the *Bradypus tridactylus*, or three-toed sloth, an edentate mammal of South America. There are several varieties of this animal. It takes its name from the loud cry which it makes while moving in the forests. It is very tenacious of life, and will move its legs long after it has been disemboweled and beheaded. In habits it resembles the other sloths.

A'i (a "ruin"), a city of Palestine, which was destroyed by Joshua. Its site is not positively known.—Also a city of Ammon, destroyed by the Babylonians.

Aid, a post-village of Lawrence co., O., in a township of the same name. Pop. of township, 1476.

Aid'an, SAINT, first bishop of Lindisfarne, was born in Ireland, and was sent as a missionary bishop to Northumbria by the bishop of Iona about 635 A. D. He was successful in establishing Christianity, being aided by the king and nobles. His life was adorned by charity, humility, and all the Christian virtues. Died Aug. 31, 651.

Aides-de-Camp, confidential officers selected by general officers to assist them in their military duties, are *ex-officio* assistant adjutants-general (act Mar. 2, 1821). They are in the U. S. service attached to the person of the general, and receive orders only from him. Their functions are difficult and delicate. Often enjoying the full confidence of the general, they are employed in representing him, in writing orders, in carrying them in person if necessary, in communicating them verbally upon battle-fields and other fields of manœuvre. It is important that aides-de-camp should know well the position of troops, routes, posts, quarters of generals, composition of columns, and orders of corps. It is necessary that their knowledge should be sufficiently comprehensive to understand the object and purpose of all orders, and also to judge in the varying circumstances of a battle-field whether it is not necessary to modify an order when carried in person, or if there be time to return for new instructions. (*Scott's Military Dictionary.*) The existing law of the U. S. allows six aides-de-camp (colonels) to the general; two and a military secretary (lieutenant-colonels) to the lieutenant-generals; three (captains or lieutenants) to a major-general; and two (lieutenants) to a brigadier-general.

Aidin', or **Guzel-Hissar** (anc. *Tral'les*), a town of Asiatic Turkey, in Anatolia, on the river Mender (Meander), about 68 miles S. E. of Smyrna, with which it is connected by railroad. It has a large trade, being next to Smyrna in commercial importance, and is the residence of a pasha. Here are several fine mosques and synagogues. American missionaries have established here a flourishing Protestant mission. Pop. estimated at 15,000.

Aido'ne, a town of Sicily, in the province of Caltanisetta, 20 miles E. S. E. of Caltanisetta. Here are mineral springs. Pop. in 1861, 5229.

Aignebelle, a small town of France, in Savoy. Pop. about 1100. Here the combined French and Spanish armies defeated Duke Charles Emmanuel III. of Savoy in 1742.

Aigucbelle, d' (PAUL ALEXANDRE NEVEUE), a French naval officer in the service of China, was born Jan. 7, 1831. He took part with the Franco-Chinese corps against the Taï-Pings, and took in 1864 the important city of Hang-Chow-Foo. He entered the Chinese service, was created a mandarin of the first rank, organized an important military arsenal at Foo-Chow-Foo, and in June, 1869, he launched the first man-of-war of the new navy built on the European plan. He was then made grand admiral of the Chinese fleets, which title was expressly created for him.

Aigues Mortes, a town of France, in the department of Gard, 19 miles from Nîmes. Pop. in 1866, 3932. The large saline works of Peccais are in the neighborhood. An interview between Francis I. of France and the emperor Charles V. took place here in 1538.

Aiguille [Fr., a "needle"], the name of numerous sharp-pointed peaks in the Alps.

Aiguillon (ARMAND VIGNEROD DUPLESSIS RICHELIEU), DUKE OF, a French statesman, born in 1720, was governor of Alsace, and afterwards of Brittany. He gained the favor of the king's mistress, Madame du Barry, and through her influence was made prime minister. Upon the accession of Louis XVI. he was removed from office and banished from court, and died in 1782.

Aiken, a county of South Carolina, formed in 1873 from parts of Barnwell, Edgefield, Lexington, and Orangeburg counties. It is bounded on the W. by the Savannah River. Area, 900 square miles. The principal minerals are kaolin (which is largely exported) and burr mill-stone. Cotton goods, paper, and pottery are manufactured.

JOHN S. SHUCK, ED. "AIKEN JOURNAL."

Aik'en, the county-town of the county of the same name in South Carolina, is noted as a resort for invalids, especially those suffering from pulmonary complaints. Being situated on a plateau 600 feet above the level of the sea and 400 feet higher than the city of Augusta, which is 17 miles distant, and the soil being sandy and porous, the system of natural drainage is almost perfect, rendering the atmosphere peculiarly dry and elastic. The dew-point is invariably low. The climate is a mean between the dry, cold region of Minnesota and the moist, temperate section of Florida, and has proved efficacious in restoring health to invalids in thousands of cases. It is easily accessible by means of the South Carolina R. R., on which it is located. The appearance of the town, with its broad streets, 150 feet wide, is pleasing and attractive. Besides public or free schools, there are several private schools, seven churches (Methodist, Baptist, Catholic, Presbyterian, and Episcopalian, and colored Methodist and Baptist), two weekly newspapers and one daily, a lyceum hall, and a reading and club room supplied with the daily papers and periodicals. The hotels, of which there are two capable of accommodating over 100 guests each, and the private boarding-houses, are well kept and adapted to the requirements of invalids. Each year the number of visitors increases as the characteristics of this locality become better known. During the season of 1872–73 some 1850 names were registered. Pop. of township, 2259. JOHN S. SHUCK, ED. "AIKEN JOURNAL."

Aiken (CHARLES AUGUSTUS), D. D., LL.D., was born at Manchester, Vt., Oct. 30, 1827, graduated at Dartmouth College in 1846, and at Andover Theological Seminary in

1853, was pastor of a Congregational church in Yarmouth, Me., from 1854 to 1859, professor of the Latin language and literature at Dartmouth from 1859 to 1866, professor of Latin in the College of New Jersey from 1866 to 1869, president of Union College from 1869 to 1871, and is now professor of Christian ethics and apologetics in the Princeton Theological Seminary. He translated and edited the book of Proverbs in the American edition of Lange's "Commentary," and has published several articles in the "Bibliotheca Sacra" and "Princeton Review."

Aiken (William), born in Charleston, S. C., in 1806, graduated at South Carolina College in 1825. He was prominent in public affairs, was governor of South Carolina (1844–46), and a Democratic member of Congress (1851–57). He was a man of great wealth, being proprietor of Jehossee Island, where he formerly employed 1000 slaves in rice-culture. He was distinguished while in public life by his wisdom and moderate views, and has contributed largely to the cause of education and to benevolent objects. While in Congress in 1857 he lacked but one vote of becoming Speaker of the House of Representatives.

Aik'in (John), M. D., an English writer, born in Leicestershire Jan. 15, 1747. He produced, conjointly with his sister, Mrs. Barbauld, an instructive juvenile book called "Evenings at Home" (1792–95), which had great popularity. He practised medicine in London and other places. Among his numerous works is a biographical dictionary, entitled "General Biography" (10 vols. 4to, 1815). He edited the "Monthly Magazine" (1796–1806). Died Dec. 7, 1822.

Aikin (Lucy), a daughter of the preceding, born Nov. 6, 1781, wrote, besides other works, a memoir of her father (1823), and "Life of Joseph Addison" (1843). Died Jan. 29, 1864.

Aik'man (William), a distinguished Scottish painter, born at Cairnby Oct. 24, 1682; died in London June 7, 1731.

Ailan'thus, or **Ailan'tus** (*i. e.* "tree of heaven"), a tree which is a native of China, and has remarkably large pinnate leaves. It grows rapidly, and is often planted as an ornamental or shade tree in the cities of Europe and the U. S. The foliage is handsome, but it causes much annoyance by the rapid spread of suckers from the parent tree. The staminate flowers, which are borne on distinct trees, have an offensive odor that often produces headache and nausea. The female plants are free from this objection, and the clusters of winged fruit which they bear are quite ornamental, so that they should always be chosen for shade trees. Besides the above (*Ailanthus glandulosus*) there are several other species, chiefly tropical. They belong to the order Simarubaceæ.

Ailanthus Silkworm (the *At'tacus cyn'thia* of the naturalists) is so named from its feeding on the leaves of the ailanthus tree. The silk obtained from this worm is extensively used in China and it is even thought by some that it will, for most purposes, ultimately supersede the culture of the common silkworm, as it is much hardier and not subject to many diseases to which the other is liable. In addition to this, the tree is easily cultivated, being readily acclimatized in most temperate countries. The eggs are hatched in a similar manner to those of the common silkworm, and the larvæ, after being fed through their first moult with picked leaves, are transferred to the trees, and there left.

Ailanthus Silkworm.

Ailly, Peter of, an eminent French prelate, born in Picardy in 1350. He became archbishop of Cambray in 1395, and a cardinal in 1414. He denounced and wished to reform some abuses in the Church. He was called "Malleus Hæreticorum" and "Aquila Doctorum." Died about 1420.

Ailred (**Ethelred** or **Alured**), Saint, Cistercian abbot of Rievaulx, Yorkshire, born in England in 1109, was educated in Scotland. He wrote numerous sermons, histories, and other works, part of which were edited by Twisden (1652), by Camerarius (1631), and by one Gibbon (Douai, 1631). Died Jan. 12, 1166.

Ail'sa, Marquesses of (1831), Barons Ailsa (1806, in the United Kingdom), earls of Cassilis (1509); Barons Kennedy (1452, in Scotland); baronets (1632, in Scotland), a prominent family of Great Britain.—Archibald Kennedy, the third marquess, born Sept. 1, 1847, succeeded his father in 1870.

Ail'sa Craig, an island 10 miles from the coast of Ayrshire, Scotland. It is a crag of trap-rock of a somewhat columnar character. It is 1098 feet high, and 2 miles only in circumference. It is not inhabited. It gives his title to the marquis of Ailsa, its proprietor.

Ailu'rus* Ful'gens, the scientific name of an animal of the class Mammalia, order Carnivora, family Ursidæ, found in the mountains of Nepal. By the inhabitants of that country it is termed *panda*, *chitwa*, and *wah*, the last name having been given it on account of its peculiar cry. It is about the size of a large cat, and is remarkable for its singularly rich and beautiful fur, which is mostly of a bright chestnut-brown, but deepens into a fine rich black on the chest and outside of the legs. It has a short head and a thick muzzle. The head is of a whitish fawn-color, with a ruddy chestnut spot under each eye. The tail is of the same color as the body, being marked with a series of dark rings. "The coat of the panda is not only handsome in appearance, but is very thick, fine and warm in texture, being composed of a double set of hairs—the one forming a thick woolly covering to the skin, and the other composed of long glistening hairs, that pierce through the wool and give the exquisitely rich coloring to the surface of the fur." Cuvier regarded the panda as the most beautiful of known quadrupeds. It is much to be regretted that these animals do not exist in sufficient numbers to render their fur an article of commercial value. The food of the panda is chiefly of an animal character, consisting of birds, their eggs, the smaller mammalia, etc. Its habits are partly arboreal.

Aimard (Gustave), a French novelist, born about 1818, came to America at an early age, and after a short stay travelled throughout Southern Europe. Among his works are "Les Trappeurs de l'Arkansas" (1858), "Les Aventuriers" (1863), "L'Araucan" (1864), etc.

Aimé-Martin (Louis), a French writer, born in 1786, became in 1815 secretary of the Chamber of Deputies. He published, among other works, "Lettres à Sophie sur la physique, la chimie et l'histoire naturelle" (1810), and "L'éducation des mères de familles" (1834). He also published the complete works of Bernardin de St.-Pierre, with a biography of the author. Died June 22, 1847.

Ai'mon, or **Ay'mond,** a French Benedictine of Fleury, wrote a "Historia Francorum," extending from 253 to 654; also a life of Abbo of Fleury, and other works. Died in 1008.

Ain, a department of Eastern France, is bounded on the N. by the departments of Saône-et-Loire and Jura, on the E. by Haute Savoye, on the S. by Isère, and on the W. by Rhône and Saône-et-Loire. Area, 2239 square miles. The department is watered by the Rhône and the Saône, which flow along its boundaries, and by the Ain. The western part consists of a large plateau, which is very fertile. In the E. large mountain-ranges prevail, which contain iron, asphaltum, and the best lithographic stones in France. It is subdivided into 5 arrondissements, 35 cantons, and 450 communes. Pop. in 1872, 363,290. Chief town, Bourg-in-Bresse.

Ain'müller (Maximilian Emanuel), a German painter, born at Munich Feb. 14, 1807, is noted as the restorer of the art of painting on glass. Among his works are the windows of the cathedrals of Ratisbon and Cologne. Died Dec. 8, 1870.

Ai'nous, a race inhabiting the Koorile Islands and the north of Japan. They have mainly attracted attention from the greatly exaggerated, though not utterly false, statements of travellers, that their bodies were entirely covered with hair; from which circumstance they are often called "hairy Kooriles." They are said to be of a mild and amiable disposition. They worship the sun and moon, but have no priests or places set aside for religious services. They have a written language, which seems to be Aryan. They are certainly not Turanian.

Ains'worth, a post-village of Washington co., Ia.

Ainsworth (Robert), an English classical scholar, born near Manchester in 1660, taught school in London. He published a well-known Latin dictionary (1736). Died April 4, 1743.

Ainsworth (William Francis), an English physician and geologist, born at Exeter Nov. 9, 1807. He accompanied Colonel Chesney on an expedition to the Euphrates in 1835. He published "Researches in Assyria" (1842), and "Travels and Researches in Asia Minor, Mesopotamia, Chaldea, etc." (2 vols., 1842).

* Ailurus signifies "having a waving tail" like that of a cat; from αἰολος, "quickly moving" or "waving," and οὐρα, a "tail."

Ainsworth (William Harrison), an English novelist, born in Manchester Feb. 4, 1805. He published "Rookwood" (1834) and "Jack Sheppard" (1839), the latter of which had an extraordinary success, and "The Tower of London." In 1845 he became the proprietor of the "New Monthly Magazine." His numerous stories have had great popularity.

Aintab', a town of Asiatic Turkey, on the S. slope of Mount Taurus or Alma-Dagh, about 60 miles N. of Aleppo, and 92 miles N. E. of Antioch. It is well built, and has manufactures of leather, woollen cloths, etc. The American Protestant missionaries have had for years a flourishing mission among the Armenians of this town. Pop. 43,410.

Air [Gr. ἀήρ, from ἄω, to "breathe;" Lat. *a'ĕr*] was considered an element by the ancient philosophers, but it is now known to be a mixture of oxygen and nitrogen with some other gases. (For information respecting the properties and phenomena of the air, see Acoustics, by Prof. O. N. Rood, A. M.; Barometer, by F. A. P. Barnard; and Pneumatics.)

Air (in painting). See Aërial Perspective.

Air, a town of Africa. See Asben.

Air-Bed, a sleeping apparatus made of air-tight cloth or vulcanized india rubber, divided into compartments and inflated with air. The coolness, cleanness, and elasticity of this bed render it desirable for the use of the sick.

Air-Bladder, or Swimming-Bladder, an organ in fishes which enables them to modify their specific gravity, and to move easily upward or downward, by increasing or diminishing the volume of air (in some instances replaced by nitrogen) in the bladder. This air is supposed to be obtained by secretion. The mackerel and some other species of fish have no air-bladder. It is the analogue of the lungs of air-breathing animals.

Air-Cells, in birds, are cavities connected with the respiratory system, and are distributed over the inside of the chest and abdomen. They also penetrate the bones and quills. Communicating with the lungs, they give a great extension to the surface with which the air inhaled comes in contact, and serve to increase the muscular energy and the animal heat, and to diminish the specific gravity.

Air-Cells, in plants, are spaces in the cellular tissue, containing air. They occur chiefly in aquatic plants.

Air'drie, a market-town and parliamentary borough of Scotland, in the county of Lanark, 11 miles E. by N. of Glasgow, with which it is connected by railway. It is well built and lighted with gas. The growth and prosperity of Airdrie have been increased by mines of iron and coal which are worked in the vicinity. Pop. in 1861, 12,922.

Aire-sur-l'Adour, an old town of France, on the river Adour, 20 miles S. E. of Mont de Marsan, is the seat of a bishop, has a cathedral and a college. It was once the capital of the Visigoth kings. Pop. in 1866, 4885.

Aire-sur-la-Lys, a fortified town of France, in Pas de Calais, on the river Lys, 10 miles S. E. of St.-Omer. It has a Gothic church, and manufactures of woollen stuffs, hats, and soap. Pop. in 1866, 8803.

Air-Gun, an instrument for projecting bullets or other missiles by means of the elastic force of condensed air. A strong reservoir of metal is constructed, into which air is forced by a condensing syringe. The reservoir may be of any form, but it is most conveniently disposed of by placing it within the stock. The bullet should fit the barrel very exactly, so as to leave no windage. On pulling the trigger, the condensed air escapes through the valve and rushes with violence into the barrel, propelling the bullet before it; and the instant the finger is withdrawn from the trigger, the valve is closed by the pressure of the air in the magazine, which remains in a somewhat less condensed state for the next discharge. Thus the same supply of air in the magazine will serve for several successive discharges, but the force becomes weaker and weaker after each. The force with which a projectile is propelled from an air-gun is commonly much less than that produced by an ordinary discharge of gunpowder, but they may be so made as to be very formidable weapons.

Air'lie, Earls of, Barons Ogilvy of Airlie (1491), Barons Ogilvy of Alyth and Lintrathen (1639, in the Scotch peerage), a prominent family of Great Britain. The first earl of Airlie was created in 1639.—David Graham Drummond Ogilvy, the tenth earl, was born May 4, 1826, and succeeded his father in 1849.

Air-Plants, a term applied to certain epiphytic tropical plants, which hang in festoons from forest trees, and are able to live suspended in the air, without the presence of earth or water. The family of Orchidaceæ furnishes some beautiful specimens of air-plants.

Air-Pump, a machine by which a partial vacuum is formed and air is exhausted from a vessel, was invented by Otto Guericke in 1654, and subsequently improved by several persons. It consists of a circular brass plate, on which is placed a bell-glass, called a receiver, and two vertical brass cylinders, each of which is furnished with a piston. By means of a hole in the centre of the plate, and a connecting tube, a communication is formed between the receiver and the cylinders. The movement of the piston expels the air from the cylinders, into which a portion of air then rushes from the receiver, and a valve is placed at the mouth of the connecting tube, so that no air can return into the receiver. Another valve in the piston opens outward and permits the air to escape. The air-pump is used in many scientific experiments to demonstrate the pressure of the atmosphere and various other properties of air.

Air'y (George Biddell), C. B., LL.D., D. C. L., F. R. S., born at Alnwick, Northumberland, June 27, 1801, graduated B. A. at Trinity College, Cambridge, in 1824, being senior wrangler. In 1826 he became Lucasian professor of philosophy, and in 1828 Plumian professor of astronomy. In 1835 he was appointed astronomer-royal, and placed in charge of the Greenwich Observatory. Dr. Airy has attained a very high rank as an astronomer and physicist, and has written much upon weights, measures, coinage, railways, and other kindred subjects. He has made important improvements in astronomical and philosophical instruments. He wrote the article "Gravitation" in the "Penny Cyclopædia," and "Trigonometry," "Figure of the Earth," and "Tides and Waves" in the "Encyclopædia Metropolitana;" also "Mathematical Tracts," "Ipswich Lectures on Astronomy," "Errors of Observation," treatises on "Sound," "Magnetism," etc., besides very numerous and important monographs and papers for periodicals.

Aisne, a river of the N. part of France, rises in the department of Meuse, flows nearly westward, passes by Soissons, and enters the Oise near Compiègne. Length, about 150 miles. The canal of Ardennes connects it with the Meuse.

Aisne, a department in the N. of France, is bounded on the N. by the department Nord, on the E. by Ardennes and Marne, on the S. by Seine-et-Marne, and on the W. by Oise and Somme. Area, 2839 square miles. It is traversed by the Oise, the Aisne, and the Marne rivers. The soil is fertile, and the manufacturing industry in this department is very large. Wheat and hay are among the staple productions. It is subdivided into 5 arrondissements, 37 cantons, and 837 communes. Chief town, Laon. Pop. in 1872, 552,439.

Aïssé (Mademoiselle), a Circassian woman, born in 1693, was bought at the age of four years by the French ambassador in Constantinople, who brought her to France. Her position in society, together with her romantic adventures, gave her quite a celebrity in the last century. Died in 1733. Her letters were published, with notes, by Voltaire in 1787, and with notes by M. Ste.-Beuve in 1846.

Ait'kin, a county in the central part of Minnesota. Area, 720 square miles. It is bounded on the S. W. by Lake Mille Lacs, and the N. by Cass and Itasca counties. It is traversed by the Northern Pacific R. R. The surface is undulating. Pop. 178.

Aitze'ma, van (Lieuwe), a Dutch historian, born at Doccum in 1600, wrote a "History of the Netherlands from 1621 to 1668" (15 vols.), which is highly commended. Died in 1669.

Aix, āks (anc. *A'quæ Sex'tiæ*), a city in the S. E. part of France, in the department of Bouches-du-Rhône, 33 miles by rail N. of Marseilles. It was formerly the capital of Provence, and was a celebrated seat of learning in the Middle Ages. It is the seat of an archbishop, has a fine cathedral, a city hall (hôtel de ville), a museum, a royal college, and a public library containing about 100,000 volumes. Here are manufactures of silk and cotton, and warm mineral springs, from which it derived its ancient name. Pop. in 1866, 28,152.

Aix, a small town of France, in Savoy, in a delightful valley 8 miles N. of Chambéry. It is near Lake Bourget, and has thermal springs, which are much frequented. Here are some ancient Roman ruins. Pop. in 1866, 4430.

Aix-la-Chapelle [Lat. *A'quis Gra'num*; Ger. *Aa'chen*], a city of Rhenish Prussia, is situated on the frontier of Belgium, and on the railway which connects Liege and Cologne, 44 miles by rail W. S. W. of the latter. It was once a famous city, and the capital of the empire of Charlemagne, who made it his favorite residence. It is a well-built, handsome city, with a cathedral founded in 796 A. D., a large town-hall, an elegant theatre, a public library, and several hospitals. Here are celebrated mineral springs, the

temperature of which is about 112° Fahrenheit. They are considered efficacious for the cure of the gout, rheumatism, and cutaneous diseases. This city has important manufactures of fine broadcloths, needles, and pins. The cathedral contains the tomb of Charlemagne and a collection of relics, which attract a multitude of visitors. The successors of Charlemagne and the emperors of Germany were crowned here from the ninth century until 1531. P. in 1871, 74,238.

Aix-la-Chapelle, Congress of. This congress was held in 1818 for settling the affairs of Europe after the war of 1815. The king of Prussia and the emperors of Russia and Austria were present in person. The different representatives were Metternich, Wellington, Castlereagh, Hardenburg, Bernstorff, Nesselrode, and Capo d'Istrias, with Richelieu on behalf of France. Their deliberations resulted in the withdrawal from French territory of the army of occupation, and prepared the way for what was afterwards known as the "HOLY ALLIANCE" (which see.)

Aix-la-Chapelle, TREATIES OF. I. *Treaty of* 1668. This treaty was concluded May 2, 1668, between Louis XIV. of France on the one side, and the "Triple Alliance," including England, Sweden, and Holland, on the other. At the death of Philip IV., Louis laid claim, in the name of his wife, and under the laws of succession of Brabant and Namur, to a large portion of the Spanish Netherlands. He had already seized several strongholds and fortresses, when Holland, becoming alarmed at his rapid progress, concluded the triple alliance with England and Sweden. Louis, rather than resort to a war against so powerful a league, determined to accept mediation; and a treaty of peace was concluded at Aix-la-Chapelle, by which France retained possession of Charleroi, Valenciennes, and other strong towns, which she had already seized.

II. *Treaty of* 1748. This treaty ended, in 1748, the Austrian war of succession, in which all the great powers of Europe were, either on one side or the other, engaged. Several German princes had disputed the claim of Maria Theresa to the throne of Austria, and from this cause the war arose. It lasted with various success for eight years (from 1740 to 1748); at the end of which time a peace was concluded which left the different states with nearly the same possessions as before.

Aiza'ni, an ancient town of Asia Minor, now in ruins. Among its ruins, the theatre, with accommodations for over 12,000 spectators, is in a fine state of preservation.

Ajaccio, ä-yät'cho, or **Ajazzo,** ä-yät'so, a seaport, the capital of Corsica, is on the W. coast, in lat. 41° 54' N., lon. 8° 44' E. It has a good port defended by a citadel. It has also a cathedral and a library of 18,000 volumes. Wine and olive oil are exported from this town. Napoleon Bonaparte was born here on Aug. 15, 1769. A magnificent monument, representing the emperor Napoleon I., surrounded by his four brothers, was finished in 1865. Pop. in 1866, 14,558.

Aj'alon, a town of Palestine belonging to the Levites, in the land of Dan. It was probably on the spot now occupied by the village of Yâlo. Over the valley in which this town was situated the moon stood still while Joshua pursued the five kings.

Ajan', a region of Eastern Africa whose coast extends from Cape Guardafui indefinitely southward.

A'jax [Gr. Αἴας], surnamed THE GREATER, the son of Telamon, a Grecian hero, was king of Salamis. He acted a prominent part at the siege of Troy, and exceeded the other Greek warriors in strength and stature. Having been defeated by Ulysses in a competition for the armor of Achilles, he became insane and killed himself.

Ajax, the son of Oïleus, surnamed THE LESSER, to distinguish him from Ajax the son of Telamon, was king of Locris. He was one of the Greek heroes that fought at the siege of Troy, and excelled all the Greeks in swiftness, except Achilles. According to tradition, he offended Minerva by his impiety, for which he was drowned on his homeward voyage from Troy.

Ajmeer, Ajmere, or **Rajpoota'na,** a city of British India, in the North-west Provinces, capital of a division and a district of the same name, is 220 miles S. W. of Delhi, and situated in a picturesque valley. It contains several massive temples and mosques; also an English and Oriental school. Pop. estimated at 25,000.

Ak'abah, a fortified village of Arabia, near the N. extremity of the Gulf of Akabah. (See ELATH.)

Akabah, Gulf of, a portion of the Red Sea, lying in the N. W. part of Arabia, and bounded on the W. by the peninsula of Sinai. It is about 100 miles long, and has high and steep shores.

Akan, a post-township of Richland co., Wis. P. 675.

Ak'bar, or **Ak'ber** (written also **Acbar** and **Ackbar**, **Mohammed,** surnamed JALÂL ED DEEN, a famous and excellent Mogul emperor, was born at Amerkote, in the valley of the Indus, in 1542. He was a son of Humâyoon, whom he succeeded in 1556. He displayed great military talents and political wisdom, and extended his dominions by the conquest of Bengal and part of the Deccan. Under his reign the Christians and Jews were tolerated and protected. He encouraged literature and promoted commerce. He ordered a complete survey and census of his empire, the result of which, with minutely detailed statistics, was recorded in a book called "Ayeen Akbery" ("Institutes of Akbar"), which is very celebrated. Akbar was greatly distinguished for his justice, humanity, and magnanimity. He died in 1605, and was succeeded by his son Selim, surnamed Jehân-Geer.

A'ken, a town of Prussia, in the province of Saxony, on the left bank of the Elbe, 24 miles S. E. of Magdeburg, has factories of beet-sugar and chemicals. Pop. in 1871, 5273.

A'kenside (MARK), M. D., an English didactic poet of high reputation, was born at Newcastle-on-Tyne Nov. 9, 1721. He studied medical sciences at Edinburgh, graduated as M. D. at Leyden in 1744, and practised in London, where he settled in 1748. His success as a physician was hindered in some degree by his reserve or lack of affability. His reputation is founded chiefly on "The Pleasures of the Imagination," in blank verse (1744), which was received with great favor. It was commended by Dr. Johnson "as an example of great felicity of genius and uncommon amplitude of acquisitions." He wrote several shorter poems and medical treatises. His "Treatise on Dysentery" (in Latin, 1764) proved him to be an excellent classical scholar. He was appointed a physician to the queen in 1760. Died June 23, 1770. His character is represented as estimable and dignified in a high degree.

A'kerblad (JOHAN DAVID), a Swedish antiquary and Orientalist, born in 1760. He visited Jerusalem in 1792, and the Troad in 1797, gained distinction by deciphering the demotic writing of ancient Egypt, and wrote a "Letter on the Egyptian Inscription of Rosetta" (1802). Died Feb. 8, 1819.

Akerman', sometimes written **Akjerman,** or **Akkerman,** a fortified town of Bessarabia, on the right bank of the Dniester, about 4 miles from the Black Sea, and 28 miles S. W. of Odessa. It has a port, numerous factories, and an extensive trade in salt, etc. A treaty concluded at Akerman on Sept. 4, 1826, exempted the Danubian provinces from all but a nominal dependence on Turkey. Pop. in 1867, 29,343. Lat. 46° 12' N., lon. 30° 22' E.

Ak'erman (AMOS T.), attorney-general of the U. S. for a short time under Gen. Grant, was born in N. H. in 1823, but for fourteen or fifteen years previous to his appointment had been a citizen and practising lawyer of Georgia. He sided with the Confederates in the late war, but after the surrender of the Southern arms he advocated the sanction of the reconstruction measures of Congress, was a member of the State convention of 1867–68, and acted a prominent part in shaping the new constitution formed by that body.

A'ker's, a township of Tuscaloosa co., Ala. Pop. 367.

A'kers (BENJAMIN), commonly known as PAUL AKERS, an American sculptor, born at Sacarappa, Me., July 10, 1825, went to Boston in 1840, and made busts of Longfellow, Samuel Appleton, and others. Mr. Akers lived much in Italy, and executed some of his finest works there. The pieces done in America were chiefly portrait busts and medallions, which were highly esteemed as likenesses and as works of art. He died in Philadelphia May 21, 1861. A man of fine sensibility and pure genius, he lived up to the highest ideal of his art, and was beloved by many friends.

Akhalies, a class of religious warriors among the Sikhs in Hindostan. They deny God, believe in fate, and are very fanatical and turbulent. (See NANEKISM.)

Akhalzikh, Akalzik, or **Akis'ka,** a city of Asiatic Russia, in Georgia, on an affluent of the Kour, about 92 miles W. of Tiflis. It contains a mosque and several churches, and has some trade in silk and honey. Many of the inhabitants are Armenians. The Russians defeated the Turks near this place in 1828, and it was ceded to Russia in 1829. Pop. in 1867, 15,977.

Ak-Hissar (*i. e.* "white castle"), written also **Ek-Hissar** (the ancient *Thyatira*), a town of Asia Minor, in Anatolia, 53 miles N. E. of Smyrna. It contains several bazaars and about 1300 houses. Here are many ancient remains. Pop. about 10,000.

Akhlat', a town of Asiatic Turkey, in Armenia, on the N. W. shore of Lake Van, 203 miles S. E. of Trebizond.

It was formerly the seat of the Armenian kings, and is at present the seat of an Armenian bishop. Pop. about 4000.

Ak'iba (Ben Joseph), a Jewish rabbi of great learning and influence, was president of the school of Bene Barak in the second century A. D. Having joined the rebellion of Barchochebas, he was flayed and burned by the Romans at the age of 120 years.

Akmol'linsk, a province of Russia, in Central Asia, is situated S. of the government of Tobolsk. Area, 244,280 square miles. It consists of a plateau, in the N. level, and in the S. mountainous, having very little rain. It is frequently visited by heavy snow-storms. Chief town, Akmollinsk. Pop. in 1867, 226,788.

Ak'ron, a post-township of Peoria co., Ill. Pop. 1185.

Akron, a post-township of Tuscola co., Mich. P. 585.

Akron, a village in Erie co., N. Y., one of the most important centres of production of hydraulic cement. It is in Newstead township, and on the Niagara Falls branch of the N. Y. Central R. R., 14 miles W. of Batavia. Pop. 444.

Akron, a flourishing city, capital of Summit co., O., on the Ohio Canal, 36 miles S. of Cleveland, on the highest point of land between Lake Erie and the Ohio River. The Atlantic and Great Western, the Cleveland Mount Vernon and Columbus, and the Valley R. Rs. pass through the city, which contains 2 woollen, 2 paper, and 7 flouring-mills, 4 foundries, 1 rolling-mill, 1 blast-furnace, 1 forge, 3 planing-mills, 2 manufactories of reapers and mowers, 1 of pearl barley, 1 of oatmeal and farina, 1 of knives and sickles, 1 of rubber goods, 1 of chains, 1 of matches, and 3 of sewer-pipes, 2 oil-refineries, 3 machine-shops, 1 manufactory of boilers, 2 of ploughs, 1 of woollen cards, 1 of horse hay-rakes, 1 of stoves, 1 of iron fences, 10 of stone-ware, 1 of blank-books. It has also 4 printing-offices, 1 daily and 3 weekly papers, 4 banks (with an aggregate capital of $1,300,000), 3 public parks, a beautiful cemetery, a public library, and a high school. It is the seat of Buchtel College, and has all the adjuncts of an enterprising and prosperous inland city. Pop. 10,006.

S. A. Lane, Ed. "Beacon."

Akshehr', or **Ak-Sheher** (*i. e.* "white city"), a city of Asiatic Turkey, in Karamania, about 70 miles N. W. of Konieh, contains near 1500 houses. It is the ancient *Philomelion* of Strabo.

Ak'su, a town of East Toorkistan, on a river of its own name, 250 miles N. E. of Yarkand. It has manufactures of woollen stuffs and jasper, and is visited by many caravans from all parts of Central Asia. Pop. about 60,000.

Ak'yab, a town of British Burmah, at the mouth of the Aracan River, 550 miles S. E. of Calcutta. Its situation is healthy and very advantageous for commerce, with a commodious and safe harbor. It has a large trade, especially of rice, large quantities of which are exported hence. Pop. about 10,000, mostly Bengalese and Chinese. Here is a Protestant missionary station.

Al, the Arabic definite article, forms a prefix to many Oriental names, as Al-Mansoor, "the victorious," Al-Amin, "the faithful," etc.

A'la [a Latin word signifying a "wing"], a Roman military term, denoting the wing of an army. At first, when the whole legion consisted of Roman citizens, it was applied to the body of horsemen who served with the foot-soldiers, but after the admission of *socii*, whether Latini or Italici, it was applied to the troops of the allies, both horse and foot, which were stationed on the wings. At a still later time, the alæ were composed of foreign troops serving with the Roman armies; while under the empire the term was given to bodies of horsemen raised generally in the provinces, and serving apart from the legion. (See Wing.)

Alaba'ma, a river of the U. S., is formed by the Coosa and the Tallapoosa, which unite about 10 miles above Montgomery, in Alabama. It flows nearly westward to Selma, and afterwards in a general S. W. direction, and unites with the Tombigbee to form the Mobile River. It is navigable for large steamboats through its whole extent, which is about 300 miles. It traverses a fertile region, of which cotton and maize are the staple products.

Alabama (signifying, in the Creek language, "Here we rest"), one of the Southern States of the Union, the twenty-first in the order of its admission. Its extreme limits are between lat. 30° 15′ and 35° N., and between lon. 84° 56′ and 88° 48′ W. from Greenwich, but the main body of the land of the State lies between lat. 31° and 35° N., and between lon. 85° 10′ and 88° 31′ W. from Greenwich. The extreme length of the State from N. to S. is 336 miles, and it varies in breadth from 148 to 200 miles. Its boundary on the N. is the State of Tennessee on the line of the 35th parallel of N. lat.; on the E. the State of Georgia, the Chattahoochee River forming the dividing line from West Point to the 31st parallel, about 120 miles, and for the small south-western section of the State, the Perdido River, which separates it from Florida, forms the eastern boundary for nearly 60

miles; the southern boundaries are the State of Florida from the Chattahoochee to the Perdido River, and the Gulf of Mexico from the mouth of the Perdido to the State line of Mississippi. On the W. it is bounded by the State of Mississippi, the Tennessee River forming the extreme north-western boundary, and causing a slight deviation westward in the boundary. Its area is 50,722 square miles, or 32,462,080 acres. Negotiations are now in progress for the acquisition from Florida of the seven counties lying between the Chattahoochee or Apalachicola and the Perdido, which will give it about 200 miles of coast, and the excellent harbor of Pensacola. The surface of the State is generally level, except in the northern portion, through which the Blue Ridge extends, but nowhere attains any great elevation. From this broken but very beautiful portion there is a gradual declination towards the S., the surface expanding into broad prairies with gentle swells, and reaching in the vicinity of Mobile Bay a level but very little above that of the Gulf of Mexico. The principal rivers are the Tennessee, the Mobile, Tombigbee, Alabama, Coosa, Black Warrior, Perdido, and Chattahoochee, all of them, except the Tennessee, having numerous affluents. The Tennessee sweeps across the entire northern section of the State from the N. W. to the N. E. corner, forming an irregular curve, or rather an obtuse angle, at Guntersville, where it is about forty miles S. of the northern line of the State. It receives no considerable tributary on its southern side, and only Elk River, Flint River, and Paint Rock River, three small streams, on the northern side in its course through the State. The Chattahoochee, a large stream, but having no considerable tributaries in the State, forms a part of its eastern boundary, and discharges its waters into the Gulf. The Perdido, a smaller but considerable stream, rises in Escambia county, and falls into Perdido Bay after a course of about 100 miles. The Escambia and Choctawhatchie rivers, with their affluents, drain a portion of the southern part of the State, and discharge their waters into Pensacola and Choctawhatchie Bays on the Florida coast. But much the greater part of the waters of the State finds their way into Mobile Bay through the Mobile River and its tributaries. The Tombigbee, the Alabama, the Coosa, the Cahawba, the Tallapoosa, and the Black Warrior are all, directly or indirectly, affluents of the Mobile. The Tombigbee, coming from Mississippi, receives the waters of the Black Warrior, and at 50 miles above Mobile Bay unites with the Alabama, which had already received the Coosa, the Tallapoosa, and the Cahawba. After the junction of the Tombigbee and the Alabama the united rivers receive the name of the Mobile River. The Tensaw River, a considerable stream, unites by natural canals with both the Alabama and the Mobile rivers, but finally makes its way, as an independent and parallel stream, to Mobile Bay. The Black Warrior is navigable for light-draft steamers for 285 miles, and the Alabama for 300 miles. The Tensaw, Chattahoochee, Tennessee, and Perdido are all navigable for a considerable distance. The whole extent of steamboat river navigation in the State is nearly 1500 miles. Mobile Bay, the main outlet of the navigable waters of the State, is in the extreme south-western part, is about 30 miles long, and from 3 to 8 broad, and has fifteen feet of water at low tide at its main entrance. The smaller bays, Grand, Bonsecours, and Perdido, are not of much commercial importance, being shallow, though mostly landlocked.

Geology and Soil.—The southern portion of the State, extending for 132 miles northward from the Gulf of Mexico and 40 from the Florida State line, and embracing an area of 11,000 square miles, belongs to the alluvial, diluvial, and

tertiary formations, and has a light but productive soil, easily tilled and well adapted to raising fruits. Corn and cotton also do well on this soil. There are extensive forests of pine, and excellent timber and considerable quantities of tar and turpentine are produced in this region. On the low lands near the Gulf the cypress and several varieties of the oak abound. The pine forests afford good natural pasturage for cattle. North of this tract, and extending 102 miles northward on the W. side and 60 on the E. side of the State, is the region known as the Cotton Belt, underlaid mostly with the Jurassic limestone, with some chalk, mostly prairie land, declining very slightly towards the S.—a fertile region well adapted to agriculture, and in the past largely devoted to the culture of the great Southern staple, cotton. In the eastern and north-eastern part of the State we find the great mineral region, an extension of the eozoic rocks from Virginia, North and South Carolina, and Georgia, in which gold has been found in paying quantities for so many years. These primitive rocks extend no farther, however, than Eastern Alabama, and do not quite reach the banks of the Tallapoosa River, occupying a portion of Lee, Chambers, Tallapoosa, and Randolph counties. Contiguous to them on the N. N. W. and W. are carboniferous rocks, the bituminous coal region occupying a tract of 4332 square miles. In this region are also many other valuable minerals. West of this is a belt of about 35 miles in width from N. to S. underlaid by palæozoic rocks, with a broken surface and a poor soil, but a healthy region, affording great facilities for manufacturing from its abundant water-power. In the extreme northern part of the State we come to the valley of the Tennessee, a limestone region, with broken surface, but with many rich and fertile valleys, and scenery of great beauty. Here are found lands adapted to grazing, as well as those which yield large crops of cotton, corn, cereals, and fruits.

Mineralogy.—The State is rich in minerals. Gold was discovered in Randolph county in 1836, and mined so successfully that $213,750.66 of it had been coined at the U. S. mint and its branches to June 30, 1872, and the greater part previous to 1859. The gold is generally found combined with silver, but there is also in the mineral districts argentiferous galena in considerable quantities. Copper is also found, but not in ores sufficiently rich to make its mining profitable, though it has been attempted in Baine county. Among other minerals scattered through the State the mineralogists report syenite, steatite, cobalt, vivianite, carite, calcite, dolomite, and quartz crystals as existing in considerable quantities. Potter's, porcelain, and fire clays, and materials for the production of hydraulic lime; lithographic stone, manganese, sulphate of baryta, slate, and red ochre, as well as various building stones, are found in such quantities as to make their exploitation profitable. The granite of Coosa county is superior, for statuary and monumental purposes, to any other in the U. S., and the white marble of the same county, and the variegated marbles of Talladega and the adjacent counties, are not surpassed on this continent.

But the most valuable portion of the mineral wealth of Alabama consists in her mines of coal and her abundant iron ores. The coal-fields contain seams of bituminous coal from one to eight feet thick, of several varieties, some well adapted for the generation of steam, others equal to the Liverpool coals for the production of gas and coke, and still others, of the splint coal variety, admirable for smelting iron ores. In close proximity to the latter are extensive beds of iron ore: the Red Mountain extends across the State for more than 100 miles, having in its whole course a stratum of solid red iron ore from two to eight feet thick. Very extensive beds of the brown hematite iron ore of the best quality are found in Bibb, Shelby, Jefferson, Talladega, St. Clair, and Claiborne counties. The iron manufactured from these ores is of excellent quality. There are numerous mineral springs, mostly of chalybeate and sulphur waters, in the State.

Vegetation.—Extending over more than four degrees of latitude, and to a point within seven degrees of the tropics, Alabama combines the vegetable products of the temperate and semi-tropical regions. In the N. the white, red, cup, pin, and post oak, the hickory, chestnut, poplar, cedar, elm, mulberry, and pine, are the principal forest trees. Below latitude 33° the trees are festooned with the long Spanish moss, and the forests begin to assume a more semi-tropical character. In Marengo and Greene counties there were extensive canebrakes, where the cane, a species of bamboo, had made large tracts almost impassable by its dense growth. In the midst of these canebrakes gigantic cedars in groves or islands, of sombre foliage, towered up through the jungle. These canebrakes have now been cleared, and reveal a soil of the most extraordinary fertility. In this region, below 33°, the deciduous trees very generally give place to the live-oak, the cypress, the loblolly, the yellow pine, the magnolia, and other forest trees of the Gulf region, while the apples, pears, plums, and hardy peaches are partially replaced by the fig, the pomegranate, the olive, the apricot, the scuppernong grape, and the orange. The northern part of the State is best adapted to the culture of the grasses, the cereals, and maize, though in the more fertile valleys considerable cotton is raised. The central and most of the southern portion is admirably adapted to cotton, and the State produced, until recently, more of that staple than any other of the Southern States. Large quantities of maize are also grown in the central counties. In the S. W. the sugar crop is usually successful, and considerable rice is grown on the wet and low lands. At one time indigo was raised somewhat extensively and successfully in that portion of the State, but the competition with the East Indian crop, raised by ryot labor, made it so little profitable that other crops were substituted for it. The Ramie is now grown largely in some of the southern counties. Tobacco is also a crop of some importance.

Zoology.—There are still great numbers of deer in the northern counties, and wild turkeys are abundant. Wild pigeons, partridges, rabbits, gray squirrels, and other game are plentiful, while opossums, racoons, wild-cats, wolves (the prairie wolf), foxes, and bears are occasionally met with. Along the rivers and bays wild ducks and teal, and in their season rice-birds, etc., afford abundant employment for the sportsman. Lizards and snakes abound in the swampy regions, and the moccasin and milk snake are particularly venomous. In some of the streams and bayous the alligator is found, though less abundant than in Louisiana. Fish are abundant in Mobile Bay and in most of the rivers, and many of them are of excellent quality and flavor.

Climate.—This varies with the latitude and elevation. In the northern counties the climate is delightful. The temperature is seldom below 32° Fahrenheit in winter, and the elevation is sufficient to prevent the intense heats of a Southern summer. Huntsville and Florence on the Tennessee River are favorite resorts for invalids. There is some malaria in parts of the valley of the Tennessee, as well as in some of the other river valleys. In the central counties the heat is greater, but not oppressive. In 1869 the highest temperature in the central counties was Aug. 22, 105° Fahrenheit; the lowest, Feb. 28, 20° Fahrenheit; and the average mean temperature of the year 62° Fahrenheit. The average monthly rainfall was 4.58 inches, February being the wettest, and May the dryest month. In the southern counties there is more malaria and a greater tendency to fevers. The heat is at times intense, but the nights are rendered comfortable by the Gulf breeze. In the central and southern portions of the State, though there is no lack of water, much of it is not potable or is of very poor quality. In some of the cities and large towns this evil has been remedied by boring artesian wells, which often furnish an ample supply of excellent water. The wells and springs of the northern counties are of the very best quality.

Agricultural Products.—Our latest dates of these are for the year 1871, except cotton, of which the estimate for 1872 is 507,430 bales, or 235,955,240 pounds. According to the careful estimates of the agricultural department, the crop of maize or Indian corn of 1871 was 19,080,000 bushels, 1,315,862 acres being cultivated in that crop, and its estimated value was $17,558,600; of wheat the crop was 832,000 bushels, raised from 132,063 acres, and having an estimated value of $1,297,720; of rye, only 24,000 bushels, raised on 2608 acres, and valued at $43,200; of oats, 672,000 bushels, raised on 50,149 acres, and worth $584,640; of barley, 6000 bushels, occupying 387 acres, and worth $6000; of potatoes (probably *Solanum tuberosum*), 157,000 bushels, from 1847 acres, worth $166,420 (the census return of sweet potatoes in the State in 1870 was 1,871,360 bushels); of tobacco (in 1870), 152,742 pounds; and of rice, the same year, 222,945 pounds (both returns undoubtedly far below the truth); hay, in 1871, 18,600 tons, from 13,284 acres, and valued at $262,700; of sugar cane, in 1870, 31 hogsheads, and of molasses (cane), 166,009 gallons; of sorghum molasses, 267,269 gallons; of butter (in 1870), 3,213,753 pounds; of cheese, the same year, 2732 pounds, and of milk sold, 104,675 gallons; of beeswax (in 1870) 22,767 pounds, and of honey, 320,674 pounds. The number of acres of improved land in farms, in 1870, was 5,072,204; of unimproved lands included in farms, 8,380,332 acres of woodland, and 1,518,642 acres of other unimproved lands. The cash value of farms the same year was $67,7[illegible], and of farming implements and machinery, $3,256,021. The estimated value of farm products for the census year (ending June, 1870) was $67,522,[illegible]. The value of orchard products in that year is stated at $27,500; of market gardens, at $139,[illegible]; of forest products, $5[illegible]; of home manufactures, $1,124,513; of animals slaughtered or sold

for slaughter that year, $4,670,146. The number of horses in the State in Feb., 1872, was estimated by the agricultural department at 106,700, and their value at $9,297,838; the number of mules at 101,600, and their value at $10,752,328; the number of oxen and other cattle at 337,800, and their value at $3,847,542; the number of milch cows at 180,700, and their value at $3,402,581; the number of sheep at 188,100, and their value at $342,342; the number of swine at 981,000, and their value at $3,590,460.

Manufactures.—Alabama has only recently given much attention to manufactures, and though her manufacturing establishments are now increasing with considerable rapidity, she still ranks low in the amount of her manufactured products. In 1860 there were 1459 manufacturing establishments in the State, of which 336 were saw-mills, 140 blacksmith-shops, 236 grist-mills, 132 tanneries and leather-dressing establishments, 110 boot and shoe shops, 27 turpentine distilleries, 123 carriage, wagon, and cart factories, and 32 saddlers' shops, or in all 1136; so that eleven-fourteenths of the whole were occupied with the simple and ordinary mechanisms of an agricultural State. The total capital invested in manufactures in 1860 was $9,098,191; the cost of raw material was $5,489,963; the number of hands employed, 7889; the annual cost of labor, $2,132,940; and the value of products for the year 1859, $10,588,571. During the war of 1861-65 some of the cities and larger towns of Alabama were largely engaged in the manufacture of war material—iron plates, cannon, firearms, powder, steamboats, etc.—as well as in the packing of provisions. In 1870 the statistics of her manufactures were—number of establishments, 2231: capital invested, $5,713,607; cost of raw material, $7,643,784; number of hands employed—males, 7489, females, 860—total, 8349; annual cost of labor, $2,211,638; value of products in 1869, $13,220,655. The manufacture of iron, of machinery, and of cotton goods had received a remarkable impulse, and there had been a general increase in all the higher branches of industry. The manufactured product of the 13 cotton manufactories in 1870 was $1,088,767, and several large factories have since been erected.

Railways.—In Jan., 1872, there were 1671 miles of completed railways in Alabama, of which 786 miles had received aid from the State, either in direct bonds or in endorsements, to the aggregate amount of $15,420,000. The aggregate cost of the nine railroads which make up this aggregate for road and equipment cannot be exactly ascertained, but it does not vary much from $64,000,000. Most of the Alabama railroads are portions of great trunk roads connecting the Northern or Southern Atlantic States with the ports of the Gulf or the Mississippi River, and in some cases destined to form links in the connection with the Pacific coast or with Mexico. Thus, the Alabama and Chattanooga R. R. forms one of the important links in that great combination of railroads now extending from the St. John's River in the province of New Brunswick almost in an air-line to Meridian, Miss., and destined by the speedy completion of its few remaining gaps soon to reach the Rio Grande. The Selma Rome and Dalton is another and perhaps still more direct link in the same line, soon to connect directly with New Orleans. The Mobile and Montgomery and the Montgomery and West Point are portions of a line which, with the completion of two or three insignificant gaps in South Carolina, will connect by a very direct line New Orleans and points still farther south-west with Richmond, Yorktown, and Norfolk. The Selma and Meridian and the Montgomery and Eufaula lines form portions of the railroad chain extending from Brunswick, Ga., which, crossing the Mississippi at Vicksburg, takes the name of the Southern Pacific, and following mainly the 32d parallel of latitude will reach the Pacific coast in Southern California. The Mobile and Ohio is the terminal link in a line of railroad which, with but one short gap, extends from Duluth on Lake Superior to Mobile. The Memphis and Charleston, crossing the upper portion of the State, forms an important section of the long line which now connects Little Rock, Ark., and Memphis, Tenn., with Richmond, Washington, New York, and New England, and which will soon be extended westward along the 35th parallel of latitude to the Pacific. Another road, as yet incomplete, is destined to connect Mobile and Charleston, S. C. Two shorter roads connect respectively Selma and Montgomery with the fine port and harbor of Pensacola, which by the consent of Florida is soon to become a port of Alabama; while other roads already finished make a continuous railroad connection between Pensacola, Selma, and Montgomery in the South, and Nashville, Louisville, Evansville, Indianapolis, Chicago, Milwaukee, and the upper peninsula of Michigan in the North. No State in the Union is more indissolubly linked to every other portion by the iron bands of its railways than Alabama.

Financial Condition.—The assessed valuation of property in Alabama in 1870 was $155,582,595, of which $117,223,043 was real estate, and $38,359,552 personal property; the census valuation the same year, which approximates more nearly to the actual value, though considerably below it on personal property, was $201,855,841. The total taxes of that year, aside from the national taxation, were $2,982,929, of which $1,156,024 were State taxes, $1,122,971 county, and $403,937 town, city, and ward taxes. The entire public debt other than national, in Jan., 1872, was $20,219,136, of which $15,420,000 was the State debt, mostly incurred in aiding railroads; $1,704,173 was county debt, and $3,094,963 was the debt of towns and cities. The average wealth to each individual of the population of the State in 1870 was $202.46; the rate of taxation per $1000, $14.77; the rate of taxation per head, $2.99; and the ratio of public debt to the population, $20.30 per head. The taxes are levied on real estate, and on the following articles of personal property: real estate bonds, town property, stocks of goods and merchandise, horses, mules, sheep, and hogs. There are also licenses, and a poll-tax of about $1.50 for school purposes.

The foreign *commerce* of the State is mostly conducted through its principal port, Mobile; the imports into that port and district for the year ending June 30, 1872, were $1,761,402, and the exports (a large proportion being cotton) for the same year were $13,938,605. Probably cotton, etc. to the value of about $2,000,000 was exported through New Orleans by way of Memphis, and through Pensacola and Savannah by railroads and the Chattahoochee River. The vessels belonging to the customs district of Mobile in the year ending June 30, 1871, were 42 schooners, 32 sloops, 52 steamers, 96 unrigged vessels, or 222 vessels in all, having a total tonnage of 18,047 tons. For the year ending June 30, 1872, there were 78 sailing vessels, 34 steamers, and 92 unrigged vessels, having a total tonnage of 13,808 tons. For the year ending June 30, 1870, 105 American and foreign vessels entered the port of Mobile, the tonnage of which was 70,249 tons, and the crews numbered 1739 men. The same year 128 vessels cleared from the port, having a tonnage of 79,738 tons, and crews numbering 1865 men. In addition to these, 9 ocean steamers, having an aggregate tonnage of 13,115 tons, entered and cleared from the port the same year. There are no means of ascertaining the internal commerce of the State.

Banks.—There were in Jan., 1873, nine National banks in Alabama—viz. the First National Bank of Mobile, capital $300,000; the National Commercial Bank of Mobile, capital $500,000; the First National Bank of Montgomery, capital $208,208; the Merchants' and Planters' National Bank at Montgomery, capital $100,000; the National Bank of Huntsville, at Madison, capital $100,000; the Selma City National Bank, capital $250,000; the Gainesville National Bank, at Gainesville, capital $100,000; the First National Bank of Tuscaloosa, capital $60,000; and the National Bank of Birmingham, capital $50,000. There were also at the same time two State banks, both located in Mobile, having an aggregate capital of $1,000,000, and five savings banks, with capital and accumulations amounting to $672,000, all of them doing a discount as well as a deposit business. There were also twenty-two private banking-houses, besides three agencies of the National Freedmen's Savings Bank and Trust Company, acting as bankers in the State.

Insurance.—There are two life insurance companies chartered by the State, organized in 1868 and 1871, having an aggregate capital of $500,000 and aggregate assets of $1,074,311; and eleven fire insurance companies, with an aggregate capital of $1,385,000 and aggregate assets of $1,406,000. The greater part of the underwriting, both of life and fire insurance, is, however, in the hands of agencies of companies from other States and countries.

Population.—Alabama appears for the first time in the census of 1820, when her population was 127,901, and her relative rank among the States in population was nineteenth. In 1830 it was 309,527, and she ranked fifteenth; in 1840 it was 590,756, entitling her to the twelfth place; in 1850 it was 771,623, and she still maintained the twelfth place; in 1860 it was 964,201, but owing to the rapid growth of the Western States she was now thirteenth. In 1870, owing to her heavy losses during the war, the population had only increased to 996,992, and she held the sixteenth place in population. In 1820 there were 41,879 slaves and 571 free colored persons in the State; in 1830, 117,549 slaves and 1572 free colored; in 1840, 253,532 slaves and 2039 free colored; in 1850, 342,844 slaves and 2265 free colored; in 1860, 435,080 slaves and 2690 free colored; in 1870 there were no slaves, but 475,510 free colored persons. The number of white persons at these dates was—in 1820, 85,451; in 1830, 190,406; in 1840, 335,185; in 1850, 426,514; in 1860, 526,271; in 1870, 521,384. In 1860 there were 160 Indians, and in 1870, 98 Indians. But a

very small portion of the population are of foreign birth or parentage. Only 9962 are reported as foreign born, 16,981 as having both parents foreigners; 20,765 as having a foreign father, and 18,060 a foreign mother; and previous enumerations vary but little from these numbers. In the matter of sex, of the entire population 488,738 are males, and 508,254 females; of the native population, 482,470 are males and 504,560 females; of those of foreign birth, 6268 are males and 3694 females; of the whites, 255,023 are males and 266,361 females; of the colored, 233,677 are males and 241,833 females; a further distinction is made between negroes, of whom 213,987 are males and 219,711 females, and mulattoes, of whom 19,690 are males and 22,122 females. The density of population for the whole State is 19.66 persons to the square mile; but the density map of the ninth census report shows that while the eastern, north-eastern, and a small district of the northern and western portions have a population of about thirty to the square mile, the remainder of the State, except the city of Mobile, has not more than eight or nine inhabitants to the square mile.

Education.—The number of children of school age (between five and twenty-one years) in the State in 1871 was 387,057; of these 77,139 (38,600 males and 38,539 females) reported themselves as having attended school during some part of the year 1869–70. Table xii. of the ninth census gives the reported attendance upon the schools of the State as 75,866 (37,223 males and 38,643 females), under the charge of 3364 teachers (2372 males and 992 females). The attendance on schools is said to have increased somewhat since 1870, but no statistics are given. The income of all educational institutions in the State in 1869–70 was $976,351, of which $39,500 was from endowments, $471,161 from taxation and public funds, and $465,690 from other sources, including tuition. Of this income $629,626 belonged to the public schools, of which there were 2812, which had 3008 teachers and 67,263 pupils that year. This income was composed of the following items: from endowments, $8000; from taxation and public funds, $447,156; from other sources, $174,470. In 1871 the funds were increased from taxation to the extent of over $90,000, and in 1872 about $110,000 more. Of these public schools, 14 were normal schools, or rather normal classes, mostly connected with the colleges, having 25 teachers and 488 pupils; 4 were high schools, with 6 teachers and 170 scholars; 10 were grammar schools, with 10 teachers and 200 scholars; and 2784 were graded and ungraded common schools, with 2967 teachers (817 females) and 66,405 pupils. Of the schools not public, 9 were colleges and universities, besides 7 other female colleges and seminaries, with 65 instructors and 667 students. The colleges had 63 professors and teachers, 1026 students, and $108,800 income, of which $31,500 was from endowment. There are 46 academies, with 132 teachers, 3086 pupils, and $142,750 of income. There are 2 theological and 1 medical professional school, the former having 4 instructors and about 25 students, and the latter 7 instructors and 30 students. The University of Alabama, at Tuscaloosa, was liberally endowed with lands by the U. S., the greater part of which have been sold, and yield a large income for its support. It still owns about 500 acres, and has new, large, and commodious buildings for instruction and dormitories, an observatory, a president's mansion, and five houses for professors. Its coal-lands yield an annual rental of sufficient coal for fuel. The university has been, however, since the war, in a greatly depressed condition, and has had but a small number of students. Some changes were made in its officers and organization in 1871, since which it is reported to be doing better. Howard College, at Marion, is a flourishing college, though insufficiently endowed. It is under the control of the Baptists, and in 1872 had 6 professors, 121 students, and a library of 5000 volumes. The East Alabama College, at Auburn, which in 1871–72 established a scientific, industrial, and agricultural department, and received the Congressional agricultural land-grant to the State, is under the control of the Methodist Episcopal Church South, and in 1871–72 had 7 professors and 98 students in the collegiate department, and 3 professors and 59 students in the scientific department. The Southern University, at Greensborough, founded in 1855, is also under the control of the Methodists. Spring Hill College, at Spring Hill, near Mobile, is a Roman Catholic institution, founded in 1835. In 1872 it had 18 instructors and 52 students. The other colleges of the State are Florence University (Presbyterian) and Wesleyan College (Methodist) at Florence, La Grange College (Presbyterian) at La Grange, and Talladega College at Talladega. The seven female colleges are respectively under the control of the Presbyterians, Methodists, Episcopals, Baptists, and the Methodist Episcopal Church South. They are all prosperous, and had an aggregate in 1872 of 58 teachers and 667 students. There are two theological seminaries in the State—the theological department of Howard College, Baptist, at Marion, and the Ecclesiastical Seminary of the diocese of Mobile (Roman Catholic) at South Orange. The Medical College of Alabama, at Mobile, organized in 1856, has 11 instructors, and gives a free course of lectures. There is one institution for the deaf and dumb and the blind, at Talladega, having, in 1871, 4 teachers, 64 pupils (50 deaf mutes and 14 blind), and $12,005 income. Besides these there were 83 day and boarding schools, having 97 teachers, 3129 pupils, and an income of $70,870; and 17 parochial and charity schools, with 52 teachers and 1256 scholars, and a reported income of only $500. The management of educational affairs in the State is in the hands of a State board of education, consisting of the State superintendent of public schools, who is its presiding officer, and two members from each of the eight Congressional districts, who are elected by the people for four years. The governor is an *ex officio* member of the board, but has no vote. The State superintendent is elected on the State ticket for two years. The board of education are also a board of regents of the State University, and appoint its president and faculties. There is a county superintendent for each of the sixty-five counties, elected by the voters of the county, and in each county these superintendents, with two other persons, constitute the county boards. There are also township boards, consisting of three trustees, who are the contracting parties in engaging teachers, who must, however, have the certificate of the county board before they can teach. The school fund (from the sale of school lands) amounted in 1872 to $3,051,746.92. It is invested so as to yield 8 per cent. interest. The other sources from which school income is derived are—special appropriations by the State or individuals, escheated estates, military exemptions, an annual appropriation of one-fifth of the revenue, and a poll-tax of $1.50. In Jan., 1872, the amount devoted to public schools was about $855,000. After paying the other expenses of the school department, there remained a dividend of $1.33 for each child of school age.

In 1869–70 there were in the State 383,012 persons over ten years of age who could not write, and 349,771 of these could not read. Of these, 22,856 were white males and 20,773 white females between the ages of ten and twenty-one years; while 48,430 whites were over twenty-one years of age; 50,007 were colored males and 51,530 colored females between the ages of ten and twenty-one years; while 189,361 were colored persons over twenty-one years of age. In Mobile, while there were 5473 children attending school, there were 7916 of ten years old and over who could not read, and 9106 of the same age who could not write. Of these, 1004 were whites and 8102 colored.

Libraries.—Of these, of all classes, there were in 1870 in the State 1430, containing an aggregate of 576,882 volumes. Of these, 1132 were private libraries, containing 490,305 volumes, while 298, containing 86,577 volumes, were public libraries. Among these, 1 was the State Library, having 3000 volumes; 4 were town or city libraries, having only 800 volumes in all; 33 were court or law libraries, with 7785 volumes; 12 were college or school libraries, having 23,300 volumes; 239 were Sabbath-school libraries, with 49,517 volumes; and 9 were church libraries, with 2175 volumes.

Newspapers and Periodicals.—The ninth census gives to Alabama 89 periodicals of all classes, having an aggregate circulation of 91,165, and issuing annually 9,198,980 copies. In 1860 there were 96 periodicals, with an aggregate circulation of 93,595, but issuing annually only 7,175,444 copies. Of those published in 1870, 9 were daily newspapers, having a circulation of 16,420; 2 tri-weekly, with a circulation of 700; 2 semi-weekly, with a circulation of 2870; and 76 weekly, with a circulation of 71,175. Of these, 87 were political, having a circulation of 88,665, and issuing annually 9,068,980 copies; and 2 were religious, having a circulation of 2500, and issuing annually 130,000 copies.

Churches.—The statistics of the census of 1870 in regard to churches in all the Southern States are necessarily incomplete, and at best only an approximation to the facts. The census reports 2695 church organizations of all denominations; 1958 church edifices, 510,810 sittings, and $2,414,515 as the value of church property. These aggregates are unquestionably considerably below the truth. It reports 786 Baptist churches, 769 church edifices, 189,650 sittings, value of church property $885,650 (the "Baptist Almanac" for 1873 gives the number of associations as 44; of churches, 1162; of ordained ministers, 574; of communicants, 74,871); of minor Baptist organizations it reports 3 churches, 3 church edifices, 500 sittings, $500 of church property; of the Christians, 19 churches, 19 church edifices, 5750 sittings, $10,050 of church property; of Congregationalists, 4 churches, 2 church edifices, 650 sittings, $7,000 of church property (the "Congregational Quarterly" for Jan., 1873, reports, for 1872, 5 churches, 6 ordained min-

isters, 204 communicants); of the Protestant Episcopal Church, 50 churches, 38 edifices, 15,520 sittings, $264,600 of church property (the "Church Almanac" for 1873 reports 1 diocese, 30 clergymen, 42 parishes, 3046 communicants); of Jews, 2 congregations, 2 synagogues, 1650 sittings, $300,000 of ecclesiastical property; of Methodists, 991 churches, 892 edifices, 218,945 sittings, $787,265 of church property (the "Methodist Episcopal Church Minutes" report for 1872, 84 itinerant ministers, 165 local preachers, 131 church edifices, 9052 communicants; and the Methodist Episcopal Church South, the same year, 228 itinerant ministers and local preachers, 483 churches, and 25,514 members); of Presbyterians (Church South), 145 churches, 143 edifices, 50,215 sittings, $322,550 of church property; of other Presbyterian bodies, 57 churches, 57 edifices, 17,400 sittings, $37,150 of church property; of Roman Catholics, there were 1 diocese, 20 congregations, 19 church edifices, 6730 sittings, $409,000 of church property; of Universalists, 6 congregations, 2 edifices, 550 sittings, $1400 of church property; of union churches, 12 congregations, 12 edifices, 3200 sittings, $8550 of church property.

Constitution.—The present constitution of Alabama was adopted in 1868, but has been largely amended. The governor, lieutenant-governor, secretary of state, auditor, treasurer, and attorney-general are chosen by the electors on the Tuesday after the first Monday in November. All hold office for two years, except the auditor, whose term is four years. The house of representatives must not exceed 100 members, apportioned according to the population, but each county has at least one member. The senators are elected from senatorial districts; they must not be less than 25 or more than 33 in number, and serve for four years, while the representatives are elected for but two years. They must be electors and residents of the State, and the senators must in addition be twenty-seven years of age or upward. In all elections by the people the vote is by ballot. All male citizens, twenty-one years of age, who have resided in the State for six months next preceding the election, and have taken the oath to support the Constitution and laws of the U. S. and of Alabama, are entitled to vote. All persons resident in the State, born in the U. S., or persons who have legally declared their intentions to become citizens of the U. S., shall be citizens of Alabama. Temporary absence from the State does not cause a forfeiture of residence. All able-bodied male citizens between the ages of eighteen and forty-five are liable to military duty. One major-general and three brigadier-generals are appointed by the governor, subject to confirmation by the senate. The adjutant-general and other staff officers are appointed by the governor. The militia is divided into two classes, the volunteer and the reserve force. Officers and men receive no pay when not in active service.

Judiciary.—The judicial power is vested in a supreme court, circuit courts, chancery courts, courts of probate, and such inferior courts as the General Assembly may establish from time to time. The supreme court has appellate jurisdiction only, and must be held at the seat of government twice every year. The State is divided into circuits, each of which must include not less than three nor more than eight counties, and a judge is chosen for each circuit, whose term of office, like the supreme and chancery court judges, is six years. He must reside in the circuit for which he is chosen, and hold court in each county of his district twice every year. The circuit court has original jurisdiction in all matters civil and criminal within the State not otherwise excepted by the constitution, but in civil cases only when the sum in controversy exceeds $50. There are now twelve circuit districts in the State. There are three supreme court judges, twelve circuit court judges, and five chancellors of the court of chancery. The judges of these higher courts can hold no other office of profit and trust under the State or U. S. during their term of office. Judges of the lower courts, justices, and constables are elected by the people in each county. The clerk of the supreme court is appointed by the judges. The other clerks of courts are elected by the people for six years. The attorney-general must reside at the seat of government. A solicitor must be appointed for each county.

Principal Towns.—Mobile, the only considerable seaport of the State, and next to New Orleans the most important commercial city of the Gulf States, is situated on Mobile Bay, and had a population in 1870 of 32,034. Montgomery, the capital of the State, situated on the Alabama River, had in 1870 a population of 10,588. The other towns and cities of the State having between 3000 and 7000 inhabitants are—Selma, on the Alabama, 6484; Huntsville, on the Tennessee, 4907; Eufaula, on the Chattahoochee, 3185. Those having between 1000 and 2000 inhabitants are—Talladega, 1933; Tuscaloosa, on the Black Warrior, 1689; and Tuscumbia, on the Tennessee, 1214.

Representatives in Congress.—Under the new apportionment of Dec. 14, 1871, Alabama is entitled to eight representatives in Congress. They are all chosen by districts.

Counties.	Population 1870.	Population 1860.	Population 1850.

History.—The first settlement made in the limits of this State by whites was in 1702, when Bienville erected a fort near Mobile Bay. In 1711 a small French colony was planted on the present site of Mobile, and in 1713 was fully organized. In 1763 all the territory now comprised in the State lying N. of the 31st parallel, and extending westward to the Mississippi River, was ceded by France to Great Britain, and by the treaty of peace with Great Britain in 1783 became a part of the territory of the U. S. It was attached to Georgia, except a strip 12 miles wide, adjoining the State of Tennessee, which was claimed by South Carolina. In 1802 the territory from the Chattahoochee to the Mississippi, lying between the 31st and 35th parallels, was ceded to the U. S. by Georgia and South Carolina, and organized as Mississippi Territory. As yet, however, this territory had no access to the Gulf except through French or Spanish territory, the peninsula of Florida and the Gulf coast to the mouth of Amite River, and thence across to the Mississippi, extending northward to the 31st parallel, having been ceded by France to Spain. During the war of 1812 with Great Britain that part of the Spanish territory lying between the Perdido and Pearl rivers was occupied by the U. S. troops as a precautionary measure, and finally annexed to Mississippi Territory. The difficulties growing out of this seizure were subsequently settled by the purchase of the entire territory held by Spain in 1819. In 1813 and 1814 the Creek Indians inhabiting the present State of Alabama became very troublesome, and finally attacked and captured Fort Mimms on the Alabama River, near its junction with the Tombigbee, Aug. 30, 1813, and killed 380 whites who

had taken refuge there. Gen. Jackson at once marched into the Creek country with a strong force, and, following up the Indians very promptly, reduced them to complete subjection in a series of engagements in which their loss was 1617 killed, and his 100 killed and 400 wounded. After the battle of Horseshoe Bend, Mar. 27, 1814, in which the Creeks lost about 600 killed, they signed a treaty of peace in which they gave up three-fourths of their territory. Emigration to the fertile lands along the Alabama River and its tributaries now increased, and in 1817, Mississippi having been admitted into the Union as a State, Alabama was organized as Alabama Territory, and on the 2d of Aug., 1819, adopted a constitution under which it was admitted to the Union Dec. 14, 1819, having at that time 127,901 inhabitants. Alabama was actively concerned, with Georgia and Mississippi, in effecting the removal of the Indian tribes in those States to the present Indian Territory. As one of the largest slaveholding States in the Union, Alabama uniformly acted up to what were considered the interests of its section, taking strong ground in favor of the annexation of Texas, resisting all measures for the restriction of slave territory, and opposing with great vehemence what its political leaders characterized as Northern aggressions. In the presidential campaign of 1860, when it became probable that Mr. Lincoln would be elected, or at all events that Mr. Breckinridge would be defeated, an active correspondence was maintained between the political leaders in Alabama and those of other Southern States as to the best measures to bring about the secession of the Southern States and the formation of a Southern confederacy. Gov. Moore of Alabama sent a commissioner to the convention of South Carolina, which met Dec. 17, 1860, urging them to secede. He had issued his proclamation for an election of delegates to a convention in Alabama on Dec. 6. The delegates were elected on the 24th of that month, and met at Montgomery Jan. 7, 1861, and the ordinance of secession was passed Jan. 11, 1861—yeas 61, nays 39; and before adjourning the convention called for delegates from all the Southern States to meet at Montgomery, Ala., on the 4th of Feb., 1861, to organize a Southern confederacy. That convention met, organized a provisional government, elected Jefferson Davis President of the Confederacy, and Alexander H. Stephens Vice-President, and the new President having chosen his cabinet and a Confederate Congress being provided for, they adjourned, making Montgomery, for the time, the capital of their Confederacy. In July, 1861, the capital and Congress were removed to Richmond. Gov. Moore had already (in Jan., 1861) seized the U. S. arsenal and arms in Mobile, had occupied with State troops Fort Morgan in Mobile Bay, and had taken possession of the revenue cutter Cass. In the progress of the war Alabama took an active part, though the northern portion of the State contained a strong Union party. Several severe battles were fought within the limits of the State—notably, the naval actions and the capture of the forts in Mobile Bay in Aug., 1864, the siege and capture of Mobile in Mar. and April, 1865, and the capture of Selma and other towns by Gen. Wilson in April, 1865. There were also minor conflicts at Athens, Montevallo, Scottsboro', Talladega, and Tuscumbia. After the close of the war Alabama was in the same condition with the other Southern States. President Johnson appointed a provisional governor June 21, 1865, and pending measures of reconstruction the State was placed under military control. On the 25th of Sept., 1865, a State convention met and annulled the ordinance of secession, and in December following the provisional governor was withdrawn and the State allowed to manage its own affairs, subject only to some slight supervision of the military authorities. In Aug., 1867, Gen. Pope, commanding the third military district, ordered an election of delegates to a State convention to prepare a new constitution and civil government for the State. The convention met Nov. 5, 1867, and the constitution was submitted to the people Feb. 4, 1868. There was much opposition to it, and many of those opposed stayed away from the polls. The result was, that though the constitution received a majority of the votes cast, it did not receive a majority of those registered, and hence was deemed to have been rejected. Most of its provisions have, however, since been engrafted on the existing constitution. The State was admitted to a representation in Congress by an act passed over the President's veto June 25, 1868.

There was great suffering in consequence of the desolation of the country by the war, the failure of crops, and the difficulty of readjusting labor on the new basis, during the transition period of 1865–67; and subsequently the number of disfranchised persons at first, though these were mostly soon restored to their political rights, the attempts of a few misguided men to coerce the newly enfranchised people of color by threats, and the suspicions entertained by many of these against their former masters, led to some disturbances and outrages, and to fears of more. Happily, ere long better counsels prevailed; the necessity of retaining her position as a State financially, socially, and politically led the citizens of Alabama to unite to preserve peace and order, and with returning prosperity a better state of feeling took the place of the old bitterness, and mutual toleration led the way to mutual regard. The State officers and legislature granted the State aid somewhat too freely for their existing financial condition to some of the great railroad enterprises of the State, as they found to their cost in 1870 and 1871; but fortunately, the error, though complicated by the mismanagement of the officials of a neighboring State, was not irretrievable, and the judicious management of the governor and his advisers and the legislature relieved the State from what seemed at first a serious embarrassment. On the whole, Alabama has passed through the crucial period of her history, the period of reconstruction, with less disturbance or disorder than most of the Southern States; and with the return of financial prosperity, and the development of the mineral, agricultural, manufacturing, and commercial resources of the State by the great railroad lines now traversing it, there is every reason to believe that she will enter on a new and more rapid period of growth and advancement. There will be occasional troubles, of course, but these will be adjusted without the interference of the general government and without serious disorder. In the autumn and winter of 1872–73 there was a marked instance of such an adjustment. The two political parties which divide the State were so evenly balanced that both claimed a majority in the Legislature, a part of whose members were elected in Nov., 1872; and so strenuous was their opposition to each other that there was a bolt at the very commencement of the session. One party, calling themselves Conservatives, assembled at the capitol in Montgomery, were duly organized by the officers of the previous legislature, and secured a quorum in both houses. The other party, claiming to be Republicans, organized as a legislature in the U. S. court-room at Montgomery, but Mr. Lindsay, the retiring governor of the State, himself a Conservative, refused to recognize the court-room legislature. The incoming governor, Mr. David P. Lewis, who was elected as a Republican, recognized each in turn; at first, there seemed to be danger of collision, but after some bitterness and denunciation the two legislatures were fused into one, and a spirit of harmony gained the ascendency.

Governors of the State.

William W. Bibb	1819–20	Henry W. Collier	1849–53

L. P. Brockett.

Alabama, a township of Columbia co., Ark. P. 866.

Alabama, a township of Sacramento co., Cal. P. 396.

Alabama, a post-township of Genesee co., N. Y. It contains fine water-power, and the "Oak Orchard" and mineral springs, nine in number. Their waters are largely used for their tonic effect. One fourth of the township is occupied by the Tonawanda Indian Reservation. P. 1866.

Alabama Claims. The protracted negotiations, the treaty of Washington resulting therefrom, and the arbitration at Geneva by which the treaty was in part executed, may justly be deemed as forming the most important *cause célèbre* of modern diplomacy. The claims themselves were

made by the government of the U. S. in favor of certain of its citizens and of itself upon the government of Great Britain, on account of the acts of certain warlike vessels which sailed from British ports in the interest or employ of the Confederate States during the war of the rebellion in the U. S. The treaty of Washington describes them as "differences [which] have arisen between" [the two governments], "and still exist, growing out of the acts committed by the several vessels which have given rise to the claims generically known as the Alabama claims." The Confederate cruisers in respect of which the U. S. made any reclamations before the tribunal of arbitration at Geneva should be separated into two classes: *first*, those which were substantially fitted out and adapted to warlike use in Great Britain, so that they actually commenced their hostile careers by sailing from a British port; and *secondly*, those which commenced their hostile careers in the Confederate service within other territorial jurisdictions.

First Class.—The Florida was an iron screw gunboat. The contract for her was made in 1861 by Bullock, the Confederate agent in England having the matter in charge, with a firm of builders in Liverpool. Her object and destination were well known at that place, but the formal pretence was kept up that she was designed for the Italian navy. She sailed for Nassau on the 23d of Mar., 1862, with a crew of fifty-two men, all British except three or four, of whom only one was an American. She was in every respect a man-of-war, except that her armament was not in place, but she could have been put in complete preparation for battle in twenty-four hours. While she was preparing to sail, shot, shells, etc. were sent by river from Liverpool to Hartlepool, and there shipped on board the steamer Bahama, which left for Nassau, and there joined the Florida. All these facts were from time to time diligently brought to the attention of the British authorities by Mr. Adams, the American minister, and by Mr. Dudley, the American consul at Liverpool. At Nassau certain abortive proceedings against the Florida were undertaken by the colonial government. She sailed from Nassau on the 8th of August, having cleared for St. John, New Brunswick. At the same time, a schooner laden with the shot, shell, and other munitions of war sailed from Nassau, and met her at a neighboring island, where the transfer was made, and the Florida immediately set out on a hostile cruise. On the 4th of September she ran through the blockading squadron into Mobile, by pretending to be a British man-of-war and flying the British flag. On the 26th of Jan., 1863, she escaped from Mobile. Her career as a Confederate cruiser ended Oct. 7, 1864. Three of her captures, the Clarence, the Tacony, and the Archer, were fitted out and armed as her tenders, and aided in the work of destruction. During her cruises she was repeatedly received into British ports, and permitted to repair and to take in full supplies of provisions and coals. She and her tenders captured and destroyed American merchant-vessels and cargoes amounting in value to many millions of dollars.

The Alabama was built for speed, and not intended for fighting, and was manned by British subjects. She was a wooden steam sloop of about 1040 tons register, built for the Confederate States by Laird & Sons at Birkenhead, in England, and was called "No. 290," from her number in the list of steamers constructed by that firm. She was barque-rigged, was furnished with two engines of 350 horse-power each, and was pierced for twelve guns. Strict precautions were taken to keep her destination a secret, but the suspicions of the agents of the U. S. having been excited before she was quite finished, the minister of the U. S. requested the British government to detain her. The British ministers consulted the Crown lawyers, and after some delay, caused by the illness of the queen's advocate, an opinion was given in favor of detaining her. In the mean time, the "No. 290" had escaped, under a pretext of a trial trip, near the end of July, 1862. She was not equipped with guns and warlike stores when she left the Mersey, but received them at Terceira, whither they were conveyed by another vessel. In August, 1862, Capt. Semmes took command of the steamer, which he named the Alabama, and began his cruise with a crew of eighty men. He burned the merchant-vessels which he captured, being unable to take them into any port of the Confederate States in consequence of the blockade. The Alabama never entered any port that was possessed by the Confederate States.

It is stated that she captured sixty-five vessels, and destroyed property valued at $6,000,000. Much greater than this amount was the damage inflicted on ship-owners of the U. S. by the heavy insurance for war-risks to which they were subjected, and by the difficulty in obtaining freight for their vessels.

After a long cruise in the Pacific Ocean, she returned to Europe, and entered the port of Cherbourg to refit and obtain a supply of stores, June 11, 1864. A few days later the war-steamer Kearsarge, of seven guns, commanded by Capt. Winslow of the U. S. navy, arrived at Cherbourg. Capt. Semmes came out of the port and offered battle on the 19th of June. When the vessels were about one mile apart, the Alabama began to fire rapidly and wildly, while the guns of the Kearsarge were served with cool precision and effect. Both vessels during the action moved rapidly in circles, swinging round an ever-changing centre. After they had described seven circles, the Alabama began to sink and raised a white flag. Capt. Semmes, who had lost thirty killed and wounded, escaped in the English yacht Deerhound. Capt. Winslow lost three killed and wounded, and took sixty-five prisoners. The Alabama went to the bottom.

The Georgia was built for the Confederates on the Clyde. She sailed early in 1863, and proceeded to a point off the French coast, where she met the steamer Alar, which had been sent from Liverpool with her arms, ammunition, etc. Some steps were taken by the British government to prevent her escape, but they were too late. After a warlike career of about a year, she returned to Liverpool, and was there sold by the Confederate agents, Mr. Adams remonstrating in vain against this proceeding. Shortly after the sale she left the port, and was captured by the U. S. cruiser Niagara.

The Second Class.—The Sumpter, the Nashville, the Retribution, the Tallahassee, the Chickamauga. These were all armed and equipped in, and sailed from, Confederate ports. The claims made in respect of them were based upon allegations that they were received into British ports, and permitted to augment their supplies of coal and supplies, in excess of the maximum amount permitted by the queen's proclamation of neutrality; and also in respect of the Retribution, that she was permitted to take captured cargo into one of the Bahamas, and there sell or dispose of it without any judicial process. The case of the Shenandoah was quite different. She was originally a British steamer, called the Sea-King, and had been engaged in the East India trade. She sailed Oct. 8, 1864, for Bombay in ballast, with a crew of forty-seven men. She was not then armed and equipped or fitted out as a man-of-war. On the same day another steamer, the Laurel, sailed from Liverpool, ostensibly for Nassau, having on board a number of Confederates and a quantity of guns, gun-carriages, and other munitions of war. These steamers met at Funchal, in the island of Madeira, where the transfer was made. Here she was taken command of by Captain Waddell of the Confederate service, and manned. A small part only of the original crew consented to remain with her, and she sailed with less than one-half of her regular force of men. On the 25th of Jan., 1865, she arrived at Melbourne, where she was permitted to repair and to coal. She also at the same place enlisted a large number of men, augmenting her crew by forty-five new enlistments. This was done so openly that it was the common talk of the town, and was freely commented upon by the local papers. The tribunal of arbitration decided that the colonial authorities did not exercise due diligence in preventing these enlistments. Leaving Melbourne, she proceeded to the Arctic regions, and there, beyond the reach of any U. S. cruisers, she made great havoc among the American whaling ships. This was continued for several months after the complete overthrow of the Confederacy. She finally arrived at Liverpool on the 6th of Nov., 1865, and was surrendered to the British government, and by it delivered over to the U. S.

A diplomatic correspondence arose at once from the foregoing events. We can only state in the briefest manner the points which were urged by either side. It should be carefully borne in mind that the protracted negotiations growing out of the recognition of the Southern States as belligerents by the queen's proclamation of neutrality on the 13th of May, 1861, had no necessary connection with the Alabama claims. Although the two alleged causes of complaint were often mingled, and perhaps deemed inseparable, in the popular opinion of Americans, yet they were entirely distinct, and were finally and definitively held to be so by the treaty of Washington. During the war the immediate object of all communications made on the part of the U. S. was to induce the British government to interfere and prevent the escape of the Confederate cruisers; the remote object of the same communications, and the sole purpose of those made after the war, was to present and urge a demand for compensation.

Mr. Secretary Seward and Mr. Adams placed themselves upon the fundamental position that a neutral nation is bound by the principles and doctrines of the international law, independent of any mere municipal regulations, to use all the means in its power to prevent its territory from being made the base of military operations by one belligerent against the other. To this it was added that if further legislation was necessary to enable the authorities to carry out their international duties, it was always within the power

of the Parliament to enact the needed statute, and that an international obligation therefore rested upon that body to pass the act. The British government took issue with all these propositions; they denied all international duty antecedent to or beyond the existing statute; this statute, they claimed, was the limit of their power and responsibility. The statute referred to, known as the Foreign Enlistment act, was passed in 1819. In substance it provides "that if any person within any part of the United Kingdom shall . . . equip, furnish, fit out, or arm" any vessel, or attempt to equip, etc. any vessel, or procure any vessel to be equipped, etc., or knowingly aid in equipping, etc. any vessel, with intent that it may be employed in the service of one belligerent, he shall be guilty of a misdemeanor, and shall be fined and imprisoned, and the vessel, with its arms, etc., shall be forfeited. Lord Russell refused to go beyond this statute, and declared that the executive as such could not act, and that all proceedings under it must be judicial. To this end he demanded from Mr. Adams such preliminary technical proofs as would warrant a conviction by the courts. There was thus thrown upon Mr. Adams and Mr. Dudley the duty of acting as police agents and detectives for the British government in obtaining the evidence which the local officials did not busy themselves with discovering. At last, a construction was given to this statute by the English courts in the case of the Alexandra which, upon the theory before urged by Lord Russell, rendered the British government powerless. Like the Florida and the Alabama, she was constructed for the Confederates, in every respect a man-of-war ready for action, except that her guns and ammunition were not on board. She was proceeded against under the statute, which makes it the offence "to equip, furnish, fit out, or arm any vessel." The judge at the trial held that each one of these words means the same thing, and, as the Alexandra was not actually armed in a British port, the law was not violated. This ruling was sustained on appeal by the higher court. As the government had denied all international obligation, so this decision removed all municipal duty to interfere with the operations of the Confederate agents. Such was the course of the negotiations during the war.

In the year 1868 a change in the sentiments of British statesmen was apparent, and it was conceded that the matter was one for amicable adjustment. Under the influence of these opinions a convention was signed on the 14th of Jan., 1869, by Mr. Reverdy Johnson, the American minister, and Lord Clarendon, the British secretary for foreign affairs. It provided that "all claims upon the part of individuals, citizens of the U. S., upon the government of Her Britannic Majesty, and all claims on the part of individuals, subjects of Her Britannic Majesty, upon the government of the U. S.," arising since Feb. 8, 1853, shall be referred to commissioners or arbitrators to be settled. This treaty was rejected by the U. S. Senate, receiving but one vote in its favor. The reasons for this action were many: the most important were, that the treaty was expressly limited to claims of individual citizens, and ignored the existence of any on the part of the U. S. as a nation, and that it provided for the payment of claims against the U. S.

The long negotiations were ended by the treaty of Washington. The operative clause in this treaty is found in Art. I., which after reciting the "differences existing," as quoted before, proceeds: "Now, in order to remove and adjust all complaints and claims on the part of the U. S., and to provide for the speedy settlement of such claims, the high contracting parties agree that all the said claims growing out of acts committed by the aforesaid vessels, and generically known as the Alabama claims, shall be referred to a tribunal of arbitration," etc. This language is broad and without limit. A correspondence had taken place between Mr. Secretary Fish and Sir Edward Thornton, the British minister to the U. S., in Jan., 1871, preliminary to the negotiation of this treaty, in which Mr. Fish wrote, Jan. 30th, that "the removal of the differences which arose during the rebellion, and which have existed since, growing out of the acts committed by the several vessels which have given rise to the claims generically known as the Alabama claims, will also be essential to the restoration of cordial relations." To this suggestion Sir Edward Thornton acceded, and a joint high commission was agreed upon to negotiate the treaty. It will be noticed that the language of Mr. Fish's note is the same as that found in the first article of the treaty. The high commission consisted, on the part of the U. S., of Hamilton Fish, the secretary of state, Robert C. Schenck, the American minister to Great Britain, Samuel Nelson, one of the justices of the Supreme Court, Ebenezer R. Hoar, and George H. Williams; and on the part of Great Britain, of Earl de Grey and Ripon, president of the queen's council, Sir Stafford Northcote, M. P., Sir Edward Thornton, Sir John Macdonald, and Professor Montague Bernard. They completed the treaty of Washington on the 8th of May, 1871. In the deliberations the U. S. commissioners claimed compensation for "*direct losses*" in the destruction of vessels and cargoes, and in national expenditure in the pursuit of the Confederate cruisers, and for "*indirect injury*" in the transfer of American shipping to the British flag, in the enhanced rates of insurance, in the prolongation of the war, and in the addition to the cost of the war; they proposed that Great Britain should pay a lump sum, to be agreed upon, for all these claims. The British commissioners in answer proposed arbitration. The American commissioners would not agree to arbitration "unless the principles which should govern the arbitrators were first agreed upon." Finally, the latter suggestion was accepted; arbitration was adopted, and the rules which should govern the arbitrators were agreed upon. Articles I. to XI. of the treaty relate to the Alabama claims. The first describes, as has been shown, the matters submitted for decision; the others describe the constitution of the tribunal, its procedure, and the form of its decision. The seventh contains the important three rules, as follows:

First. That a neutral government is bound, first, to use due diligence to prevent the fitting out, arming, or equipping, within its jurisdiction, of any vessel which it has reason to believe is intended to cruise or carry on war against a power with which it is at peace; and also to use like diligence to prevent the departure from its jurisdiction of any vessel intended to cruise or carry on war as above, such vessel having been specially adapted in whole or in part within such jurisdiction to warlike use. *Secondly.* Not to permit or suffer either belligerent to make use of its ports or waters as the base of naval operations against the other, or for the purpose of the renewal or augmentation of military supplies or arms, or the recruitment of men. *Thirdly.* To exercise due diligence in its own ports or waters, and as to all persons within its jurisdiction, to prevent any violation of the foregoing obligations and duties; it being a condition of this undertaking that these obligations should in future be held to be binding internationally between the two countries.

These rules Great Britain denies to have been parts of the international law when the acts complained of were done, but for reasons of comity only consents that they retroact and apply to those acts, and be made the basis of decision. The article concludes as follows: "The high contracting parties agree to observe these rules as between themselves in future, and to bring them to the knowledge of other maritime powers, and to invite them to accede to them." In pursuance of the treaty, the following persons constituted the tribunal of arbitration: Count Edward Sclopis, named by the king of Italy; Mr. Jacob Staempfli, named by the president of the Swiss Confederation; Viscount d'Itajuba, named by the emperor of Brasil; Mr. Charles Francis Adams, named by the President of the U. S.; and Sir Alexander E. Cockburn, named by the queen of Great Britain. Each sovereign litigant was to present its claim to the tribunal in the form of a printed "case," and subsequently in an answer termed a "counter-case." Each case was to contain the facts and arguments relied upon by the party, and the counter-case was to be a reply to the case of the adversary. The American case was separated into six parts; it gave a minute history of the acts of the British government towards the U. S. during the rebellion, and of the fitting out and subsequent operations of each Confederate cruiser; and discussed the questions of international law involved in the controversy, and concluded with a demand of the compensation to be awarded. The British case was separated into ten parts, and covers a similar ground to the American case, though from a different point of view. Both were supplemented by many volumes of evidence. Two very distinct questions arose upon these papers: (1) What matters were submitted by the treaty to the arbitrators? and (2) By what rules and principles of law were the arbitrators to be guided in deciding the matters submitted to it? The consideration of the first and preliminary one of these questions gave rise to a controversy which for a while threatened to interrupt the whole scheme of arbitration. In Part VI. of the American case the U. S. presented the items of damage to which it claimed to be entitled. Quoting the language used by the American high commissioners, the case described claims for "direct" losses or damages, and other claims for "indirect" losses. The "direct" were said to include "losses growing out of the destruction of vessels and their cargoes by the insurgent cruisers, and the national expenditures in pursuit of these cruisers." The "indirect" were said to embrace "the loss in the transfer of the American commercial marine to the British flag," "the enhanced payments of insurance," "the prolongation of the war," and the "addition to the cost of the war." The presentation of these so-called indirect claims caused a great opposition in England. The government denied that they were included,

or intended to be included, in the terms of the treaty. Fresh negotiations were opened; a supplemental treaty was proposed: the controversy was continued after the meeting of the tribunal, and for a while it seemed possible that the whole proceeding would be a failure. The British agent asked for an adjournment of the tribunal for eight months, to allow formal negotiations. Finally, on the 19th of June, Count Sclopis, president of the tribunal, announced that the arbitrators, without deciding the question whether these claims were included in the treaty, "had arrived, collectively and individually, at the conclusion that these claims do not constitute, upon the principles of international law applicable to such cases, good foundation for an award of compensation or computation of damages between nations." The difficulty was then ended and the arbitration went on.

The argument upon the merits which was presented by the litigant nations to this high tribunal was most able and exhaustive. There is not space to present it even in the briefest outline. It turned mainly upon the true meaning of the phrase "due diligence" used in the three rules. The counsel on the part of Great Britain was Sir Roundell Palmer, then the acknowledged leader of the English bar, and afterwards made lord high chancellor with the title of Lord Selborne. The counsel on the part of the U. S. were William M. Evarts and Caleb Cushing. The final decision of the tribunal was announced Sept. 14. The arbitrators decided unanimously in favor of Great Britain in respect of the Georgia, Sumpter, Nashville, Tallahassee, and Chickamauga, and similarly in respect of the Retribution, by a vote of three to two. They all decided (Sir Alexander Cockburn for reasons peculiar to himself) that Great Britain was liable for the original fitting out and escape of the Alabama, and for her subsequent free admission into British ports. The same conclusion was reached in respect to the Florida, Sir Alexander Cockburn alone dissenting. The ruling as to these vessels applied also to their tenders. The tribunal was unanimous that no liability arose in respect of the Shenandoah prior to her arrival at Melbourne; but three of the arbitrators, Count Sclopis, Mr. Staempfli, and Mr. Adams, held that the colonial authorities failed to exercise due diligence to prevent the enlistment of men at that port, and that Great Britain was liable for captures made after her departure thence. The tribunal, in making their award, formulated and announced the following general principles, a portion of which lie at the basis of the whole decision, while a portion apply only to the estimate of the quantum of damages: "Due diligence should be exercised by neutral governments in exact proportion to the risks to which either one of the belligerents may be exposed by failure to fulfil the obligations of neutrality on their part." The effects of a violation of neutrality, as committed by the Alabama and other such cruisers, were not done away with by a commission subsequently issued by the Confederate government. "The government of Great Britain cannot justify itself for its failure in due diligence on the plea of the insufficiency of the legal means of action which it possessed." The claim of the U. S. for the national cost of pursuing the Confederate cruisers cannot be distinguished from the general expenses of the war, and is therefore an indirect loss which cannot be allowed. Prospective injuries to shippers and ship-owners, such as loss of future profits, are equally uncertain and indirect. All double claims for the same losses are rejected, but interest is allowed. Upon these principles the tribunal awarded, for actual losses of ships and cargoes and interest, the sum of $15,500,000. It is thus seen that the tribunal wholly overruled the position maintained by Great Britain from the beginning, that its statute was the sole criterion of its power and duty. In like manner the tribunal brushed away all claims by the U. S. for indirect and national losses, and strictly confined its judgment to the compensation of American private citizens for losses of ships, cargoes, freight, and wages.

J. N. Pomeroy.

Alabama Indians, a remnant of the once powerful tribe of that name, reside in Polk co., Tex. They are under the care of the State, but are also assisted by the general government. They are peaceable and quite industrious. They use the English language, but no woman is allowed to speak to a stranger. They retain the dress and many of the peculiar habits of the aborigines, but the women are clothed somewhat like their white neighbors. The people are remarkably tall, strong, and well formed. They number about 260. Their language was of the Creek family.

Alabas'ter [Lat. *alabastri'tes* and *alabas'ter*: Gr. ἀλάβαστρος], a name applied to two kinds of white mineral substances which are similar in appearance, but different in composition. The alabaster proper is a fine-grained variety of gypsum or sulphate of lime; the finest quality of this is found near Volterra, in Tuscany; the other is a crystalline carbonate of lime, and is harder than the first. Both are manufactured into ornaments.

Alabaster, a post-township of Iosco co., Mich. Pop. 235.

Alabaster Box, or **Alabas'trum,** a vessel for containing precious perfumes, used by the ancients in various countries. They were made commonly of onyx-alabaster, but other materials were used. When the woman broke the "alabaster box of ointment" to anoint the feet of Jesus, as mentioned in the Gospels, it is probable that she had a vessel with a long tapering neck, which was sealed, and that she broke off the neck to get at the perfume. Alabastra of this form were not unfrequent.

Alabaster Cave, in Placer co., Cal., is a remarkable cavern 8 miles S. E. of Auburn, and 1 mile from the North Fork of the American River. This cave contains beautiful chambers incrusted with alabaster of various tints. It also contains a lake of undetermined extent.

Alach'ua, a county in the N. part of the peninsula of Florida. Area, about 1000 square miles. It is bounded on the N. by the Santa Fé River, on the W. by the Suwanee. The surface is rolling or nearly level; the soil is generally fertile. Sea-island cotton, grain, wool, molasses, and sugar are produced. Bog-iron ore has been found. It is intersected by the Florida R. R. Capital, Gainesville. Pop. 17,328.

Alago'as, a maritime province of Brazil, is between 9° and 10° S. lat. It is bounded on the N. and W. by Pernambuco, on the E. by the Atlantic, and on the S. by Sergipe and the river San Francisco. Area, 15,300 square miles. The surface is partly mountainous; the soil of the valleys and lowlands is fertile, and produces cotton, sugar, maize, etc. Capital, Maceio. Pop. of the province in 1867, estimated at 300,000, of whom 50,000 were slaves.

Alagoas [Port. "the lakes"], a town of Brazil, in the province of the same name, on the Lake Maysuaba, was until 1839 the capital of the province. It was formerly a large and important city, but since the change of the seat of government it has declined very much. It has a considerable trade in tobacco. Pop. about 4000.

Alagon', a river of Spain, enters the Tagus about 2 miles N. E. of Alcántara. Length, about 120 miles. It is noted for its fine trout and other fish.

Alaiedon, a township of Ingham co., Mich. Pop. 1296.

Alain de Lille [Lat. *Ala'nus de In'sulis*], a French philosopher and ecclesiastic, surnamed THE UNIVERSAL DOCTOR. He was born in 1114. He wrote many works in prose and verse, and was one of the most learned men of his time. Died about 1200.

Alais (anc. *Ale'sia*), a town of Southern France, in Gard, on the Gardon, and at the foot of the Cevennes, 31 miles by rail N. W. of Nîmes, with which it is connected by a railway. It is in a productive coal-field, and has several manufactories, a college, and a school of mines. Pop. in 1866, 19,964.

Al'amance', a county in the central part of North Carolina. Area, about 500 square miles. Is drained by Haw River and Alamance Creek. The surface is undulating, the soil productive. Very valuable iron ore abounds. Grain, tobacco, and wool are raised. It is intersected by the North Carolina R. R. Capital, Graham. Pop. 11,874.

Alame'da, a county in the W. part of California. Area, 820 square miles. It is bounded on the W. by San Francisco Bay, and drained by Alameda and Calaveras creeks. The surface in the E. part is mountainous, being occupied by the Coast Range; the soil of the lowlands is fertile. There are numerous warm mineral springs. Cattle, grain, and wool are produced, and saddlery, harness, and metallic wares are manufactured. Capital, San Leandro. Pop. 24,237.

Alameda, a post-township of Alameda co., Cal. It has a weekly newspaper. Pop. 1557.

Al'amo, a post-township of Kalamazoo co., Mich. Pop. 1148.

Alamo, a post-village, capital of Crockett co., Tenn.

Al'amo, The [*alamo* is the Sp. for "poplar" tree], a celebrated fort at San Antonio, Tex. A small body of Texans, mostly from the U. S., here bravely resisted a Mexican force of ten times their number from Feb. 11 to Mar. 5, 1836, and nearly all perished rather than surrender to a foe whom they despised. The six who finally surrendered were murdered by the Mexicans; Travis, Crockett, and Bowie were here killed. In consequence of this heroic defence, Alamo is styled the "Thermopylæ of America." "Remember the Alamo!" became the war-cry of the Texans in their struggle for independence.

A'lamos, Los, a town of Mexico, province of Sonora, 110 miles N. W. of Cinaloa, has rich silver-mines in the vicinity. Pop. in 1865, about 6000.

Å'land Islands, or **O'land,** a numerous group of small islands in the S. part of the Gulf of Bothnia, near the Baltic, belong to the grand-duchy of Finland, government of Abo. About eighty of them are inhabited. Pop. about 15,000. They were ceded to Russia by Sweden in 1809. The Russian fortifications here were destroyed by the English and French troops in 1854, and by a separate convention annexed to the treaty of Paris (April, 1856), the emperor of Russia agreed "that the Aland Isles should not be fortified," etc.

Alangia'ceæ [from *Alan'gium*, one of its genera], a natural order of plants closely allied to the Myrtaceæ. It consists of Indian species having aromatic roots and eatable fruit. Their long, strap-shaped petals afford one of the principal distinctions between them and the true myrtles.

Ala'ni, an ancient warlike tribe of unknown origin, who made incursions into the Roman empire as allies of the Goths and Vandals. They invaded Asia Minor in the reign of Aurelian, and co-operated with the Vandals in the invasion of Gaul in 406 A. D.

Alapayevsk, a town of Russia, in the government of Perm, 200 miles E. of Perm. It has large iron-works. Pop. in 1867, 5447.

Alarcon' y Mendo'za, de (Don Juan Ruiz), an eminent Spanish poet and dramatist, born in Mexico about 1590. He became a resident of Spain in 1622, after which he obtained the office of reporter of the royal council of the Indies. A volume of his dramas was published in 1628. Among his works, which present a faithful delineation of Spanish manners, and are commended for elevation of sentiment, are "Las Paredes Oyen" ("Walls have Ears") and "La Verdad Sospechosa" ("Suspicious Truth"), which Corneille imitated in his "Menteur." Died in 1639.

Al'aric [Lat. *Alari'cus*], a celebrated conqueror, a Visigoth, was born about 350 A. D. Soon after the accession of Arcadius as emperor of the East, Alaric invaded Thrace, Macedonia, and other provinces, in 395 A. D. He took Athens and entered the Peloponnesus, from which he was driven out by Stilicho. Hostilities were then suspended by a treaty, and Arcadius appointed Alaric governor of Illyria in 396. He invaded Northern Italy in 402, but was defeated by Stilicho at Pollentia and Verona. Stilicho having been killed in 408, Alaric renewed the invasion of Italy, which the emperor Honorius was unable to defend. The army of the Visigoths invested Rome, then the richest and most important city in the world, but they were induced to retire by the payment of 5000 pounds of gold and 30,000 pounds of silver. After unsuccessful efforts to negotiate, Honorius rejected the terms of Alaric, who in 410 took Rome, and permitted his soldiers to pillage it for six days. He was marching to Sicily when he died at Cosenza, in 410 A. D. (See Simonis, "Kritische Untersuchungen über die Geschichte Alarich's," 1858.)

Alaric II., king of the Visigoths, began to reign in 484 A. D., at the death of his father Euric. His dominions included parts of Spain and of Gaul. He was killed in battle by the hand of Clovis, king of the Franks, in 507.

A Las'co, Alas'co, or **Alas'ko** (John), a Polish Protestant, born in 1499, became Catholic bishop of Vesprim in 1529. He was afterwards converted, went to London, preached there a few years, but on the accession of Queen Mary, in 1553, he retired for safety to Germany. He wrote several theological works. Died Jan. 13, 1560.

Ala Shehr (the ancient *Philadelphia*, founded about 200 B. C. by Attalus Philadelphus), a walled city of Asia Minor, at the N. E. base of Mount Tmolus, 93 miles E. of Smyrna. Here are five Christian churches and numerous ancient ruins. Pop. about 15,000.

Alas'ka, or **Alias'ka,** a Territory forming the N. W. part of North America, is bounded on the N. by the Arctic Ocean, on the E. by British America, on the S. by the Pacific Ocean, and on the W. by the Pacific Ocean, or Sea of Kamtchatka, and Behring's Strait, by which it is separated from Asia. It lies between lat. 54° 40′ and 71° 22′ N., and between lon. 141° and 168° W. (except a narrow strip S. of Mount St. Elias). Area, 580,107 square miles. The most northern extremity is called Point Barrow. The peninsula of Alaska, which is about 350 miles long and 75 miles in average width, extends south-westward into the Pacific. The south-eastern part of Alaska is a long, narrow strip of land extending along the sea-coast from Mount St. Elias to the parallel of 54° 40′ N., and bounded on the N. E. by a mountain ridge which is parallel to the Pacific. This strip is only about thirty-three miles wide. This territory, which includes a great number of large and small islands in the Pacific and in Behring's Strait, was formerly called Russian America. It was purchased by the U. S. from Russia in 1867 for $7,200,000.

The surface of the southern and western parts is mountainous, but the northern coast on the Arctic Ocean is flat. The principal rivers are—the Colville, which flows northward into the Arctic Ocean; the Kouskoxime, which flows south-westward, and after a course of about 300 miles enters the Kamtchatka Sea; and the Yukon (or Kwichpak), which traverses the central part of Alaska and falls into Norton Sound. The length of the Yukon (or Youkon) is estimated by some writers at 2000 miles.

The climate is humid, and less severe than that on the Atlantic coast in a corresponding latitude. The mean annual temperature at Sitka is about 42°, and it is said that the mercury seldom falls below zero at Kodiak. The highest mountain-peak is Mount St. Elias, which is a volcano; its height is estimated at nearly 18,000 feet. Mount Fairweather is of nearly equal height, and there are several other volcanoes.

The parts of Alaska which are near the Pacific Ocean are mostly covered with forests of spruce, cedar, fir, etc., which grow to a great size. It is stated that some of these trees attain a height of 200 feet or more. Here occurs a species of *Cupressus*, called yellow cedar, which is an excellent timber for shipbuilding. The value of this region consists chiefly in its fisheries, timber, and furs, and perhaps in its coal, the value of which is not determined. The coal is of tertiary origin. Among the fishes that abound here are the salmon and the cod. The majority of the native inhabitants are Esquimaux. The principal wild animals are the elk, deer, bear, and seal. In the session of 1872 Congress annexed this territory to Washington Territory as a county. (See Washington Territory.) (See F. Whymper, "Travels and Adventures in Alaska," 1869; and Dall, "Alaska and its Resources," 1870.) Pop. of Alaska in 1870, 29,097 (whites and half-breeds), besides about 55,000 Indians.

Revised by L. P. Brockett.

Ala'tri, a town of Italy, in the province of Rome, 45 miles E. S. E. of Rome. It is the seat of a bishop. Here are some of the finest and best preserved cyclopean or polygonal walls in Italy. Pop. 11,370.

Alatyr', a town of Russia, in the government of Simbirsk, at the junction of the Alatyr and Soora Rivers, 70 miles N. W. of Simbirsk. Pop. in 1867, 8085.

Alau'da, a genus of passerine birds which includes the skylark (*Alau'da arven'sis*), after the nightingale the most

Alauda cristata: the Crested Lark.

celebrated song-bird of Europe. The flesh of the skylark is esteemed a delicacy, and traps and nets of many kinds are employed for its capture. Its food consists of grasshoppers and other insects, worms, spiders, and grubs of various kinds. The beautiful *Alauda cristata*, or crested lark, is one of the most common birds of Europe and

Northern Africa. For other species of this interesting genus, see LARK.

Al'ava, one of the Basque Provinces in Spain, is bounded on the N. by Biscay and Guipuzcoa, on the E. by Navarre, on the S. by Logroño, and on the W. by Burgos. Area, 1205 square miles. The country is mountainous, but fertile, especially along the shores of the Ebro. The chief products are fruit, wine, grain, and hemp. Here are also several mineral springs. Chief town, Vitoria. Pop. in 1867, 102,494.

Alb, or **Albe** [Lat. *al'ba*, from *al'bus*, "white"], a long white linen vestment worn by the clergy of the Roman Catholic Church while they are performing the service. It sometimes has a cross embroidered upon the breast. At the end of the tunic and around the wrists are ornaments called "apparels."

Alb (called also the **Swabian Alps**), a chain of mountains which extends about 75 miles, and forms the watershed between the Danube and the Neckar, and is mostly comprised in Würtemberg. The average height of this range is nearly 2200 feet. Some remarkable caverns occur in the limestone formation of this chain.

Alba, DUKE OF. See ALVA.

Al'ba (the ancient *Al'ba Pompe'ia*), a town of Italy, province of Cuneo, on the Tánaro, 30 miles S. E. of Turin. Wine, silk, grain, and oil are the staple productions of the district, in which are also quarries of marble and rock-salt. Pop. of the town in 1861, 6367.

Alba, a township of Henry co., Ill. Pop. 295.

Albace'te, a province of Spain, comprises the N. part of the kingdom of Murcia and a portion of New Castile. It is bounded on the N. by Cuenca, on the E. by Valencia, on the S. by Murcia, and on the W. by Ciudad Real. Area, 5972 square miles. It is bounded on the N. W. by the Sierra de Alcaraz, and the surface is diversified by mountains, hills, and fertile valleys. It is drained by the river Segura, which rises within its limits. Among its staple products are grain, wine, tobacco, oil, cattle, and sheep. Capital, Albacete. Pop. in 1867, 221,444.

Albacete, a town of Spain, capital of a province of the same name, 172 miles by rail S. E. of Madrid. It stands on a fertile plain, has manufactures of knives and other steel goods, and considerable trade. Large cattle-fairs are held here in September. Pop. in 1860, 17,088.

Al'ba Lon'ga, a very ancient city of Latium, in Italy, was founded, according to tradition, by Ascanius, the son of Æneas, several centuries before the foundation of Rome. It was situated near the Alban Lake, about 16 miles S. E. from Rome. Its remains have been discovered.

Al'ban [Lat. *Alba'nus*], SAINT, the first person who suffered martyrdom in England for the Christian religion. His death occurred about 286 A. D.

Albanen'ses [from *Alba*, a town of Piedmont], that division of the Catharists who believed in absolute dualism. They taught that the world was created by the Evil Spirit. (See CATHARI.)

Alba'ni (ALESSANDRO), an Italian cardinal, a nephew of Pope Clement XI., was born at Urbino in 1692. He made a rich and celebrated collection of statues and other works of art at Rome. Died in 1779.

Albani (FRANCESCO), an eminent Italian painter, born at Bologna Mar. 17, 1578, was a pupil of Denis Calvart and L. Caracci. He excelled in painting the female form and rural prospects. Among his best works are highly finished oil pictures of "The Toilet of Venus," "Diana Bathing," and "The Four Elements or Seasons." His wife and children, who were remarkable for their beauty, served him as models for angels and cupids. Died Oct. 4, 1660.

Alba'nia, the ancient name of a country bounded on the E. by the Caspian Sea, and comprising the modern Daghestan and Shirvan. Its inhabitants were often defeated, but never conquered, by Rome.

Alba'nia (called *Shkiperi* by the natives, and *Arnaoutlik* by the Turks), the south-western part of European Turkey, lies between lat. 39° and 43° N., and is bounded on the W. by the Adriatic and Ionian seas. Its length N. and S. is about 290 miles, and its width varies from 40 to 90 miles. It nearly coincides with the ancient Epirus. The surface is mountainous, being occupied with nine ridges that are nearly parallel. The highest peaks rise about 8000 feet above the level of the sea. Among the remarkable features of Albania are its subterranean rivers and its beautiful lakes. The chief articles of export are wool, horses, timber, and maize. The Albanians are rude and warlike mountaineers, more addicted to robbery than industry. They are probably descended from the ancient Illyrians and Epirotes. Philologists are not agreed respecting the affiliations of their language, which has several strongly marked dialects, and is probably Indo-European. The inhabitants are often called *Arnaoots* or *Arnauts*, and *Skipetar*. Pop. estimated at 1,300,000. Besides these, a large number of Albanians live in Greece and other parts of the Levant.

Albano, a lake and mountain in Italy, about 14 miles S. E. of Rome. The lake, which is six miles in circumference, occupies the crater of an extinct volcano, and is 1000 feet deep or more. The lake has no natural outlet, but discharges its waters through an artificial tunnel cut through tufaceous rock. This tunnel or "emissary" was undertaken by the Romans in 397 B. C. It is one of the most remarkable remains of ancient Roman engineering. It is 6000 feet long. Alba Longa stood on the N. E. margin. From the E. shore of this lake rises Mount Albano or Monte Cavo, which is over 3000 feet high, and commands an extensive and magnificent prospect. On its summit are the ruins of the temple of Jupiter Latialis.

Alba'no (anc. *Alba'num*), a city of Italy, on or near Lake Albano, and on the Via Appia, 18 miles by rail S. E. of Rome. It occupies the site of Pompey's villa, is celebrated for beauty of scenery, and is a favorite summer residence of the wealthy citizens of Rome. Here is a museum of antiquities and a large convent. Pop. 5200.

Al'bany, or **Al'bainn,** an ancient name of the Highlands of Scotland. It is supposed that Albany, or Albion (see ALBION), was the original name given to the whole island by its Celtic inhabitants, and that it was afterwards restricted to the north-western part of Scotland, when the Celts had retired from the other parts of Britain. The title of duke of Albany was given to the second sons of several kings of Scotland and England.

Albany, a small maritime division of Cape Colony, South Africa, about 450 miles E. of Cape Town, is about 65 miles long and from 30 to 40 miles wide. It is traversed by Great Fish River. The soil produces maize, barley, cotton, and other commodities. Capital, Grahamstown. Pop. in 1865, 16,264.

Albany, a county in the E. part of New York. Area, 482 square miles. It is bounded on the E. by the Hudson River, and on the N. (partly) by the Mohawk. The Normanskill and Catskill creeks afford good water-power in this county. The surface is mostly hilly; the soil near the streams is fertile, but in some parts is sandy and sterile. Magnesian limestone, marl, gypsum, and iron are found. The county is intersected by several important railroads, terminating at Albany, the capital. Grain, wool, hay, milk, butter, and cheese are the staples, and the manufactures are extremely various and important. Pop. 133,052.

Albany, a county of Wyoming Territory, bordering on Colorado. It is intersected by the North Fork of Platte River, and also drained by the Laramie River. The surface is partly mountainous, and occupied by the Black Hills. Laramie Peak, the highest point in this county, rises over 10,000 feet above the level of the sea. Valuable lignitic coal is found, and iron ore abounds. Stock-raising is an important pursuit. The soil in some parts is fertile, especially in Laramie Plains. The Union Pacific R. R. passes through the county. Cattle and wool are the staples. Capital, Laramie. Pop. 2021.

Albany, a city and capital of Dougherty co., Ga., is on the right bank of Flint River, on the South-western R. R., 106 miles S. S. W. of Macon. It is also the northern terminus of a division of the Atlantic and Gulf R. R., and is the present terminus of the Brunswick and Albany R. R. It has two weekly papers. Large quantities of cotton are here shipped by rail. The Flint River is navigable to this point only at high water. Pop. 2110.

C. W. STYLES, ED. OF "ALBANY NEWS."

Albany, a post-village of Whiteside co., Ill., in a township of its own name, on the Mississippi, 177 miles N. by W. of Springfield. Pop. of village, 606; of township, 805.

Albany, a post-village, the capital of Clinton co., Ky., 126 miles S. of Frankfort. Pop. 163.

Albany, a post-township of Oxford co., Me. Pop. 651.

Albany, a township of Stearns co., Minn. Pop. 231.

Albany, a post-village, the capital of Gentry co., Mo., on Grand River, 52 miles N. E. of St. Joseph. It has manufactures of furniture, brooms, wagons, harness, lumber, etc.; five churches, two newspapers, graded schools, a grist-mill, a foundry, and a machine-shop. Three railroads are under construction to this point. Pop. 607.

R. N. TRAVER, ED. OF "ALBANY NEWS."

Albany, a township of Carroll co., N. H. Pop. 339.

Albany, in Albany co., is the capital of New York, and is situated on the W. bank of the Hudson River, 145 miles N. of New York City, and 164 miles (or 201 by railroad) W. of Boston, in lat. 42° 39′ 49″ N., lon. 73° 44′ 33″ W.

The place was first settled by the Dutch in 1614 as a trading-post, and after Jamestown was the earliest settlement by Europeans within the limits of the thirteen States. Fort Orange, or Aurania, was erected here in 1623. The village was successively called Beverwyck and Williamstadt. In 1664 it was called Albany, for the duke of York and Albany, afterwards James II. Till the Revolution it was the centre of a large Indian trade. The colony continued to be inhabited by the Dutch, brought over largely by the Van Rensselaer family, who secured twenty-four miles square on both sides of the river, and leased the land. Feudal tenure was abolished in 1787. After the Anti-rent war the State prohibited in 1846 leases of land for a longer period than twelve years. It was incorporated as the city of Albany in 1686 and became the capital of the State in 1797.

The site of the city extends from the bank of the river, with two miles of frontage, over the alluvial plain, and after a few hundred feet rises up on the sides of the hills to and upon the table-land 150 to 200 feet high. The slopes is divided by three or four valleys, worn by former streams into the clay-beds on which the city is built; these valleys have been largely filled up and covered with houses. The

New State Capitol (Albany, N. Y.).

view of the city from the E. bank of the river is picturesque and imposing, from the full exposure of the public edifices, with their domes and steeples, the Helderberg and Catskill Mountains being visible in the S. W. The corporate limits reach to Schenectady in a strip of land thirteen miles long and a mile wide. The principal streets are Broadway and Pearl street, which run parallel with the river, and State street, 100 feet wide, which ascends the hill to the Capitol, and thence narrower to the limits of the city proper westward. Washington avenue runs parallel to it, commencing from in front of the City Hall, and continues as the Schenectady turnpike.

The chief public edifices and institutions are the Capitol, of which the corner-stone was laid in 1806; the State Hall for State offices and the City Hall for city offices, both of marble and fronting on small parks near the Capitol; the State Museum of Natural History, chiefly of geology, with a cabinet of Indian curiosities, and is in the same building with the collection of implements and productions of the field of the State Agricultural Society; the State Library, containing, with the law department, over 90,000 volumes; the Bureau of Military Record, containing memorials of past wars; the Dudley Observatory, inaugurated in 1856, possessing the best astronomical instruments and Scheutz's tabulating machine, and now having also a physical observatory; the Medical College, which, with the Law School and the Observatory, now has an organic connection with Union College at Schenectady, under the name of Union University; two public hospitals, and a State normal school. The Albany Institute is a society first formed in 1791 for the advancement of science, and publishes its transactions. There is a public high school, one academy for boys, and three for girls. In 1870 there were 10,737 children attending school, and 2398 persons over ten years of age who could not read or write. There are sixty places of worship; the largest and most imposing church being the cathedral of the Immaculate Conception. There is also a Young Men's Association (founded 1833), a Young Men's Christian Association (1857), numerous Catholic sodalities, and other benevolent societies. The Roman Catholic diocese of Albany (founded in 1847) includes all the State N. of 42° N. lat., and E. of the E. lines of Tioga, Tompkins, and Cayuga counties; the Protestant Episcopal diocese of Albany (founded in 1868) is bounded on the W. by that of Central New York. The city contains numerous lodges of Masons, Odd Fellows, and other social and benevolent organizations. The Sisters of Mercy and of Charity, and the Christian Brothers, have institutions here. The Academy of the Sacred Heart at Kenwood, but within the city limits, occupies a building of immense size. At present (1873) the Rt. Rev. John J. Conroy, D. D., is the Roman Catholic bishop of Albany, and the Rt. Rev. Francis McNeirny is his coadjutor. The present bishop of the Protestant Episcopal diocese of Albany is the Rt. Rev. William Croswell Doane, S. T. D.

The penitentiary, opened in 1848, was under the charge of A. Pilsbury to 1873, receiving annually, mostly for short terms, over 1000 prisoners, and has almost uniformly been more than self-supporting. Washington Park is an extension of a small parade-ground with that name on the W. side into a park of 250 acres, with a lake and carriage drives of several miles. The Rural Cemetery, about four from the city northward, contains 230 acres, and is admired for its picturesque beauty and its monuments, especially Palmer's statue of the "Angel at the Sepulchre."

The advantages of Albany for trade are derived from the fact that it is near the head of tide-water and navigation, and is the eastern terminus of the Erie Canal and the southern terminus of the canal from Lake Champlain. There are six or seven railroads leading from Albany: the Hudson River and the Harlem to New York City, the Boston and Albany to Boston; the Rensselaer and Saratoga to Vermont and Canada; the New York Central to Buffalo; and the Albany and Susquehanna to Binghamton on the Erie R. R., besides steam and horse railroads to Troy. The river is crossed by two railroad bridges, and a company is incorporated for a third, over which teams will also pass. The most prominent manufacture has hitherto been stoves, including now hollow-ware, averaging annually $2,500,000 in value. Latterly, nine shoe-factories have been estab-

lished. There are thirty-three brewers and maltsters, and several manufactories of aniline colors, furniture, flour, brick, oilcloth, paper collars, safes, pianos, jewelry, soap, candles, boilers, machinery, etc. The lumber-market in the value of its lumber is second to none, the quantity received being valued at $13,000,000 a year. Its cattle-trade is of the greatest importance, being the central market for New York City and New England, and its stock-traffic amounts to $20,000,000 a year. Grain and the products of the extensive local manufacturing interests are also exported. Lumber is brought chiefly from Michigan, Canada, Pennsylvania, and Northern New York. Commerce is facilitated by a large number of slips for vessels, by a large dock, and by a pier, forming a great canal basin. There is also a very large grain elevator, owned by the New York Central R. R. The various receipts by canal amounted to $15,806,259; clearances by canal, $4,753,971. The city has a board of trade and a board of lumber-dealers. Albany is a port of survey in the U. S. customs district of New York. On June 30, 1870, there were 24 schooners, 40 sloops, 57 steamers, and 194 unrigged vessels belonging to this port. Albany has 8 national banks, with large assets exclusive of the stock. It has 11 savings banks. Albany has twelve miles of street railway. In 1873 there were 4 stock-and-mutual fire insurance companies, besides 1 purely mutual and 1 life insurance company. It has 10 weekly, 2 semi-weekly, 1 monthly, and 7 daily periodicals.

The city is supplied with water by gravitation from an artificial lake in the Sand Plains about 5 miles W. Some will also be pumped from the river in future. The fire department has seven steam fire-engines and a fire-alarm telegraph system.

A magnificent edifice for a new Capitol is building, back of the present one, of New England granite, the corner-stone of which was laid June 24, 1871. It covers more than three acres of ground, being 290 feet wide by 390 feet long, and may cost at least $10,000,000 before completion. With the basement it will be four stories high, besides the mansard story. It is in the Renaissance style, and has, in addition to high pavilions and turrets, a main tower 320 feet high. The entire structure will weigh 150,000 tons.

The population in 1790 (according to the Federal census) was 3506; in 1800, 5349; in 1810, 10,762; in 1820, 12,541; in 1830, 24,238; in 1840, 33,762; in 1850, 50,762; in 1860, 62,367; in 1870 (old limits, 69,422), 76,216. In the latter year parts of Watervliet and Bethlehem were annexed to Albany, and a part of Albany to Watervliet. The U. S. census gives the population both before and after the change.

H. A. Homes, *State Library, Albany, N. Y.*

Albany, a post-village, capital of Linn co., Or., on the Oregon and California R. R., is situated on the right (E.) bank of the Willamette River, at the mouth of the Calapooya, 28 miles by rail S. of Salem. The situation is beautiful. Small steamboats can ascend to this point for eight months in the year. Albany has a collegiate institute, a brick court-house, two weekly newspapers, and three or more churches. Pop. of precinct, 1992.

Albany, a post-township of Berks co., Pa. Pop. 1510.

Albany, a township of Bradford co., Pa. Pop. 1379.

Albany, a post-township of Orleans co., Vt., 32 miles N. E. of Montpelier. It has an academy, three villages, six churches, and manufactures of lumber, boots, shoes, etc. Pop. 1151.

Albany, a post-township of Green co., Wis. Pop. 1374.

Albany, a township of Pepin co., Wis. Pop. 275.

Albany (Louisa), Countess of, a daughter of the German prince Stolberg-Gedern, born Sept. 22, 1753. She became in 1772 the wife of the Pretender Charles Edward Stuart, a grandson of James II. of England. Her husband having died in 1788, she was mistress of the poet Alfieri. Died Jan. 29, 1824. (See Alfieri.)

Al'batross (*Diomedea*), a genus of web-footed birds of the family Laridæ, remarkable for their great size and powers of flight. The wandering albatross (*Diomedea exulans*) is the largest of all oceanic birds, having wings which measure twelve feet or more from tip to tip, but are narrow in proportion to their length. This bird is sometimes seen by voyagers over 100 miles from land. It feeds chiefly on fish. "Sometimes for a whole hour together," says the duke of Argyll, "this splendid bird will sail or wheel round a ship in every possible variety of direction, without requiring to give a single stroke to its pinions." There has been much discussion as to the means which enable the albatross to maintain this remarkable kind of motion; and the matter is not well explained. The above bird, known also as the man-of-war bird and the Cape sheep, is found near the coasts of most seas, but especially near those of Asia and Africa. Besides the above, there are the sooty albatross, *Diomedea fuliginosa*, of Eastern Asia, and the *Diomedea chlororhynchus;* and still other species are described.

Albatross.

Albay, a town in Luzon, one of the Philippine Islands, 258 miles S. E. of Manila, is the capital of a province. Pop. about 13,000. Pop. of the province, about 204,840.

Al'bee, a township of Saginaw co., Mich. Pop. 197.

Al'bemarle, a town of France. See Aumale.

Albemarle, a county near the central part of Virginia, has an area of about 700 square miles. It is bounded on the N. W. by the Blue Ridge, and on the S. by the James River. It is drained by the Rivanna and Hardware Rivers. The surface is finely diversified by hills and valleys. The soil is generally fertile. This county is intersected by the Chesapeake and Ohio R. R. It was the native place of Thomas Jefferson. Grain, tobacco, and wool are the staples. Pop. 27,544. Capital, Charlottesville.

Albemarle Sound, in the N. E. part of North Carolina, extends from the mouth of the Roanoke River 60 miles eastward to a narrow island which separates it from the Atlantic. Its average width N. and S. is about 12 miles. It communicates by narrow inlets with Pamlico and Currituck Sounds. The water in it is nearly fresh. Its greatest depth is 24 feet; average depth, 20 feet.

Albemarle (George **Monk**), Duke of, a famous English general, chiefly known to history as the principal agent in the restoration of the Stuarts in 1660, was born of an ancient Devonshire family near Torrington Dec. 6, 1608. He joined the army in order to escape punishment for mishandling a sheriff who was about to arrest his father for debt. In 1625 he engaged in the expedition against Spain, and took part at the attack upon Rhé, and served ten years in the Netherlands. In the campaign against the Scots he served as lieutenant-colonel. He led a regiment against the Irish, and was governor of Dublin until peace was struck by the marquess of Ormond in 1643. In the civil war Monk was taken prisoner by Fairfax in 1644, and imprisoned in the Tower, and only regained his liberty after a confinement of two years by taking the Covenant. He was given a command by the Parliamentarians, but drew upon him suspicions of treachery, and cleared himself with difficulty before Parliament. After the defeat of the royalist cause Cromwell appointed Monk a lieutenant-general and chief of artillery, in which capacity he did such service at the battle of Dunbar that Cromwell made him general-in-chief of the army in Scotland. In 1652 he took part in the commission which drew up a pact of union between England and Scotland, and went to Scotland as governor in 1654; in which position he had great difficulties in maintaining his rule against the Presbyterians. The royalists had already some hopes of his support, and Charles sent him secret overtures in 1656. Monk delivered this letter up to Cromwell. After the death of the dictator, Monk declared in favor of Richard Cromwell, and assumed the authority of a defender of public order only when Lambert threatened to establish a military despotism. On the 1st of Jan., 1660, he marched over the border with 6000 men, joining Fairfax at York, and marched into London on the 3d of February, without drawing sword from scabbard. At first he kept every one in the dark as to his intentions. On Feb. 28 he recalled the Presbyterian members expelled from Parliament in 1648, thus creating a majority for the king. He held negotiations with Charles, and Parliament declared the latter king on the 8th of May. Charles gave Monk the offices of privy councillor, chamberlain, and lord lieutenant of Devon and Middlesex, besides creating him duke of Albemarle. In 1666 the duke of Albemarle commanded the naval expedition against Holland, was beaten by De Ruyter in the three days' conflict at Dunkirk, but defeated the Dutch admiral at North Foreland. Died Jan. 3, 1670.

Albemarle, Earls of (Viscounts Bury and Barons Ashford), one of the prominent families of England.—The first earl of this family, Arnold van Keppel, born in 1669, was a Dutch favorite of William, prince of Orange, with whom he went to England in 1688. After that prince became King William III., Van Keppel was created earl of Albemarle, and was a rival of the duke of Portland in competing for royal favor. Died in 1718.—The sixth earl, George Thomas Keppel, born June 13, 1799, was member

of the House of Commons for East Norfolk from 1832 to 1835, and for Lymington from 1847 to 1850. He succeeded his brother as earl of Albemarle on Mar. 15, 1851. He is a lieutenant-general in the British army.

Albemarle, a post-village, the capital of Stanley co., N. C., is situated in a township of its own name, about 60 miles S. by W. from Greensboro'. Pop. of township, 1600.

Alberic I., a ruler of Rome, was born in the beginning of the tenth century, the son of a Lombardian noble. He became margrave of Camerino, and, through his marriage with the celebrated Marozia, ruler of Rome. He was banished by John X. from Rome, and was murdered in 925. His son, Alberic II., was a powerful and wise ruler, and died in 954, after a reign of twenty-three years. He was succeeded by his son, Ottaviano, who was elected pope under the name of John XII. in 956.

Albero'ni (Giulio), Cardinal, an ambitious Italian, born near Pincenza May 31, 1664. He began his public career as envoy of the duke of Parma to the court of Madrid, and, having gained the favor of Philip V., became prime minister of Spain in 1715. His foreign policy was so audacious and violent that nearly all the powers of Europe combined against Spain. Among his offensive acts was the invasion of Sardinia in time of peace. He was removed from office in 1719, and banished from Spain. Died Jan. 26, 1752. (See Bersani, "Storia del Cardinale Giulio Alberoni," 1862.)

Al'bers (Johann Friedrich Hermann), an eminent German physician, born Nov. 14, 1805, became in 1831 professor of pathology in Bonn, established a celebrated asylum for insane and nervously affected persons in Bonn, and in 1856 became director of the pharmacological cabinet of the university. Died May 12, 1867. He has published, among other works, "Handbuch der allgemeinen Pathologie" (2 vols., 1842-44), "Lehrbuch der allgemeinen Arzneimittellehre" (1853), and "Die Spermatorrhöe" (1862).

Albert, a town of France, in the department of Somme, 18 miles N. E. of Amiens, has cotton-factories and paper-mills. Pop. in 1866, 4019.

Al'bert, a county in the S. E. part of New Brunswick, bordering on Chiegnecto Channel. The coal-like mineral called Albertite is found here, and petroleum has been obtained. Area, about 650 square miles. Capital, Hopewell Cape. Pop. 10,672.

Albert, crown prince of Saxony, born April 23, 1828, took part in the campaign in Sleswick-Holstein in 1849, was made lieutenant-general in 1853, and general in 1857, commanded the Saxon army in the war against Prussia in 1866, received the command of the twelfth army corps after the admission of Saxony into the North German Union, in which position he took part in the battles of Rezonville, Gravelotte, and Sedan in the German-French war of 1870, and received the command of the fourth army (of the Meuse). In July, 1871, he was created field-marshal of the empire, and soon after field-marshal of Russia.

Albert [in German, commonly *Albrecht*] **I.,** archduke of Austria, born in 1248, was a son of the emperor Rudolph of Habsburg. He was elected emperor of Germany in 1298, but his title was contested by Adolphus of Nassau, who had occupied the throne. These rivals fought a battle, in which Adolphus was killed. Albert, who was noted for his cruelty and avarice, was assassinated May 1, 1308, by his nephew, John the Parricide.

Albert V., a son of Albert IV., was born in 1397, and became duke of Austria in 1404. He was chosen king of Hungary in 1437, and emperor of Germany in 1438. His title as emperor was Albert II. Died in 1439.

Albert, archduke of Austria, a son of the emperor Maximilian II., was born in 1559. He was appointed governor of the Netherlands in 1596 by Philip II. of Spain, whose daughter Isabella he married about 1598. In 1600 he was defeated by Maurice of Nassau, who fought for the Dutch republic. The war was suspended in 1609 by a long truce. Died in 1621.

Albert I., margrave of Brandenburg, surnamed the Bear, was born about 1106. He was the founder of the House of Brandenburg. Died about 1170.

Albert III., of Brandenburg, born in 1414, was surnamed Achilles and Ulysses, on account of his courage and wisdom. Died in 1486.

Albert (of Brandenburg), first duke of Prussia, a grandson of the preceding, was born in 1490. He was elected grand master of the Teutonic Order in 1511, and was the last who held that office. In 1525 he became a Protestant, and duke of Prussia, which he held as a fief of the king of Poland. Died in 1568.

Albert (Prince), or, more fully, **Albert Francis Augustus Charles Emmanuel,** prince of Saxe-Coburg-Gotha and consort of Queen Victoria of England, was born near Coburg Aug. 26, 1819. He was a son of Duke Ernest I. His marriage with Victoria was celebrated in Feb., 1840, soon after which he obtained the rank of field-marshal in the British army. He patronized science and art, was a liberal promoter of benevolent institutions, and acquired great influence in public affairs as the prudent and trusted adviser of the queen. In 1857 he received the title of prince consort. Died Dec. 14, 1861. His death was lamented as a national loss. (Compare Morton, "The Prince Consort's Farms" (1863), Grey, "The Early Years of the Prince Consort" (1867), and "Leaves from the Journal of Our Life in the Highlands from 1848–61.")

Albert Edward, prince of Wales, the eldest son of Queen Victoria, was born Nov. 9, 1841. He is the heir-apparent to the British throne. In 1860 he visited the U. S. He married, Mar. 10, 1863, the princess Alexandra of Denmark. His children by this marriage are—Prince Albert Edward Victor Christian, duke of Cornwall, born Jan. 8, 1864; Prince George Frederick Ernest Albert, born June 3, 1865; Princess Louisa Victoria Dagmar, born Feb. 20, 1867; Princess Victoria Alexandra Olga Mary, born July 6, 1868; Princess Maud Charlotte Mary Victoria, born Nov. 26, 1869; and Prince Alexander John Charles Albert, born April 6, died April 7, 1871.

Albert, a French revolutionist and mechanic, whose original name was Alexandre Martin, was born at Bury (Oise) April 27, 1815. He founded in Paris in 1840 a journal called "L'Atelier" ("The Workshop"), and was a member of the provisional government formed in Feb., 1848.

Albert (Frederick Rudolph), archduke of Austria, oldest son of Archduke Charles, was born Aug. 3, 1817. In 1851 he was appointed military and civil governor of Hungary, which position he retained until 1860. In 1859 he was sent to Berlin to bring about an understanding between the two great powers of Germany, and in 1863 was created field-marshal.

Alber'ta, a township of Benton co., Minn. Pop. 158.

Albertinel'li (Mariotto), an eminent Italian painter, born about 1475, was a pupil of Roselli, and a friend and imitator of Fra Bartolommeo, with whom he painted several pictures. Among his most celebrated paintings is the "Visitation of Mary and Elizabeth" in Florence, "The Virgin Mary with Saint Domenico" in the Academy at Florence, "Saint Catherine" and the "Virgin Mary with the Child" in the Louvre. Died about 1520.

Albert Lea is the shire-town of Freeborn co., Minn. It is 128 miles W. of the Mississippi River, at the intersection of the Southern Minnesota and the contemplated line of the St. Louis and Minneapolis R. Rs. It has several small manufactories, public park, library association, high school, and two newspapers. It is beautifully situated between two lakes, one of which bears its name, and the surrounding country of undulating prairie and timber is charmingly picturesque. An abundance of game has made it a popular resort for pleasure-seekers. Pop. of Albert Lea township, 1167. D. G. Parker, Pub. of "Standard."

Al'bert Mausole'um, erected in commemoration of Prince Albert, consort of Queen Victoria. The first stone of this building, at Frogmore, was laid by Queen Victoria in Mar., 1862, and the remains of Prince Albert were removed from St. George's Chapel to the mausoleum in December of the same year.

Al'bertson's, a post-township of Duplin co., N. C. Pop. 667.

Alber'ti (Leon Battista), an eminent Italian architect, poet, and writer on art, was born at Genoa (or, as some say, at Florence) in 1404. He was employed as an architect by Pope Nicholas V., completed the Pitti Palace at Florence, and designed the church of St. Francis at Rimini. His "Treatise on Architecture" ("De Re Edificatoria," 1485) is highly commended. Died April, 1472.

Al'bert Nyan'za (written also **Albert N'Yanza**), a large lake of Africa, and one of the sources of the White Nile, is situated under the equator, about 90 miles W. of Victoria Nyanza. It is 300 miles long or more, and is 92 miles wide where it is crossed by the equator. The northern extremity is in lat. 2° 45′ N. The southern part has not been fully explored. The surface of this lake is 2720 feet above the level of the sea. On the eastern side it is enclosed by rocky cliffs of granite and porphyry, the average height of which is about 1500 feet, and by isolated peaks, which are supposed to rise 5000 feet or more above the lake. Near the western shore is a range called the Blue Mountains, about 7000 feet high. The scenery around this lake is described as extremely beautiful. The water is fresh, sweet, and very deep. The Albert Nyanza was discovered and named by Sir Samuel White Baker, who with his wife reached Vacovia, on the eastern shore, in Mar.,

1864, after several years of arduous and perilous adventures. "It was," he says, "a grand sight to look upon this vast reservoir of the mighty Nile, and to watch the heavy swell tumbling upon the beach, while far to the south-west the eye searched as vainly for a bound as though upon the Atlantic. It was with extreme emotion that I enjoyed this glorious scene." Embarking in a boat, he explored the lake to Magungo, which is near its northern extremity, and in lat. 2° 16′ N. The lake here was about 16 miles wide. The Somerset River, or Victoria Nile, which is the outlet of Lake Victoria Nyanza, enters Lake Albert near Magungo. Ascending the Victoria Nile, he discovered a grand cataract, 120 feet high (perpendicular), which he named Murchison Falls. (See Sir S. W. Baker, "The Albert Nyanza, Great Basin of the Nile," 1866.)

Alber'tus Mag'nus (*i. e.* "Albert the Great"), sometimes called Albert de Bollstadt. He was born in Bavaria in 1193, and became a Dominican friar. In 1254 he was chosen provincial of the Dominican Order, and in 1260 became bishop of Ratisbon. He lectured for many years at Cologne, and wrote numerous works on theology, logic, philosophy, and other subjects. He was reputed one of the most learned men of the Middle Ages, and was regarded as a magician by some of his contemporaries. Died in 1280. Thomas Aquinas was one of his disciples.

Al'bi, or **Al'by** [Lat. *Albi'ga*], an old city of France, capital of the department of Tarn, on the river Tarn, and on a hill 42 miles N. E. of Toulouse. It has a museum of natural history, a college, a normal school, a cathedral, a public library, and a theatre; also manufactures of coarse linens, tablecloths, and cotton goods. Here is an archbishop's see. The Albigenses derived their name from this town, which suffered much in the religious wars of France. Pop. in 1866, 16,596.

Al'bia, the county-seat of Monroe co., Ia., on the Burlington and Missouri River R. R. where it is crossed by the Central R. R. of Iowa, 100 miles N. W. of Burlington, and about 65 miles S. E. of Des Moines. It has one national bank and two weekly papers. Two other railroads are projected to the place. The county is mostly underlaid with coal of a good quality, and mines are being opened in numerous places. The country around it is rich and productive. Pop. 1621.

James Haynes, Ed. "Spirit of the West."

Albigen'ses [from *Albi'ga*, the Latin name of Albi, a town of France], a name given to several sects of reformers in the south of France which called themselves Catharists. In 1208, Pope Innocent III. proclaimed a crusade against these reformers and against Raymond VI., count of Toulouse, one of their principal leaders. A large army was led against them by Simon de Montfort, earl of Leicester. The war was carried on with great bitterness of feeling on both sides, and with little intermission till 1229, when a treaty between the contending parties was concluded at Paris. Many of the Albigenses emigrated to other countries, while others perished in the Inquisition, which was established about the same time that the pope proclaimed his crusade. The name gradually disappears in the early part of the fourteenth century. (See Faber's "Inquiry into the History and Theology of the Ancient Vallenses and Albigenses," London, 1838.)

Al'bin, a township of Brown co., Minn. Pop. 194.

Albi'ni (Franz Joseph), an able German statesman and lawyer, born in Rhenish Prussia May 14, 1748. He passed some years in the service of the emperor Joseph II., after whose death (1790) he became chief minister of the elector of Mentz, whom he served with fidelity until 1802. Died Jan. 8, 1816.

Albi'no [Port., from the Lat. *al'bus*, "white"], a person who has a great deficiency or an absence of pigment in the hair, skin, and eyes. The complexion is very light, the hair often snowy white, the eyes red. Albinism in the human species may be observed in white and black races, and in the negro is sometimes partial, patches of the skin having the normal color. Albinism is frequent among Zuni Indians and other tribes in Arizona. A degree of nyctalopia (day-blindness) is common among albinos. Elephants, birds, mice, and other animals sometimes exhibit the phenomena of albinism, which is often hereditary.

Al'bion, the ancient Celtic name of Great Britain. The name, said to signify "white island," is supposed by some, though without good reason, to have been given on account of the chalky cliffs of Kent.

Albion, a post-village, capital of Edwards co., Ill., in a township of the same name, and on the New Albany Mt. Carmel and St. Louis R. R. It has a high and healthy location, good schools, a chemical laboratory, a wagon-factory, and two newspapers. Pop. of village, 613; of township, 2856. J. E. Clarke, Pub. "Albion Independent."

Albion, a post-village, the capital of Noble co., Ind., in a township of its own name, about 26 miles N. W. of Fort Wayne. Pop. of township, 598.

Albion, a township of Butler co., Ia. Pop. 1039.

Albion, a township of Howard co., Ia. Pop. 682.

Albion, a post-township of Kennebec co., Me. Pop. 1356.

Albion, a post-village of Calhoun co., Mich., on the Kalamazoo River and Michigan Central and N. C. M. R. R., 37 miles S. of Lansing and 96 miles W. of Detroit. It is the seat of Albion College, under the control of the Methodist Episcopal Church. The village has four fine primary school buildings, besides an excellent central school; a national bank, two weekly papers, two large flouring and other mills, two door, sash, and blind factories, a tannery, an extensive agricultural tool manufactory, machine-shop and furnace, a library, five churches, and two benevolent societies. Pop. of Albion township, 2409.

S. W. Cole, Pub. "Albion Mirror."

Albion, a post-township of Wright co., Minn. P. 281.

Albion, the capital of Orleans co., N. Y., on the Erie Canal and the New York Central R. R., 30 miles W. of Rochester, has a brick court-house, a jail, a furnace, two banks, two newspapers, two public parks, six churches, a free library, and several important manufactories. It is the seat of a fine academy, and of Phipps' Union Seminary. It is in Barre township. Pop. 3322.

C. G. Beach, Ed. "Orleans Republican."

Albion, a township of Oswego co., N. Y. It has manufactures of leather, lumber, etc. Pop. 2359.

Albion, a post-borough of Erie co., Pa. Pop. 452.

Albion, a thriving village and township of Dane co., Wis., is situated in an important tobacco-growing region. Albion Centre is the seat of Albion Academy, also of a prosperous Sabbath school publishing-house, both under the patronage of the Seventh-Day Baptist denomination. It has one semi-monthly paper, and is three miles from Edgerton, on the Milwaukee and St. Paul R. R. Pop. of township, 1142.

Rev. J. E. N. Backus, Pub. of "Gem."

Albion, a township of Jackson co., Wis. Pop. 1991.

Al'bite [from the Lat. *al'bus*, "white," and the Gr. λίθος, a "stone"], a silicate of alumina and soda, sometimes called soda felspar. It is a constituent of granite, being associated with true felspar, from which it may be distinguished by its greater whiteness and translucency. It also occurs in syenite and greenstone.

Al'boin [Lat. *Alboi'nus*], the founder of the Lombard kingdom in Italy, was a son of Alduin, whom he succeeded in 543 A. D. He conducted an army of Longobards into Italy in 569, and conquered the northern provinces. He married Rosamund, a daughter of King Cunimund, whom he had killed. Alboin was assassinated in 573 A. D., at the instigation of Rosamund.

Albo'ni (Marietta), a popular Italian singer, born at Cesena Mar. 10, 1824, was a pupil of Rossini. She performed with great applause in Paris and London in 1846–47, and afterwards visited the U. S. She was married to the count de Pepoli. Her voice is a contralto, in the highest degree sweet and sonorous.

Al Borâk' (*i. e.* "the lightning," so called on account of its fleetness), the name of a creature on which Mohammed is said to have made journeys to the celestial regions.

Albornoz' (Gil Alvarez Carillo), or **Ægid'ius de Albornoz',** a Spanish cardinal, born at Cuenca. He was appointed archbishop of Toledo by Alfonzo XI. of Castile, whose life he saved in a battle against the Moors. In 1353, Pope Innocent VI. sent him as legate to Italy, where he distinguished himself by his military and political talents, and restored the authority of the pope over many cities. Died Aug. 24, 1367.

Al'brecht, the name of many German princes. (See Albert.)

Al'brechtsberger (Johann Georg), one of the most learned contrapuntists of modern times, born Feb. 3, 1736, became director of the choir of the Carmelites in Vienna, organist to the court in 1772, musical director at St. Stephen's cathedral in Vienna in 1792, and died Mar. 7, 1809. He published "Gründliche Anweisung zur Composition" (1790; 3d ed. 1821).

Al'bright (Jacob), an American divine of the Lutheran Church, born in Montgomery co., Pa., in 1759. He founded in 1808 the Evangelical Association (which see). Died in 1808.

Al'bright's, a township of Alamance co., N. C. Pop. 625.

Albue'ra, La, a village of Spain, in Estremadura, on a small river of its own name, 13 miles S. E. of Badajos. Here on the 16th of May, 1811, the British general Beresford defeated the French marshal Soult, who lost nearly 9000 men. The allies lost about 7000.

Albufe'ra, a lagoon of Spain, 7 miles S. of Valencia, is 11 miles long, and abounds in fish and wild fowl. It is near the sea, with which it is connected by a narrow channel. The Spaniards were defeated near this lake Dec. 6, 1811, by the French under Marshal Suchet.

Albu'men [from *al'bus*, "white"], a Latin term signifying the "white of an egg," denotes in chemistry an organic compound of great importance, which, besides being the characteristic ingredient in the white of an egg, abounds in the serum of the blood, in chyle, lymph, the juice of flesh, and forms an important part of the skin, muscles, and brain. In Bright's disease it is found in considerable quantity in the urine. "It is obvious," says Liebig, "that albumen is the foundation, the starting-point, of the whole series of peculiar tissues which constitute those organs which are the seat of all vital actions." Albumen is also found in small quantities in most vegetable juices.

When heated to a temperature from 140° to 160°, albumen coagulates and becomes insoluble in water. It is also coagulated by alcohol and most of the acids. According to Liebig, the albumen of blood is $C_{216}H_{338}N_{54}S_3O_{68}$. Lieberkühn considers it $C_{72}H_{112}N_{18}SO_{22}$.

The fibrine of the muscles and the albumen of blood contain the same elements in the same proportion.

Egg albumen differs from serum albumen by being precipitated by ether and by turpentine, and being almost insoluble in strong nitric acid. When injected into the veins of dogs or rabbits it passes into the urine unchanged, while serum albumen injected in the same way does not appear in the urine at all.

Coagulated albumen is white, opaque, and elastic. It dries to a brittle, translucent, horny mass, which when placed in cold water swells up to its original form.

Albumen is a weak acid, apparently dibasic. Its salts with the alkaline metals are soluble; they are obtained by adding the caustic alkalies or alkaline carbonates directly to albumen. The other albuminates are insoluble, and are obtained by precipitation: Potassic albuminate = $K'_2C_{72}H_{110}N_{18}SO_{22}$; calcic albuminate = $Ca''C_{72}H_{110}N_{18}SO_{22}$.

The white of egg is recommended as an antidote to corrosive sublimate, mercuric chloride, as it forms mercuric albuminate, which is insoluble in water. As it is, however, slightly soluble in saline solutions, the physician should also secure vomiting, to remove the mercury from the stomach. Albumen is much used for clarifying syrups and other liquids. When boiled with them, it coagulates to flocks, entangling the suspended impurities, and carrying them either to the surface as a scum or to the bottom as a sediment. In cooking, the white of egg is employed; in sugar refining, bullock's blood. Albumen is also used for preparing the surface of paper for photographic printing, and for making a cement with lime.

Egg and serum albumen are now manufactured in large quantities by simply drying the natural fluids in thin layers in warm air, taking care that the temperature shall not be so high as to coagulate the albumen, and thus render it insoluble. The chief application of this albumen in the arts is in calico-printing. It is employed in fastening certain colors upon the fibres of cotton cloth, especially pigments such as ultramarine, chrome yellows, and oranges, Guignet's green, etc., and also the aniline colors. The pigments or colors are simply mixed with a solution of albumen, printed on the cloth, and fixed by steaming, which coagulates the albumen and renders it insoluble. A dark-colored, inferior quality of serum albumen, sold under the name of "dried blood," is used by sugar refiners to clear the solutions of raw sugar. C. F. Chandler.

Albu'minoids, or Pro'teids, an extensive class of organic bodies found in animals and plants. They form the chief constituents of blood, muscles, nerves, glands, and other organs of animals; and though present in plants in much smaller proportions than cellulose, starch, sugar, etc., they still play a most important part in plant life. Their exact constitution has not been determined. Analysis shows them to contain—

Carbon,	52.7 to 54.5.
Hydrogen,	6.9 " 7.3.
Nitrogen,	15.4 " 16.5.
Oxgyen,	20.9 " 23.5.
Sulphur,	0.8 " 1.6.

They are amorphous, more or less soluble in water, insoluble or nearly so in alcohol, insoluble in ether, soluble in excess of strong acetic acid, soluble in alkalies, and soluble in strong mineral acids. Nitric acid produces yellow xanthoproteic acid. Strong alkalies change them to leucine, tyrosine, oxalic acid, carbonic acid, ammonia, etc., according to the temperature. From their solutions they are precipitated by excess of mineral acids, by potassic ferrocyanide with acetic or hydrochloric acid, by acetic acid in presence of a considerable quantity of alkaline or alkaline earthy salt, gum arabic or dextrine, by mercuric nitrate, Millon's reagent.

They have been classified as follows:

I. Albumens, soluble in water: 1. Serum albumen; 2. Egg albumen.

II. Globulins, insoluble in water, soluble in very dilute acids and alkalies, soluble in dilute solutions of sodic chloride and other neutral salts: 1. Myosin; 2. Globulin; 3. Fibrinogin; 4. Vitellin.

III. Derived albumens, insoluble in water and in solutions of sodic chloride; soluble in dilute acids and alkalies: 1. Acid albumen; 2. Alkali albumen, or albuminate casein.

IV. Fibrine, insoluble in water, sparingly soluble in dilute acids and alkalies, and in neutral saline solutions.

V. Coagulated proteid.

VI. Amyloid substance, or lardacein.

VII. Peptones, produced by the action of the gastric juice on all albuminoids.

For further information on this important class of bodies see Hoppe-Seyler, "Handbuch der Physiologisch-Chemischen Analyse;" the eleventh English edition of Fownes' "Manual of Chemistry;" and the "Handwörterbuch der Chemie," 2t Aut. II., p. 124. C. F. Chandler.

Albuminu'ria [from *albumen* and the Lat. *uri'na*, "urine"] is the presence of albumen in the urine, constituting a very important symptom of disease. Albumen is sometimes observed in small proportion in the urine of persons apparently healthy. Artificial obstruction (by vivisection and ligation) of the emulgent veins in the lower animals produces albuminuria, thus illustrating the fact that passive engorgement of the kidney may cause this symptom, as in organic disease of the heart. Albuminuria has been reported as following the injudicious use of oil of turpentine, in which case it results from an active congestion of the kidney. Albuminuria is sometimes associated with dyspepsia, in which case it may be either a temporary and probably unimportant symptom, or a precursor of Bright's disease—a malady which is among the most formidable of all with which we have to deal. This symptom has also been observed in malarial and typhoid fevers, pneumonia, smallpox, scarlet fever, measles, erysipelas, peritonitis, consumption, pregnancy, rheumatism, leucocythæmia, purpura, and a great variety of other conditions. In most cases it results from a degeneration of the kidney, characterized by swelling, opacity, and molecular decay of the renal epithelium.

Albuminuria is best detected either by slightly acidulating and then boiling the urine in a test-tube, or by adding nitric acid. In either case the albumen coagulates into a white, semi-solid mass. Albuminuria is best treated by attention to hygienic conditions.

Albuñol', a town of Spain, in the province of Granada, near the Mediterranean, 35 miles W. by S. of Almería. It is well built and has several convents. Pop. about 5000.

Albuquer'que, a town of Spain, in the province of Badajos, 26 miles N. of Badajos. It has a castle, and manufactures of cotton and wool. Pop. about 7500.

Albuquerque, a post-town, the capital of Bernalillo co., N. M., on the Rio Grande, 75 miles S. W. of Santa Fé. It has a trade in wool, hides, grain, and wine. Gold, silver, iron, lead, copper, and coal are found near this place, which is 5032 feet above the sea-level. Pop. 1307.

Albuquerque, or Alboquerque, d' (Affonso), surnamed the Great and the Portuguese Mars, a celebrated general, born at Alhanda, near Lisbon, in 1452, was related to the royal family. After he had distinguished himself in several expeditions to Africa and the East Indies, he was appointed viceroy of the Indies in 1509. He took the city of Goa in 1510, and conquered Malacca, in which he obtained booty of great value, in 1511. In 1513 his fleet entered the Red Sea, which had never before been navigated by Europeans. He captured the rich emporium of Ormuz in 1515. Having been removed from command, he died at Goa Dec. 16 of that year. He is said to have been eminent for justice and other virtues, which, combined with his military skill, greatly increased the power of Portugal in India.—Albuquerque (Bras Affonso), a natural son of the preceding, was born at Alhandra in 1500. He was a naval officer, and was noted for his integrity and public spirit. He wrote a narrative of his father's campaigns, entitled "Comentarios do grande Affonso d'Alboquerque" (1557). Died in 1580.

Al'burg, a post-township of Grand Isle co., Vt. This township has a celebrated mineral spring which is of a decidedly alkaline character, and contains lithia. It is useful

in gout and rheumatism, and other diseases. It has been recommended for cancer, but has no marked effect on that disease. Alburg has an academy, and is on the Vermont Central R. R. Pop. 1716.

Albur'num [from the Lat. *albus*, "white"], or **Sap-wood,** is that part of the wood of exogenous trees which is most recently formed and is contiguous to the bark. It consists partly of tubes through which the sap ascends, and is of a white or pale color, whence its name is derived. It gradually hardens with age, and is converted into duramen or heart-wood, which is more valuable than alburnum.

Alcæ'us [Gr. Ἀλκαῖος], a celebrated Greek lyric poet, born at Mitylene, flourished about 600 B. C. In the violent contests between the democracy and the nobles of Lesbos he took side with the latter. He wrote in the Æolic dialect, and invented the metre called Alcaic. His poetry is impassioned and full of enthusiasm. Horace admired and imitated the odes of Alcæus, who, among the nine lyric poets of the Alexandrian canon, was recognized as the second, or, as some say, the first. He is said to have been a friend and admirer of Sappho, to whom some of his verses were addressed. His works are lost except small fragments.

Alca'ic Me'tre, in Greek and Latin poetry, was named from Alcæus, the reputed inventor. The greater alcaic verse consists of two iambic feet, a long catalectic syllable, a choriambus, and an iambus. The lesser alcaic is two dactyls, followed by two trochees.

Alcaide. See Alcayde.

Alcala' de Guadai'ra, a town of Spain, in the province of Seville, 9 miles S. E. of Seville, has a Moorish castle, and considerable trade in grain. Pop. about 7400.

Alcala' de Hena'res, a city of Spain, in the province of Madrid, on the river Henares, 21 miles by rail E. of Madrid, was built in 1083 near the site of the ancient Complutum. It was the seat of a celebrated university founded by Ximenes, which has been removed to Madrid. After this removal, Alcalá (which had 22,000 inhabitants in 1768) rapidly declined. Cervantes was born here in 1547. The celebrated Complutensian Bible was printed at Alcalá in 1514. Pop. about 8600.

Alcala' la Real', a city of Spain, in the province of Jaen, stands in an elevated glen about 2700 feet above the sea, and 24 miles S. W. of Jaen. It has a court-house, several convents, a hospital, etc. Pop. 6738.

Alcal'de [probably a corruption of the Arabic *al cadi*, "the judge"], the title given by the Moors, Spaniards, and Spanish American nations to a judicial or administrative officer, is sometimes erroneously confounded with *alcayde*. *Alcalde pedaneo* signifies justice of the peace.

Alcam'enes [Gr. Ἀλκαμένης], an eminent Athenian sculptor, a pupil of Phidias, flourished about 420 B. C. He was equal in celebrity to any sculptor of his time except his great master. Pausanias states that he was living in 400 B. C.

Al'camo, a town on the island of Sicily, in the province of Trapani, 24 miles S. W. of Palermo, has a college and picturesque ruins of an old castle. Pop. in 1872, 20,890.

Alcañiz', ål-kân-yeeth', a town of Spain, in the province of Pernel, on the Guadalupe River, 57 miles S. E. of Saragossa. Pop. about 7500.

Alcántara, a town of Spain, in the province of Caceres, is situated on the left bank of the Tagus, near the Portuguese boundary. Here are ruins of a grand bridge built by the emperor Trajan in 103 A. D., of which a triumphal arch forty feet high still remains. The duke of Alva here defeated the Portuguese in a great battle on Aug. 25, 1580. Pop. about 4100.

Alcántara, Order of, also called the **Order of Saint Julian,** a religious order of Spanish knighthood, founded in 1156 at Alcántara for the defence of the Christians against the Moors. In 1495 the office of grand-master of this order was united to the Spanish crown. Their crest was a pear tree.

Alcatraz' (or **Alctra'ces**) **Island,** of California, sometimes called **Pelican Island,** is in the bay, 2½ miles N. of San Francisco. Length, 1650 feet; height, 130 feet. It is fortified, and commands the entrance of the Golden Gate. On its summit is a lighthouse 36 feet high, in lat. 37° 49′ 27″ N., lon. 122° 24′ 19″ W.

Alcava'la, or **Alcaba'la,** a tax formerly imposed in Spain and her colonies on all property sold, and payable as often as it changed hands. This tax, which was at first 10, and afterwards 14 per cent. *ad valorem*, was very injurious to the prosperity of the country.

Alcay'de, or **Alcaide** [from the Arabic *al*, "the," and *cadi*, a "magistrate"], a term applied by Spaniards, Moors, and Portuguese to a jailer or inferior magistrate.

Alca'zar (or **Alcazer**) **de San Juan',** a town of Spain, in the province of Ciudad Real, 47 miles N. E. of Ciudad Real, has manufactures of soap, nitre, and gunpowder. Pop. 7942.

Alca'zar Kebir' ("the great castle"), a city of Morocco, 83 miles N. W. of Fez. Pop. in 1864, about 25,000. Near it is a bridge (*Alcántara*) where Sebastian, king of Portugal, was defeated and killed Aug. 4, 1578.

Alces'tis [Gr. Ἄλκηστις], in classic mythology, was a daughter of Pelias and the wife of Admetus, king of Thessaly. The poets feigned that she prolonged the life of her husband by suffering voluntary death as his substitute, and was rescued from Hades by Hercules. The story of her devotion is the subject of one of the tragedies of Euripides.

Al'chemy [for etymology, see below] is commonly understood to mean the occult science or art of transmuting the baser metals into gold. Some writers suppose that alchemy originated in Egypt, the ancient name of which was *Chem* ("dark," "mysterious"), and that it was introduced into Europe by the Arabs. The origin of alchemy seems to be connected with the widespread notion that the manifold forms of matter have a common basis, and that the individual properties of material bodies are due to formative force separable in thought, if not in fact, from this common substratum. Hence it followed that if this first matter could be dissolved or separated from all special formative forces, and the special "form" of gold or other precious substance discovered and got under control, these or any material body could be produced at will. From this point of view we may understand the reason of the alchemists' search for the "universal solvent" and for the special "forms" of things. The union of the *materia prima* and the "form" of gold would produce the actual metal. In like manner, if the vital principle or form of the bodily organization could be found and controlled, the tendencies to disease and decay in the bodily organization could be resisted. Hence the search after the elixir of life and the philosopher's stone. It was this search after "forms" and the *materia prima* which so vitiated the method of the Middle Age investigators. It was a reaction against this false analysis of Aristotle which led to the bitter opposition to his name and doctrines which marked the rise of modern science in Europe. When belief in the reality of the Aristotelian analysis passed away, alchemy ceased.

In the Middle Ages the alchemists expended immense labor and time in experiments, the object of which was to discover the philosopher's stone and an elixir vitæ (the elixir of life) which could cure all diseases and restore old people to youth. Many useful discoveries were the results of these visionary pursuits, in which the most eminent men of those times took part. Roger Bacon (1214–92) was a believer in the doctrine that base metals can be transmuted into gold. The works which he wrote on alchemy are the oldest extant European writings on that subject. Among the other famous alchemists were Basil Valentine, R. Lully, and Paracelsus. As late as the sixteenth century many men of superior intellect devoted their time and money to alchemy, and hoped to discover the grand arcanum. According to Liebig, "The great (Francis) Bacon, Luther, Benedict Spinosa, and Leibnitz believed in the philosopher's stone, and in the possibility of the transmutation of metals." (*Familiar Letters on Chemistry.*) The same writer affirms that "Alchemy was never at any time anything different from chemistry. It is utterly unjust to confound it, as is generally done, with the gold-making of the sixteenth and seventeenth centuries. Among the alchemists there was always to be found a nucleus of genuine philosophers, who were often deceived in their theoretical views; whereas, the gold-makers, properly so called, knowingly deceived both themselves and others." Revised by M. B. Anderson.

Alcia'ti [Fr. *Alciat*], (Andrea), an eminent Italian lawyer, born in 1492 at Alzato. He lectured on law at Bourges from 1528 to 1532, after which he was professor of law at Bologna, Pavía, and Ferrara. He wrote, besides other works, "Commentaries on the Digest" and a book of emblems. Died in 1550. Erasmus said of him, as Cicero said of Scævola, "He was the most jurisprudent of orators, and the most eloquent of lawyers."

Alcibi'ades [Gr. Ἀλκιβιάδης], a famous Athenian general and politician, born of a noble family about 450 B. C., was a son of Cleinias. He was educated at the house of his relative, the illustrious Pericles, and inherited a large estate. Pericles was a second cousin to the mother of Alcibiades. From nature he received great personal beauty and transcendent abilities, with strong passions and proclivities to licentious habits. As a favorite pupil and companion of Socrates he enjoyed in his youth great advantages for the cultivation of his mind. (See Socrates.) In 420 B. C. he began his political career as the leader of the democratic party and an opponent of Nicias, who advocated peace with

Sparta. Having induced the Athenians to send a great expedition (in 414 B. C.) against Syracuse, the ally of Sparta, he was chosen to command it, in conjunction with Nicias and Lamachus. Soon after the fleet had reached Sicily, Alcibiades was recalled to defend himself against a charge of sacrilege, but he escaped to Sparta, and in his absence was condemned to death by the people of Athens. He acquired much influence with the Spartans, whom he aided in their operations against his native country, but several jealous Spartan leaders having conspired against him, he fled to the Persian satrap Tissaphernes, and again changed sides. The next scene in the drama of his eventful and wayward career presents him as the commander of the Athenian fleet, in 411 B. C. He defeated the Spartans at Abydos in 411, and at Cyzicus in 410 B. C. Having by these and other victories restored the naval supremacy of Athens, he returned in triumph to the capital in 407, and regained his popularity. He was removed from the command in 406, in consequence of a reverse which his fleet suffered in his absence, and he again went into exile. He sought refuge in Phrygia, where he was assassinated by night in 404 B. C. (See PLUTARCH, "Life of Alcibiades;" GROTE, "History of Greece," vol. viii.: THIRLWALL, "History of Greece.")

Al'ciphron [Αλκίφρων], a Greek epistolary writer, who is supposed to have lived about 180–200 A. D. He represented the manners and opinions of various classes of society in fictitious letters, the style of which is admired as a specimen of Attic purity.

Alci'ra, an ancient walled town of Spain, on an island in the river Jucar, in the province of Valencia, 25 miles S. of Valencia, has two fine stone bridges, besides an iron railway bridge. Near it is a curious cavern. Pop. 14,022.

Alcmæ'on, a Greek philosopher, a native of Crotona, and a pupil of Pythagoras, lived about 530 B. C. He is said to have been the first anatomist who dissected animals.

Alc'man [Gr. Αλκμάν], a celebrated Spartan lyric poet, born at Sardis, was originally a slave. He flourished about 650 B. C., and became a free citizen of Sparta. He wrote songs called "Parthenia," also bridal-hymns and other erotic poems which were greatly admired. According to some writers, he was the inventor of erotic poetry. Some small fragments of his works are extant.

Alcme'ne [Gr. Αλκμήνη], a daughter of Electryon and Anaxo, the daughter of Alcæus. She is said to have been the mother of Heracles by Zeus. Hera, jealous of Alcmene, delayed the birth of Heracles for seven days, that Eurystheus might be born first, and thus be entitled to greater rights, according to a vow which Zeus had made. There are different accounts of her death. According to Plutarch, Agesilaus opened her tomb at Haliartus in Bœotia, and carried her remains to Sparta.

Al'co, a kind of dog found wild in Mexico and Peru. It has been domesticated, and is described as having a very small head, with large and pendulous ears. It is not known whether it has escaped from domestication or is a native of these countries.

Al'cohol [from the Arabic definite article *al*, "the," and *kohol*, originally a "powder of antimony," used for painting the eyebrows, afterwards applied to anything very subtle], a limpid, colorless liquid, which has a hot, pungent taste, and is the essential principle of all spirituous liquors and intoxicating drinks. It is the product of the fermentation of sugar or saccharine substances, and is extracted by distillation from spirituous liquors, such as whisky and brandy, which contain nearly fifty per cent. of water. Pure alcohol is very inflammable, has a strong affinity for water, is a powerful solvent, boils at 173° Fahrenheit, and has never been congealed by the greatest degree of cold that could be produced. It is composed of carbon, oxygen, and hydrogen, the proportions being about 52 per cent. of the first, 35 of the second, and 13 of the last. Its symbol is $C^4H^6O^2$, or C_2H_6O (according to the new nomenclature). In medicine, alcohol is used as a stimulant or excitant, mostly in the form of wine, brandy, or whisky. In pharmacy, alcohol is extensively used as a solvent; its solutions are called tinctures. The strongest alcohol that can be procured is termed absolute alcohol or anhydrous alcohol; it is prepared by removing the last few per cent. of water by quicklime.

Alcohol may be produced synthetically by causing strong sulphuric acid to absorb ethene gas (olefiant gas), by which ethyl-sulphuric acid is produced, $C_2H_4 + H_2SO_4 = H.C_2H_5.SO_4$. On distilling this acid with water, alcohol is obtained, while dilute sulphuric acid is left in the retort or still, $H.C_2H_5.SO_4 + H_2O = C_2H_6O + H_2SO_4$.

C. F. CHANDLER.

Alcoholom'etry [from *alcohol*, and the Gr. *μέτρον*, a "measure"] is the method of obtaining the amount of absolute alcohol in a given quantity of spirits. This may be done—(1) by determining the specific gravity of the spirits, provided they contain nothing besides water and alcohol. The specific gravity of water being 1, that of pure or absolute alcohol is 0.7938 at 60° F. Tables have been carefully prepared showing the percentage of alcohol corresponding to different gravities between these extremes. (See SPECIFIC GRAVITY.) If the spirits contain sugar, etc., they must be purified by distillation before determining the gravity. (2) The percentage of alcohol may be determined by observing the boiling-point. Water boils at 212° F., absolute alcohol at 173° F. (3) By observing the tension of the vapor. The first method is always employed in practice.

Alcohols. The term alcohol, originally limited to spirit of wine, is now applied to a large class of bodies, some of which are solids. They are all similarly constituted, being saturated hydrocarbons, in which one or more hydrogen atoms are replaced by an equal number of molecules of hydroxyl (OH). They may also be regarded as compounds of hydroxyl with alcohol radicals. Thus propane yields three alcohols: propane, C_3H_8; propyl alcohol, $(C_3H_7)(OH)$ monatomic; propene alcohol, $(C_3H_6)''(OH)_2$ diatomic; propenyl alcohol, $(C_3H_5)'''(OH)_3$ triatomic. The last-mentioned is glycerine. The simplest alcohol is methyl alcohol or wood-naphtha, $CH_3.OH$. Common alcohol comes next in order, $C_2H_5.OH$. Cetyl alcohol $(C_{16}H_{33}.OH)$, derived from spermaceti, and ceryl alcohol $(C_{27}H_{55}.OH)$, derived from Chinese wax, are white crystalline solids. Those alcohols containing one molecule of OH are called *monatomic*. Other series of hydrocarbons yield similar alcohols; phenol or carbolic acid, $C_6H_5(OH)$, is the alcohol of benzol, C_6H_6. Diatomic alcohols contain two molecules of OH; those derived from the marsh gas or methane series of hydrocarbons are called glycols. Triatomic alcohols contain three molecules of OH; glycerine or propenyl alcohol, $C_3H_5(OH)_3$, is the last example. Tetratomic, pentatomic, and hexatomic alcohols are known. Manna sugar, or mannite $(C_6H_{14}O_6 = C_6H_8(OH)_6)$, is a hexatomic alcohol, derived from the hydrocarbon sextane, C_6H_{14}. Glucose or grape-sugar is the aldehyde of this alcohol. (See ALDEHYDE.) Cane-sugar $(C_{12}H_{22}O_{11})$ is intimately related to glucose, as it corresponds to two molecules of glucose, less one molecule of water; it is called a polyglucosic alcohol. Starch and cellulose $(C_{18}H_{30}O_{15})$ are regarded as being the oxygen-ethers or anhydrides of the polyglucosic alcohols.

By replacing the OH in alcohols by chlorine, bromine, etc., haloid ethers are produced; thus:

Common or ethylic alcohol	$= C_2H_5.OH.$
Ethyl chloride	$= C_2H_5Cl.$
Methenyl alcohol (triatomic)	$= CH(OH)_3.$
Methenyl chloride, chloroform	$= CHCl_3.$

By replacing the hydroxyl by acid radicals, compound ethers are produced:

Amyl alcohol,	$C_5H_{11}.OH.$
Amyl acetate,	$C_5H_{11}.C_2H_3O_2.$
Propenyl alcohol, glycerine,	$C_3H_7.OH_3.$
Glyceryl tristearate, stearine,	$C_3H_7.C_{18}H_{35}O_2)_3.$

C. F. CHANDLER.

Alco'na, a county in the N. E. part of Michigan. Area, about 630 square miles. It is bounded on the E. by Lake Huron, and traversed in the S. W. part by the Au Sable River. It is an almost solid forest of pine timber, but has excellent farming lands. Oats and potatoes are the staples. Capital, Harrisville. Pop. 696.

Alcona, a post-township of Alcona co., Mich. P. 146.

Alco'ra, a town of Spain, in the province of Castellon, 11 miles N. W. of Castellon. It has potteries and distilleries of brandy. Fruits are the chief articles of export. Pop. about 6000.

Al'corn, a county in the N. part of Mississippi, bordering on Tennessee. It is drained by the Big Hatchie River, which rises within its limits. The surface is undulating or nearly level; the soil is fertile. Capital, Corinth. This county is intersected by the Memphis and Charleston R. R. Cattle, grain, cotton, and wool are the staples. Pop. 10,431.

Al'cott (AMOS BRONSON), an American ideal philosopher, and one of the principal contributors to the "The Dial," was born at Wolcott, Conn., Nov. 29, 1799, and now resides at Concord, Mass. He has acquired some reputation as an educational reformer, but is chiefly distinguished for his conversational powers. He has held formal "conversations" in many of our principal cities on a wide range of speculative and practical themes, and has published two volumes of essays—"Tablets," 1868; "Concord Days," 1872.

Alcott (LOUISA MAY), an American writer, daughter of the preceding, was born in 1833. She has published a number of very popular works for children and youth; among these may be named "Little Women" (1867), "The Old Fashioned Girl" (1869), "Little Men, or Life at Plumfield" (1871), and "Work" (1873).

Alcott (William Alexander), M. D., an American writer on education, was born at Wolcott, Conn., Aug. 6, 1798. He contributed to several journals, lectured at various places on education, hygiene, and other subjects, and published a number of popular works, among which are "The House I Live In," "The Young Man's Guide," "The Library of Health," "The Young Woman's Guide," and "Moral Reform." Died Mar. 29, 1859.

Al'cove [Fr. *alcove;* Sp. *alcoba:* etymology uncertain], in architecture, a recess in an apartment, separated by an estrade or partition of columns, and occupied by a bed of state; a recess in a library or a lateral apartment for books.

Alco'y, a town of Spain, in the province of Alicante, 30 miles N. of Alicante. It is built on uneven ground among the hills, and has manufactories of paper and woollen goods. About 200,000 reams of paper are made here annually. A large part of this paper is consumed in the form of cigars (*papelitos*). Pop. in 1860, 25,196.

Al'cuin, or **Al'cwin,** an English prelate and scholar, whose full name was Flaccus Albinus Alcuinus, was born at York about 735 A. D. He went in 782 to the court of Charlemagne, of whom he became the confidential friend and adviser. He is said to have founded schools at Aix-la-Chapelle and Paris. In 796 he was appointed abbot of St.-Martin at Tours. He is regarded as the most learned man of his age. He died May 19, 804, leaving many letters, poems, and works on theology, etc.

Alcy'one, or **Halcy'one** [Gr. Ἀλκυόνη], in classic mythology, a daughter of Æolus and the wife of Ceyx. She was so inconsolable for the death of her husband that she threw herself into the sea. Tradition adds that Ceyx and Alcyone were changed into kingfishers to reward their mutual devotion.

Alcyo'nium [Gr. ἀλκυόνιον, from Ἀλκυών, a "kingfisher," so called from its supposed resemblance to the nest of a kingfisher], a genus of zoophytes belonging to the order Alcyonaria, presents a curious polype mass and star-like pores; through which polypes protrude themselves. The *Alcyonium digitatum* abounds on the shores of Great Britain. The *Alcyonium carneum* is found along the American coast from Cape Cod northward.

Aldan', a river of Siberia, the largest tributary of the Lena, rises in the Yablonoi Mountains, near the frontier of the Chinese empire. Flowing north-eastward, and afterwards in a N. W. direction, it enters the Lena about lat. 63° N., and nearly 60 miles below Yakutsk. Length, estimated at 1300 miles.

Aldan Mountains, a chain of mountains in the E. part of Siberia, connected with the Stannovoi Mountains, and extending about 400 miles, from lat. 61° 20′ N. to 67° 30′ N. The highest summit of these is Mount Kapitan, about 4200 feet high. Some geographers give the name a more extensive application—to all the mountain-ranges in the N. E. of Asia.

Ald'borough, Earls of, viscounts of Aldborough (1766), Viscounts Amiens (1777), and barons of Baltinglass (1763, in the Irish peerage), a prominent family of Great Britain. The first earl was created in 1777.—Benjamin O'Neale Stratford, the sixth earl, was born June 10, 1808, and succeeded his father Oct. 4, 1849.

Aldeb'aran [from the Arabic *al,* "the," and *dabaran,* "following," because this star follows the Pleiades], the name of a star of the first magnitude in the constellation of Taurus, otherwise called α Tauri. It is the brightest star of a group called the Hyades.

Aldegonde, Saint. See Marnix.

Al'degre'ver, or **Aldegraef** (Heinrich), a distinguished German painter and engraver, born at Soest, in Westphalia, in 1502, was a pupil and imitator of Albert Dürer. Among his numerous engravings are "The Labors of Hercules" and a portrait of Luther. Died about 1562.

Al'dehyde [from *al,* first syllable of *alcohol,* and *dehyd,* first two of *de-hydrogena'tus,* "deprived of hydrogen"], compounds formed by depriving alcohols of hydrogen. The term aldehyde was first applied to acetic aldehyde, produced from common alcohol by limited oxidation, effected by (1) imperfect combustion, as when a spirit-lamp burns out for want of alcohol; (2) by the action of potassic dichromate and sulphuric acid; (3) by the action of chlorine and water. Thus,

Alcohol. Oxygen. Aldehyde. Water.
$$C_2H_6O + O = C_2H_4O + H_2O.$$

Acetic aldehyde is a limpid, colorless liquid of a peculiar ethereal odor, which when concentrated is very suffocating. By exposure to the air it absorbs oxygen, and passes into

Aldehyde. Acetic Acid.
$$C_2H_4O + O = C_2H_4O_2.$$

It reduces oxide of silver to the metallic state. This aldehyde has been prepared in large quantities during the past few years, to be used in the manufacture of aldehyde green, one of the most beautiful of the aniline colors.

The aldehydes are intermediate in composition between the alcohols and the corresponding acids. By the loss of hydrogen the alcohol becomes an aldehyde; by the addition of oxygen the aldehyde becomes an acid:

Common ethylic alcohol, C_2H_6O.
Acetic aldehyde, C_2H_4O.
Acetic acid, $C_2H_4O_2$.

By substituting an alcohol for hydrogen in an aldehyde, a ketone is produced, acetic ketone or acetone = $C_2H_3(CH_3)O$.

Among the other more important aldehydes may be mentioned acrylic aldehyde or acrolein (C_3H_4O), a very offensive liquid produced by the dehydration of glycerine. It is always found in the destructive distillation of oils and fats containing glycerine, and is the chief cause of the very pungent odor produced. Chloral (C_2HCl_3O), produced by the prolonged action of chlorine on alcohol, is trichlorinated acetic aldehyde. By combining with water it produces the "chloral-hydrate" so extensively used of late on account of its hypnotic effects. It is supposed to be transformed by the alkali of the blood into chloroform and formic acid, thus:

Chloral-hydrate. Potassic-hydrate. Potassic-formiate. Chloroform. Water.
$$C_2HCl_3O.H_2O + KHO = KCHO_2 + CHCl_3 + H_2O.$$

Bitter-almond oil (C_7H_6O) is benzoic aldehyde.

Aldehydes possess three characteristic properties: (1) they unite with alkaline bisulphites; (2) they unite with aniline; (3) when fused with caustic potash they give off hydrogen, forming the potassic salt of the corresponding acid. C. F. Chandler.

Al'den, a post-township of McHenry co., Ill. Pop. 722.

Alden, a post-township of Hardin co., Ia. Pop. 739.

Alden, a post-township of Freeborn co., Minn. Pop. 381.

Alden, a post-township of Erie co., N. Y. It is traversed by the New York Central and the Buffalo division of the Erie R. R. Its station on the latter road is 14 miles E. of Buffalo. Pop. 2547.

Alden, a post-township of Polk co., Wis. Pop. 390.

Alden (Bradford R.), an American officer, born May, 1811, in Meadville, Pa., was descended from the famous Pilgrim Alden, who came out in the Mayflower and married the beautiful Priscilla Mullens, and his father, Roger Alden, was a major in the Revolutionary army. He graduated at West Point in 1831, captain Fourth Infantry June 14, 1842, served at Florida posts 1832–33, assistant instructor in various departments of the Military Academy 1833–40, aide-de-camp to Major-General Scott 1840–42, in military occupation of Texas 1845, commandant of cadets at Military Academy 1845–52, on frontier duty on the Pacific 1853, engaged as acting colonel commanding two volunteer battalions (which he had raised) on an expedition against the Rogue River Indians, engaged at Jacksonville, Or., Aug. 24, 1853 (severely wounded). After his resignation, Sept. 29, 1853, he travelled three years in Europe, endeavoring to regain his health. Subsequently, while on a visit to Western Pennsylvania, he became satisfied, by his extensive explorations, of the abundance of petroleum, and was among the first to appreciate and give effect in 1859 to the value of this discovery. After repeated efforts to serve in the civil war, the paralysis caused by his wound compelled him to desist. Devoting himself to the study of literature and art, in which he was accomplished, to the culture of Christianity, of which he was a bright exemplar, and to works of active benevolence, for which he was famed, he spent his after years till he died, Sept. 10, 1870, at Newport, R. I., aged fifty-nine.

George W. Cullum, *U. S. Army.*

Alden (James), U. S. N., born June 19, 1809, in Maine, entered the navy as a midshipman April 1, 1828, became a passed midshipman in 1834, a lieutenant in 1841, a commander in 1855, a captain in 1863, a commodore in 1866, a rear-admiral in 1871. He served in the Mexican war, and participated in the capture of Vera Cruz and Tobasco. In command of the steamer South Carolina, he engaged the batteries off Galveston, Tex., Aug. 3, 1861, and commanded the steamer Richmond in the engagement with Forts St. Philip and Jackson, and at the capture of New Orleans, April 24, 1862, and during the passage up and down the Mississippi River by Vicksburg, June 28 and July 15, 1862; in the engagement at Port Hudson, Mar. 14, 1863, commanded the Brooklyn at the great victory over forts, rams, and gunboats in Mobile Bay, Aug. 5, 1864, and in both the Fort Fisher fights, Dec., 1864, and Jan., 1865. Of his conduct in these affairs, Rear-Admiral David D.

Porter, in his official report of Jan. 28, 1865, speaks in terms of exalted admiration, and concludes his remarks thus: "I consider him able and worthy to fill the highest rank, and I know that the government has no one in its navy more full of energy, zeal, or intelligence in his profession. I shall feel much disappointed if Captain Alden is not promoted to a rank he has won more than once during this rebellion. I am sure the department will appreciate all I have said of this gallant officer. His record speaks for him." In 1869 he was appointed chief of the bureau of navigation, and in 1871 was appointed to the command of the European station. He retired from active service in 1873.

FOXHALL A. PARKER, U. S. N.

Alden (JOHN), one of the Pilgrim Fathers who came over in the Mayflower in 1620. He was a magistrate of Plymouth Colony for more than fifty years. He was born in 1599, and died at Duxbury Sept. 12, 1689.

Alden (JOSEPH), D. D., LL.D., was born at Cairo, N. Y., Jan. 4, 1807, and graduated at Union College in 1829, studied theology at Princeton, and was ordained pastor of a Congregational church at Williamstown, Mass. (1834), was a professor in Williams College (1835–52), in Lafayette College, Pa. (1852–57), president of Jefferson College (1857–67), and since 1867 principal of the New York State Normal School at Albany.

Alden (Rev. NOAH), a prominent advocate of religious liberty in Massachusetts. He represented the town of Bellingham in the convention which formed the constitution of that State. He was also a member of the convention which ratified the Constitution of the U. S. In 1766 he became pastor of the Baptist church at Bellingham, where he exercised his ministry with great influence and success for about thirty years.

Alden (TIMOTHY), D. D., born at Yarmouth, Mass., Aug. 28, 1771, graduated at Harvard in 1794. He was pastor of a Congregational church in Portsmouth, N. H. (1799–1805), and was for many years afterwards a prominent educator in Portsmouth, Newark, New York, Boston, Cincinnati, etc. He was the founder and first president (1817–31) of Alleghany College, Meadville, Pa. He published a collection of epitaphs (5 vols., 1814), "An Account of Missions among the Senecas" (1827), and other works. Died at Pittsburg, Pa., July 5, 1839.

Al'denhoven, a market-town of Prussia, in the Rhine province. Here the Austrians defeated the French on Mar. 1, 1793, and the French defeated the Austrians on Oct. 2, 1794. Pop. in 1871, 2898.

Al'der [Lat. *Alnus*], a genus of trees and shrubs of the natural order of Betulaceæ or Amentaceæ. They are natives of the temperate parts of Europe and North America. The wood of the common alder of Europe (*Alnus glutinosa*) is used by turners and joiners, affords good charcoal for the manufacture of gunpowder, and is valuable for mill-wheels and the piles of bridges. The alder is prized as an ornamental tree in landscapes. The *Alnus cordifolia*, a native of Italy, is a large and beautiful tree. The alders of the Eastern U. S. are shrubs or small trees, but *Alnus Oregona* of the W. coast grows to the height of sixty to seventy feet.

Al'derman (originally signifying an "older" or "senior" man), the title of a municipal officer or magistrate in the corporations of England and the U. S. The London court of aldermen exercises judicial and legislative authority in the corporation. In New York City the term is applied to the members of the city council, who are elected by the people. In some cities they are magistrates; in others councillors.

Alderney, aul'dẽr-ne, or **Aurigny,** an island in the English Channel, 7 or 8 miles from Cape la Hogue (France), belongs to England. It is about 4 miles long, and less than 2 miles wide. Guernsey, another of the Channel Islands, is about 15 miles from this place. The people of Alderney are mostly of French extraction. This island produces a celebrated breed of small cows. It is separated from France by the Race of Alderney, a strait about 8 miles wide, the navigation of which is dangerous in stormy weather. It is politically a dependency of Jersey. Pop. in 1871, 2718.

Al'dershott Camp, a permanent camp formed in 1855 for the improvement of the British army in tactics and in evolutions on a large scale. It is situated on Aldershott Heath, on the confines of Surrey, Hampshire, and Berkshire. The area of ground appropriated to this purpose is about 7000 acres. Pop. in 1871, including Frimley and Farnborough, 35,864.

Al'dine Edi'tions, the name given to the editions of Greek and Roman classics which were issued by Aldus Manutius and his descendants in Venice between 1490 and 1600. These editions are highly prized for the correctness of the text and the beauty of the typography. (See MANUTIUS.)

Aldobrandi'ni, a celebrated noble family of Florence. Among its most prominent members were Salvestro, born 1499, died 1558; Ippolito, born 1536, died 1605, who was elected pope in 1592 as Clement VIII.; his brother Tommaso, the fourth son of Salvestro; and Francesco, who was created a prince by his uncle Clement VIII. "Aldobrandine Wedding" is the name of a painting which probably dates from the time of Augustus, and was found in 1606 on the site of the former garden of Mæcenas. It was named after Prince Aldobrandini, who first came into possession of it.

Ald'rich (HENRY), D. D., an English scholar and composer of sacred music, was born at Westminster in 1647. He was one of the ablest champions of Protestantism in the reign of James II., and became dean of Christ Church, Oxford, in 1689. He composed anthems which are used in the English cathedrals. Died Dec. 14, 1710.

Aldrich (THOMAS BAILEY), a poet, born in Portsmouth, N. H., Nov. 11, 1836. He lived in his youth in Louisiana, and then in New York, where he was for a time a clerk, then a proof-reader, and afterwards attained eminence as a writer and editor. He has been connected with "The Home Journal," the "Atlantic Monthly," and other periodicals, and has published "The Bells" (1854), "The Course of True Love" (1858), "Pampinea" (1861), several volumes of poems, "The Story of a Bad Boy" (1869), "Marjorie Daw" (1873), and other works.

Ald'ridge (IRA), a negro tragedian, born in Maryland in 1804, was in his youth a personal attendant of Edmund Kean. He performed with success in England and other countries of Europe. He received medals or tokens of honor from the king of Prussia and the emperor of Austria. Died Aug. 7, 1867.

Aldrovan'dus (ULYSSES), an eminent Italian naturalist, born at Bologna Sept. 11, 1522. He graduated as doctor of medicine in 1553, and became professor of natural history at Bologna in 1560. Having expended much time and money in collecting specimens and in the study of nature, he began in 1599 the publication of his "Natural History" (13 vols.), of which three volumes on birds and one on insects appeared during his life. The other volumes were edited by several persons after his death. His "Natural History" is a laborious and ill-digested compilation. Died Nov. 10, 1607.

Ale, a sort of beer, a fermented liquor produced from malt. Ale contains more alcohol than common beer, and is a favorite beverage of the British. Scotch ale and Burton ale have a high reputation. There are three varieties of malt liquor in general use in this country—ale, porter, and lager beer. All are prepared from malt, which is barley which has been allowed to germinate (sprout), and has then been dried by artificial heat. Hops are added to give the aromatic bitter flavor. The lower the temperature at which the malt is dried the lighter will be the color of the malt and the beverage. Ale and lager beer are made from light, porter from dark-colored malt. Ale and porter are fermented at temperatures of from 65° to 90° F. while lager beer is fermented at from 46° to 50° F.

In the manufacture of ale the first fermentation is checked at such a point as to leave a considerable quantity of saccharine matter in the liquor. By the subsequent fermentation in the barrels or bottles this is changed to alcohol and carbonic acid; the latter substance causing the characteristic effervescence. (See BEER, by C. F. CHANDLER.)

Alean'dro [Lat. *Alean'der*], (GIROLAMO), a learned Italian cardinal, born at Motta Feb. 13, 1480. He was appointed librarian of the Vatican in 1519, and was sent by Leo X. as papal nuncio to Germany in 1520, to counteract the influence of Luther. He showed a violent animosity to Luther at the Diet of Worms. Died Jan. 31, 1542.

Ale'do, a post-village, the capital of Mercer co., Ill., on a branch of the Chicago Burlington and Quincy R. R., 120 miles N. W. by N. from Springfield. It has two weekly papers, is the seat of a college, and is in a fine agricultural district. Coal is found in the vicinity. Pop. 1076.

H. BIGELOW, ED. of "RECORD."

Alegam'be (PHILIP), a learned Flemish Jesuit, born at Brussels Jan. 22, 1592. He removed to Rome, where he became superior of the order of Jesuits. He wrote a valuable contribution to the biography and bibliography of the Jesuit authors, entitled "Bibliotheca Scriptorum Societatis Jesu" (1643). Died Sept. 6, 1652.

Aleman'ni (*i. e.* "all men"), the name of certain German tribes who formed a confederacy against the Romans about 200 A. D., and at that time lived on the Main. They invaded Gaul in the reign of Julian the Apostate, who gained a victory over them in 357 A. D. Having been de-

feated by Clovis in 496, their confederacy was dissolved. From this word is derived the French *Allemand*, signifying "German."

Alembert, d' (Jean le Rond), a celebrated French geometer and philosopher, born in Paris Nov. 16, 1717, was an illegitimate son of M. Destouches-Canon and Madame de Tencin. Having been abandoned by his mother in the street, he was nursed by the wife of a glazier, and continued to live with her for about forty years. He received from his father an annual pension of 1200 livres, and was educated in the Mazarin College, which he entered in 1730. His favorite study was mathematics. In 1741 he was admitted into the Academy of Sciences, and in 1743 produced his celebrated "Treatise on Dynamics," which opened a new epoch in mechanical philosophy, by the demonstration of the principle "that there is an absolute equality at all times between the entire amount of force applied and the sum-total of the effects produced." His treatise "On the Theory of the Winds" gained the prize of the Academy of Berlin in 1746. In 1752, Frederick the Great offered him the presidency of the Royal Academy of Berlin, which he declined. D'Alembert was associated with Diderot as joint editor of the famous "Encyclopédie," for which he wrote an admirable "Preliminary Discourse" and many mathematical articles. He was admitted into the French Academy in 1754. He formed a *liaison* with the accomplished Mademoiselle l'Espinasse, who lived with him twelve years. He showed his independence and indifference to riches by refusing, in 1762, the invitation of Catherine II. of Russia, who offered him a salary of 100,000 francs to direct the education of her son. In 1772 he was elected secretary of the French Academy. He was an intimate friend of Voltaire, and assumed toward Christianity the attitude of a skeptic—*i. e.* a doubter and candid inquirer—while he openly avowed his hostility to the Church of Rome. His moral character is generally represented as noble and benevolent. Among his works are "Researches on some Important Points of the System of the Universe" (3 vols., 1754–56), "Mélanges of Literature and Philosophy," "Elements of Philosophy" (1759), and eulogies on the members of the French Academy who died between 1700 and 1772. He died in Paris on the 29th of Oct., 1783. An edition of his works was published by Bossange in 5 vols. 8vo, 1821. "His literary works," says Lacroix, "constantly directed to the perfection of reason and the propagation of correct ideas, were highly appreciated by all good judges. They are all remarkable for a pure diction, a neat style, and strong or pithy thought."

Alemb'ic [from the Arabic article *al*, and the Gr. ἄμβιξ, a "cup or pot"], an apparatus formerly used by alchemists and chemists in the process of distillation and sublimation. It has been superseded by the retort and receiver.

Alemte'jo, or Alente'jo ("beyond the Tagus"), a province of Portugal, is bounded on the N. by Beira, on the E. by Spain, on the S. by Algarve, and on the W. by Estremadura and the Atlantic. Area, 9416 square miles. It is intersected by the Gaudiana River, and is washed by the Tagus, which forms part of the northern boundary. The climate is hot and dry, the surface is hilly, and the soil of the northern and eastern valleys is fertile. The chief productions are wheat, maize, barley, grapes, rice, and figs. Capital, Evora. Pop. in 1868, 332,237.

Alençon, a city of France, capital of the department of Orne, is situated on the Sarthe and in a plain, 65 miles by rail W. S. W. of Paris. It is well built and handsome, has a cathedral, a public library, and a church about 1000 years old. Here are manufactures of various articles, including muslin, leather, and a celebrated lace called Point d'Alençon. Pop. in 1866, 16,115.

Alep'po, called by the Arabs **Ha'leb** (anc. *Chal'ybon* and *Beræ'a*), an important city of Syria, and one of the chief emporiums of the Ottoman empire, is on the Kowek, about 55 miles E. of Antioch; lat. 36° 11′ N., lon. 37° 10′ E. It is surrounded by limestone hills, and presents a picturesque appearance. The houses are well built of stone, two or three stories high, mostly in the Saracenic style, with richly ornamented walls and ceilings. In the environs are celebrated gardens about twelve miles in extent. Aleppo has a castle, a Mohammedan college, and many Christian churches. It has an extensive trade in cotton and silk stuffs, tobacco, wine, oil, indigo, etc., and is visited by large caravans from Bagdad, Diarbekir, Mosul, and Armenia. It was a great emporium of trade during or before the Middle Ages. Its prosperity was greatly injured by the earthquake of 1822, which destroyed a large part of the city. The population, which before that event was more than 200,000, was about 100,000 in 1867.

Aleppo, a post-township of Greene co., Pa. Pop. 1382.

Alesh'ki, a town of Russia, in the government of Tauria, 8 miles E. of Kherson. Pop. in 1867, 8484.

Ale'sia (Ἀλεσία), the fortified capital of the Gallic tribe Mandubii, was built, according to a legend, by Hercules. Here the last desperate battle for freedom was fought by the Gauls, under Vercingetorix, against the Romans, under Julius Cæsar, in 52 B. C. The Gauls were completely defeated and the city destroyed. Alesia was rebuilt, and again destroyed by the Northmen in 864. It was on the present Mont Auxois, at the foot of which the modern town of Alise is situated.

Ale'sius [Gr. ἀλείνω, "to be a wanderer"], the name given, probably by Melanchthon, to Alexander Alane, who was born in Edinburgh April 23, 1500, was canon of St. Andrew's, turned Protestant, went to Germany in 1532, and again in 1540; was made professor at Leipsic, and died there Mar. 17, 1565. He wrote much and ably. It was he who translated the Book of Common Prayer into Latin.

Alessandres'ku (Gregory), a celebrated Rumanian poet, born in 1812, was sent in consequence of political agitations to a convent, where he wrote his most celebrated work, "The Year 1840," in which he gives expression to the hopes of his party. In 1859 he was for a few months minister of finance, since which time he has belonged to the liberal opposition, which he has effectively aided with his poems and fables. A second edition of his collected works appeared in 1863.

Alessan'dri (Basil), the most prominent Rumanian poet of modern times, born in 1821, took part in the liberal movement of 1848, was minister of foreign affairs for a few months in 1859–60, and has since resided a part of the time in Yassy and part of the time in Paris. Among his works are "Doinas" (1853), "Doine si lacrimivare" (1863), and "The Popular Ballads of Rumania" (2 vols., 1853).

Alessan'dria, a province of Northern Italy, is bounded on the N. by Novara, on the E. by Pavia, on the S. by Genoa, and on the W. by Cuneo and Torino. Area, 1952 square miles. The country consists partly of large fertile plains and partly mountains, and is traversed by the Tanaro, the Scrivia, and the Bormida. Chief town, Alessandria. Pop. in 1871, 683,473.

Alessandria (sometimes called *Del'la Pa'glia*, from its first houses having been roofed with straw), a fortified city of Italy, the capital of the province of the same name, is situated on a plain on the river Tánaro, and on the railway from Turin to Genoa, 46 miles E. S. E. of Turin. It is well built, has a cathedral, a royal college, several hospitals, and about fourteen churches. Here are manufactures of silk, linen, and woollen goods, and other articles. Two miles S. E. of this place is the village and battle-field of Marengo. The citadel is regarded as one of the largest and strongest fortresses in Europe. Pop. in 1872, 57,079.

Aleu'tian (or **Aleu'tan**) **Islands,** a group of 150 or more islands, sometimes called the **Catharine Archipelago,** in the North Pacific, extending in a row from the peninsula of Alaska towards the S. point of Kamtchatka. They are rocky and volcanic, having some active volcanoes, and are inhabited by rude natives, who subsist by fishing and hunting. The inhabitants are of a race essentially Esquimaux. These islands belong to the U. S. Onemak or Unimak, the largest of the Fox Islands, is about 50 miles long. Pop. about 1200.

Ale'wife [supposed to be a corruption of the Indian name *aloof*], (the *Alo'sa tyran'nus*), a species of American fish, belonging to the family Clupeidæ, and nearly allied to the herring and the shad. It abounds in the Chesapeake Bay, and is found along the Atlantic coast of the U. S. As many as 5000 barrels have been caught in one year in the waters of Massachusetts. In the spring the alewives ascend the rivers to deposit their eggs.

Alewife.

Alexan'der, a county forming the S. extremity of Illinois. Area, 245 square miles. It is situated between the Ohio and the Mississippi rivers, at their confluence. The surface is flat, and partly subject to inundation. Cairo, which is in this county, is the southern terminus of the Illinois Central R. R. Grain, wool, and potatoes are the staples. Capital, Cairo. Pop. 10,564.

Alexander, a county of the N. W. of North Carolina. Area, 300 square miles. It is drained by the South Yadkin River. The surface is hilly. Grain, tobacco, and wool are the staples. Capital, Taylorsville. Pop. 6868.

Alexander, a post-township of Washington co., Me. Pop. 156.

Alexander, a post-village and township of Genesee co., N. Y., on the New York Central and Rochester division of the Erie R. R. It contains a seminary, a flouring-mill, and three churches. Pop. 1605.

Alexander, a township of Athens co., O. Pop. 1511.

Alexander [Gr. Ἀλέξανδρος; surnamed THE GREAT, the third Macedonian king of the name, the most famous of all military heroes, was the son of Philip, the celebrated king of Macedon, and Olympias, the daughter of the king of Epirus, who claimed descent from Achilles. At the age of fifteen, Alexander was placed under the instruction of Aristotle, and soon distinguished himself by his rare intellectual powers and by his rapid advancement in every kind of knowledge. His descent from Achilles, for whose character and achievements he cherished an enthusiastic and misplaced admiration, appears to have given his mind an early direction towards military glory. Among all books the "Iliad" was his favorite, and we are told that every night a copy of that poem was placed, along with his sword, under his pillow. King Philip had such confidence in his son's courage and capacity that he left him, although only sixteen years of age, the regent of his kingdom during his expedition against Byzantium. At the age of eighteen years, Alexander greatly distinguished himself in the battle of Chæronea, and the victory won by the Macedonians on that occasion was due, in no small measure, to the valor of the young prince. On the death of Philip, in 336 B. C., Alexander, not yet twenty years of age, succeeded to the throne. Several of the states which his father had subjugated deemed this a favorable opportunity for recovering their liberty, but the courage and celerity of Alexander defeated all their schemes. While, however, the young king was engaged in reducing the Triballi, the Thebans raised the standard of revolt. He instantly directed his march towards Bœotia; Thebes was taken by storm, the houses were levelled to the ground, and the citizens who had escaped slaughter in the assault sold as slaves, excepting only the posterity of Pindar, the celebrated Theban poet, and those who had opposed the rebellion. Not long after, at an assembly of the Grecian states held at Corinth, Alexander was chosen generalissimo of the Greek and Macedonian troops destined for the invasion of Persia. Early in the spring of 334 B. C. he entered Asia with an army of about 35,000 men, including 4500 cavalry. At the river Granicus the Persians sought to prevent his passage. The Macedonians, though fighting at a great disadvantage, gained a signal victory. At Gordium he attempted to untie the famous knot, for he had been told that the empire of the world had been prophesied to him who should succeed in this attempt. But having for some time tried in vain, he at last drew his sword and cut it, saying that this was the only way to untie it. It is said that those whose office it was to decide upon the interpretation of the prophecy, either sincerely or from motives of policy, declared that the Macedonian king had fulfilled it. Having received reinforcements in 333 B. C., he engaged Darius, the Persian king, who commanded at the river Issus an army of 600,000 men. The Persians were defeated with immense slaughter; the mother, wife, and two daughters of Darius were taken captive, but were treated with the greatest respect and kindness by the conqueror. After this great success scarcely any of the cities of Asia presumed to offer resistance to his victorious arms. But Tyre, then a powerful maritime and commercial city, had the courage or temerity to oppose his progress. The city was taken after a most determined resistance, which lasted seven months, but the conqueror fixed an indelible stain upon his reputation by his merciless cruelty towards the conquered Tyrians, thousands of whom were cruelly slaughtered, and the rest, numbering nearly 30,000, were sold into slavery. Gaza soon after met with a similar fate. Alexander then advanced into Egypt, where the people, weary of the Persian domination, welcomed him as a liberator. In Egypt, on one of the principal mouths of the Nile, he founded a city called Alexandria.

He next visited the temple of Jupiter Ammon, situated on an oasis in the desert of Libya, with the hope, it is said, that the god would acknowledge him to be his son. This having been done through the priest of the temple, he again turned his thoughts to the invasion of Persia, where Darius had succeeded in collecting another army of more than a million men, with not less than 40,000 cavalry. Alexander had scarcely more than 40,000 infantry and 7000 horse. The opposing armies met at Gaugamela, not far from Arbela, in 331 B. C. The Persians were defeated with prodigious slaughter. Not long afterwards, Darius was murdered by Bessus, one of his satraps. As the dying king, covered with wounds, lay extended in his chariot, Alexander came up; at the tragic spectacle the conqueror could not restrain his tears. He caused the body of Darius to be taken to Persepolis, where it was interred in the tombs of the Persian kings. Bessus having been taken and put to death, Alexander carried his victorious banners beyond the Jaxartes (now called the Sihon, or the Sir Daria), subdued Sogdiana, and married Roxana, the daughter of a Bactrian prince whom he had conquered. After this he turned his thoughts to the invasion of India. He crossed the Indus 327 B. C., formed an alliance with Taxiles (or Taxilus, as the name is sometimes written), an Indian king, and advanced to the banks of the Hydaspes (now the Jhylum), where he encountered Porus at the head of an immense army, accompanied by a multitude of elephants. After a sanguinary battle, the Indian king was totally defeated and taken prisoner. Alexander's favorite horse, Bucephalus, having been mortally wounded in this battle, the conqueror founded a town on the spot where he was buried, which he called Bucephala. Taking one city after another, he had advanced as far as the Hyphasis (now called Gharra), when his troops, alike uninfluenced by his menaces and his entreaties, positively refused to go any farther. Being thus under the necessity of returning, he committed the fleet which he had ordered to be built on the Hydaspes to Nearchus, while he himself proceeded by land through what is now Beloochistân to Susa. His army encountered in this march incredible hardships and suffering, so that many soldiers perished from thirst and hunger. Having arrived at Susa, he married as his second wife a daughter of Darius. As he was forming schemes for the extension and improvement of his empire, he died, 323 B. C., at Babylon, in the thirty-third year of his age.

It would be unjust to Alexander to regard him merely as a great and successful military hero. He possessed some moral qualities of a high order, especially generosity and magnanimity. Many of his views of state policy were liberal and enlightened. But all that was most excellent and admirable in his character was impaired and vitiated by mistaken ideas of the dignity and glory which belonged to a great king. As his passions were stronger than his intellect, extraordinary as the latter undoubtedly was, they gradually acquired, during his long career of uninterrupted success, an almost unlimited ascendency over him. His uniform prosperity may be said to have been his greatest misfortune. Being a stranger to the "sweet uses of adversity," it was impossible for him to see his own character and conduct in their true light. After his unparalleled successes had turned his brain, regarding himself as little less than a god, he could not brook the slightest freedom of speech, even from his most faithful and most meritorious officers. In a paroxysm of ungovernable rage he slew his friend and foster-brother Clitus, who had once saved his life, after which a grief, scarcely less violent than his anger had been, took possession of his soul, so that if he had not been restrained he would probably have taken his own life. Pope (in "The Temple of Fame") sums up his career and character in one short line—

"The youth who all things but himself subdued."

(See ARRIAN'S "History of Alexander's Expeditions;" QUINTUS CURTIUS'S "Life of Alexander;" WILLIAMS'S "Life and Actions of Alexander the Great," 1829; DROYSEN, "Geschichte Alexanders des Grossen von Macedonien," 1833; GEIER, "Alexandri Magni historiarum scriptores ætate suppares," containing the fragments of contemporaneous historians, 1844; THIRLWALL'S "History of Greece.")

J. THOMAS.

Alexander I. (Pope), SAINT, a Roman by birth, became bishop of Rome in 108 A. D. Died in 117.—ALEXANDER II. (ANSELMO BADAGIO) was elected pope in 1061. He declared William the Conqueror the true heir to the English crown. Died in 1073.—ALEXANDER III. (ROLANDO RANUCCIO BANDINELLI), one of the ablest men that ever sat on the papal throne, was a native of Sienna. He was elected pope in 1159. He was involved in a long contest with Frederick Barbarossa, and with the anti-popes who were supported by that emperor. Having been twice compelled by his enemies to leave Rome, he was in 1163 acknowledged pope by a council at Tours. The emperor, whom he had excommunicated in 1167, made his submission soon after the battle of Legnano, and was absolved. Thomas à Becket, who had been encouraged by Alexander in his resistance to Henry II. of England, was, after his assassination, canonized by the pope. According to Voltaire, Alexander proclaimed that no Christian should be held as a slave. He is said to have been the first who reserved to the Holy See the right of canonization. Died Aug. 1, 1181. (See

Reuter, "Geschichte Alexanders III. und der Kirche seiner Zeit," 1860, 2 vols.)—Alexander IV. (Rinaldo di Anagni) became pope in 1254. Died May 12, 1261.—Alexander V. (Pietro Filargo) was chosen pope in 1409. Died May 3, 1410.—Alexander VI. (Rodrigo Lenzuoli Borgia), born at Valencia, in Spain, in 1430, was a nephew of Pope Calixtus III. Before his election to the papacy he had several illegitimate children, among whom were the infamous Cæsar and Lucretia Borgia. He became a cardinal in 1456, and was chosen pope in 1492. Among the events of his pontificate was the death of Savonarola. Died Aug. 18, 1503. His character was an infamous compound of cruelty, treachery, licentiousness, and other vices.—Alexander VII. (Fabio Chigi) was born at Sienna Feb. 13, 1599, and became pope in 1655. He embellished Rome with architectural works. Died May 22, 1667.—Alexander VIII. (Pietro Ottoboni) was born in Venice April 19, 1610, and elected pope in 1689. He assisted the Venetians in a war against the Turks. Died Feb. 1, 1691.

Alexander I., king of Scotland, a younger son of Malcolm Canmore, began to reign in 1107. He was an able ruler. He died in 1124, and was succeeded by his brother, David I.—Alexander II., born in 1198, succeeded his father, William the Lion, in 1214. He married a sister of Henry III. of England in 1221. He is said to have been a wise and able prince. Died in 1249.—Alexander III., of Scotland, born in 1241, was a son of the preceding, and became king in 1249. He married, in 1251, Margaret, a daughter of Henry III. of England. His reign was peaceful and prosperous. He fell with his horse over a precipice, and was killed in 1286.

Alexander I. (or **Alexan'der Pav'lovitch**), emperor of Russia, the son of Paul I. and Maria, a princess of Würtemberg, was born at St. Petersburg in Dec., 1777. He married, in 1793, Elizabeth, a daughter of the crown prince of Baden, and succeeded his father, who was assassinated in Mar., 1801. He promoted civilization, education, industry, and trade. His foreign policy was pacific until he joined a coalition against Napoleon in 1805. In December of that year the Russian and Austrian armies were defeated at Austerlitz. After the Russian armies had sustained several other defeats, the war was ended by the treaty of Tilsit in 1807. Alexander then became the friend and ally of Napoleon, and declared war against England. But, alarmed by the insatiable ambition of Napoleon, he resolved on a change of policy, and formed an alliance with England and Sweden. Russia was invaded in 1812 by Napoleon, who took Moscow, but his army was soon compelled to retreat, and nearly all perished with cold and hunger or were taken prisoners. After the abdication of Napoleon, Alexander entered Paris with the victorious armies in 1814, and exhibited more generosity and clemency towards the French than the other allies showed. He again entered Paris in triumph in July, 1815, and in the same year formed, with the emperor of Austria and the king of Prussia, a coalition called "the Holy Alliance," the tendency of which was reactionary and hostile to the cause of liberty. The professed object of this alliance was to promote religion and peace. As he advanced in years he became more contracted and less liberal, a prey to hypochondria and suspicion. His projects of reform were abandoned, a rigid censorship of the press was maintained, and all liberal or progressive tendencies were repressed. He died without issue at Taganrog, Dec. 1, 1825, and was succeeded by his brother Nicholas. (See Russia.)

Alexander II., surnamed Nicolaevitch (*i. e.* "the son of Nicholas"), emperor of Russia, the eldest son of Nicholas I., was born April 29, 1818. His mother was a sister of William I. of Prussia and emperor of Germany. He married in 1841, Marie, a daughter of the grand duke of Hesse-Darmstadt, and ascended the throne on the 2d of Mar., 1855, during the Crimean war, which Russia waged against France, England, and Turkey. The war was terminated by the treaty of Paris, signed in Mar., 1856. His domestic policy has been more moderate and liberal than that of his ancestors. He is commended for punishing official corruption and liberating public instruction from military discipline and control. Among the memorable events of his reign was the emancipation of about twenty million serfs, which was decreed in 1861. (See Russia.)

Alexander Alexandrovitch, grand duke of Russia and cesarevitch, the second son of the emperor Alexander II., was born Mar. 10, 1845. He married in Nov., 1866, Marie Sophie Frederike Dagmar, who is a daughter of Christian IX., king of Denmark, and who then assumed the name of Marie Feodorovna. He became, after the death of his elder brother Nicholas, in 1865, the heir-apparent to the throne. He has two sons—Nicholas Alexandrovitch, born in 1868, and George Alexandrovitch, born in 1871.

Alexander (Archibald), D.D., an eminent divine, born near Lexington, Rockbridge co., Va., April 17, 1772. He became president of Hampden-Sidney College in 1796, and pastor of a Presbyterian church in Philadelphia in 1807. In 1812 he was chosen the first professor of the Theological Seminary of Princeton, N. J., then just founded. He was distinguished as a pulpit orator and as a writer on theology. Among his works are "Outlines of the Evidences of Christianity" (1824), a "History of the Israelites," and "Outlines of Moral Science" (1852). The first of these works has been translated into several languages. He married, in 1802, Janetta Waddell, a daughter of a well-known blind preacher. Died Oct. 22, 1851.

Alexander (Barton Stone), an American officer, born in 1819 in Kentucky, graduated at West Point 1842, and Mar. 7, 1867, lieutenant-colonel of engineers. He served as assistant engineer, repairing fortifications, 1842–47, in the war with Mexico 1848, at the Military Academy as treasurer and erecting buildings 1848–52, constructing military asylum (Soldiers' Home) near Washington, D. C., 1852–55, altering Smithsonian Institution 1854, building Chelsea Marine Hospital, Mass., 1855–59, and erecting Minot's Ledge lighthouse, entrance to Boston harbor, 1855–61. In the civil war was aide-de-camp, with the rank of lieutenant-colonel, chiefly employed in the construction of the defences of Washington, D. C., 1861–66, in Manassas campaign 1861, engaged at Blackburn's Ford and Bull Run (brevet major), in Virginia peninsula campaign 1862, engaged at Yorktown (brevet lieutenant-colonel), West Point, Chickahominy, Fair Oaks, Gaines's Mill, and Golden's Farm, as consulting engineer of Major-General Sheridan's army in Shenandoah Valley 1864, present at Cedar Creek, and in preparation of bridge equipage, devising defensive works, and member of various boards 1861–66. He was made brevet colonel and brigadier-general Mar. 13, 1865, for meritorious services. Since the war he has had charge of most of the public works in Maine till Jan. 7, 1867, when he became senior engineer and member of the Pacific board of engineers for fortifications.

George W. Cullum, *U. S. Army.*

Alexander (James Waddell), D.D., an eminent divine, was born near Gordonsville, in Louisa co., Va., Mar. 13, 1804. He graduated at Princeton in 1820, and became in 1833 professor of rhetoric at the College of New Jersey (Princeton). From 1844 to 1849 he was pastor of the Duane street Presbyterian church in New York. From 1849 to 1851 he was professor of church history in the Princeton Theological Seminary. In 1851 he took charge of the Fifth avenue Presbyterian church in New York City, and died July 31, 1859. He was a man of various culture, and had uncommon unction and power as a preacher. He published numerous articles in the "Princeton Review," and a number of volumes, such as "Discourses on Christian Faith and Practice" and "Sacramental Discourses."

Alexander (John Henry), an American savant, born at Annapolis, Md., in 1812, published a "Treatise of Mathematical Instruments" (1835), "Contributions to the History of Iron" (1840), "Introits" (1844), "Dictionary of Weights and Measures" (1850), "International Coinage" (Oxford, 1857), and other works. Died at Baltimore Mar. 2, 1867. (See his Life by W. Pinkney, 1867.)

Alexander (Joseph Addison), D.D., was born in Philadelphia April 24, 1809. He graduated at the College of New Jersey in 1826. He was chosen adjunct professor of Latin in 1833. In 1838 he went into the Theological Seminary as associate professor of Oriental and biblical literature, and in one chair and another continued to serve the institution till his death at Princeton, Jan. 28, 1860. He made extraordinary attainments in the Semitic and other languages. He was also an impressive preacher. He wrote much for the "Princeton Review." His most important works are commentaries: "Isaiah" (2 vols. 8vo, 1846), "Psalms" (3 vols. 12mo, 1850), "Acts" (1 vol., 1857), "Mark" (1 vol., 1858). "Matthew" was published posthumously in 1860.

Alexander (Nathaniel), born in Mecklenburg, N. C., in 1756, graduated at Princeton in 1776, served in the Revolutionary army, and afterwards practised medicine. He was member of Congress (1803–05) and governor of North Carolina (1805–07). Died at Salisbury, N. C., Mar. 8, 1808.

Alexander (Stephen), LL.D., a distinguished astronomer, born at Schenectady, N. Y., Sept. 1, 1806, graduated at Union College in 1824. He became professor of astronomy at the College of New Jersey in 1840, and obtained in 1845 an additional chair of mechanics. He has acquired distinction as a writer on astronomy.

Alexander (William), earl of Stirling, a Scottish poet, born in 1580. He wrote, besides several dramas, a

didactic poem entitled "Doomesday" (1614), which was much admired. He was appointed secretary of state for Scotland in 1626. Died in 1640.

Alexander (William), styled Lord Stirling, an American general, born in New York in 1726. He claimed the earldom of Stirling, but did not succeed in obtaining the estate belonging to it. Having espoused the popular cause in the Revolution, he served with distinction at Long Island, Germantown, and Monmouth, and obtained the rank of major-general. He also promoted the cause by exposing the intrigues of Conway. Died Jan. 15, 1783.

Alexan'der Ba'las, a usurper of the throne of Syria, was a person of low origin, and lived in the second century B. C. He pretended to be the son of Antiochus Epiphanes, and with the aid of Rome and several Greek princes defeated his rival Demetrius Soter in 150 B. C., and Demetrius was killed in the flight. After a short reign he was defeated by his father-in-law, and in 146 B. C. was murdered by an Arabian emir with whom he had taken refuge.

Alexander John I., prince of Rumania, born Mar. 20, 1820, was elected in 1858 to the assembly of Moldavia, became in the same year minister of war of the united principalities, was elected in 1859 first prince of Moldavia, and then prince of Wallachia, in both cases by a unanimous vote, but had to pledge himself to complete the union of the two principalities, and then resign in favor of some European prince. But he was not recognised by Turkey until Dec. 23, 1861, as prince of both principalities, on which day the union of the two principalities under the name of Rumania was proclaimed. But in consequence of several unpopular measures the most prominent men of Rumania planned a revolution, and in the night of Feb. 23, 1866, entered his apartments and forced him to sign his resignation. After that time he lived in Vienna as a private citizen. He died in 1873.

Alexander Karageorgevitch, prince of Servia, the son of Gerny George (which see), the first prince of Servia, born Oct. 11, 1806, was elected prince of Servia in 1842. Russia protested against his election, but Mar. 27, 1843, he was again elected, and this time by a unanimous vote. In consequence, however, of his peace policy towards the foreign powers, he became obnoxious to the people, and was deposed Dec. 11, 1858. In 1868 he was accused of complicity in the murder of Prince Michael, his successor, and was sentenced in 1871 by the authorities of Austria, where he had resided since his deposition, to eight years' imprisonment and the costs.

Alexan'der Nev'ski (or **Nev'skoi**), a Russian prince and hero, born in 1219, was a son of the grand duke Yaroslaf II. He gained in 1240 a signal victory over the Swedes on the Neva; hence his surname. On the death of his father, about 1246, he became grand duke of Vladimir. Died in 1263. By the Russians he is regarded as a saint.

Alexan'der of Aphrodis'ias, a celebrated Greek commentator on Aristotle, lived at about the close of the second century after Christ. Like his masters, Herminus and Aristocles the Messenian, he tried to free the Peripatetic philosophy from the syncretism of Ammonius and others, and to restore the true interpretation of Aristotle.

Alexander of Hales. See Hales.

Alexander Seve'rus, a Roman emperor, born about 205 A. D. His original name was Alexianus Bassianus, but when upon his removal to Rome he was created cæsar, pontiff, consul, and *princeps juventis* elect by his cousin, the emperor Elagabalus, he assumed the name M. Aurelius Alexander, and added Severus afterwards. In 222 A. D., upon the death of his cousin, Alexander was proclaimed emperor by the prætorians, and confirmed by the senate. In 232 he gained a great victory over the Persians; in 234 he marched into Gaul against the Germans, but was waylaid and murdered by some mutinous soldiers in 235.

Alexan'dra (Caroline Marie Charlotte Louise Julie), princess of Wales, a daughter of Christian IX., king of Denmark, was born in 1844. She was married in Mar., 1863, to Albert Edward, prince of Wales.

Alexan'dri, or **Aleksandri** (Vasilio), a Moldavian poet and *littérateur*, born at Yassy in 1821, was educated in Paris. He produced, in French and Moldavian, a number of dramas which were performed with success at Yassy. In 1852 he published "Popular Ballads of Rumania." His novels, songs, and ballads have been much admired.

Alexan'dria [classical accentuation, *Alexandri'a*; Gr. Ἀλεξάνδρεια], an ancient and celebrated city and seaport of Lower Egypt, named from Alexander the Great, by whom it was founded in 332 B. C. It was situated on a low and narrow tract which separates Lake Mareotis from the Mediterranean, near the western mouth of the Nile, and 117 miles N. W. of Cairo. Lat. of Pharos, the Alexandria lighthouse, 31° 12′ 9″ N., lon. 29° 53′ E. Soon after its foundation it became the capital of the Grecian kings who reigned in Egypt, and one of the most populous and magnificent cities in the world. It was a great emporium of commerce, for which its position between Europe and India was very advantageous. Before, as well as after, the Christian era this city was a celebrated seat of learning and philosophy. Here was founded the greatest library of antiquity (see Alexandrian Library), and the celebrated Museum. Among the principal edifices was the Serapeion, or temple of Serapis. In front of the city stood a famous lighthouse called Pharos, on an island of the same name. It is supposed that during its greatest prosperity Alexandria had 600,000 inhabitants, a majority of whom were Greeks and Jews. Even after Egypt had been conquered by the Romans, this city was second only to Rome in size and importance. About the period 300–640 A. D. it was a great focus of Christian theology and sectarianism. It was captured by the Saracen caliph Omär about 640, after which its prosperity declined. The discovery of a passage to India by the Cape of Good Hope (1497) contributed to its ruin, so that the population was reduced in 1778 to 6000. The principal remains of its ancient grandeur are—a granite monolith erroneously called Pompey's Pillar; the Catacombs; and two obelisks named Cleopatra's Needles, one of which, about seventy-two feet high, is standing, and the other lies prostrate.

The modern city, which has again become populous and important, is built near the site of the ancient, and on a mole or isthmus connecting the main land with the island of Pharos. It is connected with Cairo by a canal and railway, and with Suez by a railway, which is continued from Cairo. Here are a palace of the pasha, a custom-house, a large naval arsenal, and medical, naval, and other schools. Some of the new streets present the aspect of a European city, but in the Turkish quarter the streets are narrow and dirty. In consequence of steam navigation, Alexandria has again become a great emporium of the commerce between Europe and India. The chief articles of export are grain, sugar, drugs, cotton, gums, rice, dates, and hides. Steamers ply regularly between this port and Brindisi, Malta, and Constantinople. Eleven newspapers are published here in the Italian, Greek, and French languages. Pop. in 1871, 219,602; among whom there are 25,000 Greeks, 20,000 Italians, 15,000 French, 8000 Germans and Swiss, and a large number of other foreigners. Its new artificial harbor, with a breakwater 2 miles long, commenced in 1871, is one of the most important works of the kind in the Mediterranean.

Revised by A. J. Schem.

Alexandria, a town of Russia, in the government of Kherson, 148 miles N. E. of Kherson. Pop. in 1867, 10,434.

Alexandria, a town in Wallachia. Pop. 8596.

Alexandria, a county in the N. E. part of Virginia. Area, about 36 square miles. It is bounded on the N. E. by the Potomac, which separates it from the city of Washington. The surface is hilly. This county was formerly a part of the District of Columbia, and was retroceded to Virginia in 1844. Grain is the chief crop. Capital, Alexandria. Pop. 16,755.

Alexandria, the capital of Glengary co., Ontario, is about 130 miles N. E. of Kingston.

Alexandria, a twp. of Calhoun co., Ala. Pop. 1689.

Alexandria, a township of Leavenworth co., Kan. P. 1179.

Alexandria, the capital of Rapides parish, La., is on the S. bank of the Red River, 350 miles by water N. W. of New Orleans. It has a convent of the Sisters of Mercy, four well-established and prosperous institutions of learning, five churches (Catholic, Episcopalian, Methodist, colored Methodist, and colored Baptist), a large three-story brick hotel, two well-organized companies of firemen, three shipping warehouses, a large number of stores, and two weekly papers. It has two weekly packets to New Orleans, besides which the Shreveport, Jefferson, Tex., and other boats, some thirty-five in all, stop here. In 1872 Alexandria shipped 8265 bales of cotton, 3662 hogsheads of sugar, and 584 barrels of molasses, besides large quantities of hides, peltries, moss, beeswax, tallow, pecan-nuts, and fruit. Pop. 1218.

E. R. Bossat, Ed. "Louisiana Democrat."

Alexandria, a post-village, capital of Douglas co., Minn., in a township of the same name, 140 miles W. N. W. of St. Paul, on the proposed line of the St. Vincent branch of St. Paul and Pacific R. R. It has a weekly paper, a U. S. land-office, and steam grist and saw mills. The village is pleasantly situated on one of the many beautiful lakes which abound in that part of the State. Pop. of Alexandria township, 503.

Joseph Gilpin, Ed. "Post."

Alexandria, a township of Benton co., Mo. Pop. 921.

Alexandria, a post-village of Clarke co., Mo. It has one weekly newspaper. Pop. 688.

Alexandria, a post-township of Grafton co., N. H. It has manufactures of lumber. Pop. 876.

Alexandria, a township of Hunterdon co., N. J. Pop. 3341.

Alexandria, a post-village of Jefferson co., N. Y., in a township of its own name, on the St. Lawrence River, 25 miles N. by E. of Watertown. Alexandria Bay is a port which is visited by steamboats. It has a lighthouse. The township embraces a part of the Thousand Isles, and is a great summer resort. It contains a glass-factory and eight churches. Pop. of township, 3087.

Alexandria, a post-borough of Huntingdon co., Pa. Pop. 556.

Alexandria, a city, port of entry, and capital of Alexandria co., Va., is pleasantly situated on the right bank of the Potomac, 7 miles below Washington. The river is here 1 mile wide, and forms a good harbor, which is deep enough for the largest ships. The streets are regular and well paved, and the principal thoroughfare is traversed by a horse railway. The city contains a court-house, a new and very handsome market-house, fifteen churches, several banks, has two daily and three weekly newspapers, an efficient steam fire department, and is lighted with gas and supplied with water. An extensive cotton-factory has been in operation for a number of years, with flouring-mills, machine-shops, plaster-mills, and other industries. The city is noted for the number and excellence of its institutions of learning, and has a large public library. It is the terminus of a number of railroads; one crosses the State to the North Carolina border; another, to connect with the Ohio River, is being constructed; one to Richmond, *viâ* Fredericksburg; and a short line affords hourly communication with Washington. Alexandria enjoys an extensive coal-trade by the Chesapeake and Ohio Canal from the Cumberland region, a large number of vessels being employed in the shipment of the product of the mines to Northern ports. Pop. 13,570.

E. Snowden, Ed. "Alexandria Gazette."

Alexan'drian Li'brary, the largest and most celebrated library of antiquity, was founded by Ptolemy Philadelphus, king of Egypt, about 275 B. C. He purchased many books at Athens, Rome, and other places. This library is said to have been partially destroyed by fanatical Christians about 395 A. D. According to some authorities, it was burned in 642 A. D. by order of the caliph Omär, who argued that if books agree with the Koran they are unnecessary, if they differ they should be destroyed. (See Ritschl, "Die Alexandrinischen Bibliotheken," 1838.)

Alexandrian (or **Alexandrine**) **School** is the name given to a certain type of thought and culture which began to prevail in Egypt about 300 B. C. The intercourse of the Jewish and Greek colonists who had previously settled in that country had given rise to a blending of the peculiar religious ideas of each. The Gnostics, whose system was a mingling of Oriental with Christian thought, originated chiefly in Alexandria; and Philo-Judæus, generally regarded as the founder of Neo-Platonism, was also a native of that city. Athanasius, Gregory of Nazianzus, and other eminent Christian Fathers favored the Alexandrian School, and adopted to a certain extent the doctrines of the Neo-Platonists. This school was likewise renowned for the culture of mathematics and physical science, and numbered among its disciples Euclid, Aristarchus of Samos, and, according to some writers, Archimedes. The celebrated critic Aristarchus is said to have passed the greater part of his life in Alexandria, where he founded a school. With regard to correctness and elegance of expression the Alexandrian writers were highly distinguished, but they were deficient in life and spirit. In a school where imitation and rule took the place of inspiration, each generation became more artificial and lifeless than its predecessor, and both prose and poetry often became labored affectation. Special works on the history of the Alexandrine School have been written by Matter, 2 vols., 2d. ed., 1840–44; Barthélemy St.-Hilaire (1845), and Simon (2 vols., 1844–45).

Alexan'drine, a poetical metre or verse, formed of twelve syllables, which was first used by a French poet of the twelfth century, named Alexander of Paris. The second line of the following couplet from Pope's "Essay on Criticism," part ii., line 156, furnishes an example:

"A needless Alexandrine ends the song,
Which, like a wounded snake, drags its slow length along."

See also Virgil's "Georgics," iii., 424.

Alexandrine Age, a name applied to a period during which Alexandria was the principal centre of literature and science in the world. It extended from about 300 B. C. to 600 A. D., and was represented by many eminent grammarians and critics, who excelled in correctness and elegance of style, but were deficient in genius and originality.

Alexandro'pol (called also **Huenri** or **Guenri**), a fortified town of the Caucasus, in the government of Erivan, on the Arpa-Chai River, 85 miles S. W. of Tiflis. The fort, which lies about 2000 feet from the city, 300 feet above the level of the river, commands the entire vicinity, and can hold 10,000 men. Alexandropol is an important strategical point, as it is the key to Armenia. Pop. in 1867, 17,272.

Alexan'drov, a town of Central Russia, in the government of Vladimir, 70 miles W. N. W. of the city of Vladimir. It contains a convent founded by Ivan IV., who is said to have also established here the first printing-press in Russia. Pop. in 1867, 5810.

Alex'is (or **Alex'ius**) Comnenus, the name of several emperors who reigned at Trebizond (Trapezus) in the thirteenth, fourteenth, and fifteenth centuries. They belonged to the same family as the Alexis Comnenus mentioned below.

Alexis (or **Alexius**) **I.,** Comnenus, emperor of Constantinople, born in 1048. Having distinguished himself by his military talents, he was proclaimed emperor by his soldiers about 1080, in place of Nicephorus, who was then deposed. He showed himself an able and a crafty ruler. Some writers censure him for his failure to support the operations of the first Crusade, which occurred in his reign. He died in 1118, and was succeeded by his son John.

Alexis Alexandrovitch, grand duke of Russia, a younger son of the emperor Alexander II., was born in Jan., 1850. He visited the U. S., making an extensive tour in 1872, and meeting nearly everywhere a warm reception among the Americans.

Alexis Michaelovitch, czar of Russia, was born Mar. 10, 1629, and succeeded his father Michael in 1645. He promoted civilization and improved the laws. He was the father of Peter the Great. Died Jan. 29, 1676.

Alexis Petrovitch, or Petrowitsch, a Russian prince, a son of Peter the Great, was born in 1690. He showed such a hostility to the reforms of his father that the latter resolved to exclude him from the throne. While Peter was travelling in Western Europe in 1717, Alexis fled to Vienna and Naples. He was soon brought back, and condemned to death on a charge of treason or rebellion. He was found dead in prison in July, 1718. Scarcely a doubt can be entertained that he was poisoned by the order of his father. His son Peter became emperor in 1727.

Alex'isbad, a watering-place of Germany, in the Harz Mountains, 9 miles from Ballenstädt, was established as a watering-place by the duke of Anhalt-Bernburg in 1810. It has two springs—the Selke spring, which contains no carbonates, and very little carbonic acid gas, but large quantities of chloride and sulphate of iron, and is only used for bathing; and the Alexis spring, containing carbonate of iron, is used for drinking. The scenery in the neighborhood is beautiful.

Alex'ius, Saint, the son of a noble Roman, who lived at the time of Pope Innocent I. (402–416). He married at the wish of his father, but fled after the marriage, and after having lived for a long time as a hermit, he returned and devoted himself to a life of charity, and only made himself known a short time before his death. His life was dramatically treated in the Middle Ages in most of the European languages.

Alfalu, a town of Austria, in Transylvania. Pop. in 1869, 5041.

Alfie'ri (Vittorio), Count, the most popular Italian poet of his time, was born at Asti, in Piedmont, Jan. 17, 1749, and inherited a large fortune. He was sent to the Academy of Turin, in which he learned little, and which he quitted about 1764. Recoiling with disgust and resentment from the stupid pedantry and tyranny of his teachers, he plunged into dissipation and neglected the cultivation of his mind. He passed many years in travel, for which he had a strong passion, and visited nearly all the countries of Europe, impelled by morbid unrest and love of excitement, rather than a rational resolution to complete his education. He began his literary career by the drama of "Cleopatra," which was performed with applause in 1775. About this time he entered a more regular course of life, and devoted himself with passionate ardor to study and composition. It is stated that he commenced the study of Greek after he was forty years old. His literary success was promoted, as he affirms, by the influence of the countess of Albany, the wife of the Pretender Charles Edward Stuart. (See Albany, Countess of.) He passed many years in her society at Florence and Rome, and in France. He composed numerous tragedies, comedies, sat-

ires, and lyrical poems. His reputation is founded chiefly on his tragedies, among which we notice "Virginia," "Filippo II.," "Orestes," "Abel," "Mary Stuart," "Myrrha," "Octavia," and "Saul." His dramas, which display great energy of language and intensity of passion, and abound in noble sentiments, were well adapted to reform the national literature, which had become effete, insipid, and destitute of manly vigor. "The aim of his works," says Madame de Staël, "is so noble, the sentiments which the author expresses accord so well with his personal conduct, that his tragedies ought always to be praised as actions, even when they may be criticised as literary works." (*Corinne.*) Alfieri was liberal in politics, and ardently desired to improve the political and social condition of Italy by his writings. Among his works are an "Essay on Tyranny," five odes on the American Revolution, and his interesting Autobiography. He died at Florence Oct. 8, 1803. His complete works were published at Pisa in 22 vols. 4to, 1808. A new edition of his dramatic works was published by Milanesi (1855, 2 vols.). His life was written by TEZA (1861).

Alfon'sine (or **Alphon'sine**) **Tables,** the name of the astronomical tables prepared by the order of Alfonso X. of Castile and Leon, at a cost of 400,000 gold ducats—say, $800,000. They were published in 1252. They were first printed in 1483, and were the first printed tables that ever appeared. For about three centuries they were all that astronomy had to depend on.

Alfon'so III. of Asturias, surnamed THE GREAT, began to reign in 866 A. D. He enlarged his dominions by victories over the infidels of Spain. Died in 910.

Alfonso I. of Castile (or **Alfonso VI.** of Leon), surnamed THE BRAVE, was a son of Fernando I. He became king of Leon in 1065, and of Castile in 1073. Aided by the famous Cid, he defeated the Moors in several battles. He died in 1109.—ALFONSO VIII. of Castile (sometimes called ALFONSO III.) was born about 1155, and became king in 1158. He defeated the sultan Mohammed An-Nâsir in a great battle in 1212. Died in 1214.—ALFONSO XI. of Castile, born in 1311, succeeded his father, Fernando IV., in 1312. He gained a great victory over the sultan Aboul-Hassan at Tarifa in 1340. Died in 1350.

Alfonso X., king of Leon and Castile, surnamed EL SABIO ("the Wise"), was born in 1221. He succeeded his father, Fernando III., in 1252. He was one of the most learned men of his time, and was distinguished as a patron of literature and science, but he was not prosperous in political and military affairs; his reign was disturbed by rebellions. Under his auspices an excellent code of laws was given to Spain, and the Bible was translated into Castilian. He wrote several works in verse and prose which are highly commended. Died April 4, 1284.

Alfonso I., king of Naples and Sicily, born about 1385, was a son of Fernando I. of Aragon, whom he succeeded in 1416. On the death of Joanna II., queen of Naples (1435), that kingdom was claimed by Alfonso and René of Anjou. After a long war between these rivals, Alfonso obtained the throne of Naples in 1442. He died June 27, 1458, and was succeeded by his son, Ferdinand I.

Alfonso [Port. *Affon'so*] **I.,** the first king of Portugal, born about 1100, was a son of Henry of Burgundy. He inherited from his father the title of count of Portugal. Having gained a great victory over the Moors at Ourique in 1139, he then assumed the title of king. He afterwards took Lisbon, and became master of all Portugal. He died Dec. 6, 1185, and left the throne to his son, Sancho I.

Al'ford, a post-township of Berkshire co., Mass. It has valuable marble-quarries. Pop. 430.

Alford (HENRY), D. D., an English poet and theologian, born in London in 1810. He became a fellow of Trinity College, Cambridge, in 1834, incumbent of Quebec street chapel, London, in 1853, and dean of Canterbury in 1856. His most popular poetical work is "The School of the Heart, and other Poems" (1835), which was highly commended by the "Edinburgh Review" for Jan., 1836. He gained a high reputation as a biblical critic by his edition of the Greek New Testament (1844–52). A revised edition of it appeared in 4 vols. (1859 *et seq.*). He published also a small volume entitled "The Queen's English," which attracted some attention. Died Aug. 13, 1871.

Alford (JOHN), born in 1686, was the founder of a professorship of natural religion, moral philosophy, and civil polity in Harvard College, and also a benefactor of Princeton College and other institutions. Died at Charlestown, Mass., Sept. 29, 1761.

Al'fordsville, a township of Robeson co., N. C. P. 1041.

Al'fred, surnamed THE GREAT, written also **Ælfred, Alured,** or **Alvred** [Lat. *Ælfre'dus*], king of the West Saxons in England, was born in Berkshire in 848 or 849 A. D. He was a younger son of Ethelwolf, and succeeded his brother Ethelred in 871, when he found the country in a miserable condition. In the preceding reign the kingdom had been invaded and ravaged by an army of Danes, whom the Saxons were unable to resist. After the accession of Alfred these piratical incursions were continued or renewed, and nearly all of the kingdom was conquered by the Danes. Alfred was forced to flee from his court and conceal himself in the hut of a cowherd. Having by furtive measures raised a small army, he attacked and routed the Danes at Eddington in 878. Soon after this battle the Danish king Godrun (or Guthrum) surrendered himself, was converted to Christianity, and remained a peaceable subject of Alfred, who now directed his attention to civil affairs. He founded or improved the British navy, rebuilt cities and forts, established schools, compiled a code of laws, and reformed the administration of justice. In that age of ignorance he was distinguished as a scholar, as well as a patron of learning. He translated several works from the Latin into Anglo-Saxon. About 886 he was recognized as the sovereign of all England. His kingdom was again invaded in 894 by an army of Northmen under Hastings, who is said to have had a fleet of 300 ships. Alfred defeated them in several battles, and finally drove them out of the island. He died in 901, and was succeeded by his son, Edward the Elder. Alfred is regarded as the wisest and greatest of all the kings of England. He was, says Freeman, "a saint without superstition, a scholar without ostentation, a conqueror whose hands were never stained with cruelty, a prince never cast down by adversity, never lifted up to insolence in the day of triumph." (See also SHARON TURNER, "History of the Anglo-Saxons.")

Alfred, a post-village, the capital of York co., Me., in a township of its own name, on the Portland and Rochester R. R., 32 miles W. by S. of Portland. It has manufactures of lumber and woollen goods, and contains a Shaker village. Pop. of township, 1224.

Alfred, a post-village and township of Alleghany co., N. Y., has a sash, blind, and door factory, cheese-box factory, one academy, and one weekly paper. It is the seat of Alfred University, a Seventh-Day Baptist institution. Pop. of township, 1555.

N. V. HULL, Ed. "SABBATH RECORDER."

Alfred (or **Alured**) **of Beverly,** an English priest and historian, born about 1100. He wrote a history of Britain in Latin, which is supposed to be an abridgment of the work of Geoffrey of Monmouth.

Al'freton, a market-town and parish of England, in Derbyshire, 12 miles N. N. E. of Derby. It is supposed to have been named in honor of Alfred the Great. Pop. in 1871, 11,805.

Alfs'borg, a township of Sibley co., Minn. Pop. 264.

Al'gæ (the plu. of Lat. *alga*, a "sea-weed"), the scientific name of the sea-weeds, etc., a division of cryptogamous plants belonging to the class Thallogens, and comprising many species which grow in salt or fresh water, and are greatly diversified in form, size, and structure. Some are too small to be seen by the naked eye, while the stem of the "giant kelp" of the W. coast of America sometimes attains a length of from 1000 to 1500 feet. Having no true roots, they sometimes adhere to rocks or the sea bottom, and sometimes they float on the surface. Navigators sometimes meet with masses of gulf-weed (*Sargassum*) many miles in extent. An area of this kind in the Atlantic is said by Maury to be as large as the Mississippi Valley. There are several such areas in the ocean, called SARGASSO SEAS (which see). Algæ are cellular in structure, are useful as manure, and some species, like Irish moss, are used as food. Kelp or barilla, made by burning sea-weeds and other marine plants, yields soda and iodine. The Algæ proper are divided into three groups—the green-spored, the red-spored, and the brown-spored Algæ, each containing many orders. (See PHYCOLOGY.)

Algan'see, a post-twp. of Branch co., Mich. P. 1421.

Algar'di (ALESSANDRO), an eminent Italian sculptor and architect, born at Bologna about 1600, studied design under the Carracci. His masterpiece in sculpture is a colossal work in relief in St. Peter's church, Rome, the subject of which is Pope Leo forbidding Attila to enter Rome. He was, according to some critics, equal or superior to any sculptor of his age. Died in 1654.

Algarot'ti (FRANCESCO), COUNT, an eminent Italian writer, born at Venice Dec. 11, 1712. He was a skilful connoisseur of the fine arts, and wrote, besides other works in prose and verse, "Letters on Painting," which are highly commended. He removed to Berlin, where he passed many years, enjoying the favor and intimacy of Frederick the Great, who gave him the title of count in 1740. He corresponded with Voltaire. Died at Pisa in 1764.

Algarovil'la, an astringent substance procured from a

tree called *Juga marthæ*, which grows in New Carthagena, in South America. It is a powerful agent for tanning leather.

Algar've, the southernmost province of Portugal, is bounded on the N. by Alemtejo, on the E. by Spain, and on the S. and W. by the Atlantic Ocean. Area, 1872 square miles. The surface is mostly mountainous. The main exports are wine, salt, dates, and other fruits. The chief towns are Faro and Lagos. Pop. in 1868, 177,342.

Al'gebra [supposed to be derived from the Arabic *al*, "the," and *jabara* (or *jabara*), to "bind," to "consolidate"], an important branch of mathematics, sometimes called universal arithmetic, but it may be more properly described as a calculus of symbols. The symbols it employs are of three kinds: (1) those of quantity, known or unknown, which consist of ordinary numbers and letters of the alphabet; (2) those of operation, amongst which are $+$, $-$, $\times$, $\div$, $\surd$, etc.; and (3) mere abbreviations for ordinary words. (See SIGN.) The combination of these symbols according to fixed laws leads to algebraical expressions or formulæ, in which actual computations are indicated rather than performed. The universality of algebra as compared with arithmetic consists in the fact that in the latter, computations being effected as they arise, all traces of the intermediate steps are obliterated, and the result is applicable to a single case only; whereas in algebra the formulæ contain implicitly the answers to an unlimited number of questions. Again, to the equivalence of two algebraical formulæ always corresponds a general theorem, which arithmetic can only *verify* in particular cases. Thus, from the algebraical identity,

$$(a+b)(a-b)=a^2-b^2,$$

we learn that the "product which results from multiplying the sum by the difference of *any* two numbers is equal to the difference of their squares."

The systematic notation, to which algebra owes its chief power as an instrument of research, has been of very gradual growth, and is still being extended. In the first known treatises on the subject, by Diophantus, who probably lived in about the fourth century of our era, the few symbols employed are mere abbreviations for ordinary words. The Arabians, who obtained their algebra from the Hindoos, did little or nothing towards its extension, though their treatises, after being carried into Italy by a merchant of Pisa, Leonardo Bonacci (1202 A. D.), gave rise to important improvements. Scipio Ferreus of Bononia is said to have solved the first problem of the third degree (1505); but it was Tartaglia, or rather Cardan, who first gave the general solution of a cubic equation, and employed letters to denote the unknown quantities, the *given* one being still mere numbers. Without extending algebraic notation, Ferrari, a disciple of Cardan, discovered the general solution of a biquadratic equation, and thus, unknown to himself, reached the barrier which, as has since been proved, will ever remain impassable to the searcher for *general* solutions of equations of the fifth and higher degrees. (See EQUATIONS.) Towards the middle of the sixteenth century algebra was introduced into Germany, France, and England, by Stifelius, Peletarius, and Robert Recorde, respectively. In doing so, the latter also invented the very convenient symbol of abbreviation $=$, and Stifelius the far more important symbols of operation $+$, $-$, $\surd$. In the same century, through her far-famed son Vieta, France contributed still more to the progress of the science. Vieta introduced letters as symbols for known as well as for unknown quantities, and by the increased power thus acquired he laid the foundation of the general theory of equations. In this direction he was followed by Girard, Harriot, Descartes, and others; in short, the science now advanced rapidly towards its present state of perfection. It would be fruitless here to attempt to trace its progress. (The reader who wishes to do so may consult with advantage HUTTON'S "Mathematical Tracts," vol. ii., BONNYCASTLE'S translation of BOSSUT'S "Histoire des Mathématiques," or the works of MONTUCLA.) The last great improvement in algebraic notation, that of determinants, is of quite recent date. (See DETERMINANTS, by PROF. H. A. NEWTON.)

Algeci'ras, or **Algezi'ras**, a seaport-town of Spain, in the province of Cadiz, 6 miles W. of Gibraltar, from which it is separated by the Bay of Gibraltar; lat. 36° 8′ N., lon. 5° 26′ 5″ W. Pop. in 1860, 18,216. Leather and charcoal are exported from this port. Here occurred a naval battle between the English and French in July, 1801.

Al'ger (CYRUS), born at West Bridgewater, Mass., in 1782, became in 1809 an iron-founder in South Boston, and became famous as a founder of cannon. He was also distinguished for his benevolence and public spirit. Died Feb. 4, 1856.

Alger (REV. HORATIO, JR.) was born at North Chelsea (now Revere), Mass., Jan. 13, 1834, and graduated at Harvard in 1852. He studied divinity at Cambridge, and in 1864 was ordained over the Unitarian church at Brewster, Mass. He published "Bertha's Christmas Vision" (1855), "Paul Preston's Charge" (1865), besides other volumes of prose and poetry and contributions to periodical literature.

Alger (WILLIAM ROUNSEVILLE), born at Freetown, Mass., Dec. 11, 1823, graduated at Harvard Theological School in 1847. He is a Unitarian clergyman and a diligent and various author. Besides his most important work, "A Critical History of the Doctrine of a Future Life" (1861), his "Genius of Solitude" (1867) and "Friendships of Women" (1870) have been admired. He has also translated a volume of Oriental poetry from the German. He is now (1875) pastor of a church in New York City.

Alge'ria is the name of a country on the North African coast which since 1831 has belonged to France. It is situated between Tunis on the E. and Morocco on the W., while in the S. it extends indefinitely into the Sahara. In the main, the French rule may be said to be established over the territory from lat. 37° to 32° N., and from lon. 2° W. to 8° E. The coast, which is mostly high and steep, has but few and poor harbors, although the rocky promontories form many inlets of the sea. At a distance from the coast the country forms a plateau with an elevation of 2000 to 3000 feet, which gradually declines in the S. towards the Sahara. In regard to formation of the ground, three divisions are distinguished. Along the coast is the zone of the Tell, or Little Atlas, a mountainous region with many coast-streams, fertile valleys, and deep gaps. The principal plain of this zone is the Metidjah, immediately south of Algiers, 50 miles by 20, fertile, well watered, and covered with an abundant vegetation. To the S. of the Little Atlas lies the Shott or Sbakh, the zone of the large, arid plains, which are mostly covered only by a long dry grass called *halfa* (*Stipa macrochloa*, the esparto grass of commerce), but in summer present a most remarkable appearance, from the shining crust of salt which covers the beds of the saline lakes. In the S. the Greater Atlas separates the Shott from the third zone, the Sahara, whose loose sand extends to the wooded heights of the southern slopes of the mountains. The entire area is estimated at 258,000 square miles.

The climate of Algeria is warm and of a very uniform character. The winter, from September to April, is the rainy season of the country, but this rainy season is often interrupted by a period of good weather lasting many weeks. The summer is almost entirely without rain. The plants and animals are those of the temperate and subtropical zone. The coast produces vegetables, such as cauliflowers and artichokes, which are exported in large quantities to Europe. Other products are wheat, barley, tobacco, and tropical fruits of all kinds. The dwarf fan-palm, with its rankling roots, has long been a plague to the agriculturist, but recently it has been extensively used for industrial purposes. Forests of palms, cedars, and cork-oak, as well as different kinds of shrubs, cover the Little Atlas. The grasses and reeds of the Shott afford rich nourishment for the beautiful Arabian horses and large herds of asses, mules, and sheep. The fruit of the date-palm begins to ripen in the oases of the Sahara. The beasts of prey, which formerly were very numerous in Algeria, are almost entirely exterminated, hyænas and jackals occurring now and then. Among the valuable minerals of the country are iron, copper, lead, marble, sulphur, and salt.

The total number of Europeans, without the army, in 1866, was 217,990, of whom the majority live in the cities; of these, 122,119 were French, 58,540 Spaniards, 16,655 Italians, 10,627 English and Maltese, 5436 Germans, and 4643 of other nationalities. The three provinces of Algeria had, according to the census of 1866, the following population: Algiers (39,120 square miles), 200,060; Oran (111,830 square miles), 146,302; and Constantine (107,367 square miles), 139,910; so that there is, inclusive of 2,434,974 natives, and exclusive of 67,774 soldiers, a total population of 2,921,246. The population remains stationary, as immigration has almost ceased in late years. The native Jews were estimated in 1866 at 33,952. The native Mohammedans are chiefly divided into Arabs and Kabyles. In 1857 the number of the former was estimated at 1,385,000, the number of mountain Kabyles at 580,000, and Kabyles of the plains at 379,000; but other statements of the numerical strength of these two races widely differ. Both Kabyles and Arabs live in tribes, the total number of which in Algeria is 1364. As regards the religion of the inhabitants, there were, according to the census of 1866, 211,195 Catholics, 5002 Protestants, 33,952 native Jews, 1785 European Jews, 17,232 members of other Christian sects or persons of unknown religion; the remainder, more than 2,600,000, were Mohammedans. The Roman Catholics have an archbishop at Algiers, and bishops at Oran and Constantine. For the Protestants there are consistories at Algiers, Oran, and

Constantine, under which both the Lutheran and Reformed churches are placed. The highest authority for the Mohammedan worship are the muftis of the two principal mosques at Algiers. There are lyceums at Algiers, Bona, Constantine, Philippeville, and Oran. At the head of the administration is (since 1870) a civil governor-general, who directs the action of both the civil and the military authorities in the settled districts, the territory of the Algerian Sahara and the adjoining districts, inhabited chiefly by nomad tribes, remaining under exclusive military rule. The country under civil government is divided into three provinces, Algiers, Constantine, and Oran, at the head of each of which is a prefect. The imports of Algeria in 1869 amounted to 118,000,000 francs, the exports to 154,000,000. The aggregate number of vessels entered and cleared was, in the same year, 6232, of 1,125,343 tons. The commercial navy consisted of 152 sailing vessels, of 4609 tons.

History.—Numidians in the E. and Moors in the W. ruled in ancient times in Algeria, until by the capture of Carthage (146 B. C.) the foundation for the Roman power in Northern Africa was laid. Extensive ruins of forts, cities, roads, and aqueducts, buried in the deserts at the present, show what a high state of civilization the country reached at that time. Algeria then supplied Rome to a great extent with grain. The conquest of the country by the Vandals, and subsequently by the Arabs, cast it back into barbarism. Although the nomadic tribes accepted Mohammedanism, and although there were some well-cultivated districts and thriving cities, still no well-regulated, lasting state could be formed. Christianity, which had flourished in the early centuries, was entirely suppressed. In 1505 the emir of the Metidjah, being hard pressed by the Spaniards and Portuguese, called to his aid the renowned pirates Horuk and Khaireddin Barbarossa, who by cruelty and treachery made themselves rulers of the country. Being again attacked by the Spaniards, Khaireddin acknowledged the supremacy of Turkey. He received Turkish assistance, and now begins a new period in the history of Algeria, during which it was a constant terror to the navigation and the coasts of the Mediterranean. Several expeditions against Algeria by the Christian powers were either unsuccessful or remained without lasting results. The Turkish authority was gradually restricted, until in 1705 the ruler or dey of Algeria made himself entirely independent. Large French fleets held the Algerians partly in check during the rule of Napoleon I. But after the restoration of peace the Algerian piracies recommenced on a large scale, and at length called forth energetic measures on the part of the Christian countries. The U. S. took the lead. On June 20, 1815, the fleet under Commodore Decatur won a brilliant victory at Cartagena, and forced the dey to sign a treaty of peace, in which the flag of the U. S. was recognized as inviolable. In the next year the city of Algiers was bombarded by the English, and the dey compelled to surrender all the Christian slaves. But soon the piracies were again resumed, and the pirates even ventured into the German Ocean. A conflict which arose in consequence of a disputed claim of France on Algeria at length put an end for ever to this state of affairs. A personal insult offered by the dey to the French consul induced the French government to send out a fleet, which began the blockade of the Algerian ports on June 12, 1827. But as nothing was effected in this way during three years, a large expedition was fitted out, which set sail on May 25, 1830. The city of Algiers was besieged, and surrendered after a bombardment of three days on July 5. The French captured in the city about 1500 cannon and 50,000,000 francs. But the real difficulties had but just begun, for every inch of land was only gained by a fight with the Kabyles. The French committed many blunders and cruelties, so that provinces, like Constantine and Oran, which had already declared their submission, again revolted. The marabouts commenced to preach the holy war against the oppressors, and Abd-el-Kader placed himself at the head of the natives. The French authority decreased more and more, and even the energetic duke of Rovigo, who was appointed governor in Dec., 1831, was not able to improve the situation, but only made matters worse by his unparalleled cruelties. Only when Abd-el-Kader, who, as the head of thirty hostile tribes, had been elected emir of Mascara, signed a treaty of peace in 1834 did the province of Algiers (and that province only) have peace for a short time. Soon the French again began hostilities, and were severely defeated on the river Makta (1835). In Dec., 1835, the French took Mascara, but Abd-el-Kader was in a short time more powerful than ever, so that the French were forced to make peace with him (1837), giving him, under French sovereignty, the administration of the entire west of Algeria, with the exception of the large cities. Oct. 13, 1837, Constantine was taken by the French, and then the French rule was firmly established in the east. In 1839, Abd-el-Kader again opened the war, and devastated the French colonies on the lowlands. Mascara and Saida were taken by the French, and Abd-el-Kader was compelled to fly to Morocco, where the French followed him, forcing the sultan of Morocco, after several decisive victories, to sue for peace. But Abd-el-Kader again succeeded in raising fresh forces, and continued to devastate the French border districts, until a conflict with Morocco (Dec., 1847) compelled him to surrender to the duc d'Aumale (Dec. 21), as he found the passes of Karbene, through which he had hoped to escape, occupied. A large number of expeditions under Pelissier, Jussuf (a chief of Turkish troops, who had joined the French in 1832), and others secured for the French the oases of Laghuat, Tuggurt, Wadi-Suf, and Wargela. In 1856–57, Random undertook a large and successful expedition against the Kabyles. From Oct., 1865, to the beginning of 1867, Algeria was the scene of new insurrections under the leadership of Si Lala and Si-Hamed-ben-Hamza, the latter of whom was a commander of the Legion of Honor. The great events of 1870 in Europe produced a sensation in Algeria. When the news of the surrender of Napoleon and the continued defeats of the French army under MacMahon, whom the Arabs had considered invincible, became known among the southern tribes, their hopes of throwing off the French rule were again revived. The first disturbances arose in the S. E. part of the province of Constantine; as the rebels were in want of war-material, the troubles spread slowly, but in October the situation became more dangerous, as large hordes of Arabs from the extreme S. of Oran began to move towards the E. In Mar., 1871, the Arab chief Sidi-Mokrani was said to be within twenty-five leagues of the city of Algeria with 40,000 men, having declared war against France. Sidi-Mokrani was killed in May, but nevertheless several districts remained in insurrection. In October several tribes recommenced hostilities in Constantine, but in November order was again restored throughout Algeria.

The history of the French administration in Algeria indicates anything but success. The colony has cost, and still costs, large amounts of money, without giving to France anything in return except the belief that it is a good training-school for French generals. In 1858 an attempt was made to give the colony a separate ministry under Prince Napoleon, who was followed by Count Chasseloup-Laubat in 1859. But as early as Dec. 11, 1860, the old system was again taken up, and yielded as small results as before. In 1863, Napoleon addressed a letter to the governor-general, Pelissier, which indicated an intention to try a radical change of administration. Algeria was to be treated as an Arabic kingdom, rather than a French colony, and the tribes should be made the owners of the lands they occupied. In May, 1865, Napoleon himself visited Algeria, and in a proclamation addressed to the whole population the sentiments of his letter to Pelissier were repeated. The hopes of the emperor were, however, not fulfilled, the new system remaining as unsuccessful as its predecessors. In 1870 the European inhabitants demanded the abolition of the military rule, under which they had thus far been placed, in common with the natives, and which was regarded as the chief impediment to the prosperity of the colony. The republican government in Paris immediately granted their demand. The military rule was abolished for all the districts occupied by the settlements of the Europeans and their descendants. A civil governor, assisted by a colonial council, is the highest authority, and the colony is represented by six deputies in the National Assembly of France. The transition from military to civil rule was attended by some revolutionary troubles, which, however, did not last long. (See MacCarthy, "Géographie Physique, économique et politique de l'Algérie," 1858; Nettement, "Histoire de la conquête d'Algerie," 2d ed. 1871.)

A. J. Schem.

Alghe'ro, or Alghe'ri, a fortified town and seaport of the island of Sardinia, is on the W. coast, 15 miles S. W. of Sassari. It has a cathedral and several convents. Wine, grain, tobacco, coral, etc. are exported from it. Pop. in 1861, 8092.

Algiers' [Arab. *Al-Jezair'*; Fr. *Alger*], a seaport and city of North Africa, on the Mediterranean; lat. 36° 47′ 3″ N., lon. 3° 4′ 5″ E. It was formerly the capital of the dey of Algiers, but since 1830 has been the capital of the French colony of Algeria. Built on the slope of a steep hill which rises to the height of 500 feet, it presents from the sea an imposing appearance, which is partly owing to the whiteness of the houses. The old streets are mostly narrow and crooked, but several straight and elegant streets have been made since the French became masters of the city. The houses are built of stone and brick, have flat roofs, and are annually whitewashed.

Among the public buildings are numerous mosques, several Roman Catholic churches, a fine cathedral and exchange, and a public library. The beauty and prosperity of the city have been much improved by the French, and its commerce has been greatly increased. Among the articles of export are wheat, coral, animal skins, and olive oil. Steam vessels ply frequently between Algiers and Toulon and Marseilles. This city was for three centuries the rendezvous of the Algerine pirates, who, though few in number, defied the power of the greatest nations of Europe. It was bombarded by the English admiral Lord Exmouth in July, 1816, when a large part of the city was reduced to ruins, and was taken by the French in July, 1830. Pop. without the military, was estimated in 1866 at 52,614.

Algiers, a suburb of New Orleans, is a post-village on the Mississippi River, opposite New Orleans. It has important drydocks and yards for ship and boat building. It is the northern terminus of the Louisiana and Texas R. R. Steam ferryboats ply between Algiers and the city proper.

Algo'a Bay is on the S. coast of Africa, in Cape Colony, about 425 miles E. of Cape Town. Here is a good harbor, and a flourishing seaport called Port Elizabeth, situated at the mouth of the Baasher River.

Al'gol, a star in the constellation of Perseus, is remarkable for its periodical variation in brightness.

Algo'ma, a district which forms the north-western portion of the province of Ontario in Canada. It borders on Lakes Huron and Superior. It has recently become famous for its rich silver-mines, and also contains copper, tin, and iron, and abundance of timber. Pop. in 1871, 4807.

Algoma, a township of Kent co., Mich. Pop. 1959.

Algoma, a township of Winnebago co., Wis. P. 807.

Algo'na, a post-village, the capital of Kossuth co., Ia., on the East Fork of the Des Moines River, and on the Iowa division of the Milwaukee and St Paul R. R., 51 miles W. of Mason City, and about 120 miles N. by W. of Des Moines. It has two weekly newspapers. Pop. 860; of Algona township, 2157. J. H. Warren, Ed. "Upper Des Moines."

Algonac, a post-village of St. Clair co., Mich. P. 754.

Algon'kins, one of the two great families of Indians that formerly occupied the Valley of the Mississippi and the regions east of it. The Indians of New England were Algonkins. The Chippewas are at present the most numerous tribe of the Algonkins. Their migration eastward (some 1200 years ago) is supposed to have been later than that of the Iroquois. (See Parkman's "The Jesuits in North America," and Baldwin's "Ancient America," 1872.)

Algon'quin, a post-township of McHenry co., Ill. It contains the villages of Algonquin, Cary, and Crystal Lake. The first is noted as a milk-shipping station, about 65,000 gallons being monthly sent to Chicago; also celebrated for its fine water-power and three flouring-mills, and its mineral spring. Crystal Lake is a fine summer resort; the lake of the same name is a beautiful sheet of water, from which ice is harvested for the Chicago market. Pop. 2157.
G. E. Earlie.

Algonquin, a township of Ontonagon co., Mich. P. 54.

Al'gorithm [Fr. *algorithme;* It. *algoris'mo,* formed from the Arabic *al,* "the," and the Gr. ἀριθμος, "number," with the insertion of the letter *g* between the article and initial vowel of *arithmos*], the art of computing in reference to some particular subject or in some particular way, as the *algorithm* of numbers, of surds, etc.

Algreen-Ussing (Tage), a contemporary Danish jurist and statesman, born at Frederiksborg, in Seeland, in 1797. He became in 1848 procurator-general for the kingdom of Denmark, and professor of law at Copenhagen. He has published several legal works. Died in 1870.

Alguazil', or **Alguacil',** the name given in Spain to an inferior officer appointed to execute the law, corresponding to a constable, bailiff, or policeman.

Al-Hak'em-Ibn-At'tâ (called **Al-Moken'na, -Mokanna,** or **-Mukanna,** *i. e.* "the veiled one"), an impostor who in 774 A. D. announced himself as a prophet and lawgiver in Khorassân. Having been attacked by the troops of the caliph Mahdi in 780, he set fire to his castle and consumed himself to ashes. His story is the subject of Moore's "Veiled Prophet of Khorassân."

Alha'ma (*i. e.* "the bath"), a town of Spain, in the province of Granada, in a beautiful valley 23 miles S. W. of Granada. Here are celebrated warm springs. Pop. 6931.

Alham'bra (the "red citadel"), a famous palace and citadel of the Moorish kings of Granada, was built 1248–1314 in a suburb of the city of Granada. It is surrounded by beautiful gardens and groves of aromatic trees. The interior of the palace is exceedingly gorgeous, and richly ornamented with arabesques, filigree, and fretwork. Among the portions now standing are the Court of the Lions and the Court of the Fish-pond. The former, which is built of white marble and alabaster, is named from a fountain in its centre supported by twelve lions, and surrounded by a gallery resting on columns and arches which are admirably light and elegant. This place capitulated to the Spaniards in 1491, and was entered in triumph by Ferdinand and Isabella in 1492. (See Irving, "The Alhambra," 1832.)

Alhaurin' el Gran'de, a town of Spain, in the province of Malaga, 15 miles S. W. of Malaga. Marble and granite quarries are worked in the vicinity. Pop. 5514.

A'li, pasha of Yanina, born in 1741, was the son of an Albanese chief. Upon the death of his father, who had been robbed of all his possessions by his neighbors, his mother placed him, when only sixteen years old, at the head of their partisans. At first he was unsuccessful, owing to a want of funds, but at last defeated his enemies and returned in triumph to Tepelen, his native town. The day after his return he murdered his brother, and then imprisoned his mother in the harem, where she soon died, he having accused her of this crime. He now rendered some important service to Turkey, so that he was first appointed in the place of Dervendshi Pasha, who had to look out for the safety of the highways, and then pasha of Tricala in Thessaly. He seized the city of Yanina by means of a forged firman, and then forced the inhabitants to demand him as ruler from the sultan. He was for a time in correspondence with Napoleon, but afterwards occupied the places on the Albanian coast belonging to Napoleon. In 1803 he was made governor-general of Rumelia. In 1820, in consequence of his treasonable intercourse with France and Russia, an army was despatched against him, but owing to the Greek revolution, which he used for his own ends, he succeeded in keeping Yanina until 1822, when he surrendered, having been promised amnesty. He was nevertheless executed, and his head was sent to Constantinople.

A'li, or **A'li-Ibn-A'bi-Tâ'lib',** surnamed the Lion of God, an Arabian caliph, a cousin-german of the prophet Mohammed, was born at Mecca in 602 A. D. He married Fâtimah, a daughter of Mohammed, whose doctrines he adopted and enforced with great ardor and courage. In 632 his rival, Abu-Bekr, was chosen caliph, after a contest which caused a schism and the formation of the sects of Sunnites and Shiites, the latter of which were partisans of Ali. He succeeded Othmân as caliph in 655, and was assassinated about 661 A. D. His son Hassan became caliph. Ali was distinguished as an author of maxims and proverbs. His religious party, the Shiites, are especially numerous in Persia and Turkestan. His descendants have ruled in Egypt, Spain, Western Africa, and Syria. The sentences ascribed to him were published by Fleischer (1837); a new edition of his "divan" (lyrical poems) was published at Boulâk, near Cairo, in 1840.

Alia, a town of Italy, on the island of Sicily, in the province of Palermo, is situated on a high mountain, 28 miles S. E. of Palermo. Pop. in 1861, 5425.

Ali-Bey, a celebrated chief of the Mamelukes, born in Abkhasia in 1728. He was taken to Egypt at an early age, and raised himself from a servile condition by his ability, became bey of the Mamelukes, and in 1757 bey of Egypt, and succeeded in becoming independent of Turkey. He attempted to restore the ancient Egyptian empire, and had almost conquered Syria when his chief general, his adopted son, was bribed by the Turks, and drove him from Egypt. He succeeded in getting up another army, but after a few victories was again defeated and captured, and died a few days after, in 1773.

Alibert (Jean Louis), a distinguished French medical writer, born in Aveyron May 26, 1766. He was first physician-in-ordinary to Louis XVIII. after 1815. He wrote, besides other able works, a "Description of the Diseases of the Skin" (1806–25), which is commended for its style and other merits. Died Nov. 6, 1837.

Al'ibi [Lat., meaning "elsewhere"], in law, is the absence of a person accused of crime from the place where the offence is charged to have been committed. If established, it is a defence to the accusation.

Alican'te, a province in the south-eastern part of Spain, is bounded on the N. by Valencia, on the E. by the Adriatic, and on the S. and W. by Murcia. Area, 2118 square miles. The country consists partly of fertile plains and partly sterile mountains. Pop. in 1867, 426,656. Chief town, Alicante.

Alicante (anc. *Lucen'tum*), a fortified city and seaport of Spain, the capital of the above province, is on the Mediterranean Sea; lat. 38° 20′ N., lon. 0° 26′ W. It is well built, with high and substantial stone houses, and contains

several hospitals, one college, and a theatre. Wine, grain, soda, oil, oranges, etc. are exported from this place, which is the chief seaport of Valencia. Pop. in 1860, 31,162.

Alica'ta, or **Lica'ta,** a seaport-town of Sicily, in the province of Sicily, on the S. coast, 25 miles S. E. of Girgenti. It exports grain, wine, sulphur, etc. Near it are the ruins of the ancient *Gela*. Pop. in 1874, 17,036.

A'lien [from the Lat. *alienus*, "belonging to another" (*alius*)]. An alien by English law is a person born out of the allegiance of the king. In this country he is one born out of the jurisdiction of the U. S., who has not been naturalized or made a citizen under their laws. By the common law the children of public ministers born abroad are citizens, for their fathers owe allegiance to no foreign power. By the laws of Congress, children of American fathers born abroad, where such fathers have resided in the U. S., are American citizens. (See CITIZEN.) It has been claimed that, independent of this statute, such children are American citizens. (The arguments against this view are stated with great cogency and learning by the venerable Horace Binney in an article upon "The Alienigenæ of the U. S.") Aliens are subject to certain disabilities affecting their exercise of political rights. After naturalization they are ineligible to the office of President and Vice-President of the U. S. The principal disability affecting aliens concerns the acquisition of the title to real estate. There are two general modes of acquisition —by purchase and by descent. An alien may acquire title by purchase (including conveyance and devise) in the absence of statutes to the contrary, and can hold it subject to a proceeding by the state termed "office found." This is in substance an inquiry through an authorized officer into the fact of alienage; and if that be found, the land is adjudged to belong to the state. An alien can convey no better title to a citizen than he himself possesses. This defect in the title can be cured by a private act of the State legislature. In the case of descent no title at all passes to the alien, and no inquest of office is necessary. A citizen brother can inherit from a brother, though their father be an alien, owing to the common-law rule that inheritances never ascend, and it is accordingly not necessary to trace title through the alien father. This disability is wholly removed in a number of the U. S., and modified in others. Where the disability is not removed, legislation is almost universal in favor of resident aliens, allowing them, if they intend to become citizens, to acquire land for a limited period, and to dispose of it and to transmit it to heirs. Aliens are capable of acquiring, holding, and transmitting personal property in the same manner as citizens, and may freely resort to courts of justice to maintain and protect their rights. Under the laws of Congress they are not, however, entitled to take out a copyright. Aliens have been distinguished in time of war into friends and enemies. An alien enemy cannot make a contract with a citizen. It is illegal in its inception, and cannot be enforced even after peace. Nor can such an alien prosecute actions of any kind while the war lasts, though, if there be no illegality in the claim, the right to sue revives in time of peace. An alien becomes a citizen through naturalization. The difficulties growing out of this subject have led to the negotiation of various treaties between the U. S. and foreign powers. (See NATURALIZATION.)

T. W. DWIGHT.

Align'ment [from the Fr. *aligner*, to "arrange in a line"], a military term, signifies the arrangement of men in line. The alignment of a camp is the rectilinear disposition of the tents. The word sometimes denotes the laying out or regulation of a street by a straight line.

Aliment. See FOOD, by EDWARD SMITH, M. D., LL.B., F. R. S.

Alimentary Canal, the cavity in the body of an animal in which food enters to be digested before it is conveyed by the nutritive vessels into the system. In some animals it is a simple cavity, with only one opening; in others it is a proper canal, with an outlet or anus distinct from the inlet or mouth, and is a continuous passage of variable dimensions from the mouth to the anus. The principal portions of the alimentary canal of Mammalia are the œsophagus, a duct or tube leading from the mouth to the stomach; the more expanded cavity of the stomach; the small intestines, which are long and convoluted; and the large intestines. The canal is lined throughout its whole length with mucous membrane. Its entire length in man is about thirty feet.

Al'imony [Lat. *alimonia*], in law, an allowance granted by a court to a wife from the husband's estate, either during a litigation between them or at its termination. Originally, it was only granted in suits for separation, but now by statute it is usual to make the allowance in proceedings for divorce dissolving the bonds of matrimony. In England the ecclesiastical court had jurisdiction of this subject until 1857, when it was vested in a court of divorce. In this country the jurisdiction is conferred in general on courts of equity. Alimony is of two sorts—*pendente lite*, and permanent. (1.) The object of the first is to enable the wife to carry on a litigation with her husband, or to sustain herself during its pendency. It is immaterial whether the proceedings be instituted by or against her. Should the wife have sufficient means of her own, no allowance of this kind will be made. The amount rests in the sound discretion of the court, and is subject to increase or diminution. (2.) *Permanent Alimony.*—This is a periodical allowance given from the husband's estate as the result of the litigation in the wife's favor. No allowance is made when the proceedings terminate unfavorably to her. The amount varies with the husband's wealth and position, and is commonly from one-third to one-half of his income. It is subject from time to time to variation by the action of the court, depending upon the circumstances of the case. The court has ample power to make its decree effectual, and may have recourse to the writ of *ne exeat* to prevent the husband's withdrawal from the State without proper security for its payment. Should the husband depart to another State, the parties might become "citizens of different States," within the view of the U. S. Constitution; so that she could enforce her claim to alimony in the Federal courts. The ordinary rule that the domicil of the wife follows that of the husband would not be applicable to this case, even though the case were one of judicial separation rather than of total divorce.

T. W. DWIGHT.

Alisal, a township of Monterey co., Cal. Pop. 2723.

Alisma'ceæ [from the Gr. ἄλισμα, a "water-plant"], a natural order of endogenous plants, natives of temperate climates. They are herbaceous, and usually grow in swamps or shallow waters. Among the genera of this order are *Alis'ma* and *Sagitta'ria* (arrowhead).

Aliso is the name of a fortification erected by Drusus in the year 11 at the entrance of the Elise into the Lupia (Lippe). It was the scene of several severe contests between the Romans and the Germans.

Al'ison (ARCHIBALD), a Scottish writer, born in Edinburgh Nov. 13, 1757, was educated at Oxford. He took orders in the Church of England in 1778, and became curate of Kenley, in Shropshire, in 1790. In 1800 he removed to Edinburgh, where he preached for many years. His chief works are "Essays on the Nature and Principles of Taste" (1784), and two volumes of sermons (1814). Died May 17, 1839.

Alison (Sir ARCHIBALD), BART., D. C. L., a son of the preceding, was born at Kenley, in Shropshire, Dec. 29, 1792. He graduated in the University of Edinburgh, studied law, and was called to the bar in 1814. In 1832 he published his "Principles of Criminal Law," a work of standard authority. His chief work is a "History of Europe during the French Revolution" (10 vols. 8vo, 1833–42), which comes down to 1815, and has had a great popularity. "Its merits," says the "Edinburgh Review" for Oct., 1842, "are minuteness and honesty—qualities which may well excuse a faulty style, gross political prejudices, and a fondness for exaggerated and frothy declamation." He wrote a continuation of this History to the year 1852, a "Life of John, duke of Marlborough" (1847), and other works. In politics he was ultra Conservative. Died May 23, 1867.

Alison (WILLIAM PULTENEY), M. D., a physiologist, a brother of the preceding, was born in Edinburgh in 1790. He became professor of the institutes of medicine at Edinburgh in 1828, and professor of the practice of medicine in 1832. He published "Outlines of Physiology and Pathology" (1833), and other works. Died in 1859.

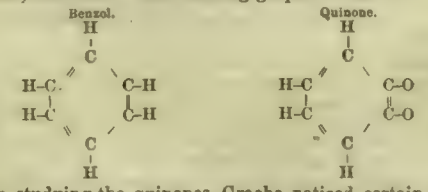
Aliz'arine [from *al-izari*, the commercial name of madder in the Levant] is the coloring-matter of madder (*Rubia tinctorum*). Alizarine was discovered in 1824 by Robiquet and Colin, by treating madder with strong sulphuric acid, producing a black mass, which they called *charbon de garance*. On heating this, it yielded a sublimate of alizarine crystals.

Preparation.—Several processes have been employed for the extraction of alizarine, more or less pure, from madder. Kopp's plan, which has been applied on a larger scale by Schaaf and Lauth of Strasburg, consisted in treating the madder with an aqueous solution of sulphurous acid, by which both alizarine and purpurine, another coloring-matter, were dissolved. On adding 3 per cent. of sulphuric acid to the solution, and heating to 95° or 104° Fahrenheit, the purpurine was precipitated. In the filtrate from the purpurine the alizarine was precipitated in an impure state. This was extensively sold under the name of "green alizarine." From the washings a brown alizarine of inferior

quality separated. The green alizarine was sometimes purified by dissolving it in rectified petroleum, withdrawing the alizarine by agitating with soda lye, and precipitating it by sulphuric acid. It was thus obtained comparatively pure in yellow flakes, which dried to a yellow powder. Another process for extracting alizarine was based upon the observation of Leitenberger that purpurine is soluble in water from 77° to 131° Fahrenheit, while alizarine requires a much higher temperature. Alizarine is largely sold to the calico-printers in the form of a yellowish-brown paste, under the name of "madder extract;" also in the form of a dry powder. It may be crystallized from solution in red prisms or by sublimation in yellow needles.

Properties.—It is but slightly soluble in water, except under pressure at temperature much above the boiling-point. One hundred parts of water dissolve

at 212°	Fahrenheit,	0.034 alizarine.
302°	"	0.035 "
392°	"	0.820 "
437°	"	1.700 "
482°	"	3.160 "



It is soluble in alcohol and in ether, forming yellow solutions. It is also soluble in wood-naphtha, benzol, bisulphide of carbon, turpentine, glycerine, and petroleum. In sulphuric acid it dissolves with a deep-red color, and is precipitated unchanged on adding water. It is soluble in caustic alkalies and alkaline carbonates, forming a violet solution, from which it is precipitated by acids. Alkaline solutions of alizarine form, with soluble lime and baryta salts, precipitates of a beautiful purple color; with alumina salts, a red; with iron salts, a purple precipitate. If a piece of cotton cloth which has been printed with the common alumina and iron mordants is placed in water holding a little alizarine in suspension, it will be found on heating the whole that the cotton will become permanently dyed in shades of red and purple. Alizarine is a feeble acid, forming, as above shown, soluble salts with the alkaline metals, insoluble colored salts with most other metals. Turkey-red, madder-pink, and the various shades of purple and chocolate on calico, are compounds of alizarine with metallic bases.

Origin of Alizarine.—Little if any alizarine exists in the living madder root, and after the root is gathered it is found that the alizarine increases in quantity by keeping for several years. It is now believed that the alizarine is produced from a substance called rubian or rubianic or ruberythrinic acid, a glucoside, by a peculiar fermentation induced by a peculiar madder ferment called erythrozone:

Rubian.		Alizarine.		Glucose.
$C_{26}H_{32}O_{16}(?)$	=	$C_{14}H_8O_4$	+	$2C_6H_{12}O_6$.

Rubian undergoes the same change under the influence of dilute acids.

Artificial Alizarine.—One of the greatest triumphs of modern chemistry was the artificial production of alizarine by Graebe and Liebermann in 1869. By a careful study of an extensive class of bodies, Graebe established the existence of a peculiar series of compounds called quinones, which contain the *phenyl nucleus*, and in which two atoms of oxygen are united together by a common bond, forming a dyad radical $(O_2)''$, which aids in binding together two adjacent carbon atoms. The molecular structure of the lowest quinone, that derived from quinic acid or from benzol, is shown in the following graphic formulæ:

In studying the quinones, Graebe noticed certain general characteristics, which he attributed to their peculiar molecular structure. Thus, two of the hydrogen atoms associated with the oxygen radical $(O_2)''$ may be replaced by HO, H_2N, or HSO_3, the product being an acid, an amide, or a sulpho-acid. The following table illustrates the most important relations in this connection of the quinones:

Primary Hydrocarbons.	Quinones.	Acids.
Benzol.	Quinone.	Quinonic Acid.
C_6H_6.	$C_6H_4=(O_2)''$.	$(HO)_2=C_6H_2=(O_2)''$.
Naphthalene.	Naphtho-quinone.	Naphtho-quinonic Acid.
$C_{10}H_8$.	$C_{10}H_6=(O_2)''$.	$(HO)_2=C_{10}H_4=(O_2)''$.

Five years before, Martius and Griess, while investigating some derivatives of naphthalene, discovered a body very similar but not identical with alizarine; and Graebe had obtained a body from a naphtho-quinone derivative which resembled alizarine in some respects. Graebe came therefore to the conclusion that alizarine belonged to the quinone series, and, associated with Liebermann, he began his investigation upon it. The starting-point was to ascertain the primary hydrocarbon from which the alizarine could be constructed. They therefore subjected alizarine from madder to the process devised by Bayer for the conversion of phenol into its hydrocarbon, benzol. They passed alizarine vapor over heated zinc-dust, and obtained the hydrocarbon anthracene, $C_{14}H_{10}$. It only remained to change the anthracene into its quinone, and then into its quinonic acid, to form the alizarine:

Anthracene,	$C_{14}H_{10}$.
Anthraquinone,	$C_{14}H_8=(O_2)''$.
Anthraquinonic acid or alizarine,	$(HO)_2=C_{14}H_6=(O_2)''$.

A body, anthracenuse, had been prepared years before by Laurent and Anderson, which Graebe and Liebermann now recognized as the quinone of anthracene, $C_{14}H_8=(O_2)''$. They heated this with bromine, by which they replaced H_2 by B_2H_2, obtaining bibrom-anthraquinone, $C_{14}H_6Br_2=(O_2)''$. To replace the Br_2 by hydroxyl $(HO)_2$, they heated it with caustic potassa, KOH, and thus obtained the potassium salt of the new acid, from which the acid was precipitated by hydrochloric acid as a yellow powder indentical with the alizarine derived from madder. The practical importance of this discovery attracted to it the attention of numerous chemists, and simpler processes, avoiding the use of the expensive bromine, were soon devised. An abundant supply of anthracene is obtained from the refuse coal-tar of gas-works, and in a few months anthracene, which had never been seen except as a chemical curiosity, became a regular article of commerce. (See ANTHRACENE.)

The annual consumption of madder in dyeing and calico-printing is estimated to exceed $10,000,000. Large tracts in Holland, Alsace, Italy, and the Levant are devoted to its culture. It not only supplies dyestuffs, but in Alsace it yields a large proportion of the alcohol of commerce; the root containing sugar, which is extracted and subjected to fermentation.

This brilliant discovery of Graebe and Liebermann seems destined to effect a very serious change in the agricultural system of people as remote from each other as the shores of the North Sea and Asia Minor. In addition to alizarine, an anthra-purpurine has been obtained from anthracene, which is apparently identical with madder purpurine, and another color called pseudo-purpurine:

Alizarine,	$(HO)_2$	$C_{14}H_6=(O_2)$.
Anthra-purpurine,	$(HO)_3$	$C_{14}H_5=(O_2)$.
Pseudo-purpurine,	$(HO)_4$	$C_{14}H_4=(O_2)$.

Thus, we now have four classes of beautiful colors derived from coal: 1, Phenol colors; 2, Aniline colors; 3, Naphthaline colors; 4, Anthracene colors. Theoretically, 1 pound of alizarine would require 0.60 pound anthracene, which would be obtained from 30 pounds of coal-tar, requiring 660 pounds of coal. In practice, the yield is less than half this amount. There are now about twenty factories, chiefly in Germany and Switzerland, engaged in the manufacture of alizarine. (For further details with regard to alizarine, consult "Die Farbestoffe," von P. SCHÜTZENBERGEN, uebersetzt von Dr. H. SCHRÖDER, Berlin, 1873.)

C. F. CHANDLER.

Al'kali [from the Arabic definite article *al*, and *kali*, the plant from which soda was first obtained], a chemical term applied to an important class of bases which combine with acids to form salts, turn vegetable yellows to red, and vegetable blues to green, and unite with oil or fat to form soap. The proper alkalies are potash, soda, lithia, cæsia, rubidia, and ammonia, which are extremely caustic. Potash is called vegetable alkali, soda is called mineral alkali, and ammonia, volatile alkali. Lime, magnesia, baryta, and strontia, having some properties of alkalies, are called *alkaline earths*. The alkalies and alkaline earths are metallic oxides, except AMMONIA (which see). When an alkali and an acid combine in due proportion they are said to neutralize each other; they really produce metallic salts:

$$KOH + HCl = KCl + H_2O.$$
$$NaOH + HNO_3 = NaNO_3 + H_2O.$$

(See ACIDS, by PROF. C. F. CHANDLER, PH. D., LL.D.)

Alkalim'eter [from *alkali*, and the Gr. *μέτρον*, a "measure"], an instrument used to ascertain the proportion of pure carbonate of potash or of soda in a commercial sample of those articles, and to test the strength and purity of soda-ash, potash, etc. It consists of a graduated glass tube divided into 100 degrees (numbering from the top), and filled with diluted sulphuric acid, which is poured into a given quantity of the solution of the alkali until it is neutralized. If this process empties the tube to the eightieth degree, it shows that the article contains 80 per cent. of pure alkali. This process is called alkalimetry. The same instrument is also used to test the strength of acids, by filling the tube with a solution of alkali and reversing the process. (See VOLUMETRIC ANALYSIS.)

Alkalimetry. See preceding article.

Al'kaloids [from *alkali*, and the Gr. *εἶδος*, "form"], an important class of substances of organic origin, having the qualities of alkalies more or less strongly marked, and being capable of forming salts with acids, like the inorganic bases. They are often substitution products of ammonia. They are divided into two classes—*natural* and *artificial*. The natural alkaloids are found in plants and animals. They are composed essentially of carbon, hydrogen, and nitrogen; besides which a great number contain oxygen. The alkaloids have generally an energetic action on the animal system, and hence are employed as medicine; in comparatively large doses they are often powerful poisons. They have generally a bitter taste, and form in many instances the active principles of the plants in which they are found. Such are morphine, found in opium; quinine and cinchonine, in cinchona bark; strychnine, in nux vomica; hyoscyamine, in henbane; atropine, in belladonna; caffeine or theine, in coffee and tea, etc.

The animal alkaloids are few, the more important being urea, found in the urine of the Mammalia; and kreatine and kreatinine, two of the constituents of the juice of flesh. The artificial alkaloids are those organic bases which are formed in the researches of chemists. Recently several of the natural alkaloids have been manufactured on a small scale without the intervention of the living plant or animal. Urea can be formed from the simplest form of dead organic nitrogenous matter. Conline, the alkaloid of hemlock, has been prepared artificially. (See Amines, Urea, etc.)

Alka'na, or **Alkan'na** [Sp. *alcaña*], a name of the coloring-matter obtained from the plant *Lawsonia inermis*, of the order Lythraceæ, which is used by the Oriental ladies to color their nails and teeth.

Al'kanet (*Anchu'sa*), a genus of herbaceous plants found in Europe, belong to the natural order Boraginaceæ. They have five stamens. Some of the species are cultivated for the beauty of the flowers. The root of the *Anchusa tinctoʻria* affords a resinous red coloring-matter, and is used to color pomades, lip-salves, hair-oils, etc.

Al-Katif', or **El-Chatif,** a town of Arabia, on the bay of the same name, which is part of the Gulf of Persia. It has a fort, a bazaar, and a citadel which is said to have been built by the Portuguese. Pop. about 6000.

Alkmaar', or **Alckmaer',** an old and important fortified town of Holland, in the province of North Holland, 20 miles N. N. W. of Amsterdam, and 5 miles from the ocean. It is well built, and is traversed by several canals, by which it carries on an active trade in butter and cheese. It is said to be the greatest mart for cheese in the world. Here are manufactures of soap, leather, sail-cloth, etc. This town was defended with success against the Spaniards in a long siege which began in 1573. Pop. in 1867, 11,609.

Alkmaar, van (Henry), a Low-German poet who lived about 1475–1500. He was the author or translator of a very popular poem and satire entitled "Reinecke Fuchs" ("Reynard the Fox"), which he published in Low German at Lübeck in 1498. He professed that he translated this from the Walloon and the French, but no such original is extant.

Alkoran. See Koran, by Prof. Tayler Lewis, LL.D.

Al'la Bre've, äl'lä brā'vā, in music, the name of a movement whose bars or measures consist of the note called a breve, equal therefore to two semibreves or four minims. It is sometimes marked thus, ¢.

Alla Capella, the same as Alla Breve (which see).

Al'lah, the Arabic name of the Supreme Being, the only true God, as distinguished from the deities worshipped by idolaters.

Allard (Jean François), born in 1785, went to Egypt in 1815, and thence to Persia, where Abbas Mirza gave him the title of colonel, but with no command. For that reason he went to Lahore, where he gained the confidence of the maharajah of the Sikhs, who made him commander-in-chief of his army, which he organized according to European custom. He died in 1839.

Al'lahâbâd' (*i. e.* "the city of God"), an ancient and holy city of Hindostan, the capital of the North-western Provinces, is at the confluence of the Ganges and the Jumna, 498 miles by rail N. by W. of Calcutta: lat. 25° 25′ 26″ N., lon. 81° 51′ E. Many thousand pilgrims annually resort to this place to bathe in the sacred rivers which here unite. The houses of the natives are mostly mean. This city is important as a military point, and is advantageously situated as an emporium of trade on the East Indian Railway, and also on the Grand Trunk road. A large part of the city was reduced to ruins by the hostile operations between the mutinous Sepoys and the British in 1857. Pop. in 1861, 64,785.

Allamakee', a county which forms the N. E. corner of Iowa, has an area of 667 square miles. The soil is fertile, and the surface undulating and well timbered. Grain, wool, hay, and dairy products are the staples. Carriages and wagons are manufactured. Capital, Waukon. Pop. 17,868.

Al'lan (David), a Scottish painter of domestic and humorous subjects, was born at Alloa Feb. 13, 1744, and was called the "Scottish Hogarth." He studied and worked for many years in Rome, whither he went in 1764. Among his works are "The Origin of Painting," which represents a Corinthian maiden drawing her lover's profile on the wall; and illustrations of Allan Ramsay's "Gentle Shepherd." Died Aug. 6, 1796.

Allan (Sir Hugh), born in Ayrshire, Scotland, in 1810, emigrated at an early age to Canada, where he became, in conjunction with his brother Andrew, proprietor of a line of steamships. In 1870 they had eighteen steamships plying between Montreal and Great Britain. He was one of the canal commissioners "inspecting the internal navigation" of Canada (1870–71), and in 1873 became prominent in operations in support of the Canadian Pacific Railway.

Allan (Sir William), an eminent Scottish historical painter, born in Edinburgh in 1782. He worked some years in St. Petersburg, visited Circassia and Turkey, and returned to Edinburgh in 1814. He received 1000 guineas for his picture of "Circassian Captives." In 1835 he was elected academician of the Royal Academy of London, and in 1840 succeeded Wilkie as limner to Her Majesty for Scotland. Among his works are "The Death of Regent Murray," "Peter the Great Teaching Shipbuilding to his Subjects," "Knox Admonishing Queen Mary," and two pictures of the battle of Waterloo. Died Feb. 22, 1850.

Allan'toin ($C_4N_4H_6O_3$), a colorless crystalline substance found in the allantoic fluid of the fœtal calf and in the urine of the sucking calf. It is produced artificially by boiling uric acid with lead dioxide and water.

Allan'tois [from the Gr. ἀλλᾶς, ἀλλᾶντος, a "sausage," and *εἶδος*, a "form"], a thin membranous sac developed during incubation in the eggs of birds and reptiles, and in the embryo of viviparous animals during gestation. (For its development and uses, see Embryology, by Prof. J. C. Dalton, M. D.)

Allatoo'na, a post-village of Bartow co., Ga., on the Western and Atlantic R. R., 40 miles N. W. of Atlanta. Gen. J. E. Johnston, when pursued by Gen. Sherman, made a stand in the strong position of Allatoona Pass, in May, 1864, until his flank was turned. The Union general Corse defended this place with success against the assault of a superior force in Oct., 1864, while Gen. Sherman, from the top of Kenesaw Mountain, signalled that he should hold out to the last.

Al'legan, a county of the W. S. W. of Michigan, bordering on Lake Michigan, contains 840 square miles. It is traversed by the navigable Kalamazoo River. The surface is undulating or nearly level; the soil is fertile, and produces good timber, fruit, grain, wool, hay, and cattle. Lumber, brick, carriages, etc. are manufactured. Capital, Allegan. Pop. 32,105.

Allegan, a post-village, capital of the above county, on the Kalamazoo River, and on the Kalamazoo division of the Lake Shore and Michigan Southern R. R. and Mansfield Coldwater and Lake Michigan R. R. It has a national and private bank, two newspapers, two foundries, five hotels, the Holly water-works, car-works, and twenty-four other manufactories propelled by water and steam, an academy, two Masonic and two Odd Fellows' lodges, nine churches, and the library of the Allegan literary and library association. Pop. 2374; of Allegan township, 3642.

D. C. Henderson, Ed. "Allegan Journal."

Allega'ny, a county of the W. S. W. of New York, bordering on Pennsylvania. Area, 1033 square miles. It is intersected by the Genesee River. The soil is generally fertile and adapted to grazing. Bog-iron ore and limestone are found. This county is traversed by the New York and Erie R. R. Cattle, grain, wool, and hay are produced, and metallic wares, leather, lumber, flour, carriages, etc. are manufactured. Capitals, Belmont and Angelica. P. 40,814.

Allegany, a post-village and township of Cattaraugus co., N. Y. It contains a Roman Catholic college and Franciscan convent, and has important manufactures. Pop. of village, 746; of township, 2485.

Allegha'ny, a river which rises in Potter co., Pa., makes a short circuit in New York, and returns into the former State. Flowing afterwards in a S. S. W. direction through the hilly oil-regions, it unites with the Monongahela at Pittsburg, forming the Ohio. It is navigable for small steamboats 150 miles or more above Pittsburg. It

is over 400 miles long, and its waters are remarkably clear and pure.

Alleghany, a county situated in the north-west part of Maryland, bordering on Pennsylvania and West Virginia. Area, 800 square miles. The Potomac River and its north branch form the southern boundary of this county, which is traversed by several ridges of the Alleghany Mountains. Between these are fertile valleys called *glades*, adapted to pasture and dairies. Iron ore, excellent bituminous coal, limestone, and hydraulic cement are abundant. Coal is extensively mined. Grain, wool, hay, fruit, and dairy products are the staples, and lumber, leather, firebrick, and metallic wares are manufactured. The water-power is very extensive. Garrett county was cut off from it in 1873. Capital, Cumberland. Pop. 38,536.

Alleghany, a county of the N. W. of North Carolina, bordering on Virginia. It contains important deposits of copper ore. The Alleghany Mountains pass through it. Grain and wool are raised. Capital, Gap Civil. Pop. 3691.

Alleghany, a county in the W. of Virginia. Area, 500 square miles. It is drained by Jackson's River, which unites with the Cow Pasture River on the E. border to form the James River. The main Alleghany ridge forms the N. W. boundary of this county, which is traversed by other mountain-ranges, and contains fine scenery and valuable mineral springs. The Chesapeake and Ohio R. R. and the James River Canal connect this county with Richmond. Grain, tobacco, and wool are raised. Capital, Covington. Pop. 3674.

Alleghany, a township of Davidson co., N. C. P. 436.

Alleghany, a township of Armstrong co., Pa. P. 2568.

Alleghany, a township of Blair co., Pa. Pop. 1913.

Alleghany, a township of Butler co., Pa. Pop. 890.

Alleghany, a township of Cambria co., Pa. P. 1230.

Alleghany, a township of Potter co., Pa. Pop. 625.

Alleghany, a township of Somerset co., Pa. P. 1133.

Alleghany, a township of Venango co., Pa. P. 1485.

Alleghany, a township of Westmoreland co., Pa. P. 1710.

Alleghany, a township of Craig co., Va. Pop. 938.

Alleghany, a post-township of Montgomery co., Va. Pop. 2504.

Alleghany College. See COLLEGES.

Alleghany Mountains, or **Alleghanies,** a name sometimes used as synonymous with the Appalachian system of mountains. (See APPALACHIAN MOUNTAINS.) In a more restricted sense it is applied to the parallel ranges which traverse Pennsylvania, Maryland, and Virginia, and form the most prominent features in the physical geography of those States. The general direction of these ridges is nearly N. E. and S. W., and their mean height about 2500 feet. Among their highest summits are the Peaks of Otter, in Virginia, rising to 4200 feet above the sea. These ridges are remarkable for the parallelism of their direction and the uniformity of their outline and altitude, and enclose several beautiful and fertile valleys. The rocks of the Alleghanies are the Silurian and Devonian limestones and sandstones, and the group of strata called the coal-measures.

Alleghany Springs, in Montgomery co., Va., 3 miles from Shawsville, on the Virginia and Tennessee R. R., and 77 miles S. W. of Lynchburg, are a popular resort for invalids and others. The springs are highly saline, and produce laxative, tonic, or alterative effects, according to the method of use. They are especially recommended for dyspeptics. Eight miles distant are the sublime Puncheon Run Falls, and the scenery near is wild and picturesque.

Alleghe'ny, a county of the W. S. W. of Pennsylvania. Area, 750 square miles. The Allegheny and Monongahela rivers unite near the centre of the county, and form the Ohio. The surface is diversified by hills, valleys, rolling uplands, and deep ravines, which present a variety of picturesque scenery. The soil is fertile and the land nearly all arable. Among the products of this county are bituminous coal, iron, and limestone. In population and manufactures this county exceeds all others in the State except Philadelphia. Cattle, grain, wool, and hay are staples. The manufactures are extremely varied and important. Capital, Pittsburg. Pop. 262,204.

Allegheny, a city of Allegheny co., Pa., separated from Pittsburg by the Allegheny River. Five fine bridges connect the two cities. It contains over 100 large manufacturing establishments, including extensive iron and steel rolling-mills, locomotive-works, cotton and woollen mills, 10 foundries, 8 machine-shops, 10 tanneries, 2 flouring-mills, salt-works, white-lead works, etc. It has 45 churches, including 15 Presbyterian of the different branches, 9 Methodist Episcopal, 10 Roman Catholic, 2 Protestant Episcopal, 2 Baptist, 3 Methodist, 2 Lutheran, 1 Disciples, 1 Congregational. There are in Allegheny 3 theological seminaries, numerous benevolent and reformatory institutions, the Western Penitentiary, 2 national banks; a soldiers' monument, costing over $40,000; a beautiful park, embellished with costly fountains, statues, etc.; 2 beautiful cemeteries—Union Dale and St. Mary's; 1 public library, a fine market-house, 4 horse railroads, and very extensive water-works. Allegheny City is growing very rapidly. Pop. 53,180. W. D. CUMMINGS.

Alle'giance [Fr. *allégeance*], in law, is the tie or obligation which binds a citizen or subject to a state. The common law distinguishes between natural and local allegiance. The former is that which a citizen owes to the state of which he is a member; the latter is due from a person who is not bound by the rules of natural allegiance, but who is temporarily subject to the laws of the state by which the allegiance is claimed. Under this theory a foreigner temporarily residing in a country is subject to its laws. Under such circumstances, should he conspire to overturn the government he may be guilty of treason. When he departs his allegiance is at an end. Natural allegiance, on the other hand, cannot be shaken off at the will of the citizen. Should he abandon the country to which he belongs, and engage in war on the part of a foreign state against it, he might, in strictness, if taken prisoner, be treated as a traitor. Such a treatment would, under some circumstances, be extremely harsh, as where the state had encouraged emigration, and the consequent assumption by an emigrant of relations naturally leading to a duty to take sides in a controversy with an adopted country. The doctrines of allegiance are of feudal origin, and it has been found difficult to reconcile them with the requirements of modern times. The U. S. in their legislation upon naturalization have proceeded upon the theory that a citizen of a foreign country might, at his will, shake off his allegiance and become a citizen here. The European nations have quite uniformly denied that there is any such general rule of public law, whatever may be the opinion of individual jurists. The perplexing and irritating questions thus raised have been for the most part recently disposed of by treaties between the U. S. and the leading foreign nations. (For these treaties see NATURALIZATION.) T. W. DWIGHT.

Al'legory [Gr. ἀλληγορία; Lat. *allegoria*], a figure of speech which may be termed a prolonged metaphor; a narrative in which abstract ideas are personified, as Bunyan's "Pilgrim's Progress," which furnishes one of the finest examples of allegory to be found in literature. Allegory is not confined to literature, but may also be employed in painting, sculpture, and pantomimic representations. It differs from symbol with respect to the relation between idea and form. In a symbol the form is naturally indicative of the idea, as when a lion rising from its couch is taken as a representative of the awakening spirit of democracy, while in an allegory idea and form are entirely disconnected, as when a city is represented by a female figure. Mere allegory without any power of symbolization is tiresome, and often stupid.

Allegret'to [a diminutive of the It. *allegro*, "lively"] is a musical term which denotes a movement or time quicker than *andante*, but not so quick as *allegro*.

Alle'gri (GREGORIO), an Italian composer of sacred music, born in Rome about 1580. He was a singer in the pope's chapel and a pupil of Nanini. His masterpiece is the "Miserere," which is annually performed in the pontifical chapel during Passion Week. Died in 1652.

Alle'gro (*i. e.* "lively," "cheerful"), in music, one of the principal degrees of movement; a term which signifies that the piece to which it is prefixed is to be performed in a brisk and lively manner. The word is sometimes used as a substantive, and a name of an entire musical composition.

Al'lein, or **Al'leine** (JOSEPH), an English non-conformist minister and writer, born at Devizes in 1633, was educated at Oxford. He was ejected from a curacy at Taunton in 1662, after which he was persecuted by imprisonment in Ilchester jail, and was fined for preaching. His death was hastened by ill-treatment, and he died Dec. 22, 1668. Among his works is an "Alarm to the Unconverted" (1672), which is highly esteemed.

Allein, or **Alleine** (RICHARD), an English non-conformist and Puritan, born in Somersetshire in 1611, educated at Oxford, was rector of Batcombe in that county, but was ejected in 1662. He published "Vindiciæ Pietatis" ("Vindication or Defence of Piety," 1663), and other works. Died Dec. 22, 1681.

Al'len, a county of Indiana, bordering on Ohio. Area, 638 square miles. The St. Joseph and St. Mary rivers unite in this county to form the Maumee. It is also drained by the Aboite River and several creeks. The surface is nearly level; the soil is very fertile. Cattle, grain, wool, and hay are staple products. Machinery, flour, carriages, metallic wares, etc. are among the manufactures. It is intersected by the Pittsburg Fort Wayne and Chicago R. R., and the Toledo Wabash and Western, Fort Wayne Jackson and Saginaw, and Fort Wayne Muncie and Cincinnati R. Rs. Capital, Fort Wayne. Pop. 43,494.

Allen, a county in the S. E. of Kansas. Area, 432 square miles. It is intersected by the Neosho River, and drained by Elm and Deer creeks. The surface is undulating; the soil is fertile. Excellent timber abounds. The county contains a large proportion of prairie, and is well adapted to the raising of stock. Grain, wool, potatoes, and hay are staple products. It is traversed by the Leavenworth Lawrence and Galveston R. R. The most valuable mineral found here is coal. Capital, Iola. Pop. 7022.

Allen, a county of Kentucky, bordering on Tennessee. Area, 300 square miles. It is bounded on the N. E. by the Big Barren River. The surface is generally level, and the soil moderately fertile. Limestone caverns are found in this county. Cattle, grain, tobacco, and wool are produced. Capital, Scottsville. Pop. 10,296.

Allen, a county in the W. N. W. of Ohio. Area, 405 square miles. It is intersected by the Auglaize and Ottawa rivers. The surface is generally level and well timbered; the soil is fertile. Cattle, grain, wool, hay, and lumber are produced. Carriages and wagons are manufactured. This county is traversed by the Dayton and Michigan and the Pittsburg and Chicago R. Rs. Capital, Lima. Pop. 23,623.

Allen, a township of Pope co., Ark. Pop. 225.

Allen, a township of Lasalle co., Ill. Pop. 877.

Allen, a township of McLean co., Ill. Pop. 1224.

Allen, a post-township of Miami co., Ind. Pop. 1042.

Allen, a township of Noble co., Ind. Pop. 1754.

Allen, a township of Polk co., Ia. Pop. 732.

Allen, a township of Warren co., Ia. Pop. 788.

Allen, a post-township of Hillsdale co., Mich. Pop. 1759.

Allen, a township of Worth co., Mo. Pop. 1352.

Allen, a post-village and township of Allegany co., N. Y. Pop. 794.

Allen, a township of Darke co., O. Pop. 781.

Allen, a township of Hancock co., O. Pop. 969.

Allen, a township of Union co., O. Pop. 1198.

Allen, a township of Northampton co., Pa. Pop. 2040.

Allen, a township of Washington co., Pa. Pop. 815.

Allen, a township of Morgan co., West Va. Pop. 766.

Allen (Charles), LL.D., a jurist, was born at Worcester, Mass., Aug. 9, 1797, and was admitted to the bar in 1818, was a judge of various State courts of Massachusetts between 1842 and 1859, and chief-justice of the Massachusetts superior court (1859-67). From 1849 to 1853 he was a Free-Soil member of Congress. He published fourteen volumes of legal reports (1861–68), and was long an influential lawyer and an able jurist. Died Aug. 6, 1869.

Allen (David Oliver), D. D., an American divine, born at Barre, Mass., in 1800. He graduated at Amherst College in 1823, and labored as a missionary in India from 1827 to 1853, in which latter year he returned to America. He published a "History of India" in 1856. Died July 17, 1863.

Allen (Elizabeth Akers), known as "Florence Percy," was born in Strong, Me., Oct. 9, 1832. Her first husband was the sculptor Akers. She is now the wife of E. M. Allen of New York. She published in 1867 a volume of poems of decided merit, and has contributed much to periodical literature.

Allen (Ethan), General, born at Litchfield, Conn., Jan. 10, 1737. He became an owner of iron-works at Salisbury, Conn., and in 1766 removed to Vermont, where he became a leader in the popular resistance to the claims of New York. The province of New York declared Allen an outlaw, and offered £150 for his arrest. On the outbreak of the Revolution, Allen heartily joined the movement, and on the 10th of May, 1775, he surprised and captured the fort at Ticonderoga, summoning its astonished commandant to surrender "in the name of the great Jehovah and the Continental Congress." This capture gave the army a valuable supply of artillery and stores. He had but eighty-three men under him, among whom was Benedict Arnold. On the 24th of Sept., 1775, he attacked Montreal with a small force, but was captured and sent to England as a prisoner. He was treated with great cruelty, and was not exchanged till 1778. The British authorities tried in vain to bribe him to induce the Vermonters to join their cause, but he skilfully contrived by his negotiations to keep the British troops out of Vermont. He published pamphlets against the New York domination, a narrative of his captivity (1799), a "Vindication of Vermont" (1779), and "Allen's Theology, or the Oracles of Reason" (1784), an attack upon the Christian religion. He professed to believe in the transmigration of souls. He was courageous, humane, and generous, but ambitious, rash, and eccentric. Died of apoplexy near Burlington, Vt., Feb. 12, 1789. (See his "Life" by Hugh Moore (1834), and by H. W. de Puy (1853).)

Allen (Heman), LL.D., born at Poultney, Vt., Feb. 23, 1779, graduated at Dartmouth 1795, became a lawyer, was chief-justice of a Vermont State court (1811–14), member of Congress (1817–18), U. S. minister to Chili (1823–28), and held various other important positions. He was a nephew of Ethan Allen. Died at Highgate, Vt., April 9, 1852.

Allen (Henry), an enthusiast, born at Newport, R. I., June 14, 1748, founder of the "Allenites." He maintained that Adam and Eve before the fall had no corporeal bodies, and denied the resurrection of the body. He preached in Nova Scotia, and published some hymns and religious treatises. Died Feb. 2, 1784.

Allen (Ira), General, born in Cornwall, Conn., April 21, 1751, was a younger brother of Ethan Allen. Emigrating in 1772 to Vermont, he became a prominent and public-spirited citizen. While he was colonel of militia his regiment did good service at the battle of Bennington. He bore a prominent part in settling the early difficulties of Vermont with the neighboring States. In 1795 he went to France to purchase arms for his State, but was taken on the voyage home, carried to England, and there sustained with success an eight years' lawsuit on the charge of attempting to supply the Irish with arms. He was afterwards imprisoned in France. He wrote a "Natural and Political History of Vermont" (1798) and other works. Died Jan. 7, 1814.

Allen (Joseph W.), an English landscape painter, born at Lambeth, in Surrey, in 1803. He was the principal scene-painter at the Olympic Theatre, and is said to have corrupted his style in landscape by the "brilliant effects" which are only adapted to the stage. He had previously painted rural scenery with success. Died Aug. 30, 1852.

Allen (Nathan), M. D., LL.D., of Lowell, Mass., born at Princeton, Mass., April 25, 1813, graduated at Amherst in 1836. He has published several valuable pamphlets on the laws of life and health, as well as the causes affecting the changes and increase of population.

Allen (Paul), born at Providence, R. I., Feb. 15, 1775, graduated at Brown University in 1796, studied law, and removed to Philadelphia, where he engaged in journalism, serving as editor and correspondent to various journals. He published a volume of poems (1801), "Lewis and Clarke's Travels" (1814), "Life of Alexander I." (1818), and other works. His "History of the Revolution" (1819) was written by John Neal and others. He was for a time insane. Died at Baltimore (where he was an editor of the "Morning Chronicle") Aug. 18, 1826.

Allen (Philip), born in Providence, R. I., Sept. 1, 1785, graduated at Brown University in 1803. He was an extensive cotton manufacturer, and built the first Watt steam-engine ever made in Providence; was governor of Rhode Island (1851–53), and U. S. Senator (1853–59). Died Dec. 16, 1865.

Allen (Richard), first bishop of the African Methodist Episcopal Church in the U. S. He was originally a preacher in the Methodist Episcopal Church, and was ordained deacon by Bishop Asbury in 1799. He was elected bishop of the African Methodist Episcopal Church in 1816. Died in Philadelphia in 1831. (See Methodism.)

Allen (Richard L.), born in Hampden co., Mass., Oct., 1803. Was a merchant in Buffalo, N. Y., in 1834, residing later at "Allenwood," his farm, on the Niagara River. With his brother, A. B. Allen, he established the "American Agriculturist" in the city of New York, in 1842, which became a very successful paper. He was the author of the "American Farm Book," and the "Diseases of Domestic Animals" (1845). D. at Stockholm, Sweden, Sept. 22, 1869.

Allen (Robert), an American officer, born in 1812 in Ohio, graduated at West Point in 1836, and, July 20, 1866, assistant quartermaster-general with rank colonel), and brigadier-general U. S. volunteers, May 13, 1863. Served in the

artillery till May 11, 1846, and subsequently in the quartermaster's department; on engineer duty in 1836, and in Florida war in 1837–38, in emigrating Cherokees to the West in 1838, in quelling the Canada border disturbances in 1840–41, in garrison in New York harbor in 1841–46, in the war with Mexico in 1846–48 on quartermaster duty, being present at the battles from Vera Cruz to the city of Mexico (brevet major), on quartermaster duty at New Orleans and New York in 1848–49, as chief quartermaster of Pacific division in 1849–52 and 1854–61. In the civil war served as chief quartermaster at St. Louis, Mo., in 1861–63, and at Louisville, Ky., 1863–66; from which points he directed the furnishing of transportation and supplies for the various armies operating in the Mississippi Valley (brevet lieutenant-colonel and brigadier-general July 4, 1864), and for several expeditions, including those against the North-west Indians; as chief quartermaster of the division of the Pacific in 1866–69, and senior assistant in quartermaster-general's office in Washington, D. C., since 1869. GEORGE W. CULLUM, *U. S. Army.*

Allen (SAMUEL), a London merchant, born about 1635, was one of the proprietors of New Hampshire under Mason's patent, and was governor of the colony (1691–99). His claim involved him and his heirs in expensive litigation. Died May 5, 1705.

Allen (SOLOMON), an American patriot and preacher, born in Northampton, Mass., Feb. 23, 1751, was a brother of Moses, noticed above. He served as a major in the Revolutionary war. Died Jan. 20, 1821.

Allen (STEPHEN), born in New York City in 1767, became mayor of the same in 1821. He was distinguished for his public spirit and public services, being one of the persons who originated the enterprise of supplying New York with Croton water. He was a victim of the burning of the steamer Henry Clay in July, 1852.

Allen (STEPHEN), D. D., an eminent divine and educator of the Methodist Episcopal Church, was born in Maine in 1810, graduated at Bowdoin College in 1835, entered the ministry in the Maine Conference in 1839, and has devoted much of his life to education in his native State, particularly as principal of the Maine Wesleyan Seminary.

Allen (THOMAS), an American patriot, born at Northampton, Mass., Jan. 17, 1743, was a brother of Moses, noticed above, and the father of William Allen (1784–1868). He was the first minister in Pittsfield, where he began to preach in 1764. In the Revolution he served as chaplain in the American army. Died Feb. 11, 1810.

Allen (WELD N.), U. S. N., born Mar. 27, 1837, in Maine, graduated at the Naval School in 1856, became a lieutenant in 1861, a lieutenant-commander in 1863, a commander in 1871, served during the summer of 1861 at Fort Dahlgren near Alexandria, and was for some weeks in command of that important post. In 1862 and 1863 served on board the gunboat Kanawha, and in 1864 commanded the steamer New London, Western Gulf blockading squadron. In 1865, while attached to the steam-sloop Tuscarora, Allen led the men of that vessel in the assault upon Fort Fisher, and was wounded in the left arm. Died Feb. 7, 1875 FOXHALL A. PARKER, U. S. N.

Allen (WILLIAM), a lawyer, who was chief-justice of Pennsylvania before the Revolution, and a royalist after it began. He aided Dr. Franklin in founding the College of Philadelphia. Died in 1780.

Allen (WILLIAM), F. R. S., an English chemist and philanthropist, born in London Aug. 29, 1770, was a friend of Sir H. Davy. He was elected F. R. S. in 1807, and in conjunction with W. H. Pepys made researches on respiration, etc. He devoted much time to benevolent enterprises, and as a minister of the Society of Friends travelled in France, Germany, and Russia, in which latter country he had an interview with the emperor Alexander in 1822. In 1825 he founded two manual-labor schools at Lindfield, Sussex. Died Dec. 30, 1843.

Allen (WILLIAM), D. D., b. at Pittsfield, Mass., Jan. 2, 1784; graduated at Harvard in 1802, was licensed to preach in 1804, in 1810 succeeded his father as pastor in Pittsfield, was chosen president of Dartmouth College in 1817, and was president of Bowdoin College from 1820 to 1839. His last days were spent at Northampton, Mass., where he died July 16, 1868. He published numerous volumes, both of prose and of poetry. His best known work is an "American Biographical and Historical Dictionary" (1809; 3d ed. 1857).

Allen (WILLIAM), governor of Ohio. See APPENDIX.

Allen (WILLIAM HENRY), a naval officer, born at Providence, R. I., Oct. 21, 1784. He served with distinction under Decatur when the latter captured the Macedonian, in Oct., 1812. Having obtained the command of the Argus, Captain Allen took several prizes from the English. He was mortally wounded in a battle between the Argus and the Pelican Aug. 14, 1813.

Allen (WILLIAM HENRY), M. D., LL.D., was born at Readfield, Me., Mar. 27, 1808, educated at Bowdoin College, Me., 1833, was professor of Latin and Greek in the Cazenovia Methodist Seminary, N. Y., from 1833 to 1835, professor of chemistry and natural philosophy in Dickinson College, Carlisle, Pa., from 1836 to 1846, professor of philosophy and English literature at the same institution from 1846 to the close of 1849, president of Girard College, Philadelphia, from 1850 to 1863, president of the Agricultural College of Pennsylvania during 1865 and 1866, and was reappointed president of Girard College in 1867, which office he still sustains with eminent ability. In 1872 he was elected president of the American Bible Society. He is author of "A Manual of Devotion for Girard College of Orphans," and of numerous and able addresses, reviews, etc.

Allen (WILLIAM HOWARD), an officer of the U. S. navy, was born at Hudson, N. Y., July 8, 1790. He commanded the Argus after William Henry Allen was mortally wounded, in 1813. Nov. 8, 1822, he was killed by pirates whom he attacked near Matanzas.

Allen (WILLIAM STICKNEY), an American journalist, born at Newburyport, Mass., in 1805, was for nearly twelve years editor of the "Newburyport Herald." He removed in 1837 to Missouri, where he afterwards edited the "St. Louis Republican." Died June 16, 1868.

Al'lendale, a post-village and township of Ottawa co., Mich. Pop. 799.

Allendale, a post-village of Bergen co., N. J., on the Erie R. R., 26 miles from New York. Large quantities of berries are here shipped to New York.

Allendale, a township of Barnwell co., S. C. P. 1847.

Al'len's, a township of Winston co., Ala. Pop. 553.

Allen's Creek, a township of Hanover co., Va. Pop. 2844.

Allen's Factory, a post-township of Marion co., Ala. Pop. 587.

Allen's Fresh, a post-township of Charles co., Md. Pop. 4584.

Allen's Grove, a township of Mason co., Ill. P. 1199.

Allen's Grove, a post-township of Scott co., Ia. Pop. 646.

Al'lenstein, a Prussian town, province of East Prussia, situated on the Alle, 65 miles S. of Königsberg. Pop. in 1871, 5514.

Al'lenstown, a township of Merrimack co., N. H., on the Suncook Valley R. R., has manufactures of cottons, twine, brick, etc. Pop. 804.

Al'lensville, a post-township of Person co., N. C. Pop. 1120.

Al'lenton, a post-township of Wilcox co., Ala. P. 1954.

Al'lentown, a borough of Allegheny co., Pa. P. 772.

Allentown, a city, capital of Lehigh co., Pa., on the right bank of the Lehigh River, 60 miles N. by W. of Philadelphia. It is on the Lehigh Valley R. R. The Lehigh and Susquehanna R. R., leased by the Central R. R. of New Jersey, runs on the opposite bank of the river. The East Pennsylvania R. R. connects at this place with the Lehigh Valley R. R. Some seven trains run daily to New York. There are ten blast-furnaces at this place, two large rolling-mills, foundries and machine-shops, large tanneries, shoe manufactories, tube-works, woollen-mills, fire-brick works, etc. There is a fine court-house, a prison costing $250,000, three national banks, public school property worth $300,000, and five weekly and two daily newspapers. It is the seat of Muhlenberg College. Pop. 13,884.
W. J. S. COXWORTH, ED. "LEHIGH VALLEY DAILY NEWS."

Al'ler, a river of Germany, an affluent of the Weser, rises near Magdeburg and flows north-westward. It is about 150 miles long.

Al'lerton (ISAAC), one of the "Pilgrim Fathers," left London in 1608, and went to Holland. He came to New Plymouth in the Mayflower's first voyage. He was a man of some wealth, and was at first a man of influence, but was afterwards unpopular. He became a merchant of New Amsterdam (New York), residing at Marblehead, New Haven, and other points. The second of his three wives was Fear, a daughter of William Brewster. Died in 1659.

All-Hal'low, the old English name for All Saints' Day (the 1st of November).

Al'lia, or **A'lia,** according to Livy, a small stream which entered the Tiber 11 miles above Rome, was the scene of the battle in which Brennus and the Gauls defeated the Roman army, about 388 B. C. It has not been identified in modern times.

Alli'ance, Stark co., O., at the crossing of the Pittsburg Fort Wayne and Chicago and the Cleveland and Pittsburg R. Rs., is a very thriving and prosperous town, containing many extensive manufactories of horse-rakes, reapers, pumps, terra-cotta ware, steam-hammers, tin presses, besides rolling-mills, white-lead works, etc. etc. Two newspapers are published here. It has one national bank, extensive gas-works, excellent public schools, a college, and good libraries. Pop. 4063.

W. H. Phelps, Pub. "Alliance Monitor."

Alliance, Holy. See Holy Alliance.

Al'libone (Samuel Austin), LL.D., an author, born in Philadelphia April 17, 1816. His principal work is a "Critical Dictionary of English Literature and Authors" (3 vols., 1859–70), an excellent work, of very great value to the student; also a "Dict. of Poetical Quotations" (1872), etc.

Al'lier, a river of France, is the most important affluent of the Loire. It rises in the S. of France, near the source of the Loire, flows nearly N., and enters that river at Nevers. Its entire length is about 260 miles.

Allier, a department of France, is bounded on the N. by Cher and Nièvre, on the E. by Saône-et-Loire, on the S. by Puy-de-Dôme, and on the W. by Creuse and Cher. Area, 2822 square miles. It is intersected by the Allier, and bounded on the N. E. by the Loire. The soil is fertile. The chief productions are wine, grain, timber, cattle, horses and sheep. Iron, coal, and marble are found here. It is subdivided into 4 arrondissements, 28 cantons, and 317 communes. Chief town, Moulins. Pop. in 1872, 390,812.

Alliga'tor [corrupted from the Sp. *el lagarto*, the

Alligator.

"lizard"], a genus of American saurian reptiles (nearly allied to the crocodile) which abound in the rivers and swamps of the Southern U. S. They have broader heads, more numerous teeth, and more obtuse snouts than crocodiles. Various reptiles of this genus are called caymans in South America. They all hibernate in the winter or dry season, when they bury themselves in the mud. The alligator is about fourteen feet long, including the tail, which is a powerful weapon for defence. It is a fierce and voracious animal, and sometimes attacks and kills men both on water and land, but it cannot turn quickly on land. During the heat of the day it is often seen basking in the sun on the dry ground. Its back and sides are defended by hard mailed plates, which are proof against a rifle-ball. The alligator is an oviparous animal, its eggs being small, but numerous. The parent deposits them in the sand of the river-side, scratching a hole with her paws, and placing the eggs in a regular layer therein. She then covers these with sand, grass, mud, etc., and deposits another layer on top of them, and so on until she has laid from fifty to sixty eggs. These are hatched by the heat of the sun and the decaying vegetable matter. The name alligator is also frequently applied to the muggur of India. The common alligator of the Southern States is the *Alligator Mississippiensis*, but among the so-called alligators of Florida a true crocodile has been discovered.

Al'ligator, a township of Tyrrel co., N. C. Pop. 778.

Alligator, a township of Chesterfield co., S. C. P. 659.

Alligator Pear. See Avocado Pear.

Alligator Swamp, an extensive marshy tract in North Carolina, occupies a large part of the peninsula between Albemarle and Pamlico sounds.

Al'lingham (William), born at Ballyshannon, Ireland, about 1828, published "Poems" (1850), "Day and Night Songs" (1854), "Lawrence Bloomfield in Ireland" (1864), in which year he obtained a literary pension.

Allio'li (Joseph Franz), a German Catholic theologian, born at Sulzbach Aug. 10, 1793. He became professor of theology at Munich in 1826, resigned in 1835, and became soon after canon at Ratisbon. His German translation of the Bible (6 vols., 6th ed. 1839–45) was approved by the pope, and has had a very wide circulation. He also published a "Manual of Biblical Antiquities" (1841). Died May 22, 1873.

Al'lison, a township of Lawrence co., Ill. Pop. 855.

Al'lison (Francis), D. D., a Presbyterian minister, born in Ireland in 1705, came to America in 1735. He was for many years vice-provost and professor in Philadelphia College. Died Nov. 28, 1777.

Alliso'nia, a village of Franklin co., Tenn., on the Elk River and on the Nashville and Chattanooga R. R., 77 miles S. E. of Nashville. Here is an abundant water-power.

Allison's Mills, a township of Jackson co., Ala. Pop. 564.

Allitera'tion [from the Lat. *ad*, "to," and *litera*, a "letter"], in composition, the frequent recurrence of the same letter, or of words beginning with the same letter, as "When friends were few and fortune frowned." It is often used in proverbial phrases, as, "Wilful waste makes woeful want," and in poetry for the production of effect, as in this line of Gray: "To high-born Hoel's harp or soft Llewellyn's lay." In the Celtic and early Gothic languages alliteration was a recognized ornament of poetry, and was used instead of rhyme.

Al'lium [from the Gr. ἀλέομαι, to "avoid," because of its offensive smell], a genus of herbaceous plants of the natural order Liliaceæ, natives of the temperate and cold regions of the northern hemisphere, including the garlic, onion, leek, and chive. They have mostly bulbous roots, umbellate flowers, narrow and fistulose leaves, and a peculiar smell and taste called *alliaceous*.

Al'loa, a seaport and market-town of Scotland, in the county of Clackmannan, on the left (N.) bank of the Forth, and at the head of its frith, 28 miles W. N. W. of Edinburgh. It has a good harbor and an active trade. Glass, ale, whisky, woollen goods, and leather are manufactured here, and coal is an important article of export. Steamboats ply daily between Alloa and Edinburgh. Pop. 6676.

Allob'roges, a nation of ancient Gaul which occupied the territory now comprised in Dauphiny, Savoy, and Piedmont. They were allies or peaceable subjects of Rome.

Alloc'ution [Lat. *alloc'tio*, from *ad*, "to," and *lo'quor*, *locu'tus*, to "speak"], a formal address; a term used especially by the court of Rome, and applied to a speech which the pope addresses to the college of cardinals on some political or ecclesiastical subject. The pope often resorts to this method to define his position or explain his policy, or reserve a claim which he cannot enforce in the present circumstances.

Allo'dium, or **Allo'dial Ten'ure,** in feudal law, freehold estate, land held by an individual in his own absolute right, and free from feudal tenure or obligation. There is no allodial land or property in England, the laws

of which declare that the king is the original proprietor and lord paramount of all the land in the kingdom.

Allom'erism [from the Gr. ἄλλος, "different," and μέρος, a "portion" or "share"], a term denoting constancy of crystalline form under variation in the proportion of the constituents of a compound. Thus, an alloy of zinc and antimony containing 36 per cent. of the latter metal crystallizes in needles which do not vary in angular measurement, though the antimony be increased 20 per cent.

Allop'athy [from the Gr. ἄλλος, "other," "different," and πάθος, an "affection"], a supposed theory of medicine, according to which remedies are used whose effects are opposite to the symptoms of the diseases treated. The term allopathy was formed after that of homœopathy, and both terms were introduced by Hahnemann. The two terms are contrasted, the one teaching that medicines must produce a *similar affection* to the disease itself, the other a *different affection*. The idea of this method of medication is at least as old as Hippocrates, who used the expression, "τὰ ἐναντία τῶν ἐναντίων ἐστιν ἰήματα"—"opposites are remedies of opposites." It has been contrasted in modern times especially with the maxim of Hahnemann, "*similia similibus curantur*," or "like cures like," which is the fundamental principle of homœopathy—an idea which is also advanced by Hippocrates. It is altogether an error to designate the prevalent and ancient science and practice of medicine as allopathy. The teachers and adherents of this science insist that its scope legitimately embraces all positive truth concerning disease and its treatment; no more to be narrowed down to an exclusive principle, such as that of allopathy, than astronomy can be made synonymous with the nebular theory, or zoology with the theory of development.

Allo'ri (Alessandro), a skilful Italian painter, born in Florence in 1535, excelled in the science of anatomy. Among his masterpieces are "The Last Judgment" and "Christ disputing with the Doctors." Died in 1607.

Allori (Cristofano), an eminent painter, a son of the preceding, was born at Florence in 1577. He was a good colorist, and excelled in portraits. Among his works, which are exquisitely finished, is a Magdalene. Died in 1621.

All'otta'va, in music, is a direction to play an octave higher or lower.

Allot'ment Sys'tem, or **Allotment of Land,** an expression commonly used in England in reference to small portions of land cultivated as gardens by peasants and other poor laborers, who hold the land as tenants. Allotment, as a legal term, may be defined as the grant or allowance of a portion of land too inconsiderable to be the subject of a formal conveyance.

Allot'ropy, or **Allot'ropism** [from the Gr. ἄλλος, "other," and τροπή, "conversion"], in chemistry, a term applied to the diversity of form and properties which some elements exhibit under certain circumstances, as, for example, when exposed to a great heat or to an electric discharge. Many chemists believe that every element is capable of existing under several allotropic modifications. Among the substances which afford examples of allotropy are sulphur, phosphorus, oxygen, and carbon. If the solid and brittle sulphur be heated to 480° F., and then poured into water, it ceases to be brittle and becomes very elastic. Sulphur in its ordinary state is slightly soluble in turpentine and some fixed oils, but in its elastic condition it becomes insoluble in those oils. Phosphorus affords a remarkable illustration of the same principle. In ordinary circumstances, when freshly prepared, it is a pale yellow solid, resembling wax. In this form it is extremely combustible, requiring to be kept under water to avoid taking fire spontaneously. But if this same substance be excluded from air and kept several days at a temperature of about 450° Fahrenheit, it becomes red, and ceases to be readily combustible, so that it need not be kept under water to prevent its taking fire. Oxygen, which in its common state has no odor, may, by an electric discharge through a glass tube or bottle containing air, be transformed into ozone, which has a peculiar odor and other new properties. (See Ozone.) The diamond and graphite are allotropic forms of carbon.

Allouez (Claude Jean), a Jesuit, born in France in 1620, went to Quebec in 1658 as missionary to the Algonkins, settled on Lake Superior in 1665, at Kaskaskia, Ill., in 1676, and visited numerous tribes in the North-west. Died in 1690. He was bitterly disliked by La Salle.

Allow'ances, Officers', are the payments made to officers in the British army for special duties. An officer commanding and paying a company receives a contingent allowance for the expense of repairing arms, etc. An officer sent on duty from one place to another has a travelling allowance of so much a mile. A somewhat similar system is observed in the U. S. army.

Al'loway Kirk, an old ruined church in the parish of Ayr, near the mouth of the river Doon, is the scene of Burns's poem of "Tam O'Shanter." A monument has been erected here to the memory of Burns, who was born near the kirk.

Allox'an ($C_4N_2H_2O_4$), a white crystalline substance formed by the action of cold strong nitric acid on uric acid. It is converted by baric hydrate into alloxanic acid, $H_2.C_4N_2H_2O_5$.

Alloxan'tin ($C_8N_4H_4O_7.3Aq$), a colorless crystalline compound produced by the action of hot dilute nitric acid on uric acid; also by the action of deoxidizing agents, as H_2S, on alloxan.

Alloy' [Fr. *alloyer*, to "mix" (as metals), probably from the Lat. *ad legem*—that is, "with legal tolerance;" Fr. *loi*, "law"], a mixture or compound of two or more metals fused together; sometimes a compound of precious metal with a metal of less value; thus, in coinage, the term alloy is applied to a baser metal mixed with gold or silver in order to make it harder. Chemists apply this term to all combinations obtained by fusing metals together; thus, brass is an alloy of copper and zinc; bronze is an alloy of copper and tin; pewter is an alloy of tin and lead. In many cases the metals do not unite in definite or invariable proportions. The density—or, in other words, the specific gravity—of an alloy is sometimes greater and sometimes less than the mean of its components. Most alloys have greater cohesion than either of the metals of which they are composed, so that a bar of an alloy will bear a greater longitudinal strain than a bar of either metal. British gold coin contains 11 parts of pure gold and 1 of copper; the law of the U. S. requires that in 1000 parts of coin there must be 900 parts of gold; and the intent of the law is, that the alloy shall be of copper only; but, as in parting silver from native gold it has been heretofore impossible to separate the whole, except at an expense too great to be economical, it has been permitted to allow the residual silver to be counted as part of the alloy, provided the proportion of silver be *not greater* than one-half. The more effectual processes introduced of late years into the U. S. assay offices have made it possible to make the parting nearly complete; and it is now provided that the silver shall not exceed *one-tenth* part of the whole alloy. A compound of mercury with another metal is an *amalgam*.

All Saints' Day, or **All Hallows** [Ang.-Sax. *all*, and *hâlig*, "holy"], a festival of the Roman Catholic, Anglican, Lutheran, and the various Oriental churches. Observed on the 1st of November, in honor of the saints in general.

All Souls' Day, a festival of the Roman Catholic Church, observed on the 2d of November, in order to alleviate the sufferings of the souls in purgatory.

All'spice, a common name of pimento, or Jamaica pepper, the dried berry of the *Euge'nia pimen'ta*, which is a native of the West Indies. It is called allspice because it is supposed to combine the flavor of several spices.

All'ston (Joseph), an American planter, born in 1778, became governor of South Carolina (1812–14). He married Theodosia, the only child of Aaron Burr. Died Sept. 10, 1816.

Allston (Robert F. W.), an American officer and governor, born April 21, 1801, in All Saints' parish, S. C., graduated at West Point in 1821, served as lieutenant of artillery on topographical duty till he resigned, Feb. 1, 1822, to become a rice-planter on the Great Pedee River; surveyor-general of South Carolina 1823–27, member of the house of representatives of South Carolina 1828–32, of the senate 1832–56, presiding 1847–56, deputy adjutant-general of South Carolina 1831–38, and governor of South Carolina 1856–58. He was much interested in agriculture and public education, and wrote valuable memoirs upon both subjects. Died April 7, 1864, on his plantation, near Georgetown, S. C. George W. Cullum, *U. S. Army*.

Allston (Washington), an American painter of celebrity, both at home and abroad, born Nov. 5, 1779, on his father's plantation, at Waccamaw, S. C.; died at Cambridge, Mass., July 9, 1843. Being of delicate constitution, he was sent to school at Newport, R. I., at the age of seven. There he formed the acquaintance of Edward Malbone, the miniature painter, a kindred spirit, two years his senior, whose taste, enthusiasm, and unusual culture stimulated the lad's ambition and fixed the bent of his genius. On graduating from Harvard College in 1800, he went to Charleston, and at once began his art-life under the influence of his Newport friend, whom he found there. The opportunities for intelligent study of good masters were small at that time, but zeal and patience used them all. The young man scorned no helps, but copied the best he could find, and felt grateful, especially to Robert Edge Pine, whose portraits of General Gates,

Charles Carroll, Baron Steuben, and Washington were much admired as examples of color. In 1801, Allston, accompanied by his friend Malbone, is in London, a student of the Royal Academy, whereof Benjamin West was president. West became his intimate friend, and so remained to the last. London opened to the young artist a new world of opportunity and sympathy. His three years there were full of improvement and delight. Then the Louvre in Paris offered to him its superb gallery, rich with gems of Italian art. This prepared him for Italy, where, principally in Rome, he spent four years in close companionship with Thorwaldsen the sculptor and Coleridge the poet. In 1809 he returned, richly freighted, to his native country, but soon went back to London with his wife, a sister of Dr. William E. Channing. There he produced his first great work, "The Dead Man Restored to Life by the Bones of Elisha." The picture obtained the prize from the British Association, and was afterwards purchased by the Pennsylvania Academy of Fine Arts. Allston's reputation was made. Other great paintings followed: "St. Peter Liberated by the Angel," "Uriel in the Centre of the Sun," "Jacob's Dream," with smaller things between—all eagerly sought by purchasers. But toil and confinement, and sorrow from the death of his wife, impaired his health; in 1818 he came to America again. The next twelve years were passed in Boston, where, in spite of a feeble body and a saddened mind, he painted the "Jeremiah," "Saul and the Witch of Endor," "Miriam," "Beatrice," and other pieces exquisite in color and feeling. In 1830, Allston married, as his second wife, a daughter of Chief-Justice Dana of Cambridge, Mass.; and at Cambridge he thenceforth lived, writing and painting, in great seclusion, but enjoying the society of a group of intimate and noble friends. To this period of his activity belong "Spalatro's Vision" and "Rosalie," the former one of his most weird, the latter one of his loveliest creations. The work which he meant should be his masterpiece, and on which he bestowed immense labor in the latter years of his life, "Belshazzar's Feast," was never finished. It was after a week of steady, severe labor on it that the artist gently expired from an attack of heart disease. The sketch, probably never intended by the painter to be exhibited, is in the Athenæum Gallery in Boston.

If Allston had not been a painter, he might have been distinguished as an author. The few writings from his pen that have been published indicate a rare penetration and refinement of mind. His novelette, "Monaldi," deserves to be still read and admired for its literary excellence. His poems were light and incidental productions, and have been forgotten. He prepared a course of lectures on art, which were published after his death.

Allston had the poetic temperament; his passion was for beauty—not for the sensuous beauty that charms the eye, so much as for the intellectual beauty that enchants the soul. Neither the landscape nor the human face interested him so much as the forms that stood before his imagination. He was of a thoughtful, interior, speculative cast of mind, meditative and dreamy. His sensibility to spiritual impressions was acute; he was a lover of the supernatural and the mysterious, with a love of the romantic. He never wholly outgrew his liking for ghost-stories, and the awful, the grand, the wild possessed an unfailing attraction for him to the end of his life. This peculiarity of his mind displays itself in the subjects of his greatest paintings—"Uriel," "Saul and the Witch of Endor," "The Vision of the Bloody Hand," "The Dead Man Coming to Life"—and not less in his last and most ambitious piece, "Belshazzar's Feast;" the great feature of which was the awful handwriting on the wall, glaring down on the scene of revelry, making the light of the candles dim and striking consternation into royal hearts. Conceptions like these transcend any artist's power of execution, and much of the disappointment with Allston's work arises probably from the sense of inadequacy of the performance. The grandeur is there, the impression of intellectual power is always conveyed, the spiritual influence of a subtle imagination is always felt; but the skill to tell satisfactorily the wonderful story is wanting. It is when he descends from such ambitious flights and paints a "Rosalie," a "Beatrice," a "Lorenzo and Jessica," that the exquisite quality of his art appears. These are creations of the fancy too, pure dreams of the poet, attempts to catch and portray what the eye cannot perceive, and only the most ethereal touch can feel. Their charm is indescribable. It is not in the composition, which is not always admirable, nor in the drawing, which is now and then deficient in freedom and grace, nor even in the color, rich and mellow as it is: it lies rather in the refined delicacy of sentiment which pervades the work, spiritualising whatever the master touches. His most tremendous creations are touched with this subtle grace. They are never appalling or grotesque; they are always, in some aspects, lovely.

The technical excellence of Allston's art was its color. Leslie is quoted as saying that the harmony of tint in the "Uriel" suggested the best pictures of Paul Veronese; and the appellation given him in Rome, "the American Titian," proved that the artists there discovered in his canvas something more than the adroit use of pigments, something of the strange art of mingling them that in the great master was so inimitable. Artists could even rejoice in the melancholy incompleteness of the "Belshazzar," because it allowed them an opportunity to study the painter's method.

The personal qualities of Allston were exceedingly attractive. His high-toned moral integrity, his enthusiasm, his utter singleness of mind, his maidenly purity of heart, fascinated all who approached him. He was free from envy and jealousy and guile. Artists revered him. Horatio Greenough, a man of culture as well as an artist, said, "He was a father to me in what concerned my progress of every kind." And Washington Irving wrote of him: "To the last he appeared to retain all those elevated, refined, and gentle qualities which first endeared him to me—a man whose memory I hold in reverence and affection as one of the purest, noblest, and most intellectual beings that ever honored me with his friendship."

Allston was slight in form, and carried about him an air of refined dignity that at once attracted attention. His countenance wore an expression of serene abstraction. His brow was broad, his eye large; his white hair fell long upon his shoulders in his latter years. In the public street he seemed wrapped in thought till a friend spoke to him, and then he seemed the soul of love. Before his death, in 1839, his paintings, those that were in America, forty-two in number, were collected a short time for exhibition. The best of them are in private galleries; some of the very best are in England. Mr. Allston was chosen a member of the Royal Academy soon after his return from his first long residence in England. O. B. Frothingham.

Allu'vion [from the Lat. *ad*, "to," and *luo*, to "wash"], the soil imperceptibly formed by the constant washing of the waters along the banks of a river or the sea. (See Accretion.) It differs from "avulsion," as the latter is not gradual, but sudden and perceptible.

Allu'vium, a geological term, signifies gravel, sand, and other matter washed down by rivers and floods, and spread over land that is not permanently submerged. Such deposits, which belong to the post-tertiary formation, often accumulate at the mouths of large rivers and form deltas. (See Delta.) All the land of Lower Egypt is alluvial. It has been estimated that the Mississippi annually carries down a quantity of sediment sufficient to cover 144 square miles with a stratum one foot deep. Alluvial soil is frequently the most fertile part of the earth's surface.

Al'lyl, Ac'ryl, or **Propyle'nyl** (C_3H_5), the third term in the homologous series C_nH_{2n-1}. Oil of garlic is the sulphide of allyl $(C_3H_5)_2S$. Oil of mustard is the sulphocyanate of allyl, $C_3H_5.CNS$.

Al'lyn (Robert), D. D., an eminent clergyman and educated in the Methodist Episcopal Church, born at Ledyard, Conn., Jan. 25, 1817, graduated in 1841 at the Wesleyan University, Conn.; mathematical teacher in Wilbraham Academy, Mass., 1841–43, joined the New England Conference 1842, was elected principal at Wilbraham 1845, principal of the Providence Conference Academy 1848; commissioner of public instruction for Rhode Island 1854, served three terms in the Rhode Island legislature, appointed professor of ancient languages in Ohio University at Athens 1857, president of the Wesleyan Female College, Cincinnati, O., 1859, and president of McKendree College, Ill., 1865–73.

Al'ma, a small river of Russia, in the Crimea, flows W. and enters the sea about 20 miles N. of Sevastopol. On its banks the allied armies of England and France, commanded by Lord Raglan and Marshal St.-Arnaud, defeated the Russians on the 20th of Sept., 1854.

Alma, a post-township of Marion co., Ill. Pop. 794.

Alma, a post-village, the capital of Wabaunsee co., Kan., in a township of its own name, about 65 miles W. of Lawrence, situated at the crossing of the prospective Manhattan Alma and Burlingame, and the Mill Creek Valley and Council Grove R. Rs. It contains several stores, wagon and other shops, one flouring-mill and one saw-mill, run by water-power. The town is at the junction of four creeks, each furnishing water-power. Boring for coal is now going on, which geological experts say is to be found at a depth of about 350 to 400 feet. The town is growing very rapidly. Six important mail-routes centre at this point, and stages arrive and depart daily. One newspaper is published here. Pop. of Alma township, 890.

A. Sellers, Pub. "News."

Alma, a post-township of Allegany co., N. Y. It has manufactures of lumber. Pop. 766.

Alma, the county-seat of Buffalo co., Wis. It has one weekly paper. It is on the Mississippi River, 60 miles N. of La Crosse, and within 4 miles of the celebrated Beef Slough Booms. It has manufactures of bricks, wagons, flour, etc. Pop. of village, 565; of township, 1049.
Ed. of "Express."

Alma, a township of Jackson co., Wis. Pop. 731.

Al'mack's, a suit of assembly-rooms in King street, St. James, London, was formerly celebrated as a fashionable place of resort for the aristocracy. Annual balls were given in these rooms, the managers of which were ladies of high rank, who conducted them with great exclusiveness. These rooms were built in 1765 by a person named Almack, an anagram of McCall, his original name. The desire of admission to the balls and parties at Almack's was so eager that it is said votes in Parliament have been purchased by tickets offered to the wives and daughters of members.

Almaden', or **Almaden' del Azo'gue** (*i. e.* "the mines of quicksilver"), a town of Spain, in the province of Ciudad Real, 50 miles S. W. of Ciudad Real. Here are mines of quicksilver (cinnabar), which are said to be the richest and most ancient in the world, producing annually about 2,000,000 pounds. They were worked by the ancient Spaniards, and afterwards by the Romans. Almaden has a practical school of mines and three hospitals. The mines were rented in the sixteenth century by the Fuggers, the famous bankers of Antwerp, and in 1843 the Rothschilds obtained the contract from the Spanish government. Pop. 8645.

Al'maden, a township of Santa Clara co., Cal. Here are important mines of mercury and valuable mineral springs. Pop. 1647.

Almaden Quicksilver-mines, The, of Santa Clara co., Cal., are named after those of Almaden in Spain, the latter being the most important in the known world. The Santa Clara mines are the New Almaden, Providence, Enriquita, and Guadalupe. The first mentioned is 14 miles from San José and 65 miles S. of San Francisco, in a region remarkable for its picturesque scenery. The ore (cinnabar) has from time immemorial been known to the Indians, who used it for making vermilion paint. Some Mexicans having bribed them to disclose the profound secret of its place, a company was formed in 1846, which began to work the mine. The presence of this deposit has been of incalculable benefit to California, since enormous quantities are employed in gold and silver mining. The metallic mercury is separated from the ore by a simple process of distillation.

Al'magest [from the Arabic *al*, "the," and the Gr. μέγιστος, "greatest"], a name given by the Arabs to Ptolemy's great work on astronomy, which was written in Greek, and translated in the ninth century into Arabic.

Alma'gro, a city of Spain, in the province of Ciudad Real, 14 miles S. E. of Ciudad Real. It is well built, has a town-hall, two hospitals, and one Latin school. Large quantities of lace are made here; also brandy, soap, and earthenware. Pop. 10,273.

Almagro, de (Diego), a Spanish soldier of fortune, and one of the conquerors of Peru, was a foundling, and was named after the city in which he was found in 1475. At an early age he went to America, where he is said to have enriched himself by plunder. Pizarro, Almagro, and Luque in 1525 united in an enterprise to conquer Peru, in which they were successful. (See Pizarro, Francisco.) In 1535, Almagro invaded Chili and gained some victories over the natives, but his progress was hindered by the enmity and perfidy of Pizarro. He returned from Chili in 1536, and took Cuzco, which Pizarro claimed as part of his possessions. In April, 1538, Almagro was defeated in battle and taken prisoner by Pizarro, who put him to death.

Almagro, de (Diego), a son of the preceding, was born about 1520. He became the leader of a party which was hostile to Pizarro, whom they assassinated in 1541. He then took the title of captain-general of Peru, but he was defeated in battle by the royal army under Vaca de Castro, and was executed in 1542.

Alma'li, a large town of Asiatic Turkey, in the S. part of Anatolia, on the river Myra, 25 miles from the Mediterranean Sea. It is beautifully situated in a valley, contains several factories and mills, and has a prosperous trade. The appearance of the town is uncommonly picturesque. Pop. about 20,000.

Al'ma Ma'ter (*i. e.* "fostering or propitious mother"), a name used to express the relationship of a university to its "foster-children" (alumni) who have been educated in it.

Al'manac, or **Almanack** [Arab. the "register"], an annual publication containing a calendar of the days and months of the year, the time of the sun's rising and setting, a notice of the eclipses of the sun and moon, and other astronomical phenomena. To these essential topics are often added predictions of the weather, and sometimes useful information of different kinds. The origin of almanacs is very ancient. They correspond in some respects to the Fasti of the Romans. The first printed almanac was that of George von Burback, resident at Vienna, in 1460. Regiomontanus began in 1474 a series of almanacs in their present completed form. In the sixteenth and seventeenth centuries they were often used as organs of political parties, were filled with the absurdities of astrology and vain prognostications, and were enlisted in the service of superstition and imposture. Among the most widely-known almanacs of the present time is the "Gotha Almanack," which was first published in German in 1763. It is also published in French. It contains statistics respecting all nations, with much political information.

The first American almanac was that of William Bradford of Philadelphia, published in 1687. In 1732, Franklin first published his celebrated "Poor Richard's Almanac." The "American Almanac" appeared in Boston from 1828 to 1861. At present over 100 almanacs are published in the U. S., embracing every possible subject, a number of which appear in foreign languages, especially the German.

Almanac, Nautical, an annual work devoted to astronomical phenomena and used in navigation. The "British Nautical Almanac" was planned by Maskelyne, and first published in 1767. A similar French work, entitled "Connaissance des Temps," was commenced by Picard in 1678, and has been continued to the present time. There is an excellent almanac published in Berlin under the title of *Ephemeris*. The "American Nautical Almanac," which first appeared in 1853, has a high reputation. It is published annually by the U. S. navy department through the board of navigation. It is a large volume, published for the use of the navy, and sold at cost to others. (See Ephemeris, by Prof. J. H. C. Coffin, LL.D.)

Alman'sa, or **Alman'za,** a town of Spain, in the province of Albacete, 52 miles by rail E. of Albacete. It has manufactures of linen and cotton fabrics, brandy, leather, and soap. Near this town the French under the duke of Berwick defeated the British and Spanish armies, April 25, 1707. Pop. 7900.

Al-Mansoor' (Aboo Jaafar), the second caliph of the family of the Abbassides, was born in 712. He ruled from 754–775, persecuted the Christians in Syria and Egypt, founded Bagdad, and promoted arts and sciences.

Almas, a town of Hungary, in the county of Bacs, 16 miles W. N. W. of Maria-Theresienstadt. Pop. in 1869, 8193.

Al'meh, or **Al'mah,** written also **Almé** (plu. **Awâlim**), a name applied to the professional female singers and dancing-girls of Egypt. The singers are hired to perform in the harems of the rich. The common dancing-girls are a different and less respectable class, belonging to a tribe called Ghawazi. They perform lascivious pantomimes in the streets.

Almei'da, or **Almey'da,** a fortified town of Portugal, in Beira, and on the Coa, 83 miles N. E. of Coimbra. It is an important stronghold. Here Lord Wellington defeated the French general Massena, Aug. 5, 1811. Pop. about 1150.

Almeida, a town of Brazil, province of Espirito Santo, is on the ocean, about 20 miles N. of Victoria. It was founded by the Jesuits in 1580. Pop. about 4000.

Almeida, de (Don Francisco), a famous Portuguese commander and viceroy of India, was born in Lisbon about 1450. He was a son of the count of Abrantes. Having gained distinction in wars against the Moors, he was appointed viceroy of India in 1505. He built several forts on the Indian coast, and extended the dominion of Portugal by his conquests. In 1507, Albuquerque was sent to India with a commission to supersede Almeida, but the latter refused to resign. He gained a decisive victory over the Egyptian fleet near Diu in 1508, and resigned his office about the end of that year. As he was returning to Portugal, he was killed by some Caffers near the Cape of Good Hope Mar. 1, 1510.

Almeida-Garrett, de (João Baptista), a Portuguese poet and politician, born Feb. 4, 1799, minister of public education 1820–24, was compelled to leave the country several times, and was elected a member of the Cortes in 1836. Died in 1854. Among his works (16 vols., 1854–55), the most celebrated are the epic-lyrical poems "Camões" and "Adozinda," the satirical poem "Dona Branca," as well as several dramas.

Alme'na, a post-township of Van Buren co., Mich. Pop. 980.

Al'mer, a township of Tuscola co., Mich. Pop. 671.

Almeri'a, a province of Spain, forms the E. part of the former kingdom of Granada. It is bounded on the N. by Murcia, on the E. and S. by the Mediterranean, and on the W. by Granada. Area, 3299 square miles. It contains rich mines of silver and lead. Grain, silk, and wine are the chief productions. Capital, Almeria. Pop. in 1867, 352,946.

Almeria, âl-mâ-ree'â, a city and port of Spain, on the Mediterranean, 104 miles E. of Málaga, is the capital of a province of the same name. Under the reign of the Moorish kings it was one of the richest and most important towns in the kingdom of Granada. It has a safe harbor, defended by two forts, and a fine cathedral. Wine, silk, cochineal, and other articles are exported from this port. Pop. in 1861, 29,426.

Almi'ra, a post-township of Benzie co., Mich. P. 393.

Al'mohades [Arabic, *Al-Mowahidoon, i. e.* "unitarians," or advocates of the unity of God, as taught in its original purity by Mohammed], a Mohammedan dynasty that reigned in Spain and Northern Africa from 1129 to 1269. It was founded by Abu-Abdillah Mohammed, surnamed Al Mahdi, "the director." The Almohades were the conquerors and successors of the Almoravides. The first Almohade who took the title of sultan was Abd-el-Mumen.

Almoji'a, a Spanish town in the province of Málaga, 10 miles N. W. of Málaga, is noted for its baths. Pop. 7041.

Almonacid', a town of Spain, in the province of Toledo, on the Tagus. Here the French under King Joseph defeated the Spaniards under Vanegas on Aug. 11, 1809.

Al'mond (*Amyg'dalus*), a genus of plants of the natural order Rosaceæ, composed of trees and shrubs nearly allied to the peach. The common almond (*Amyg'dalus communis*) is a tree from twenty-five to thirty feet high, a native of Barbary, but it now abounds in the south of Europe, from which great quantities of the fruit (kernels) are exported. Sweet almonds, which contain a large proportion of bland fixed oil, are an agreeable article of food. Bitter almonds contain a peculiar principle called *amygdalin*, and yield a poisonous oil. The leaves of the almond contain prussic acid. The dwarf almond tree is cultivated for the beauty of its flowers, which resemble the blossoms of the peach, but are generally double.

Almond, a township of Clay co., Ala. Pop. 967.

Almond, a post-village and township of Allegany co., N. Y. It contains an academy, a mowing-machine factory, four churches, several quarries, mineral springs, and has manufactures of boots, shoes, etc. Pop. 1686.

Almond, a post-township of Portage co., Wis. P. 651.

Almond'bury, a large village, township, and parish of England, in the West Riding of Yorkshire. The village is on the Calder, 36 miles S. W. of York, and has cotton and woollen mills. Pop. in 1871, 12,268.

Almon'de, van (Philippus), sometimes written **Allemon'da,** a Dutch admiral, born at Briel in 1646. He was the second in command under De Ruyter when the latter was killed in 1676, and contributed to the victory which Van Tromp gained over the Swedes in 1677. He commanded the Dutch fleet which, aided by the English, defeated the French at La Hogue in 1692. Died in 1711.

Al'mond's, a township of Stanley co., N. C. P. 792.

Almonds, Oil of. Both sweet and bitter almonds yield by pressure a fixed oil, which is of a light-yellow color and odorless. It consists chiefly of olein; is soluble in 25 parts of alcohol. It is used in medicine, having a mild laxative property. It is sometimes given to newborn infants, mixed with syrup of roses. One hundred pounds of almonds yield about fifty pounds of oil. Bitter almonds, macerated with cold water and distilled, yield a volatile oil known as the "oil of bitter almonds," or hydride of benzoyl. This does not pre-exist in the almonds, but is produced, together with hydrocyanic or prussic acid, from the glucoside amygdalin under the influence of the ferment emulsin:

Amygdalin.		Water.		Hydride of Benzoyl.		Prussic Acid.		Glucose.
$C_{20}H_{27}NO_{11}$	+	$2H_2O$	=	C_7H_6O	+	HCN	+	$2C_6H_{12}O_6$

It is a colorless, limpid oil, smelling of bitter almonds. When freed from prussic acid it is not poisonous. It oxidizes to benzoic acid, $C_7H_6O_2$. It is regarded as the aldehyde of the benzoic group. It is also produced by the action of manganese dioxide and sulphuric acid on albumen, fibrine, caseine, and gelatine. It has been used to a considerable extent for flavoring confectionery and for scenting soap. For the former purpose the prussic acid which it usually contains makes it dangerous. For the latter purpose it has been entirely superseded by the much cheaper nitrobenzol or essence of mirbane ($C_6H_5NO_2$), also called artificial oil of bitter almonds, which possesses the same odor.

Al'moner [Fr. *aumônier;* Lat. *eleemosyna'rius*], an officer whose duty is to distribute alms for a king or other person of rank, or for a monastery. The grand almoner of France was a functionary of high rank, and usually a cardinal. This office was abolished during the Revolution. In England there is a lord high almoner, who distributes the bounty of the queen twice a year.

Al'mont, a post-township of Lapeer co., Mich. P. 2298.

Al'monte, a village of Lanark co., Ontario, on the Brockville and Ottawa R. R., 6 miles N. of Carlton Place. It has one weekly newspaper, and large manufactures of woollen goods. Pop. about 2500.

Almon'te (Don Juan Nepomuceno), a Mexican general and statesman, born in 1804 of Indian descent, was attached to the embassy in London in 1824 and 1832, minister of war under Bustamente, and in 1841 minister plenipotentiary. He distinguished himself in the war against the U. S., was sent to Washington in 1853, and in 1857 to Paris. He went to Mexico with the French expedition in 1862, and was declared president in Juarez's place, but was not able to gain recognition. He entered the capital with the French army June 10, 1863, and was made president of the government junta. Died Mar. 22, 1869, in Paris.

Almo'ra, or **Almo'rah,** a town and important fortress of Northern Hindostan, is situated among the Himalayas, 85 miles N. of Bareilly, and at a height of 5337 feet above the sea.

Al'moravides [a corruption of the Arabic *Almorabitun,* signifying those "bound" or "devoted" to the service of God], the name of a Moslem or Arabian dynasty that reigned in Northern Africa and Spain. It was founded by Adballah-Ibn-Yaseen about 1050, and continued to reign until 1145, when the last Almoravide sultan was conquered by the Almohades.

Alm'quist (Karl Jonas Ludwig), a Swedish poet and prose writer, born in 1793. He published histories, works on grammar, romances, epic poems, etc. Among his works are "Amorina," a romance, and a collection of poems entitled "Book of Thorn Roses" (*i. e.* "Sweet Briars"). Died Oct. 26, 1866.

Alms'houses, institutions for the reception and support of indigent and sick persons who are unable to maintain themselves. Almshouses (officially called "workhouses" in England and "poorhouses" in Scotland) have been long maintained in the latter country, in a few of the larger towns, at the public expense, but there was no general statutory provision to that effect until 1845. In England public provision was made for the poor in 1535, houses for their reception were established by statute in 1563, and the employment of the poor in compulsory labor was inaugurated in 1601. Workhouses in London were established in the reign of William and Mary, and the workhouse system has been since extended by numerous statutes. A similar system was introduced into Ireland in 1838. All paupers who are able to earn their subsistence are compelled to do so. On the continent of Europe outdoor relief is much more frequent, the helpless and homeless poor being cared for in the hospitals. In most of the U. S., almshouses are maintained by county or municipal authorities. In Massachusetts, almshouses, with farms attached, are maintained in nearly all the towns, though some of the smaller towns board their paupers in private families. The "State paupers" of Massachusetts, chiefly of foreign birth, who have no legal residence in any town, are maintained in the State almshouses, of which that at Tewksbury is the principal. Among the other celebrated institutions of this character may be mentioned that on Blackwell's Island, N. Y., that on Deer Island, near Boston, and the Philadelphia county almshouse, West Philadelphia, Pa. (See Pauperism.)

Al'mug Tree, a name found in the Old Testament, is supposed to denote a species of sandal-wood.

Almuñecar', a seaport-town of Spain, in the province of Granada, and on the Mediterranean, 33 miles S. of Granada. It exports fruits and other articles. Pop. about 6000.

Al'my (John J.), born in Rhode Island April 25, 1814, became in 1829 a midshipman in the U. S. navy, a lieutenant in 1841, served in the Mexican war and in the Nicaragua and Paraguay expeditions, became a commander in 1861, a captain in 1865, and a commodore in 1869. During the civil war he was an officer of the blockading squadron, and subsequently chief signal-officer of the navy.

Al'my (William), an American philanthropist, born Feb. 17, 1761, was a member of the Society of Friends. He lived at Providence, R. I., and amassed a large fortune in the cotton manufacture. He endowed a large boarding-school at Providence. Died Feb. 5, 1836.

Al'na, a post-township of Lincoln co., Me. Pop. 747.

Aln'wick, a market-town of England, in the county of Northumberland, on the river Alne, 32 miles N. of Newcastle. It is well built of stone, and has a town-hall, a theatre, a mechanics' institute, etc. Pop. in 1871, 7055.

Alnwick Castle, the seat of the duke of Northumberland, adjoining the above town, is one of the most magnificent baronial castles in England. It is supposed to be 1200 years old or more, and has belonged to the Percy family since the reign of Edward II. In 1830 it was repaired at a cost of £200,000. Malcolm III., king of Scotland, while besieging this castle in 1093, was killed, with his eldest son, by the earl of Northumberland. William the Lion of Scotland, having laid siege to it in 1174, was defeated and made prisoner.

Al'oĕ, a genus of endogenous plants of the order Liliaceæ, natives of Africa and other warm regions, and chiefly valuable for their medicinal properties. The drug called aloes is obtained from several species, among which the *Aloe Socotrina,* found in the island of Socotra, affords the best quality. (See Aloes.)

Aloe, American. See Agave.

Al'oes, a stimulating, purgative drug having a bitter taste, is the inspissated juice or extract obtained from the leaves of several species of the aloe. It is imported from Bombay, Socotra, the Cape of Good Hope, the West Indies, etc. "Cape aloes" is obtained from the *Al'oe spica'ta;* "Socotrine aloes," from the *Al'oe Socotri'na;* and "Barbadoes aloes," from the *Al'oe vulga'ris.* Aloes is much used combined with other cathartics; from its stimulating effect upon the lower bowel it is unsuitable for those suffering from piles. Heated with nitric acid, aloes yields chrysammic acid. (See Wood and Bache's "Dispensatory.")

Aloes Wood, called also **Agila** or **Eagle Wood,** is the inner part of the trunk of the *Aquila'ria ova'ta* and the *Aquila'ria agal'lochum,* trees which are natives of tropical Asia. It is supposed to be the lign-aloes of the Bible. Aloes wood contains a fragrant resinous substance, which emits a pleasant odor when burned, and is highly prized as a medicine by the Orientals.

Al'ogi, a sect of religionists opposed to the Montanists, was formed about 160 A. D. They were styled Alogi, a name of double meaning, signifying their rejection of writings in which the Logos is mentioned, and also that they were without reason.

Aloï'adæ (*i. e.* "sons of Aloeus"), in Greek mythology, Otus and Ephialtes, two giants of extraordinary strength who attempted to storm Olympus, and were condemned to suffer in Tartarus.

Alom'pra, the founder of the reigning dynasty of Burmah, was born about 1700. He revolted against the king of Pegu in 1753, was victorious in several battles, and became master of Burmah, in which he founded Rangoon. Died May 15, 1760.

Alopecia. See Baldness.

Alo'ra, a city of Spain, in the province of Málaga, 17 miles N. W. of Málaga. Soap and oil are manufactured here. Pop. 6818.

Alosa. See Shad.

A'lost, or **Aalst,** an ancient walled town of Belgium, in East Flanders, on the navigable river Dender, 18 miles by rail W. N. W. of Brussels. It contains the church of St.-Martin, one of the largest and finest in Belgium, a town-hall, a college, and an academy of design. Here are cotton-mills, copper-foundries, distilleries, and manufactures of lace, leather, etc. Alost has an active trade, and exports hops, corn, and oil. It was formerly the capital of Austrian or imperial Flanders. Pop. in 1866, 18,978.

Aloysius (Saint) of Gonzaga. See Gonzaga.

Alpa'ca (the *Auche'nia pa'co,* supposed by several zoologists to be only a domesticated variety of the *guana'co*), a ruminant animal nearly allied to the lama, and belonging to the family Camelidæ, is a native of the mountains of Peru and Chili. It is rather smaller than the lama, and has a long neck, which it carries erect. Flocks of domesticated alpacas are kept by the Peruvians, who export great quantities of their wool. This wool, which varies in color,

Alpaca.

is remarkable for its length, fineness, silken texture, and a lustre almost metallic. It is longer and straighter than that of sheep. The most extensive manufactures of alpaca cloth are in England, which imports annually about 3,000,000 pounds of this wool. It first became an article of commerce in England in 1829. The alpaca has also been introduced into Australia, whence the wool was first obtained in 1859. A great part, however, of the so-called alpaca goods of commerce are made of the wool of the Cotswold, Leicester, and other long-wooled breeds of sheep.

Alp-Arslân' (*i. e.* "strong lion"), written also **Alp-Arselan,** a famous Persian sultan of the Seljookide dynasty, was born in Turkistan in 1030. He ascended the throne in 1063, and embraced Islamism. Under the direction of his wise vizier, Nizâm-ul-Mulk, Persia enjoyed great prosperity, many colleges were founded, and learning was promoted. In 1071, Alp-Arslân defeated and took prisoner Romanus Diogenes, emperor of Constantinople, whom he treated generously. He was assassinated in Dec., 1072.

Alpe'na, a county in the N. E. of Michigan, bordering on Lake Huron, has an area of about 700 square miles. It is drained by the Thunder Bay River, and is heavily timbered. Oats, barley, potatoes, and lumber are produced. Capital, Alpena. Pop. 2756.

Alpena, a city, the capital of Alpena co., Mich., at the head of Thunder Bay. It manufactures 125,000,000 feet of lumber yearly, contains a large hemlock-extract factory, two weekly papers, an excellent harbor, and is situated about 210 miles N. by W. from Detroit on Lake Huron. Pop. of township, 2612.

A. C. Tefft, Ed. of "Alpena County Pioneer."

Alpes, Basses. See Basses-Alpes.

Alpes, Hautes. See Hautes-Alpes.

Alpes-Maritimes, a department forming the S. E. extremity of France, bordering on Italy. It is bounded on the N. and E. by Italy, on the S. by the Mediterranean Sea, and on the W. by Var and Basses-Alpes. Area, 1518 square miles. It is drained by the river Var. The surface is diversified by mountains and fertile valleys. This department includes the county of Nice, which was ceded by Italy to France in 1860; also the arrondissement of Grasse, detached from the department of Var. It is partly covered with forests of valuable timber. Among its staple products are grapes, olives, oranges, lemons, figs, and silk. The chief towns are Grasse, Antibes, Cannes, and Nice, which is the capital. It is divided into 3 arrondissements, 25 cantons, and 146 communes. Pop. in 1872, 199,037.

Al'pha and **Ome'ga,** the names of the first and last letters of the Greek alphabet, A, Ω. These words occur in the book of Revelation as a title of the Lord Jesus Christ. The two letters were used by the early Christians as symbols of faith, and were sometimes marked on coins, tombs, ornaments, etc.

Al'phabet, a word formed of the first two Greek letters (α, β, *alpha, beta*), and used to denote the entire series of letters (arranged in a certain order fixed by custom)

with which any language is written. Nearly all the modern European tongues, deriving their letters, for the most part, from the ancient Romans, have, with slight exceptions, the same characters (though pronounced differently), arranged in precisely the same order as the Roman (or Latin) alphabet. The *ä* (*ae*), *ö* (*oe*), and *ü* (*ue*), occurring in the German, Danish (or Norwegian), Swedish, and Hungarian, but not found in the other languages, are to be considered as diphthongs, or at least as compound characters, rather than single letters. *W* is not found in the Italian, Spanish, or Portuguese alphabet, nor in French, except in words or names of foreign origin. *K* is scarcely used in French, Spanish, or Portuguese, except in a few words of foreign derivation. The Italians discard not only *w* and *k*, but also *x* and *y*. The ancient Romans used *k* and *y* in a very few words, but *w* was entirely unknown to them. It was originally written *vv*, whence the English name of the letter. *u* and *v*, like *i* and *j*, having formerly been equivalent to each other.

The order of the letters is the same in the alphabets of most of the European languages; in the Greek, however, the letters, though nearly corresponding in power, and often similar in form, to those of the Roman alphabet, are arranged very differently, *g* (γ) being the third and *z* (ζ) the sixth in the order of the letters; and *x* (ξ), instead of being almost at the end, as in our alphabet, is near the middle, not to mention other differences. In Russian, Hebrew, Arabic, and Sanscrit the order of the alphabet varies still more from the Roman, while many of the letters differ not only in form, but in power, from those of the languages of Western Europe.

Not only the origin of letters, but also the successive steps or stages by which they were brought to their present perfection, is involved in great obscurity. According to a commonly-received theory, all writing was in the first instance *ideographic* (from the Gr. *εἰδέα*, an "image," and *γράφω*, to "write" or "paint"), that is, representing images or scenes directly to the eye (and hence called picture-writing), instead of being *phonetic*, *i. e.* representing sounds or words which are merely the signs of ideas. Picture-writing, which even a few years since prevailed very extensively among our aboriginal tribes, was doubtless one of the earliest arts known to the human race. To convey, for example, the idea that one man had killed another, they would represent the figure of a dead man stretched upon the ground, and another man standing by erect, with some deadly weapon in his hand. Since, however, this kind of writing would only be adapted to represent images or scenes, and not thoughts, as mankind advanced in culture and required a more perfect instrument for communicating their ideas, phonetic writing, representing sounds by means of signs (which we term letters), was at length invented. But between the primeval ideographic writing and the fully-developed phonetic method there was, we have every reason to believe, an intermediate stage—namely, symbolic writing. Thus, the ancient Egyptians represented, it is said, a siege by a scaling-ladder, a battle by two hands holding a bow and shield, etc. In the progressive steps towards a perfect system of writing by phonetic signs, it seems probable that those signs were at first used to represent entire syllables. But such a system would obviously require many different characters, rendering it extremely complicated and difficult to learn. To obviate this difficulty, signs were at last employed to represent the simple elementary sounds produced by the human voice.

There is reason to believe that the forms of the letters were first suggested by some animal or object whose name had as its initial sound that which was to be represented by the letter. Thus, in Hebrew, the word *âlĕph*, an "ox," has for its initial syllable the sound of the first letter, and this letter was originally represented by the mere outline of the head of an ox; so also *bêth*, a "house," having *b* for its initial sound, that letter was formed after a rude picture, in outline, of a house; and so on. (For a presentation of the most remarkable alphabets, see the notices of the various languages under their respective heads, as Arabic, Greek, Hebrew, etc., etc.) J. Thomas.

Alphæ'us (in John xix. 25 called **Clopas**), the father of the apostle James the Less, and also possibly of Jude.

Alpharet'ta, a small post-village, the capital of Milton co., Ga., about 100 miles N. W. of Milledgeville. Pop. 126.

Al'phen, van (Hieronymus), a popular Dutch poet and jurist, born at Gouda in 1746. He became treasurer-general of the United Provinces. He produced, besides other works, "Poems and Meditations" (1777), "Short Poems for Children" (1781), which are highly commended, and an admired imaginative poem on "The Starry Heavens" ("De Starrenhemel," 1783). Died in 1803.

Alphe'us, or **Alphei'us** [Gr. Ἀλφειός], the modern Roupbia, a celebrated river of Greece, in the Morea. It rises in Arcadia, flows westward by Olympia, and enters the Mediterranean after a course of about 100 miles. Flowing through a formation of cavernous limestone, it sometimes sinks and is lost in a subterranean channel.

Alpheus, in classic mythology, a river-god and a son of Oceanus. According to the poetical legend, he loved the nymph Arethusa, who fled from him to the island of Ortygia, and was transformed into a fountain. Alpheus pursued her under the sea and was united to the fountain.

Al'pine, a county of the E. part of California, bordering on Nevada. Area, estimated at 1000 square miles. It is drained by the Carson River, by the North Fork of the Mokelumne, and by the North Fork of the Stanislaus River. The surface is mountainous, the county being traversed by the great Sierra Nevada. It contains rich mines of silver. It was formed in 1864. Cattle, grain, and wool are produced. Capital, Silver Mountain. Pop. 685.

Alpine, a post-township of Clarke co., Ark. Pop. 828.

Alpine, a post-township of Kent co., Mich. Pop. 1445.

Alpine Club, a society for the promotion of Alpine discovery, was formed in England in 1858. Three members of this club, Mr. Hudson, Lord Francis Douglas, and Mr. Haddo, perished with their guide in the descent of the Matterhorn in July, 1865. Other Alpine clubs were formed in Austria, Switzerland, Italy, and Germany. In 1873 an American Alpine club was formed.

Alpine Plants are those plants, usually of a somewhat arctic character, which are found in elevations approaching perpetual snow in the Alps and in other regions in different parts of the world. On the Andes, near the equator, at an elevation of from 12,000 to 15,000 feet above the sea, many kinds of plants are found resembling in their general appearance those which occur in Switzerland at an elevation of 6000 feet; and these, again, resemble, or are even identical with, the species which in Lapland grow upon hills of very little elevation, or which are found at the level of the sea. Similar plants occur also in all lofty mountain-ranges at elevations varying greatly within narrow geographical limits. When the alpine plants of Central Europe are spoken of, those are meant which grow at an average height of 6000 feet, marking what, in the language of science, is called a *zone*. This on the Riesengebirge falls as low as 4000 feet, and rises in the Southern Alps and Pyrenees to 9000 feet, and even higher. Although rich in forms peculiarly its own, this zone contains many plants which are likewise found on much lower hills. But the number of these diminishes as the elevation increases. Hence the spaces clear of snow in the highest regions possess a characteristic flora, the plants of which are distinguished by a diminutive habit, and an inclination to form a thick turf, frequently also by a covering of wool, whilst their stems are often partly or altogether woody, and their flowers are in many instances remarkably large, of brilliant colors, and very odoriferous. In the Alps, gentians, saxifrages, rhododendrons, and various species of primrose abound. With the phanerogamous plants are associated a number of delicate ferns and exceedingly beautiful mosses. Many alpine plants are limited to a very small district.

Alpi'nus, or **Alpin** (Prosper), M. D. [It. *Prosper Alpi'no*], a celebrated Italian botanist, born at Marostica, in the Venetian state, Nov. 23, 1553. Having passed several years in Egypt, he published in Latin a work "On the Plants of Egypt" (1591), and obtained a chair of botany at Padua in 1593. He made important contributions to the science of botany. Among his works is one "On Exotic Plants." Died Feb. 5, 1617.

Alp'nach, or **Alp'nacht,** a Swiss village in the canton of Unterwalden, at the foot of Mount Pilatus, 8 miles S. S. W. of Lucerne. Here was the famous *Slide of Alpnach*, a wooden trough or railway on which timber was moved down with great velocity from a height of 2500 feet. Pop. in 1870, 1630.

Alps [Lat. *Al'pes*; Fr. *Alpes*; Ger. *Al'pen*; etymology uncertain], the most remarkable system of mountains in Europe in regard to both extent and elevation, may be said to extend from the Mediterranean between Marseilles and Nice irregularly eastward to near 18° E. lon. and 45° 30′ N. lat. They form a crescent-shaped chain, and stretching across the country cover a part of France, the greater part of Switzerland, and a considerable portion of Northern Italy and Austria. They culminate in Mont Blanc, and form the watershed or dividing line between the rivers that flow into the Mediterranean and those which discharge their waters into the German Ocean and Black Sea. Several important rivers of Europe take their rise in Alpine valleys; the largest are the Rhine and the Rhone. This system of mountains is included between the parallels of 44° and 48° N. lat. and 6° 40′ and 18° E.

lon., and covers an area of about 95,700 square miles. It is estimated that the Alps, with their various windings, have an extent from W. to E. of about 700 miles, and a breadth varying from 50 to 200 miles. The bases of the northern and the southern sides are encircled by an extensive series of lakes, those on the former side being from 1200 to 2000, and those on the latter from 600 to 700 feet above the level of the sea, while in the interior some are found at an elevation of 6000 feet. The different ranges have an average elevation of above 7700 feet, from which altitude over 400 peaks rise into the limits of perpetual snow. From these snowy heights descend, under various forms, the destructive avalanches. In the numerous valleys of these lofty regions are collected the immense quantities of snow which form the long streams of ice called glaciers. (See GLACIERS, by J. BALL, F. R. S.) The Alps are generally divided into three parts, which are distinguished as the East, the West, and the Middle Alps. I. WEST ALPS.—The principal ranges included within these are: 1. The Maritime Alps, commencing not far from Genoa, extend westerly along the coast of the Mediterranean to near Barcelonette in France, and attain in their highest part an elevation of nearly 10,000 feet. 2. The Cottian Alps, culminating in Monte Viso, 12,600 feet high. 3. The Graian Alps, forming the boundary between Savoy and Piedmont, and rising in Mont Iseran to an elevation of 13,272 feet, and in Mont Cenis to 11,785 feet. II. MIDDLE ALPS, *Central Chain*.—1. The Pennine Alps, between the plains of Lombardy and the valley of the Rhône. Their most lofty peaks are—Mont Blanc, 15,784 feet high, and Grand Cervin, 14,815 feet high. 2. The Helvetian Alps, extending from the pass of the Simplon along St. Gothard (10,000 feet) to the pass of Splügen. 3. The Rhætian Alps, between the Inn, the Adda, and the Upper Adige. *Northern Chain*.—1. Bernese Alps, between the Rhône and the Aar. The highest summits are Finsteraarhorn, 14,025 feet, Jungfrau, 13,114 feet, and Schreckhorn, 13,393 feet high. *Southern Chain*.—1. Oertler Alps, between the Adda and the Adige, the highest peak being Oertlerspitze, 12,823 feet high. 2. The Tridentine Alps, between the Adige and the Piave. III. EAST ALPS.—The principal chains of these are: 1. The Noric Alps, highest summit Gross-Glockner, 12,957 feet high. 2. The Carnic Alps. 3. The Julian Alps. 4. The Dinaric Alps. Generally speaking, the Alps are lowest where the system is broadest, and highest where the system is narrowest.

The passes over the Alps are called, in French, *cols*. They are about sixteen in number, and now most of them can safely be travelled over by carriages. One of the most noteworthy is the Great St. Bernard, connecting the valley of the Rhône with Piedmont. It was crossed by Napoleon in 1800. Its highest summit is about 8170 feet. The Little St. Bernard connects Geneva, Savoy, and Piedmont. This is the pass by which some suppose Hannibal to have crossed into Italy. Its highest point is about 7190 feet above the level of the sea, and is now but little used. The Splügen Pass, connecting the sources of the Rhine with the Adda, was used by the Romans in their intercourse with the countries bordering on the Danube and the Rhine, by the Germans in the Middle Ages, as well as by modern tourists. In some places bridges, terraces, and long galleries are constructed of stone to afford protection against the avalanche and whirlwinds. The latter are not only destructive in themselves, but frequently set the former in motion. The Alps, with the exception of Switzerland, are rich in minerals, and offer one of the finest fields in the world for the geologist. It has been shown that the highest central mass, the primary Alps, consists chiefly of the crystalline rocks, gneiss and mica-slate, with a small proportion of granite. Representatives of the carboniferous and Jurassic formation appear among the Central Alps. In the Pennine, Graian, and Rhætian Alps are found large masses of serpentine. Quartz-porphyry is found in the N. of Piedmont and in the upper valley of the Adige; and in the E. of Piedmont, on the N. and S. sides of the chief range, extensive deposits of clay-slate and grauwacke, mixed with transition limestone, occur. Precious stones are found in considerable numbers. Among these is the well-known rock-crystal of St. Gothard. Most of the mining and smelting is done in the eastern part of the Alps; gold and silver are found in Tyrol, Salzburg, and Carinthia; copper exists in the French Alps, in Tyrol, and in Styria. The amount of iron and lead extracted from the mines of Carinthia and Styria is about 745,000 hundredweight per annum. Large quantities of quicksilver are extracted from the mines in Carniola. Salt exists in almost every part. Coal is found in abundance in Switzerland and Savoy, and hot springs are numerous. Many animals inhabit the Alps. Among them are the chamois, the ibex, marmots, wolves, bears, lynxes, wild-cats, and various species of birds. Of the domestic animals, goats and oxen abound, but horses, sheep, dogs, etc. are found in small numbers. Fish are found in some of the lakes at an elevation of 6000 feet. The inhabitants of the Alps are industrious and simple-hearted, but the spirit and manners of the neighboring plains have penetrated the larger valleys; the true Alpine life has passed away, and the simplicity and characteristic industry of the Alpine farms are now preserved only in the higher valleys. REVISED BY A. GUYOT.

Alpujar'ras, a mountain region or range of Spain, in Granada, between the Sierra Nevada and the Mediterranean. The direction of the range is nearly parallel to the sea-coast. The highest peaks rise to the altitude of about 7000 feet. Rich pastures abound on the slopes and in the valleys of the northern side of the range.

Alrau'nen, or **Alru'næ,** a name given by the ancient Germans to certain prophetic women who were employed in sacrificing victims, and were supposed to have magical or supernatural skill. Also applied to small images carved out of mandrake roots, and exhibiting a rude imitation of the human form. These were venerated or superstitiously prized by the Germans and other northern nations.

Alsace and **Alsace-Lorraine.** See ELSASS and ELSASS-LOTHRINGEN.

Alsace, a post-township of Berks co., Pa. Pop. 1294.

Alsa'tia, a name formerly given to Whitefriars, London, which was used as a sanctuary by criminals in the early part of the seventeenth century. This privilege was abolished by an act passed in 1697. (See WHITEFRIARS.)

Alsatia. See ELSASS and ELSASS-LOTHRINGEN.

Al Se'gno, in music, a notice to a performer that he must return and commence again that part of the movement to which the sign 𝄋 is prefixed.

Al'sen, an island belonging to the Prussian province of Sleswick-Holstein, in the Baltic, near the coast of Sleswick, is 18 miles long, and has an area of 106 square miles. It is remarkable for its picturesque and beautiful scenery, is very fertile, and produces excellent apples. Christian II. of Denmark, who was deposed in 1523, was imprisoned here for nearly seventeen years. Pop. in 1860, 23,188.

Al Sirat' (literally, the "road" or "passage"), a bridge as narrow as the edge of a razor, supposed by the Mohammedans to extend from this world over hell to paradise.

Al'sop (CHARLES RICHARD), born in 1802, graduated at Yale in 1821, became a lawyer of Middletown, Conn., was mayor of that city (1843–46), and State senator in 1855, besides holding other responsible positions. Died Mar. 5, 1865.

Alsop (RICHARD), born at Middletown, Conn., Jan. 23, 1761, was versed in Greek, Latin, French, and other languages. In conjunction with Theodore Dwight and others, he edited the "Echo," a satirical publication, the first number of which was issued at Hartford in 1791. He published a "Monody on the Death of Washington" (1800), and translated from the Spanish Molina's "Natural and Civil History of Chili." Died Aug. 21, 1815.

Al'stead, a post-township of Cheshire co., N. H., has five churches, and manufactures of paper, edge tools, lumber, etc. Pop. 1213.

Al'ston (JOHN), celebrated as the introducer of an improved system of printing books for the blind with embossed or raised Roman capital letters, was a merchant of Glasgow, Scotland, who died in 1846. He was long a director of an asylum for the blind in that city.

Alston (WILLIS), a native of North Carolina, represented a district of that State in Congress from 1803 to 1815, and from 1825 to 1831. He was chairman of the committee of ways and means during the war of 1812–14. Died April 10, 1837.—His father, WILLIS ALSTON, was a member of Congress 1799–1803.

Alstræme'ria, or **Al'strœmer's Lily,** a genus of plants of the order Amaryllidaceæ, natives of Peru and Chili. Several species of this genus have beautiful flowers, and are cultivated in gardens. The tubers of the *Alstræmeria Salsilla* are cultivated for food in the West Indies.

Al'strömer, or **Alstrœmer** (KLAUDIUS or KLAS), a Swedish naturalist, was born at Alingsås Aug. 9, 1736. He was a pupil of Linnæus, who named in his honor a genus of plants, Alstrœmeria. He travelled in Spain and other countries, and published a "Discourse on the Breeding of Fine-woolled Sheep" (1770). Died Mar. 5, 1796.

Alt, in music, a term applied to the high notes of the scale.

Alt, or **Al'ten,** a German word signifying "old," forms the prefix of numerous names in Central Europe, as "Alt-Ofen" ("Old Ofen").

Altai', or **Al'ta Yeen Ooo'la** (*i. e.* "the golden mountain"), the name of a system or range of mountains

of Central Asia, near the S. border of Siberia. They extend from the sources of the Irtish to Lake Baikal. One range, called the Little Altai, forms the boundary between Siberia and Chinese Tartary. According to some authorities, the Altai proper extends from 84° to 100° E. lon., and lies between 48° and 54° N. lat. The Obi and other large rivers rise in the Altai Mountains, and flow northward. On the west the range terminates in the Katoonsk or Katoonya mountains, a small isolated group, in which Mount Bielookha or Beluka rises to the height of 11,063 feet. Their flanks in many places are covered with magnificent forests of cedar. A large portion of this system of mountains is covered with perpetual snow. Rich mines of gold, silver, and copper have been opened in them. Porphyry and several kinds of precious stones are also found.

Altamaha', a river of Georgia, formed by the union of the Oconee and Ocmulgee in the central part of the State. Flowing south-eastward through sandy plains, it enters the Atlantic 12 miles below Darien, after a course of about 140 miles. It is navigable for vessels of thirty tons.

Al'tamont, a post-township of Alleghany co., Md. Pop. 1133.

Altamont, a post-village, capital of Grundy co., Tenn., about 120 miles S. W. of Knoxville.

Altamu'ra, a handsome town of Southern Italy, in the province of Bari, at the foot of the Apennines, 33 miles S. W. of Bari. It is defended by a castle, and has a fine cathedral. It was formerly the seat of a university. Here is the site of the ancient *Lupatia*. Pop. in 1861, 17,198.

Al'tar [Lat. *alta'ria*], a table or elevated place on which the ancient Jews and pagans offered sacrifices. The first altar mentioned in history was built by Noah immediately after the Flood. Altars were sometimes erected as memorials of some great event by the religious personages of sacred history. The ancient Greeks and Romans used a great number of altars, each of which was dedicated to some particular deity. They were constructed of different materials and in various forms. The name is also applied to a part of the furniture of Christian churches. The altar of Episcopalian churches is the communion-table. In the Prayer Book of Edward VI. (1549), the word altar was retained in the communion service, but "table" was substituted a few years later for the word altar. The Lutheran Church retains the altar.

Alt'dorf, or **Al'torf,** a town of Bavaria, on the river Schwarzbach, 13 miles E. S. E. of Nuremberg, had a university from 1623 to 1809. Pop. in 1867, 3317.

Altdorf (Switzerland). See ALTORF.

Alt'dorfer (ALBRECHT), an eminent German painter and engraver, a pupil of Albert Dürer, born at Altdorf, in Bavaria, in 1488. He is called by the French "Le Petit Albert" (in allusion, doubtless, to the great Albert Dürer). His works are characterised by a romantic spirit. A painting of the victory of Alexander over Darius is called his masterpiece. He left many engravings on copper and on wood. Died in 1538.

Alte'a, a seaport-town of Spain, in the province of Alicante, on the Mediterranean, 38 miles N. E. of Alicante. Pop. 5193.

Al'tena, a town of Prussia, in Westphalia, on the Lenne, 18 miles S. E. of Dortmund. It has manufactures of iron and steel. Pop. in 1871, 7122.

Altenburg, Saxe, German duchy of. See SAXE-ALTENBURG.

Al'tenburg, a walled town of Germany, capital of Saxe-Altenburg, is 24 miles by rail S. S. E. of Leipsic. It is the seat of the higher courts, and contains seven churches, one theatre, and several hospitals. Linen goods, brandy, porcelain, and optical instruments are made here. Pop. in 1871, 19,966.

Altenes'sen, a town of Prussia, in the Rhine province, has some iron-works. Pop. in 1871, 10,099.

Al'tengaard', a seaport-town of Norway, capital of the province of Finmark, on the Alten, at the head of a fiord, 53 miles S. S. W. of Hammerfest. It is often visited by Russian vessels.

Al'ten-Oet'ting, or **Alt'ötting,** a small town of Bavaria, near the river Inn, 42 miles S. W. of Passau. It is visited by great numbers of Roman Catholic pilgrims, who are attracted thither by an image of the Virgin Mary, called the "Black Virgin." Several German emperors held their court here in the Middle Ages. Pop. in 1867, 2408.

Al'tenstein, a castle in Saxe-Meiningen, Germany, near the watering-place Liebenstein. Near this castle is the beech tree where Luther was captured and taken to the Wartburg on May 4, 1521.

Alt'enstein, von (KARL), BARON, a Prussian minister of state, born at Anspach Oct. 7, 1770. In 1815, he rendered important services to Germany by the recovery of works of art and literature which the French had removed to Paris. He was appointed minister of public instruction and worship in 1817, and held that office for many years. Died May 14, 1840.

Al'teratives [from the Lat. *al'tero, altera'tum*, to "change"], a term applied to medicines which are often irritant or poisonous in full doses, but which almost imperceptibly alter disordered secretions, acting specially on certain glands, or upon absorption in general, when given repeatedly in small doses. Thus, mercury is an irritant capable of producing salivation and other distressing symptoms; but if small doses are given at intervals, they produce alteration in disordered actions, which may result in an improvement in the nutrient functions, and they may effect these changes without otherwise affecting the constitution or inducing salivation. So iodine, also an irritant in large doses, and poisonous in some forms, is most useful, when given in proper doses, in correcting a scrofulous condition, promoting the absorption of tumors, etc. Preparations of arsenic are powerful alteratives in some cases of skin-disease. So also are the decoctions of certain plants, which, taken in large quantities of water, operate partly by their solvent properties, and partly by their stimulant effect on the organs of the body. Properly speaking, any medicine is an alterative which, when given either in large or small quantities, has the power of gradually correcting or modifying a diseased condition. The term "alterative" is less used than formerly, and physicians differ as to the propriety of using drugs of this class.

Al'ter E'go ("my other self"), a term used in the former kingdom of Naples to signify the king's deputy, who was authorized to perform the functions of royalty during the compulsory absence of the king.

Alter'nate [Lat. *alterna'tus*, from *alter'no, alterna'tum*, to "interchange"] **Generation,** in biology, is that modification of generation in which the young do not resemble the parent, but the grandparent, or even some more remote ancestor, so that the successive series of individuals seem to represent two or more different species alternately reproduced. The salpa, a floating gelatinous molluscoid animal, is an example; it may be found as a solitary individual, pregnant with numerous minute salpæ of a more simple structure, which continue after birth to be united together in the form of a long chain floating on the sea. In each individual of this chain there is generally developed an egg from which is hatched a solitary salpa, of the form and organisation of its grandparent (*i. e.* the parent of the chain of aggregate salpæ); thus the species is represented by an alternation of simple and aggregate salpæ. (See PARTHENOGENESIS and CESTOID WORMS.)

Althæ'a [Gr. ἀλθαία, from ἄλθω, to "heal"], a genus of plants of the natural order Malvaceæ, natives of Europe and naturalized in the U. S. It includes the hollyhock (*Althæ'a ro'sea*) and marshmallow (*Althæ'a officina'lis*), which is used in medicine as a demulcent or emollient. Althæa, or shrubby althæa, is also a common name of the *Hibis'cus Syri'acus*.

Althen (EBAN or JEAN), a Persian who gained distinction by introducing Turkey madder into France, born in 1711, taken captive by the Arabs in his youth, and sold as a slave in Smyrna, whence he escaped to France with seeds of madder, 1761. He made successful experiments in the cultivation of that plant, which was afterwards extensively cultivated and became very profitable. Died in 1774.

Althorp, LORD. See SPENCER.

Altin' Nor, or **Altyn' Nor** (*i. e.* "sea of gold"), or **Teletskoi,** a lake of Siberia, in the S. part, is about 320 miles S. of Tomsk, and is traversed by one of the headstreams of the Obi. It is about 48 miles long and 8 miles in average width.

Al'titude [Lat. *altitu'do*, from *al'tus*, "high"], a scientific synonym for height. In astronomy, it signifies the height of a star or other body above the horizon—that is, the angle of elevation of a celestial body. This altitude is expressed in degrees, the greatest possible altitude being 90 degrees. It is measured in observatories by means of a telescope attached to a graduated circle, which is fixed vertically. The altitude of a triangle is measured by a straight line drawn from the vertex perpendicular to the base; that of a cone by a straight line drawn from the vertex perpendicular to the plane of the base.

Alt'mühl, a river of Bavaria, rises near the village of Hornau, flows S. E. and E. and enters the Danube at Kelheim, after a course of 100 miles. The Ludwigs Canal connects this river with the Regnitz, and opens communication between the Danube and the Rhine.

Al'to, a township of Lee co., Ill. Pop. 832.

Alto, a township of Fond du Lac co., Wis. Pop. 1448.

Al'to, in music, the counter-tenor part, or that immediately below the treble; the deepest and lowest kind of musical voice in females and boys.

Altomün'ster, a place of pilgrimage in Northern Bavaria, has a nunnery which was founded by the Scotchman Saint Alto in the eighth century. Pop. about 1000.

Al'ton, a city and port of entry in Madison co., Ill., on the Mississippi River, 21 miles above St. Louis and 3 miles above the mouth of the Missouri. It stands on a high limestone bluff. It is connected with Chicago by the Chicago Alton and St. Louis R. R., and its trade is facilitated by the St. Louis Alton and Terre Haute R. R. The city has important manufactures. Large quantities of grain, hay, fruit, stone, and lime are shipped here. It has two national banks and a female seminary. Alton contains a large Roman Catholic cathedral and ten churches. One daily and two weekly papers are issued here. It has an excellent system of public schools, has a large number of factories, foundries, glassworks, etc., and is connected by horse railroad with Upper Alton, 2 miles distant. Upper Alton is the seat of Shurtleff College. Pop. 8665.

L. A. Parks & Co., Pubs. "Alton Telegraph."

Alton, a post-township of Penobscot co., Me. P. 500.

Alton, a township of Waseca co., Minn. Pop. 429.

Alton, a post-village, the capital of Oregon co., Mo., about 150 miles S. S. W. of St. Louis. Pop. 76.

Alton, a post-township of Belknap co., N. H., on the Dover and Winnipiseogee R. R. It has a savings bank and some manufactures. Pop. 1768.

Al'tona, the most populous and important city of the Prussian province of Sleswick-Holstein, is on the right bank of the Elbe, one or two miles below Hamburg. It is connected by railroad with Kiel, and has an extensive trade by the navigation of the Elbe. Many of the merchants of Hamburg reside in Altona, which contains an observatory, a gymnasium, and a library of 12,000 volumes or more. Here are important manufactures of tobacco, soap, chemicals, leather, ropes, etc. Altona is a free port, accessible to large vessels. In 1869, 1185 ocean vessels entered the port. Pop. in 1871, 74,131.

Alto'na, a post-village of Knox co., Ill. Pop. 902.

Altona, a post-township of Clinton co., N. Y. P. 2759.

Alton Bay, N. H., on Lake Winnipiseogee, and at the terminus of the Dover and Winnipiseogee R. R., 96 miles from Boston, is a place of summer resort. It is connected by steamer with Centre Harbor.

Alton-Shee, d' (Edmond), Comte, a French democrat, born in 1810. He promoted the revolution of Feb., 1848, after which he acted with the socialists and radical reformers.

Altoo'na, a growing city in Blair co., Pa., on the Pennsylvania R. R., 237 miles W. of Philadelphia, and 117 E. of Pittsburg, at the E. base of the Alleghany Mountains, which the railroad here crosses. It contains fifteen churches, one national bank, one daily and three weekly newspapers; the principal offices and extensive machine-shops of the Pennsylvania R. R., in which locomotives and cars are manufactured, and in which over 2000 men are employed; large individual car-works, several extensive planing-mills, one large rolling-mill, partly in the city; extensive water-works, costing over $300,000; mechanics' library, containing about 3000 volumes. Pop. 10,610.

E. B. McCrum, Ed. "Altoona Tribune."

Alt'orf, or **Alt'dorf,** a town of Switzerland, the capital of the canton of Uri, is near the S. extremity of the Lake of Lucerne, and at the foot of the Grunberg. Here is an old tower which is said to mark the place where William Tell shot the apple off his son's head. Pop. in 1870, 2724.

Al'to-Rilie'vo (*i. e.* "high relief"), a term used in sculpture to designate the mode of representing objects by figures which stand completely out from the ground, being attached to it only in a few places, and in others worked almost entirely round like single statues. This branch of art was brought to the highest perfection by Phidias in the metopæ of the Parthenon, which are now in the British Museum. Figures which have only a slight projection from the ground are said to be in basso-rilievo (or bas-relief).

Altran'städt, a town of Saxony, at which Charles XII. of Sweden concluded a treaty with Augustus, elector of Saxony, in 1706. A treaty was also signed here in 1714 between the emperor Charles VI. of Germany and Louis XIV. of France.

Al'tringham, a market-town of England, in Cheshire, is on the Cheshire Midland R. R. and on Bowden Downs, 8 miles by rail S. W. of Manchester. It is a very neat town, and has some cotton factories. It is a resort for invalids, because of the salubrity of the air. Pop. 6648.

Alt'stät'ten, a town of Switzerland, in the canton of St. Gall, 8 miles S. E. of St. Gall. Pop. in 1870, 7575.

Altu'ras, a county in the S. part of Idaho, borders on Nevada and Utah. It is intersected by the Lewis or Snake River, and also drained by the Malade River. The surface is generally mountainous. Gold and silver are found in this county in quartz rocks. The silver ore is particularly rich. Wheat, oats, and barley are produced. Capital, Rocky Bar. Pop. 689.

Alturas, a village of Rockland co., N. Y., on the Erie R. R., 28 miles from New York. It has a public park of twelve acres, and is the seat of Alturas Home Institute, an industrial school for young women.

Alt'wasser, a town and watering-place of Prussia, in the province of Silesia. It has iron-foundries, coal-mines, and porcelain-factories. Pop. in 1871, 6985.

Al'udels (plu.), [a word of Arabic origin], pear-shaped glass or earthen vessels used as receivers in the distillation of certain substances, especially mercury and hydrochloric acid. They are generally arranged in the form of a chain on an inclined surface.

Al'um [Lat. *alu'men*]. Common alum is a double salt of great importance, the chemical name of which is "sulphate of alumina and potash." It occurs in colorless octahedral crystals, having a sweet astringent taste. It is a powerful styptic, and is applied sometimes as a mild caustic. Its formula is $KOSO_3 + Al_2O_3 3SO_3 + 24HO$ (or, by the new notation, $K_2Al_24SO_4.24H_2O$). Alum is largely manufactured, and is much used in preparing skins, as a mordant in calico-printing, and in glazing paper, and occasionally for the adulteration of bread.

Ammonia alum, $(NH_4)_2Al_24SO_4.24H_2O$, containing ammonium in place of potassium, has of late largely replaced potash alum in the arts, owing to the low cost of the ammonic sulphate prepared from gas liquor. The term alum is now applied to a class of isomorphous double sulphates containing a monad sulphate, a trivalent sulphate, and 24 molecules of water. The monad metals which are known to form alums are potassium, sodium, lithium, cæsium, rubidium, thallium, and silver, and also ammonium, etc.; the trivalent metals aluminium, iron, chromium, manganese. Next to the alums above mentioned, the most common is potassic-chrome alum, $K_2Cr4SO_4 24H_2O$. Ammonio-ferric alum is used in medicine and the arts.

Al'um Bagh, a fort in Oude, about 4 miles from Lucknow, was originally a palace surrounded by a fine garden and a park. During the mutiny of 1857 it was used as a fort by the Sepoys, from whom it was taken by the British under Outram and Havelock. It was afterwards defended with success by Sir James Outram and a garrison of 3500 men against the Sepoys.

Alu'mina, the oxide of aluminium, is the most abundant of all the earths, and is the principal constituent of clay. In 100 pounds of alumina there are 52.94 of aluminium and 47.06 of oxygen. Its symbol is Al_2O_3. In its common state this earth is a soft white powder, without taste, and in the crystalline form it occurs as sapphire and ruby, two of the hardest and most valuable of the precious stones. An impure alumina, which is found in the islands of the Grecian Archipelago, Asia Minor, and Chester, Mass., is the emery used as a polishing-powder for glass and metals, on account of its hardness. The clay of arable land is mostly produced by the disintegration of felspar, which is a compound of alumina, potash, and silica. Alumina has two properties which render it of great importance in the useful arts: one is that its silicate forms with water a plastic material adapted for pottery; the other is its strong affinity for coloring and extractive matter, by which it is useful as a mordant in printing calico and in dyeing.

Alumin'ium, or **Alu'minum,** a white metal which is the base of alumina, was discovered by Wöhler in 1828. Its symbol is Al; its equivalent is 13.7 (by the new notation, 27.4). Aluminium is ductile, tenacious, and very malleable, and remarkable for its sonorousness and levity. The specific gravity of aluminium when fused is only 2.56, but when it has been hammered or rolled it is 2.67. As this metal is not found in nature in a separate or metallic state, it was formerly very rare, and cost as much as gold, but the price has been reduced to ten dollars a pound or less. It is now obtained from a mineral called cryolite, which is a double fluoride of aluminium and sodium, and is imported in large quantities from Greenland. When this cryolite is mixed with an excess of soda and heated, the metal is readily separated. It is also obtained from bauxite, a mineral found near Les Baux, Provence, in the department of Bouches-du-Rhône. It is not oxidized by exposure to air

and moisture, and is not tarnished by sulphuretted hydrogen. Fused with copper, it forms useful alloys resembling fine brass, though much more beautiful, and specially adapted for gun-metal. An alloy with silver is also much used.

Alum'nus, plu. **Alumni** (fem. sing. **Alum'na,** plu. **Alumnæ**), a Latin word signifying a "foster-child," is applied in modern times to the graduates of a university or college, in order to express the relation between them and their ALMA MATER (which see). In Germany there were recently institutions called *alumnat*, founded for the gratuitous education of poor boys, termed alumni.

Alum Ridge, a township of Floyd co., Va. Pop. 1035.

Alum Root, a name of two species of plants, natives of the U. S., the *Gera'nium macula'tum* and the *Heuche'ra America'na*. Their roots are astringent, and are used in medicine.

Alum Shale, Alum Slate, or **Alum Schist,** consists of clay, combined with much iron pyrites and some bituminous or carbonaceous matter. From it the alum of commerce is obtained by a double decomposition, induced by burning the alum schist slowly until its condition is sufficiently changed, leaching, and then adding sulphate of potash or ammonia to the solution.

Al'unite, or **Alum-stone,** a mineral found in various localities, which was formerly largely used for the preparation of Roman alum. It is a basic sulphate of aluminium and potassium, $K_2Al_6(SO_4)_4(OH)_{12}$.

Alu'nogen, a mineral which has the composition of a simple sulphate of aluminium, $Al_2(SO_4)_3.18H_2O$.

Alu'ta, called also **Alt,** a rapid river of Transylvania, rises in the Carpathian Mountains, flows southward through Wallachia, and enters the Danube at Nicopolis. Length, 341 miles.

Al'va, or **Al'ba** (FERNANDO ALVAREZ DE TOLEDO), DUKE OF, a celebrated Spanish general, was born of a noble Castilian family in 1508. He entered the army in his youth, and accompanied Charles V. in his campaign against the Turks in 1530. In 1547 he gained a decisive victory over the German Protestants at Mühlberg. In 1555–56, as commander-in-chief of the army of Philip II., he defeated the French and papal forces in Italy. As a general he was inclined to pursue a Fabian policy. He was distinguished for cool determination and remorseless cruelty. In 1567 he was sent by Philip II. to the Netherlands with an army of about 10,000 veterans, to suppress the revolt of the Protestants. He established the "Council of Blood," beheaded Count Egmont after a mockery of a trial, and commenced a reign of terror and sanguinary persecutions of persons suspected of heresy. To defend the country against this bloody despotism, William, prince of Orange, raised an army in 1568, but the duke of Alva avoided a battle, and by delay compelled William to retire from the contest, because he could not pay his troops. Although Alva defeated or outgeneralled the Dutch patriots in war, he utterly failed to subdue or pacify them, and he was recalled in 1573. He boasted that he had put to death 18,000 persons in the Netherlands, besides those killed in battle. In 1580 he invaded and conquered Portugal. Died Jan. 12, 1583. (See PRESCOTT, "Philip II.," vol. ii.; MOTLEY, "History of the Dutch Republic.")

Al'va Planta'tion, a post-township of Aroostook co., Me. Pop. 496.

Alvara'do, a post-village of Washington township, Alameda co., Cal., on Alameda Creek, 6 miles from San Francisco Bay. Salt is here procured for market. P. 315.

Alvara'do, de (PEDRO), a Spanish general and adventurer, born at Badajos, went to America in 1518. He served with distinction under Cortez in the conquest of Mexico, and in 1520 was selected by Cortez to command in the city of Mexico during the absence of his chief, who marched against Narvaez. He conducted a successful expedition against Tehuantepec and Guatemala in 1523, and was appointed governor of Guatemala. After a voyage to Spain, he led an army across the Andes into the province of Quito, which he found already occupied by Pizarro. This chief induced Alvarado to retire by the payment of a large sum of money. Alvarado was killed in a fight with some natives in 1541.

Al'varez (FRANCISCO), a Portuguese priest, born at Coimbra, went to Abyssinia in 1515 in company with the Portuguese ambassador, Duarte Galvam. He passed about six years in that country, which he explored, and returned to Portugal in 1527. An interesting account of his travels was published in 1540, entitled a "True Account of the Country of Prester John." Died about 1540.

Alvarez (Don JOSÉ), an eminent Spanish sculptor, born at Priego, in the province of Córdova, in 1768. He gained a prize in 1799, after which he pursued his studies in Paris. He removed to Rome, where he passed many years, and was intimate with Canova. Among his works are "Orpheus Sleeping," "Antilochus and Memnon," and "Grupo Colosal de Zaragoza," which represents a scene in the defence of Saragossa. He was appointed court-sculptor to Ferdinand VII. Died at Madrid in 1827.

Alvarez (JUAN), a Mexican general, born in 1790. He was a leader of the insurgents who took arms against Santa Anna in the spring of 1854, and drove him from power in Aug., 1855. Alvarez became president of Mexico in October, but he resigned in December of the same year. During the French invasion of 1863–66 he was one of the most determined opponents of Maximilian and his party. Died in 1863.

Al'verson (JAMES LAWRENCE), LL.D., born at Seneca, N. Y., in 1816, graduated at Wesleyan University in 1838, was a successful teacher in the institutions at Elmira, Canandaigua, and Lima, N. Y., and was professor of mathematics in Genesee College (1849–64). Died Sept. 12, 1864.

Al'vinczy, von (JOSEPH), BARON, an Austrian general, born in Transylvania Feb. 1, 1735. He served with distinction in the Seven Years' war, and obtained the rank of lieutenant-field-marshal in 1789. In the summer of 1796 he took command of an army of about 55,000 men sent to oppose Bonaparte in Italy. He was defeated at Arcola in Nov., 1796, and at Rivoli in Jan., 1797, soon after which he was superseded in the command. Died Sept. 25, 1810.

Alvi'so, a post-township of Santa Clara co., Cal. Pop. 588.

Al'vord (BENJAMIN), A. M., an American officer, born Aug. 18, 1813, at Rutland, Vt., graduated at West Point 1833, paymaster-general U. S. A. Jan. 1, 1872, and brigadier-general U. S. volunteers April 15, 1862. He served chiefly at frontier posts 1833–54, in Florida war 1835–37 and 1841–42, engaged at Camp Izard, Oaklikaha, Thlonotosassa, and Big Cypress Swamp, as assistant professor at the Military Academy 1837–39, in Cherokee nation 1839–40, adjutant Fourth Infantry 1840, in military occupation of Texas 1845–46, in the war with Mexico 1846–47, engaged at Palo Alto and Resaca de la Palma (brevet captain), Paso Ovejas, National Bridge, Cerro Gordo (Aug. 15), Las Animas (brevet major), and Huamantla, and, upon being transferred from the infantry to the pay department, as chief paymaster of the department of Oregon 1854–62. In the civil war was in command, as brigadier-general of volunteers, of the district of Oregon. Brevet lieutenant-colonel, colonel, and brigadier-general U. S. A. Aug. 9, 1865, for faithful and meritorious services. Since has been paymaster in New York City 1865–67, and chief paymaster of the district of Omaha and Nebraska 1867–72; and is now paymaster-general U. S. A., head-quarters at Washington, D. C. Author of a memoir on the "Tangencies of Circles and of Spheres," 1855, "The Interpretation of Imaginary Roots in Questions of Maxima and Minima," 1860, and of numerous essays and reviews, 1833–73.

GEORGE W. CULLUM, *U. S. Army.*

Alyat'tes [Gr. Ἀλυάττης], a king of Lydia, who ascended the throne about 618 B. C., was the father of Crœsus. During a battle between him and Cyaxares of Media an eclipse of the sun occurred, and made such an impression that they ceased fighting and made a treaty of peace. Some astronomers identify this eclipse with that of 610 B. C. Died about 560 B. C.

Al'zei, an old city of Germany, in the grand duchy of Hesse, on the Selz, 19 miles S. of Mayence. It has a real-schule. Alzei and the vicinity is the scene of the events of the Nibelungenlied. Pop. in 1867, 5102.

Al'zog (JOHANNES BAPTIST), a German Catholic theologian, born at Ohlau, in Silesia, in 1808, became in 1853 professor of ecclesiastical history at Freiburg. His "Manual of Universal Church History" ("Handbuch der Universalkirchengeschichte," 1840; 9th edit. 1872, two vols.) has been translated into the principal European languages.

Amade'us [It. *Amede'o* or *Amade'o*], the name of nine counts and dukes of Savoy, the first of whom was a son of Count Humbert, and lived in the eleventh century. —AMADEUS V., count of Savoy, a son of Count Thomas II., was born in 1249. He succeeded his uncle Philip in 1285, increased his dominions by marriage, and was the first prince of Savoy that made any considerable figure in history. Died in 1323.—AMADEUS VI., of Savoy, was born in 1334, and became count in 1343. He was an able and successful ruler, defeated the French in battle in 1354, and added a part of Piedmont to his dominions. Died in 1383.

Amadeus VIII., duke of Savoy, a grandson of the preceding, was born in 1383, and succeeded his father in 1391. He received the title of duke from the emperor

Sigismund in 1416. In 1434 he resigned his power to his son Louis, and retired to the monastery of Ripaille. Having a high reputation for wisdom, he was chosen pope by the Council of Bâle in 1439, and took the name of Felix V. As Eugenius IV., who had been deposed by that council, was still recognized as pope by a strong party, a schism ensued in the Church. Felix V. resigned the papacy in 1448, and died in 1451.

Amade'us [It. *Amede'o;* Fr. *Amédée*], king of Spain, a son of Victor Emmanuel, king of Italy, was born May 30, 1845. He received the title of duke of Aosta, and married, in May, 1867, Marie Victoire Charlotte, a daughter of the prince dal Pozzo della Cisterna. On the 16th of Nov., 1870, the Spanish Cortes, by a vote of 191 against 98, elected him king of Spain, the throne of which had been vacant for two years. It had been offered to several foreign princes, who declined. Amadeus accepted it, and arrived at Madrid Jan. 2, 1871. Feb. 11, 1873, he abdicated the throne and the republic was proclaimed.

Am'adis of Gaul, or **Am'adis de Gaul'a,** a celebrated hero of romance, was called a son of the fabulous King Perion of France. The story of his adventures, entitled "Amadis de Gaula," was written by Vasco de Lobeira, a Portuguese, in the fourteenth century. This work, which has been translated into several languages, is commonly admitted to be the best of all the romances of chivalry. There were other fictitious heroes of romance, called Amadis of Greece and Amadis of Trebizond.

Amador', a county of the E. central part of California. Area, about 600 square miles. It is bounded on the N. by the Cosumne River, and on the S. and S. E. by the Mokelumne. The surface is hilly or mountainous. This county contains mines of gold and copper, and quarries or beds of marble. Cattle, grain, wool, and wine are produced. Capital, Jackson. Pop. 9582.

Amador, a post-village of Amador co., Cal., on Amador Creek, 6 miles N. W. of Jackson.

Amador, a township of Chisago co., Minn. Pop. 77.

Am'adou ("German tinder"), a name given to several species of fungus called agarics, growing on oak and ash trees in Europe. The hard amadou (*Polyp'orus igniа'rius*) and the soft amadou (*Polyp'orus fomenta'rius*) are used for tinder, and applied to wounds as styptics. Some varieties are prepared for tinder by charging them with saltpetre.

A'mager, a small island of Denmark, adjoining the harbor of Copenhagen, is partly occupied by a suburb of that city. Area, 22 square miles. Here are gardens which supply that capital with vegetables, and a large chemical factory. Pop. 6500.

Am'alek, a grandson of Esau and one of the chieftains of Edom (Gen. xxxvi. 12, 16). A remnant of his posterity existed in the time of Hezekiah (1 Chron. iv. 43).

Amal'ekites, a nomadic and warlike people, occupying, at the time of the Exodus, the Sinaitic peninsula and the wilderness between Egypt and Palestine. Opposing the march of the Israelites, they were signally defeated at Rephidim. Centuries later, they were severely punished by Saul, and finally destroyed by David.

Amal'fi, an ancient and decayed city and seaport of Southern Italy, on the Gulf of Salerno, 25 miles S. E. of Naples. During the several centuries of the Middle Ages it was a great commercial emporium and the capital of a republic. It is the seat of an archbishop. Its situation is rocky and very picturesque. Amalfi was the birthplace of Masaniello and of Flavio Gioja, called the inventor of the mariner's compass. Pop. in 1861, 4186.

Amal'gam [perhaps from the Gr. μάλαγμα, a "poultice"], a combination or alloy of mercury with another metal. Some amalgams are definite chemical compounds. Glass plates are converted into mirrors or looking-glasses by covering one surface with an amalgam of tin. Gold and silver are dissolved in mercury, and form amalgams which are used in the processes of gilding and plating various objects.

Amalgama'tion, the act or process of combining mercury with another metal, applied especially to the process of separating gold and silver from the quartz rock in which they are found imbedded. The quartz is first crushed, and then shaken in a barrel or machine in contact with mercury, which unites with and collects the small particles of gold or silver. The precious metal is afterwards easily separated from the amalgam by the application of heat.

Ama'lie, or **Ame'lia** (Anna), duchess of Saxe-Weimar, a daughter of the duke of Brunswick-Wolfenbüttel, was born Oct. 24, 1739. She was married in 1756 to Ernest, duke of Saxe-Weimar, who died in 1758. She was a generous patron of men of genius, and attracted to her court the greatest German authors, including Goethe, Wieland, Schiller, and Herder. She died April 10, 1807.

Amalie (Marie Friedrike Auguste), duchess of Saxony, a sister of Frederick Augustus II., was born in 1794. She wrote a number of dramas performed with success, among which are "The Marriage Ring," "The Coronation Day," and "Falsehood and Truth." Died Sept. 18, 1870.

Amalrich of Bena. See Appendix.

Amalthe'a, or **Amaltheia** [Gr. Ἀμαλθεία], in classic mythology, the name of the nurse of Jupiter. This nurse was supposed to have been a goat, the horn of which, broken off by Jupiter, was endowed by him with magical power, and became famous as the cornucopiæ, or the "horn of plenty."

Amamba'hi, or **Amamba'y,** a South American mountain-range, is about 200 miles long, and forms the watershed between the Paraná and the Paraguay rivers. The river Amambahi rises in this range, flows eastward about 100 miles, and enters the Paraná.

Amana, a township of Iowa co., Ia. Pop. 1441.

Aman'da, a township of Allen co., O. Pop. 1376.

Amanda, a post-village and township of Fairfield co., O., 130 miles from Cincinnati. Pop. of township, 1547.

Amanda, a township of Hancock co., O. Pop. 1469.

Amani'ta [Gr. ἀμανῖται], a genus of fungi nearly allied to *Agar'icus,* from which is derived a poisonous principle called *amanitine.* The *Amani'ta musca'ria,* a native of Europe, is very poisonous, and is used to kill flies.

Amapa'la, a city and seaport of Honduras, is situated on Tigre, the most important island of the Bay of Fonseca, which contains a number of excellent harbors. The chief articles of export are tobacco, hides, precious woods, and indigo. Pop. about 1000.

Amar (J. P.), a French Jacobin notorious for his cruelty, was born at Grenoble in 1750. He became a member of the Convention in 1792, voted for the death of the king, and in Oct., 1793, presented to the Convention a report which condemned to death twenty-two Girondists. He contributed to the ruin of Robespierre on the 9th Thermidor, 1794. Died in Paris in 1816.

Am'aranth [Lat. *amaran'thus;* Gr. ἀμάραντος, *i. e.* "unwithering," from α, priv., and μαραίνω, to "wither"], a flower which does not wither or fade; also the poetical name of an imaginary flower, considered as an emblem of immortality; a genus of plants of the order Amaranthaceæ, has in some species richly colored flowers, that are scarious, persistent, and not liable to wither. The *Amaran'thus cauda'tus* ("prince's feather"), "love-lies-bleeding," and other exotic species are cultivated in the gardens of the U. S. Several other unsightly species are naturalized as weeds.

Amarantha'ceæ [from *Amaran'thus* or *Amaran'tus,* one of the genera], a natural order of plants comprising about 300 species, which are mostly natives of tropical countries. They are herbaceous or fruticose, with simple leaves, and dry persistent flowers in heads or spikes. This order includes, besides the genus *Amaranthus,* the *Gomphrena globosa* (globe amaranth), the purple flowers of which retain their beauty for several years.

Am'arapoo'ra, or **Ummerapoora,** a fortified city of Burmah, on the Irrawadi River, about 8 miles N. E. of Ava. It was formerly the capital of Burmah, and had a population of about 179,000, but after the seat of government was removed in 1819 it rapidly declined. The houses are mostly built of bamboo. Pop. in 1870, estimated at 90,000.

Am'ara-Sing'ha, or **-Sin'ha,** an eminent Hindoo poet and grammarian, of unknown period, is supposed by some to have lived about 50 B. C. He belonged to the sect of Buddhists, and wrote works which were all destroyed by the Brahmans, except his "Amara Kosha," which is a vocabulary of about 10,000 Sanscrit words.

Ama'ri (Michele), an Italian historian, born at Palermo in 1806. His chief work is "The War of the Sicilian Vespers" (2 vols., 1842), which was very popular, but was proscribed by the government. He escaped to France, and acted a prominent part in the revolution of Sicily in 1848. After the defeat of the Italian patriots in 1849 he became a resident of Paris. During the dictatorship of Garibaldi, in 1859, he was minister of foreign affairs; subsequently he became a member of the Italian senate, and in 1863 minister of public instruction. He resigned in 1864. Among his other works are a "History of the Mussulmans of Sicily" (1853–72, 3 vols.), and "I Diplomi Arabi del Archivo Fiorentino" (1863).

Amaryllida'ceæ (so called from *Amaryl'lis,* one of its genera), a natural order of endogenous herbaceous plants,

which generally have beautiful flowers and bulbous roots. The species of this order are very numerous, and most abundant in tropical regions, especially near the Cape of Good Hope. It comprises the *Amaryllis*, the *Narcissus*, the *Fourcroya*, the *Nerine*, the *Cobaegia*, the *Agave*, *Snowdrop*, etc. The U. S. have several genera.

Amaryl'lis (gen. **Amaryl'lidis**), a genus of bulbous-rooted plants of the natural order Amaryllidaceæ. They have beautiful flowers, with six stamens. The *Amaryl'lis formosis'sima* and *Amaryl'lis amab'ilis* are cultivated in gardens, and much admired. The Atamasco lily (*Amaryllis Atamasco*) is a native of the U. S.

Ama'sia, Amasieh, or **Amasiyah,** a city of Asia Minor, on the Yeshil-Irmak, 355 miles E. of Constantinople. It contains nearly 4000 houses, many of which are of stone, a strong citadel, and a fine mosque. Silk is produced here and is exported. Strabo was a native of Amasia, which was formerly the capital of the kings of Pontus (which see). Pop. between 20,000 and 25,000.

Ama'sis, a famous king of Egypt, who succeeded Apries about 570 B. C., was more friendly to the Greeks and other foreigners than his predecessors. Under his reign Egypt enjoyed peace and prosperity. He built some magnificent monuments at Memphis, his capital. He died about 525 B. C., and was succeeded by his son, Psammenitus.

Am'athus [Gr. Ἀμαθοῦς], an ancient city of Cyprus, especially addicted to the worship of Venus, who was hence called Amathusia.

Ama'ti (Andrea), an Italian who lived at Cremona about 1550, made excellent violins, which are equal or superior to any made in the present time.—Antonio, a son of the preceding, was born about 1565. He was a celebrated maker of violins. Died 1635.—Nicolò, Antonio (1550–1635), and Geronimo, all excelled in the art, but Nicolò, junior (born Sept. 3, 1596, died Aug. 12, 1684), excelled the rest of the family in the number and quality of his violins.

Amatitlan', or **Amatitan',** a town of Central America, in Guatemala, 19 miles S. W. of the city of Guatemala, and near the lake of the same name; lat. 14° 28′ 39″ N., lon. 90° 37′ 50″ W. The houses are made of mud, and are only one story high. Wells of boiling hot water occur in this vicinity. The chief business of this town is the production of cochineal. Pop. about 7000.

Ama'to, d' (Giovanni Antonio), an Italian historical painter and theologian, called the Elder, was born at Naples in 1475. He painted religious subjects, and no others, in a style which resembled that of Perugino. Among his works is a "Dispute on the Sacrament." Died in 1555.—His nephew of the same name, surnamed the Younger, born at Naples in 1535, was an able painter. He excelled in coloring. Died in 1598.

Amauro'sis [Gr. ἀμαύρωσις, from ἀμαυρόω, to "darken"], a term formerly much employed to designate total or partial blindness dependent upon diseases of the optic nerve, either at its origin, in its course, or in the retina; the last-mentioned seat of the disease being by far the most frequent. If the local disease be temporary or functional, the sight will probably be regained, but in the majority of cases there is no such hope. It may arise from many causes, one of the most remarkable of these being the existence of Bright's disease; and in cases resulting from this cause there is an organic change in the structure of the retina, readily discernible by the aid of the ophthalmoscope. Amaurosis sometimes comes on at once, but is generally gradual in its attack. The treatment varies with the extremely various pathological conditions. Active treatment is seldom called for, and no item in the cure of this disease is more important than strict attention to the hygienic condition.

Amau'ry (or **Amal'ric**) **I.** [Lat *Amalri'cus*], king of Jerusalem, a son of Baldwin II., was born in 1135. He began to reign at the death of his brother, Baldwin III., in 1162 or 1163. In 1168 he invaded Egypt, from which he was soon forced to retreat by Saladin, who in turn invaded Amaury's dominions in 1170. Died July 11, 1173.

Amaury II., sometimes called **Amaury de Lusignan,** became king of Cyprus as heir of his brother Guy, and took the title of king of Jerusalem in 1194. His dominions were occupied by the victorious Saracens, so that his reign was only nominal. Died in 1205.

Amaxichi, the capital of the Ionian island of Santa Maura (or Leucadia), is on its E. coast. It has a lighthouse, and a harbor adapted for small vessels. It is the residence of a Greek archbishop. Pop. about 4000. Earthquakes often occur here. The remains of cyclopean walls are found in the vicinity.

Amazi'ah, king of Judah, succeeded his father Joash about 837 B. C. He waged war with success against the Edomites, and reigned twenty-eight or twenty-nine years. He was killed by conspirators in 809 B. C.

Am'azon, Marañon', or **Orellana,** a South American river, and the largest river on the globe, rises among the Andes in Peru. It is formed by the union of several large head-streams called the Beni, Apurimac, Ucayale, and Tunguragua, which last is the most western branch, and is sometimes called the Upper Marañon. Geographers have not unanimously decided which of these is the main stream. The Apurimac, the most southern of all the branches, rises about lat. 15° S.

According to the statements of recent explorers, this river is known under three different names in different parts of its course; from its mouth to the mouth of the Rio Negro it is called the Amazon or Amazonas; from the mouth of the Rio Negro, through Ecuador, to Tabatinga, on the borders of Ecuador, it is known as the Solimoës or Solimoens; and from Tabatinga to its source in the Andes, it is called the Marañon. The Amazon, from its junction with the Napo in Ecuador, has a nearly due eastern course, varying therefrom not more than two or three degrees throughout its whole length; it is therefore almost wholly in the same latitude, which is not the case with any other river of large size on the globe. It is also entirely within the tropics, and only about three or four degrees from the equator, but the climate is not so hot and sickly as might, from this, be supposed, the average temperature being 84°, and the extremes 72° and 92°. The waters of the river, owing to the white clay which they contain, are turbid and of a milky color. Those, however, which rise in the woody plains have their waters black or of a dark amber color, and in some cases of a deep green, being dyed by the vegetable matter found so abundantly along their banks. This mighty stream, flowing through Ecuador and the boundless forests of Brazil, and increased to an immense volume by the great tributaries that enter it from the right and from the left, empties itself into the Atlantic Ocean under the equator. Its whole length is about 3500 miles, and the area of the countries which it drains is estimated at 2,264,000 square miles or more. It is said to be four miles wide at the mouth of the Japura, more than 1000 miles from the sea. The navigation of the Upper Amazon is obstructed by cataracts. One of the most interesting facts, indeed, connected with the Amazon, is the smallness of its fall; at a distance of 3000 miles from its mouth the elevation is only 210 feet; the descent is therefore considerably less than an inch to the mile. According to Lieut. Herndon, the river and its Ucayale branch are navigable for a distance of about 3300 miles from the ocean. The Tunguragua is likewise navigable for many miles above the mouth of the Ucayale. Vessels can also pass from the Amazon, through the Rio Negro and the Casiquiare, into the Orinoco. It is estimated that the Amazon and its affluents open to the ocean 10,000 miles of interior navigation for large vessels. The tide ascends it over 400 miles, and about the time of full moon the great tidal wave which passes round the globe from E. to W. rushes into the mouth of the river with such violence that it raises the water nearly fifteen feet high. This wave, which is very dangerous to small vessels, is called *bore* in English and *pororoca* by the natives. The river abounds, in some parts, in turtles, whose eggs yield a valuable oil. The principal affluents from the right are the Ucayale, the Yurua, the Purus, the Madeira, the Tapajos, and the Tocantins. Those that enter it from the left are the Napo, the Putumayo, the Japura, and the Rio Negro. During the rainy season the Amazon overflows its banks and submerges a large extent of country. It is well supplied with fish, and flows through a region of great fertility, which is densely covered with primeval and almost impassable forests, in which jaguars, panthers, pumas, monkeys, tapirs, and other wild animals abound. The river encloses numerous large islands, besides that named Joannes or Marajo, which is 150 miles in diameter. This island divides the mouth of the river into two channels, one of which is nearly 100 miles wide. The mouth of the Amazon was discovered by Yanes Pinçon in 1500, but the first European who explored the river was Orellana, in 1539. Among the recent voyages of exploration are those of Lieutenant Herndon in the employ of the U. S. government, in 1850, of the Brazilian government in 1862–64, and of Prof. Agassiz, who discovered 1163 new species of fish, in 1867. Since 1867 the river has been opened for trade to all nations. The dense forest that covers the whole valley of the Amazon is a remarkable feature. (See Herndon and Gibbon, "Exploration of the River Amazon," 2 vols., 1853–54; Agassiz, "A Journey in Brazil," 1867; and the publications of Orton, Hartt, C. B. Markham, Wallace, Myers, and Hassaurek.)

A. J. Schem.

Amazo'nas, or **Al'to Amazo'nas,** a province in

Northern Brazil, is bounded on the N. by Dutch and British Guiana and Venezuela, on the E. by the province of Para, on the S. by Bolivia and Matto Grosso, and on the W. by the United States of Colombia, Ecuador, and Peru. Area, about 574,000 square miles. It consists chiefly of forests, inhabited by independent tribes of Indians. The entire civilized population amounted, according to a census of 1862, to 40,259; according to an official work published in 1867 ("l'Empire du Brésil"), to 95,000 free persons and 5000 slaves. Capital, Barra do Rio Negro.

Amazonas, a department of Peru, is bounded on the N. by Ecuador, on the E. by Loreto, on the S. by Junin, and on the W. by Caxamarca and Libertad. The soil is fertile, but, owing to the thinness of the population, very little is done to cultivate it. Straw hats of a superior quality are made here and exported. Chief town, Chachapoyas. Pop. about 38,000.

Am'azons [Lat. *Ama'zones;* Gr. Ἀμαζόνες, perhaps meaning "without breasts;" they are said to have cut off the right breast, which interfered with their aim in archery], female warriors; a semi-fabulous nation of martial women which was celebrated by the ancient Greek poets. According to tradition, they lived in Asia Minor, and fought against the Greeks at the siege of Troy, where they were commanded by their queen, Penthesile'a. Another queen of the Amazons, named Thalestris, is said to have made amorous overtures to Alexander the Great. The battles of the Amazons were favorite subjects with ancient Greek painters and sculptors.

Ambale'ma, a town in the United States of Colombia, in the state of Cundinamarca, on the Magdalena, about 50 miles W. of Bogotá. Excellent tobacco is produced in the neighborhood. Pop. about 9700.

Ambal'la, a city in the East Indies, in the Northwestern Provinces. Pop. about 22,000. Here a treaty was concluded between the governor-general of India, Lord Mayo, and the emir Shere Ali of Afghanistan in 1869.

Ambarva'lia [derived from a Latin term, *ambi're ar'va, i. e.* to "go round the fields"], applied to a religious festival observed by the ancient Romans in the month of May, in order to propitiate Ceres and invoke her blessing on the coming harvest. It was so called from the victims being carried round the fields by the priests.

Ambas'sador, or **Embassador** [Fr. *ambassadeur;* It. *ambasciato're;* originally, a "servant" or "minister"], a diplomatic minister of the highest order, sent by a prince or nation to the court of another power to manage special affairs of state. He is expected not only to be the agent of his government, but to represent the power and dignity of his sovereign or his country. By the law of nations he and his suite are entitled to peculiar privileges and immunities. They, as well as other diplomatic agents, are exempt from the control of the municipal laws of the country in which they perform their duties, and are not amenable to punishment for acts which are only *mala prohibita* (*i. e.* "evils or offences [merely] prohibited by statute"), and not *mala per se* (*i. e.* "things evil or criminal in themselves"). They are usually exempt from direct taxation, and are allowed to import goods without paying custom-house duties. The word ambassador is recognized as an official title of the highest rank of diplomatic service of the U. S. (See INTERNATIONAL LAW No. I., by PRES. T. D. WOOLSEY, S. T. D., LL.D.)

Amba'to, a town of Ecuador, 65 miles S. S. W. of Quito, has an active trade in grain, sugar, and cochineal. It was destroyed in 1698 by an eruption of Cotopaxi, but was soon rebuilt. Pop. estimated at 13,000.

Am'ber [Lat. *suc'cinum;* Fr. *ambre;* Gr. ἤλεκτρον], a fossil resin, usually of a pale-yellow color, sometimes nearly transparent. It is found in many parts of the world in deposits of cretaceous or more recent age, and is now known to be the resinous exudation from several species of extinct coniferous trees, of which one, called *Pinites succinifer*, is supposed to have produced the greater part. Over 800 species of insects have been found preserved in amber, and leaves or other fragments of 163 species of plants. Amber is extensively used for ornaments, and especially for the mouth-pieces of pipes, the consumption being greatest in Eastern Europe, Turkey, Persia, etc. Fine pieces of it are worth more than their weight in gold. The largest mass known is in the Cabinet at Berlin; its weight is eighteen pounds, and it is valued at $30,000. Most of the amber of commerce is obtained from the shores of the Baltic, between Königsberg and Memel. Small pieces are frequently found in the green sand of Gay Head and New Jersey, and in the cretaceous coals of the far West. Amber was highly prized and much used by the ancients. It was one of the chief articles of commerce among nations. It was the special object of many of the voyages of the Phœnicians, and it was an article of exchange long anterior to the dawn of history, as we know by its frequent occurrence in the remains of the lake-dwellings of Switzerland.

Amber exhales a fragrant odor when burned, and was formerly in high repute as a medicine. An acid obtained from it (succinic) is a useful agent in chemical operations. When rubbed, amber becomes strongly electro-negative, and the first exhibition of electric force which received intelligent attention was the attraction exerted on light bodies by amber. This force, at first supposed to be possessed by amber alone, took the name of that substance, ἤλεκτρον, from which "electricity" is derived.

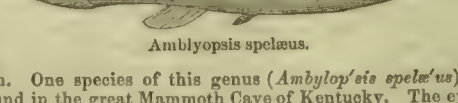
Amber, a post-township of Mason co., Mich. P. 392.

Am'berg, a walled town of Bavaria, on the river Vils, 39 miles E. of Nuremberg, was formerly the capital of the Upper Palatinate. It is well built, and has a gymnasium, a normal school, and a large public library; also a royal manufactory of muskets, and several breweries and potteries. The French Republican army under Jourdan was defeated near this town by the archduke Charles, commanding the Austrians, in 1796. Pop. in 1871, 11,688.

Am'bergris [from the Fr. *ambregris, i. e.* "gray amber"], a peculiar perfume, a gray substance found floating on the sea or lying on the sea-coast, and in the intestines of the spermaceti whale (*Physe'ter macroceph'alus*). It is supposed to be a morbid secretion of this animal. When heated or dissolved in alcohol it emits a peculiar and agreeable odor, not easily described or imitated, and exceedingly diffusive. It has also the remarkable power of increasing the odor of other perfumes. The price of it is about five dollars an ounce. It affords about 85 per cent. of a peculiar fatty and crystalline substance called *ambrein*. The specific gravity of ambergris is about 0.8.

Ambergris (so called from the ambergris found on its shores), a barren island in the Gulf of Mexico, belonging to Yucatan, is 30 miles long from N. E. to S. W., and 3 miles wide.

Ambert, a town of France, in the department of Puy-de-Dôme, on the river Dore, 37 miles S. E. of Clermont. It has extensive manufactures of paper and silk ribbons. Pop. in 1866, 7519.



Ambidex'ter [from the Lat. *am'bo,* "both," and *dex'ter,* "right-handed"], a person who uses both hands with equal facility. The proportion of such persons in the world is small. The term is sometimes applied to a double-dealer, and to a juror who takes a bribe from each party in a lawsuit.

Ambi'orix, a famous Gallic chief who ruled over the Belgic tribe of Eburones, and waged war against Julius Cæsar. By insidious measures and stratagem he gained a decisive victory over the Roman generals Sabinus and Cotta, whose army he annihilated in 54 B. C., during the absence of their commander. He was afterwards signally defeated by Cæsar. (See CÆSAR'S "Gallic War," book v.)

Am'bitus [from the Lat. *am'bio, ambitum,* to "go round"], a term used by the ancient Romans to designate the going about and soliciting votes by candidates for office. The practice of offering one's self as a candidate in an open and honorable way was called *am'bitus popula'ris.* Another kind, which was common, but disreputable, consisted in cajolery, bribery, etc.

Ambleteuse, a decayed seaport of France, on the English Channel, 6 miles N. of Boulogne, and about 25 miles from the English coast. Here James II. of England landed after his abdication in 1689, and here Napoleon I. erected a granite column in honor of the grand army in 1805.

Amblyop'sis [from the Gr. ἀμβλύς, "blunt," "dulled," and ὄψις, "vision"], the term applied to a genus of blind

Amblyopsis spelæus.

fish. One species of this genus (*Amblyop'sis spelæ'us*) is found in the great Mammoth Cave of Kentucky. The eyes of this fish, though seemingly absent, exist in a rudimentary state, enclosed beneath the epidermis. The amblyopsis is quite small, the largest specimens averaging from four and a half to five inches in length. The body is nearly white, and partly covered with scales. Prof. Cope, describing the habits of these fish, says, "They are easily taken by the hand or net if perfect silence be preserved, for they are unconscious of the presence of an enemy except through the sense of hearing. This sense is, however, evidently very acute, for at any noise they turn suddenly

downward and hide beneath stones, etc. on the bottom." Their food consists in a great part of the crayfish found in the cave, but they sometimes feed on other fish, in the pursuit of which they show remarkable activity, thus proving that the tactile sense is well developed. According to Prof. Cope, the amblyopsis belongs to the order Haplomi, its nearest kindred being minnows, pickerels, and herrings. The *Amblyopsis spelæus* is not confined to this cave alone, but has also been found in two or more places north of the Ohio. (See an interesting account of the Blind Fishes of the Mammoth Cave in the "American Naturalist" for Jan., 1872.)

Am'bo [Gr. ἄμβων], a reading-desk or pulpit which was common in ancient Christian churches, and is still found in Oriental churches. The Gospels and Epistles were read from the ambo.

Amboina. See Amboyna.

Amboise (anc. *Ambacia*), an old town of France, in the department Indre-et-Loire, on the railway from Orleans to Tours, 14 miles by rail E. N. E. of Tours. It is celebrated as the place of imprisonment of Abd-el-Kader from 1848–52. Here the "Conjuration d'Amboise," a conspiracy of the Huguenots against the Guises, was formed in 1560. It has been the residence of several of the kings of France. Pop. in 1866, 4188.

Amboise, d' (Georges), Cardinal, a French statesman, born at Chaumont-sur-Loire in 1460. He became archbishop of Rouen in 1493, and a faithful adherent of the duke of Orleans, who, on ascending the throne as Louis XII. in 1498, chose him for his prime minister. He became a cardinal in 1499. He was an able administrator and a prudent counsellor. He retained power until his death, Mar. 25, 1510.

Am'boy, near the centre of Lee co., Ill., at the crossing of the Illinois Central and Chicago and Rock Fall R. Rs., 91 miles almost due W. of Chicago. It has one weekly paper, seven churches, a fine public hall, four free-school buildings, two flouring-mills, three grain elevators; the Illinois Central shops, employing over 400 hands; is division head-quarters of the Illinois Central road from Dunleith to Centralia; was laid out in 1854. Pop. 2825; of Amboy township, 1279.

W. H. Haskell, Ed. "Amboy Journal."

Amboy, a post-township of Hillsdale co., Mich. Pop. 1160.

Amboy (N. J.). See South Amboy.

Amboy, a township of Oswego co., N. Y. Pop. 1431.

Amboy, a township of Fulton co., O. Pop. 1089.

Amboy'na, or **Amboi'na** [Malay, *Amboon'* or *Ambun*], the most important, though not the largest, of the Moluccas or Spice Islands, situated E. of Booro, in lat 3° 46′ S., lon. about 128° E. It is about 30 miles long, and has an area of 282 square miles. The surface is mountainous, and granite rock occurs on the summits of some of the mountains. The staple production is cloves, the trade in which was once monopolized by the Dutch. About 500,000 pounds of cloves is the average quantity annually produced here. This island belongs to the Dutch. Pop. 30,000.

Amboyna, the capital of the Dutch government of Amboyna, is on the island of the same name, and is defended by Fort Victoria. It is regularly built, has a public garden and a good harbor. Pop. about 9000.

Ambra'cia, a town of ancient Greece, on the site of the modern Arta, was the capital of Epirus during the reign of King Pyrrhus, who was killed 272 B. C.

Am'briz, a small native kingdom on the W. coast of Africa. Its capital is Quebranza. The port of Ambriz, about 70 miles N. of Loando, at the mouth of the Ambris River, has considerable trade.

Am'bros (August Wilhelm), a German composer, born Nov. 17, 1816, became in 1869 professor of music in the University of Prague. Among his works are overtures to "Genofeva" and "Othello," and a "History of Music" ("Geschichte der Musik," vols. i.–iii., 1862–68).

Am'brose [Lat. *Ambro'sius*], Saint, one of the Latin Fathers of the Church, was born in Gaul about 340 A. D. He was a son of the Roman prefect of Gaul, and is supposed to have been born at Treves. Having studied law, he was appointed governor of Liguria and Milan about 370, and distinguished himself in that position by his wisdom and moderation. On the death of the bishop of Milan, in 374 A. D., a violent contest ensued between the Catholics and Arians about the choice of his successor. By general consent, Ambrose, who was not obnoxious to either party, was elected bishop, although he had never been a priest. He accepted the office with reluctance, and performed its duties with great ability and zeal. He favored the Catholics and earnestly opposed Arianism, but he does not appear to have been a violent persecutor. On several occasions he manifested moral courage by denouncing the sins and checking the arrogance of temporal rulers and potentates. The emperor Theodosius the Great having ordered a massacre of the Thessalonians in 390, Ambrose forbade him to enter the church, and excluded from him the performance of a public penance. Died in 397 A. D. He was the author of a method of singing called the "Ambrosian Chant," and left numerous religious works and letters. He is commended by Villemain as "a man who, amidst the turbulence and instability of the empire, never had a fickle or a stain on his character, and whose magnanimity was adequate to all trials."

Ambro'sia [from the Gr. ἄμβροτος, "immortal"], in classic mythology, "the food of the gods," which was supposed to confer immortal youth. According to a poetical legend, it was sometimes given to mortals who were favorites of the gods, and was used by Jupiter and Venus to anoint their hair. Ambrosia is also the name of a genus of weeds, one species of which, common in the U. S., is known by the name of hogweed or Roman wormwood.

Ambro'sian Chant, the choral music of the early Christian Church, derived its name from Saint Ambrose, bishop of Milan, who introduced it into the Western Church about 386 A. D. The style of singing was Greek; the musical notation was, no doubt, borrowed from the Greek, and adapted to the church services to relieve their monotony. The Ambrosian chant is the foundation of church music.

Ambrosian Library, a library founded at Milan in 1609 by Cardinal Federigo Borromeo, and named in honor of Saint Ambrose, the patron saint of that city. It contains over 90,000 printed volumes and 15,000 manuscripts, including some rare palimpsests discovered by Angelo Mai, and a MS. of Virgil enriched by marginal notes of Petrarch.

Ambula'cra [from the Lat. *am'bulo*, to "walk"], a name of the peculiar organs of locomotion of the starfish and sea-urchin; the narrow longitudinal portions of the shell of the sea-urchin (*Echinus*), which are perforated by small orifices, giving passage to tentacular suckers.

Am'bulance [probably from the Lat. *am'bulo*, to "walk" or "move slowly," because a gentle motion was necessary for the wounded], a military term applied in France to a movable hospital which is attached to each division of an army, and furnished with apparatus for the relief of the sick and wounded. It was invented or improved by Baron Larrey. The name is now commonly given to a covered vehicle by which wounded men are removed from the field of battle. Improvements were made in the construction of ambulances by the Americans in the civil war of 1861–65, the excellence of which was recognized by their use during the Franco-German war of 1870.

Ambulance Corps, a body of men employed in the British army in the Crimean war to drive ambulances and attend the sick and wounded. The experiment was not successful, and the ambulance corps was superseded by the land transport corps. In the late civil war of the U. S. the officers and men of the ambulance corps were detailed from the line.

Amelan'chier, a genus of plants of the natural order Rosaceæ, comprises a small number of species, natives of Europe and North America. The *Amelanchier Canadensis*, called June-berry or service-berry, is a shrub or small tree which bears a pleasant fruit, and is sometimes cultivated in the U. S.

Ame'lia (anc. *Ame'ria*), a town of Italy, 22 miles S. W. of Spoleto, has a cathedral and is a bishop's see. *Ameria* was one of the oldest cities of ancient Umbria, and has well-preserved cyclopean walls. Pop. about 5000.

Ame'lia, a county of S. E. Virginia, has an area of 300 square miles. It is bounded by the Appomattox River on nearly all sides except the S. The surface is diversified, the soil fertile. The county is intersected by the Richmond and Danville R. R. Grain, tobacco, and wool are produced. Capital, Amelia Court-house. Pop. 9878.

Amelia, a township of Orangeburg co., S. C. P. 2040.

Amelia Court-house, a small post-village, the capital of Amelia co., Va., on the Richmond and Danville R. R., 36 miles W. S. W. of Richmond.

Amelia Island, in the Atlantic, is a part of Nassau county, which forms the N. E. extremity of Florida. It is 16 miles long and 4 miles wide. The town of Fernandina is near the N. extremity. Amelia Island light, in lat. 30° 40′ 23″ N., lon. 81° 28′ 20″ W., is at the N. end of the island. The lighthouse is of brick, 58 feet high, and shows a flashing white light 112 feet above the sea.

Amen' [Heb. אָמֵן, signifying "So be it," or "Let it be irrevocably fixed;" Gr. Ἀμήν, "verily," "of a truth"], has been adopted in the service of the Christian Church as a

response and an expression of assent at the end of a prayer. In some passages of the New Testament at the beginning of an emphatic declaration, it is translated "verily."

Amende Honorable, in French law, a form of infamous penalty to which criminals who offended against public decency or morality were condemned. The simple *amende honorable* consisted of a confession in open court made by a bareheaded and kneeling criminal. The *amende honorable in figuris* was made by a culprit kneeling in his shirt, with a torch in his hand and a rope round his neck. In modern speech the term is applied to a public recantation or apology.

Amend'ment, in law, is the correction of an error committed in any process, or the alteration of the record or of any pleadings in a civil or criminal cause. The deficiency of means of amendment in pleading at common law led to the statutes of amendments and jeofails.

Amendment, in legislation, is an alteration in the words of any bill, motion, or resolution. Any member may move an amendment to a bill or resolution after it has been read twice, and it is usual to take a vote on the amendment first, and next on the main question. An opponent of a bill has a right to move an amendment to it by a motion to strike out all after the enacting clause, and to substitute a contrary principle. Either house of Parliament (or Congress) has a right to amend a bill which has been approved by the other, but such amendments must receive the assent of both houses before the bill can become a law.

The term amendment is also applied to an alteration of the Constitution of the U. S. To render an amendment valid it must be first proposed by two-thirds of both houses of Congress, and must be ratified by the legislatures of three-fourths of the several States. The most recent of these changes in the organic law is the Fifteenth Amendment, which ordains that no man shall be disfranchised on account of color or race. (See Constitution.)

Ame'nia, a post-village and township of Dutchess co., N. Y., on the New York and Harlem R. R., 85½ miles N. N. E. of New York. It has a distributing post-office, five iron-mines, yielding in the aggregate some 250 tons of ore per day, and a condensed-milk factory, using nearly 6000 quarts of milk per day. It has five churches, a seminary, one weekly paper, and a national bank with $500,000 capital. Pop. of township, 2662.

C. H. Scott, Jr., Pub. "Amenia Times."

Amenites. See Omish.

Ameno'phis (or **Am'enoph**) [Gr. Ἀμενῶφις], **I.,** a powerful king of Egypt, the second of the ten kings of the eighteenth dynasty, began to reign about 1500 B. C.

Amenophis (or **Amenoph**) **II.,** the sixth king of the eighteenth dynasty, is regarded by some authors as identical with Memnon, who fought against the Greeks at the siege of Troy. (See Memnon.)

Amenophis III. was a grandson of the preceding, and the eighth king of the eighteenth dynasty. He came to the throne about 1400 B. C. His reign was long, and greatly promoted the prosperity of Egypt, which he adorned with many noble monuments. He is supposed to have built the palace of Luxor (El-Ukser) at Thebes, which was his capital. His military exploits are recorded on the obelisk which now stands in the Place de la Concorde in Paris. According to Bunsen, Amenoph III. was the king whom the Greeks called Memnon.

Amenta'ceæ [from the Lat. *amenta'ceus*, "having an amentum"], a name given by Jussieu to a natural order of exogenous trees or shrubs having their flowers arranged in amenta or catkins. It included the birch, willow, alder, and other common trees. By recent botanists this order has been broken up into the Betulaceæ, Salicaceæ, and others.

Amen'tum [a Latin word meaning a "thong"] is applied in botany to a kind of inflorescence (also called catkin) which occurs in the willow, poplar, and birch. It differs from a spike in being deciduous.

Amer'ica [so called from Amerigo Vespucci, a Florentine navigator in the Spanish service, who visited South America in 1499], one of the grand divisions of the globe, being smaller than Asia, but larger, perhaps, than both Europe and Africa taken together. It is the only one of these divisions that is washed by all the four great oceans —the Northern, the Southern, the Atlantic, and the Pacific. It extends from Point Barrow, lat. 71° 24′ N., to Cape Horn (on Horn Island), lat. 55° 58′ 40″ S. (the continental portion reaching only to Cape Froward, on the Straits of Magellan, in lat. 53° 53′ 7″ S.). The continent may be said to consist of two vast peninsulas, called, respectively, North and South America, which are connected by the Isthmus of Panamá or Darien (in its narrowest part only 28 miles wide). The American continent, stretching as it does from N. to S. for about 9000 miles in a nearly straight line, is the longest continuous body of land on the globe. Its greatest breadth in South America is between Cape St. Roque in Brazil and Cape Parina in Peru, between lat. 4° and 7° S., a distance of over 3250 miles. In North America its greatest breadth is over 3100 miles, between Cape Canso in Nova Scotia and Cape Lookout in Oregon. America is bounded on the E. by the Atlantic, and on the W. by the Pacific, and is separated from Siberia by Behring's Strait.

The physical features of this portion of the globe are on the most gigantic scale, for here are found the greatest rivers and lakes, the largest valleys, the loftiest mountains (with the exception of the Himalayas), and the finest forests in the world. Here (particularly in the Andes) also is exhibited the greatest development of volcanic phenomena in the world. The whole number of active volcanoes on the earth is estimated at about 270. Of these, 190 (over two-thirds of the whole) occur on the coast and islands of America.

As the northern limits of America are not yet accurately ascertained, and as the statements of the area of most of the large political divisions widely differ, the area of America can only be roughly estimated. The following table (see Behm and Wagner, "Bevölkerung der Erde," Gotha, 1872) exhibits the area and population of each political division, according to the latest official censuses and the most recent scientific calculations:

Names of Countries.	Square Miles.*	Population.*
North America	**8,657,000**	**51,964,000**
Greenland	759,800	10,000
British America	3,524,200	3,888,557
Bermudas	24	11,796
St. Pierre and Miquelon	81	3,971
United States (with Alaska)	3,611,800	38,877,000

Total America	15,896,000	84,524,000

America, North, exclusive of Central America, extends from the Arctic Ocean to lat. 16° N. It is bounded on the N. by the Arctic Ocean, on the E. by the Atlantic Ocean and Gulf of Mexico, on the S. by the Gulf of Mexico and Central America, and on the W. by the Pacific Ocean. Its contour is more irregular than that of South America, being deeply indented by gulfs, bays, etc. The length of the eastern coast, from Hudson's Strait to Florida Channel, is about 13,700 miles; on the Pacific its length is estimated at 10,500, on the Arctic Ocean at 3500 miles; thus making a total of 27,700 miles of coast-line for North America. Along the E. coast of the continent some important changes of elevation are being wrought; in some places the coast is rising, and in others subsiding. The area of North America is estimated at 8,657,500 square miles.

* As most of the following figures are not official statements, but estimated, no regard could be taken in summing up the totals of the grand divisions to any hundreds, tens, and units.

Face of the Country, Mountains, etc.—In North America the mountains and plains almost balance each other. To the N. of the basin of the Gulf of Tehuantepec, in lat. 17° N., a mountain-range rises, which becomes wider the farther N. it proceeds, and up to lat. 21° N. occupies almost the entire country between the two oceans. This is the table-land of Anahuac. It is cut up by several rows of hills into plateaus, between which volcanic peaks rise to a great height. Among the highest are the peak of Orizaba (17,809 feet), Cofre de Perote (14,310 feet), and the Popocatepetl (17,744 feet). Northward from the 21st degree of N. lat. the character of the mountains begins to change, and the isolated peaks become connected mountain-chains. Three chains branch off from this point: the north-western branch, the Cordillera of Sonora, runs along the coast of the Gulf of California to its northern point in lat. 33° N.; the central branch, or Sierra Madre, goes farther N.; the Eastern Cordillera is low until it reaches the Rio del Norte, after that it becomes higher and higher, until it reaches the region of the head-waters of the Rio del Norte, where it again joins the central branch and forms with it a wild mountainous region. These chains enclose the plateau of New Mexico, which rises to a height of 4000 to 6000 feet. Between the parallels of 35° to 40° N. lat., the Rocky Mountains attain as a whole their greatest elevation, a large number of peaks exceeding 14,000 feet, while the passes retain an elevation of 8000 to 11,000 feet. Farther N., from 42° to 45° N. lat., the Wind River Mountains, with their northern prolongation, form a remarkable hydrographical centre, from which flow the waters of the Columbia and Colorado rivers on the W., and on the E. those of the Missouri and its branches, the Yellowstone, Wind River, and South Platte. It is in this region of mountain lakes, of boiling springs and geysers, that a national park has been reserved by an act of Congress around the Yellowstone Lake. The western branch, the Wahsatch Mountains, encloses a wide plateau, with an elevation of 4000 to 5000 feet, which contains its own system of lakes and rivers. The most important of its lakes is the Great Salt Lake. The western border of this plateau is formed by the Sierra Nevada and the Cascade Mountains, which run along the ocean and enter Alaska. The highest peaks in this range are Mount Fair Weather (14,735 feet) and Mount St. Elias, in lat. 60° 17′ 35″ N. (about 16,000 feet). To the N. E. of the Wind River Mountains are the Black Hills, rising isolated from the plains, in lat. 46° N. The most northern branch is the most important, and runs in a N. W. direction to the Arctic Ocean. Between lat. 42° and 53° N. many peaks reach above the line of perpetual snow. Among the highest of these are Mount Hooker (15,700 feet) and Mount Brown (16,000 feet). From lat. 52° N. the range gradually descends to 4200 feet, then branches off into several chains, and terminates at the Mackenzie at an elevation of only 2100 feet. Among the isolated systems of North America the most prominent are the Coast Range in the W., and the Appalachian system in the E. The Coast Range begins at Cape San Lucas in Lower California, and running parallel to the coast has openings at only two points for rivers to pass through, and continues through Vancouver and the other islands in that region. The Appalachian system (also called from one of its parts the Alleghanies) is separated from the other mountains of this continent by large plains, the plain separating it from the Rocky Mountains being, with the exception of the great desert plain of Africa, the largest in the world. The highest peak in this system is Mitchell's Peak, in North Carolina, 6707 feet. Mount Washington, the highest peak of the White Mountains, rises to a height of 6288 feet. Farther N. a rocky plateau extends between the Atlantic and the lower St. Lawrence: Mount Katahdin, its highest peak, is 5385 feet high. To the N. of the St. Lawrence the rocky plateau of Labrador rises to a mean elevation of 2000 feet.

Geology.—The geology of North America is so complicated that no detailed description of it could be compressed into the necessarily limited space of this article. It may, however, be very briefly sketched as follows: N. of the St. Lawrence is a belt of old crystalline rocks—Laurentian and Huronian—which stretches from Labrador to Lake Superior, and thence northward. The Adirondacs in New York, and a similar space on the S. shore of Lake Superior, may be said to form part of this eozoic belt. This is the oldest known portion of the earth's surface, and has not been submerged since the beginning of the Silurian age. New England is, for the most part, underlaid by metamorphic rocks, which are of Laurentian, Silurian, Devonian, and carboniferous age. S. of the great lakes, and between the Atlantic and the Mississippi, is an extensive district, chiefly of palæozoic age, having been elevated above the ocean at the close of the carboniferous period, when the Alleghanies were raised. This area is skirted on the Atlantic coast by a belt of trias, which fills the valley of the Connecticut, underlies much of New Jersey, and holds the coal of Eastern Virginia and North Carolina. Outside of the triassic area, and reaching around from New York to the mouth of the Mississippi, are more or less broken belts of cretaceous and tertiary strata. W. of the Mississippi the great area of "the Plains" is underlaid on the E. by carboniferous and permian, more westerly by triassic, Jurassic, and cretaceous rocks, with broad areas of fresh-water tertiary of miocene and pliocene age. The Rocky Mountains have axes of granite and crystalline slates, flanked in some localities by Potsdam sandstone, more generally by carboniferous and more recent strata; all of which, even to the tertiary, are more or less upheaved. Volcanic rocks also abound in this chain. W. of the Rocky Mountains is a high plateau reaching to the Sierra Nevada, and extending N. and S. from the city of Mexico far into the Canadian territory. This plateau is cut by the cañons of the Colorado and its tributaries to the depth of over 6000 feet, and is shown to include representatives of almost the entire geological series. The western part of the plateau exhibits a great prevalence of modern volcanic rocks, and from the number and richness of its veins of silver may be called the silver belt of the continent. The Sierra Nevada has a granitic axis, flanked by metamorphosed triassic and Jurassic slates, which contain quartz veins rich in gold. The "placer" or surface deposits of gold skirt the western base of the Sierra Nevada for 700 miles, and have yielded nearly $1,000,000,000 since 1848. The Coast Mountains of California are mainly composed of cretaceous and tertiary strata, are more recent than the Sierra Nevada, and are richer in mercury than in gold and silver. The mercury is contained in metamorphosed cretaceous rocks.

The geological structure of Mexico is essentially the same as that of the adjacent portions of the U. S., with the same richness in the precious metals. The only noteworthy elements in the mineral resources of Mexico not found farther N. are the tin of Durango and the triassic anthracite of Sonora.

In the region about Hudson's Bay, and farther N., Silurian rocks have been found in various localities. On Melville's Island carboniferous strata occur, while on Disco Island, Greenland, on the lower Mackenzie and Yukon rivers, tertiary rocks are exposed. These contain great quantities of fossil leaves, which prove that in the miocene epoch a luxuriant vegetation covered all the shores of the Arctic Sea, and that the climate was then as mild as that of the State of Virginia is now. In the glacial epoch ice covered the continent as far S. as the 40th parallel, grinding down the rocks and spreading the drift over most of the country N. of this line.

Copper is abundant, especially in Mexico and on the shores of the great lakes. In the latter locality it has been chiselled out from its native bed in masses weighing as much as 150 tons of nearly pure metal. Quicksilver occurs in Mexico and California. Probably the richest lead district in the world is that on both banks of the Mississippi, between 41° and 44° N. lat. Over 54,000,000 pounds have been extracted at this point in a single year. The coal-fields of North America are immense, extending over an area in the U. S. alone of more than 150,000 square miles; large beds occur also in New Brunswick, Nova Scotia, the Rocky Mountains, and on the Pacific coast. Both bituminous and anthracite coal exists; the former is most abundant, but the latter is found in large beds in Eastern Pennsylvania, where millions of tons are mined every year. Since 1862 great quantities of petroleum have been obtained in Western Pennsylvania, West Virginia, Canada, and other districts. Iron is abundant. Antimony, zinc, cobalt, arsenic, titanium, and chrome are also found. Salt is found abundantly in various localities.

Bays, Gulfs, Lakes, and Rivers.—By the indentations of the bays, gulfs, and rivers the interior of North America is at once laid open to the commerce of the world. On the E. coast we first meet with Baffin's Bay, which separates British America from Greenland; Hudson's Bay, which opens into the Atlantic by Hudson's Strait; the Gulf of St. Lawrence, connecting the great lakes with the Atlantic; the Bays of Fundy, Cape Cod, Delaware, and Chesapeake; Long Island, Pamlico, and Albemarle sounds; the Gulf of Mexico, Gulf of Campeche, Bay of Honduras, and Mosquito Bay—all on the E. coast. The indentations on the Pacific coast are neither so large nor so numerous as those on the E.; among the more important are the Gulf of Tehuantepec, Gulf of California, San Francisco Bay, Straits of Juan de Fuca (opening into Puget's Sound, St. George's Channel, and Admiralty Inlet), Queen Charlotte's Sound, Cook's Inlet, and Bristol Bay. To the N. of the basin of the Mississippi is found the region of the great lakes and of the St. Lawrence River. These lakes form together the greatest mass of fresh water found in any one spot on the globe. They are five in number. Lake Superior has an

area of more than 31,400 square miles; Lake Erie has an area of 10,000 square miles, and is connected by canals with the Hudson and the Mississippi; Lake Ontario, from which the St. Lawrence passes, has an area of 7300 square miles; Lake Huron covers 23,800 square miles; and Lake Michigan 25,600 square miles. Other large lakes in North America are Lake Winnipeg, Athabasca, Great Slave, and Great Bear lakes in British America; Lake Champlain and Great Salt Lake in the U. S.; Lake Nicaragua in Central America; and Lake Chapala in Mexico. Besides these, numerous other beautiful sheets of water of smaller sizes occur, especially N. of 42° N. lat. No other continent is more favored with large rivers than North America, nearly every portion being accessible from the sea. In the N. the Mackenzie River empties into the Arctic Ocean, and the Saskatchawan into Hudson's Bay; the St. Lawrence eastward into the Atlantic; and the Mississippi and Rio Grande del Norte southward into the Gulf of Mexico. The Columbia and Colorado of the West take their rise in the western declivities of the Rocky Mountains; the former, after a course of 1200 miles, empties directly into the Pacific; the latter, after flowing 1000 miles, empties into the Gulf of California. In lat. 32° 30′ N., Frazer's River empties opposite to Vancouver's Island into the Pacific. The Atlantic slope is drained by a large number of rivers of different lengths. The largest river-system in North America is that of the Mississippi. Its most important tributaries are the Arkansas, Red River, the Illinois, the Ohio, and the Missouri, which in itself forms another great river-system. The most important tributaries of the Missouri are the Yellowstone and the Platte River.

Islands.—South-east of Florida, in the recess formed by the narrowing of the continent at Central America, lies an extensive archipelago called the West Indies. This group extends E. into the Atlantic to about 60° W. lon., whence it turns almost directly S. and reaches to the mouth of the Orinoco River, thus enclosing the Caribbean Sea on the N. and N. E. The larger of these islands are Cuba (the most western), Hayti, Jamaica, and Porto Rico. Near the mouth of the St. Lawrence are the islands of Newfoundland, Cape Breton, Prince Edward, Anticosti, etc. Besides these, Long Island and the Bermudas are the only islands of any account on the E. coast. The principal ones on the Pacific coast are Vancouver's; Queen Charlotte's and King George III.'s Archipelagoes, W. of British America; and Prince of Wales, Sitka, and Admiralty on the coast of Alaska, and the Aleutian Islands reaching westward towards Asia. A large number of barren islands lie in the Arctic Ocean of which but little is known.

Climate.—In comparing the climate of the western with that of the eastern continent, we must compare not the E. with the W. coast, but E. with E. and W. with W.; which comparison will show that the difference of temperature lies not between the two continents, but between the opposite shores of each continent. Take, for example, Nain in Labrador: while the mean temperature of this place is 25° F., at Archangel, on the western coast, it is 44°. This difference of 19° between the eastern and western coasts of the New World is but very little less than the difference between the eastern coast of the New and the western coast of the Old, for the temperature of Gothenburg, in Sweden, is only 21° higher than that of Nain. This difference decreases the farther S. we go. But, generally speaking, the climate of North America is 10° lower than the same parallels in Western Europe. On the E. side and middle of the continent N. of 50° N. lat. it is so intensely cold that it is almost uninhabitable. In Mexico and Central America the climate is similar to that of the torrid zone, being very changeable; the table-lands of the former generally have a delightful climate. In Canada the change from winter to summer is very sudden, the spring being of short duration.

Vegetable Productions.—North America abounds in immense forests, in which are found vast numbers of large and valuable trees. One of the most noted is the *Sequoia gigantea*, belonging to the cedar family and a native of California, which is one of the greatest wonders of the vegetable world. It sometimes attains a height of 400 feet and a diameter of from 30 to 40 feet. By the Spaniards it is called the *Palo colorado*. Another remarkable tree is a species of pine or fir in Oregon, which grows from 200 to 300 feet in height, and has a girth of from 60 to 80 feet. The forests contain pine, oak, ash, hickory, red beech, the lofty Canadian poplar, several species of chestnut, walnut, several species of maple (among them the sugar-maple), cedar, cypress, juniper, hemlock, basswood, palmetto, dogwood, willow, catalpa, wild-cherry, tulip tree (or American poplar), elm, sycamore, magnolia, gum, locust, etc. The most important farinaceous plant peculiar to the New World is maize or Indian corn. It extends over a large part of North America, but is found mostly in the Central U. S. It is also naturalized, or nearly so, in the warmer parts of the Old World. Cacao, vanilla, pimento, copaiba, jalap, cinchona, tobacco, sweet potatoes, and the cochineal plant (*Cactus cochinilifer*), are also indigenous. Wheat, barley, peas, oats, and rice are cultivated with success throughout the greater portion of the continent. Many vegetables, besides various fruit trees, are grown. Among the latter are the orange, lemon, apple, peach, etc.; the principal native fruits are of the nut kind. Coffee, sugar, and cotton are staple products. The vine generally succeeds when properly cultivated. An interesting native cereal is the *Zizania aquatica*, the wild rice of the North-west, yielding an important supply of food to the native tribes. The true potato (*Solanum tuberosum*) is a native of both North and South America.

Zoology.—The number of ferocious animals found in America is comparatively very small. Of those found the principal ones are the polar, black, and grizzly bears. The former (sometimes called the white bear) is the largest of his genus, and is an inhabitant of the Arctic regions, being seldom seen S. of 55° N. lat. The latter is a native of North America, and is found in the regions of the Rocky Mountains, from New Mexico to as far N. as 61° N. lat. Besides these may be mentioned the cougar or panther, lynx, and wild-cat. The bison, or American buffalo, roams over the prairies W. of the Mississippi in immense herds, but is rapidly disappearing in consequence of the advance of civilization. The musk-ox is smaller, seldom weighing more than 300 pounds. The deer family is represented by several species, the largest being the moose, whose height is about six feet. A single specimen of the antlers of these animals has been found to weigh over 50 pounds. Reindeer are numerous in the frozen regions. Among the Rocky Mountains are found peculiar sheep and a goat-like antelope; the former are covered with short, fine, and flexible wool, and are much larger than the domestic sheep; the latter, inhabiting the highest cliffs of the mountains, are covered with long hair, beneath which is a very fine wool. Among the wolves, the prairie-wolves are found in great numbers on both sides of the Rocky Mountains. Among the domestic dogs are the Newfoundland dog, Mackenzie River dog, the Arctic dog, etc. Of the foxes there are several kinds—viz., the red, gray, Arctic, etc. The other principal quadrupeds are beavers, otters, raccoons, badgers, opossums, weasels, hares, muskrats, marmots, squirrels, porcupines, gophers, and antelopes. There are numerous species of reptiles, the rattlesnake being among the most dangerous. The alligator, a native of the Southern U. S., attains a length of from fourteen to sixteen feet. Tortoises, sea-turtles, toads, and frogs abound. Several hundred species of birds are found, the greater number of which are peculiar to this continent. The wild turkey, one of the principal native birds, formerly existed in large numbers, but is rapidly disappearing. Wild pigeons are so numerous in some localities as to darken the air when they fly over, and to break the limbs of the trees on which they roost. Among the rapacious birds are the bald eagle, the sparrowhawk, the swallow-tailed hawk, falcon, vulture, turkey-buzzard, and owl. Among the gallinaceous birds are turkeys, pheasants, grouse, and quails. The representatives of the Grallæ are cranes, herons, flamingoes, spoonbills, rails, and purple gallinules. Swans, wild-geese, ducks, pelicans, etc. constitute the principal water-fowls. Some of the smaller birds are larks, orioles, buntings, magpies, jays, cedar-birds, thrushes, shrikes, mocking-birds, robins, grosbeaks, blue-birds, parrots, woodpeckers, humming-birds, kingfishers, chuckwills-widow, whippoorwills, etc. Of fish there are almost endless varieties; the chief ones are sturgeon, salmon, salmon-trout, shad, white fish (peculiar to the great lakes), mackerel, herring, halibut, sheepshead, trout, bass, perch, pike, blue-fish, etc.

Population, Races, etc.—The aboriginal races of Mexico and Central America still constitute an important part of the population. Many of the North American Indians are yet in existence, but they are fast disappearing before the advance of the white man. Almost all the authorities on the subject agree with the traditions of the Indians and Esquimaux that an immigration of the native race took place at an early period—probably from Asia. In spite of the difference existing between many tribes in different localities, one race seems to have inhabited the whole continent, to which the Esquimaux bear the same relation as the Lapps and Samoyedes to the other Mongolians of the Old World; and this race resembles most closely the Mongolians. According to ancient Chinese legends, an early Mongolian emigration and Chinese colonization appear very probable; while the original languages, in spite of their great variety, in their uniform formation resemble those of Eastern Asia more than any others. Much is still in the dark with respect to the original inhabitants. Their character at the present day shows a great capability of being

civilized, as they had their own civilization in Mexico and Central America, and in South America in Peru and New Granada, and as is shown by the fact that under the Jesuits, the Quakers, and the Moravian Brethren some have attained a considerable degree of civilization. The African race constitutes a large portion of the population, especially of the southern part of North America. It was introduced for the purpose of slavery, but seems to prosper better than in its native continent. From 1789 to 1860 (*i. e.* while it was in slavery) it increased in the U. S. 28 per cent. every ten years, or 5 per cent. less than the Caucasian race; while in San Domingo, where it was in a free state, its increase from 1793 to 1868 was larger than that of the Caucasian race, while the natives have decreased everywhere. The Caucasian race is only represented in North America by the Germanic and the Romanic families, the latter chiefly in Mexico and the Central American republics, the former in the U. S. and British America. Among the 40,000,000 of the Germanic family, the Anglo-Saxons predominate largely, constituting over two-thirds of the population as regards the descent, and over three-fourths with regard to the language.

History.—If we except the reputed early visits of the Danes and Norwegians to Greenland in the ninth and tenth centuries, America was first made known to the civilized world by Christopher Columbus, who set sail under the patronage of Ferdinand and Isabella from Palos on the 3d of Aug., 1492, with a view of finding Eastern Asia by a western passage. He first landed at San Salvador, on the 12th of October. During the ensuing months he visited Cuba, Hispaniola, and other islands. But the continent of North America was first discovered by John Cabot and his son Sebastian in 1497, one year before Columbus reached the continent of South America. The Cabots sailed under the patronage of Henry VII. of England, and touched the first year at Labrador, and the next at Newfoundland. Gaspar de Cortereal, a Portuguese nobleman, who made two voyages to the coast of Labrador, is supposed to have been murdered on his second voyage, as he never returned. In 1512, Ponce de Leon discovered Florida. In 1524, Giovanni Verrazzano, a Florentine navigator, under the patronage of Francis I. of France, explored more than 2000 miles of the coast of the present U. S. and British America. A few years later, Jacques Cartier made several voyages and explored Newfoundland, and first ascended the St. Lawrence. Not many years subsequent a French fortress was erected near the present site of Quebec. While these discoveries were being made, Cortes discovered and conquered Mexico. Within the last twenty-five years it has been clearly established that there is a communication by water between the Atlantic and Pacific by an Arctic sea. But the passage has never been made by vessels alone, the voyage in question having been partly effected by means of sleds and partly by sailing. As the discovery and exploration of North America by Europeans advanced, it became a political dependency of several European nations, in particular of Spain, France, England, Holland, and Denmark. In 1776 most of the English colonies established an independent American commonwealth under the name of the United States of America; they have since become one of the greatest states of the globe. In 1821 Mexico became independent of Spain. The remainder of North America, comprising about one-half of its extent, is either a dependency of European powers, or, like the greater portion of Greenland, is without any organized government.

CENTRAL AMERICA is that narrow strip of land which unites North and South America, but which properly belongs to the former. It lies between the parallels of about 7° and 18° of N. lat. It is about 800 or 900 miles long, its breadth varying from 20 miles in its narrowest to 400 in its widest part. It is bounded on the N. by Mexico, on the E. by the Caribbean Sea, on the S. by New Granada, and on the W. by the Pacific. Its area, according to Behm and Wagner, is 188,370 square miles.

Face of the Country, Mountains, etc.—Central America consists almost entirely of mountainous regions, but the mountains are entirely distinct from those of North and South America. They are separated from the cordilleras of South America by a row of hills ranging in height from 300 to 1000 feet, while in the W. the Mesa de Tarifa (600 feet high) separates the Isthmus from the North American continent. N. of Panama rises the plateau of Veragua, in which the Silla de Veragua (8000 feet high) is the highest point. Farther N. is the plateau of Costa Rica, with an average height of 2000 feet, and that of Cartago, 4400 feet. Numerous peaks of 10,000 feet and over are interspersed. In the N. the plateau gradually descends, until it forms the plain of Nicaragua. To the N. of this plain rises the table-land of Honduras, with an average height of 4000 feet. Apart and on the S. of the plateau are two rows of volcanoes, the highest of which are San Miguel, a peak of 15,000 feet, San Vincente, San Salvador, and Isalco. A mountain of not quite 2000 feet connects the table-land of Honduras with that of Guatemala, rising to an average height of 5000 feet. Here also are a number of high volcanoes, among which are the Pacaya, the two volcanoes of Guatemala, those of Amilpas, 12,500 feet high, Quezaltenango, 12,300 feet, and the more distant Soconusco.

Geology.—The central axis of the Isthmus is composed of crystalline and volcanic rocks. These are flanked on either side by strata of tertiary age, which contain, in some places, valuable beds of lignite. Gold, silver, lead, and mercury are found in many localities, and rich mines of all these are known to exist in Costa Rica and Honduras; but the obstacles presented by the climate, the governments, and the population of these countries have limited their productiveness. The ancient inhabitants of Central America, who constructed the cities of which the ruins have been so frequently described, possessed large quantities of gold, as we know from the numbers of gold images and implements found in their sepulchres. The exploration of the graves of Chiriqui was at one time an exciting industry. Jasper and marble are worked in Honduras, and sulphur is collected near the volcano of Quezaltenango. Large quantities of salt are produced on the Pacific coast, and also from the salt springs, which are numerous.

Bays, Gulfs, and Rivers.—Central America is intersected by numerous streams of considerable size, but necessarily short from the narrowness of the country. All the longer streams are on the northern and eastern sides of the mountains, and flow into the Atlantic. Among these the Usumasinta is the largest, and the San Juan, which forms the outlet of Lake Nicaragua, is next in size. Among the bays and gulfs, the most important are the Gulf of Honduras on the E. coast, the Bay of Panama, the Gulf of Dulce, Coronada Bay, Gulf of Nicoya, and the Gulf of Fonseca on the Pacific coast. Besides Lake Nicaragua, which has an area of 3400 square miles, we find in Central America the lakes of Managua in Nicaragua, Iloponga in San Salvador, Amatitlan (or Atitlan) in Guatemala, and the Yojoa in Honduras.

Climate.—In Central America the year consists of two seasons—viz., the wet and the dry. In the former the sun is always vertical, and is seldom seen, the skies being filled with clouds and falling rain, while in the latter the temperature does not rise near so high, but hot and dry weather prevails, with a clear and more healthy atmosphere. In the higher regions, where the land is more open, few noxious vapors are generated, and health is comparatively good, but in the low marshes, where decomposition is rapid, many contagious diseases prevail.

Vegetable Productions.—Central America is remarkably adapted to the growth of vegetables and tropical fruits. Indian corn, sweet potatoes, sugar-cane, indigo, tobacco, cacao, the cactus, mandioca, and bananas flourish. Many other tropical fruits, among them the cherimoya (said by Humboldt to be the most delicious fruit in the world), grow abundantly. In the large forests mahogany, logwood, lignumvitæ, pimento, sarsaparilla, vanilla, black balsam, etc. are met with. There are not less than ninety-seven different kinds of trees growing luxuriantly in the forests of Panama that are fatal to animal life.

Zoology.—The zoology of Central America is very similar to that of the other divisions of America. Its birds are chiefly remarkable for their brilliant plumage. Among them are many species of humming-birds and the quezal. Serpents are numerous, many of them being dangerous. Two species of locusts, a brown and a green, are known here. The former is very destructive. Fish abound in the seas, rivers, and lakes.

History.—In 1502, Columbus visited the E. coast of Central America, and passed along the shores of Honduras, Mosquito territory, Costa Rica, and Veragua, but being opposed in his undertakings, both by the inhabitants and his crew, he was forced to return home. In 1523, Pedro Alvarado was despatched by Cortes to conquer Central America, and within two years had subdued the whole country. After that it remained subject to Spain till 1823, when it was formed into a federal republic and became independent; but in 1833 the republic of Central America was dissolved, and the separate republics of Guatemala, Honduras, San Salvador, Nicaragua, and Costa Rica were formed. Since then several attempts have been made to reunite these five republics in a confederation, but they were not successful. Only a small portion of Central America (British Honduras) is a European dependency.

Inhabitants.—The population of Central America consists of whites and creoles; mestizoes, or the offspring of whites and Indians; aboriginal natives, and a few blacks. It is estimated that one-twelfth of the inhabitants are whites, four-twelfths mixed races, and seven-twelfths In-

dians. Generally speaking, the inhabitants are immoral, ignorant, and superstitious.

South America, a vast triangular-shaped piece of land, with its apex S., extends from lat. 12° 30′ N. to Cape Horn, in lat. 55° 59′ S., a distance of about 4800 miles, its greatest breadth from E. to W. being about 3300 miles. Its area is estimated by Behm and Wagner at 6,958,600 square miles. At least three-fourths lie within the temperate zone. Its coast-lines, particularly the western, have but few indentations, except near the S., where both on the E. and W. sides there are many inequalities. Here also lies an extensive group of mountainous islands, forming the archipelago of Tierra del Fuego. These islands are indented on all sides by numerous bays and narrow inlets.

Mountains and Volcanoes.—The mountains of South America comprise four great systems; the most remarkable of these are the Andes, which stretch along the Pacific coast from N. to S., in a continuous chain, for a distance of about 4200 miles in a nearly straight line. This range is of no great width, but of very great altitude, ranking in this respect next to the Himalayas, the highest point of the former, the Sorata, being 24,800 feet high, and the highest of the latter, Everest, 29,000 feet high. The second system is that of Parime or Parima, also called the Highlands of Guiana, consisting of numerous irregular groups of mountains of about 2000 feet in height, which separate the plains of the lower Orinoco from those of the Rio Negro and the Amazon. The culminating peak of this range is Maravaca, about 8200 feet high. The third system is generally known by the name of the Coast Chain of Venezuela, the culminating point of which is the Silla de Caracas, 8600 feet high. The fourth is that of Brazil, which consists of two great ranges running nearly parallel to the coast, and numerous other smaller ranges stretching far into the interior and crossing the country at different angles. It may be well to remark that all the higher mountains of South America are confined to the Pacific and Atlantic coasts, while the interior is occupied by a series of low, level plains, with an elevation of near 1000 feet, that reach from one extremity of the continent to the other. The active volcanoes of South America are about thirty in number. They all occur among the Andes, and consist of three distinct series—those of Chili, those of Peru and Bolivia, and those of Quito. The loftiest of these mountains is Sahama, one of the Peru and Bolivian series, 23,000 feet high. The heights of the others vary from 13,000 to 18,000 feet.

Plains.—The plains of South America are of vast extent, stretching for hundreds of miles with but few perceptible inequalities. During the rainy season they are covered with verdant grasses, but when the dry season comes on the grass dies out entirely in some sections, so that they present the appearance of a desert. These great plains are variously designated the Pampas of Buenos Ayres, the Selvas of the Amazons, the Llanos of the Orinoco, etc. The Pampas of Buenos Ayres are about 900 miles in breadth, cover an area of about 315,000 square miles, and have an elevation of about 1000 feet above the sea. The several regions of these plains are marked by the growth of different kinds of vegetation, such as thistles, lucerne, grasses, etc. The thistles in some cases grow so large and have such formidable spines that they form an almost impenetrable barrier, individual stalks being ten or twelve feet high. Thousands of cattle and horses roam over these grassy plains, where they find inexhaustible quantities of food. The Selvas of the Amazon, in the centre of the continent, are so densely covered with wood (hence their name) that the country in some parts, were it not for the rivers, would be impenetrable. They extend along the Amazon for about 1500 miles, and vary in width from 350 to 800 miles. The Llanos of the Orinoco and Venezuela are also very extensive, occupying a tract of about 153,000 square miles. They lie between the deltas of the Orinoco and the river Coqueta, and present a remarkably level surface. It is stated that there is scarcely an eminence one foot high in the space of 270 square miles. Trees are not very numerous, except on the banks of the Orinoco, where the forests are dense. Besides these, there is also the desert of Patagonia, occupying an estimated area of 100,000 square miles. This is the most barren of all the plains in America.

Rivers and Lakes.—Of the three most important rivers of South America, the Amazon, the Orinoco, and the Plata, the first is the largest on the globe. It takes its rise among the Andes, and after a course of 4000 miles empties its waters into the Atlantic directly under the equator. Its waters are navigable from its mouth, which is 96 miles in width, for a distance of about 2300 miles. The Orinoco rises among the Parime Mountains, and has a course of about 1400 miles. This river has many affluents that are large streams. It is connected with the Amazon by one of its affluents, the Rio Negro, by means of a natural canal, called the Cassiquiare. This is one of the most remarkable phenomena in physical geography. The Plata (Rio de la Plata) is more of an estuary than a river, and is formed by the confluence of the Paraná and Uruguay Rivers. It is about 185 miles long, and at its mouth, between Punta del Este and Cape San Antonio, it is near 130 miles wide. The navigation of this stream is obstructed by frequent shoals, and its waters are so turbid that they tinge the sea for a distance of near 200 miles from its mouth. There are many other important rivers in South America, of less magnitude than those just enumerated, but equal, if not superior, in size to Europe's largest streams. The principal ones are the San Francisco, the Rio Negro, Colorado, Essequibo, etc. But few lakes of any considerable size exist in South America, the chief one being Titicaca, which is situated on the frontiers of Bolivia and Peru, and covers an area of about 4000 square miles. It is at an elevation of about 12,800 feet above the level of the sea, and in some parts is 120 fathoms deep. There are many small lakes on the table-lands of the Andes and in the elevated mountain-valleys. Their water is of the purest blue and green colors, and in many of them intensely cold, being near the line of perpetual congelation.

Climate.—The climate of South America is neither so extremely hot in the N. nor so intensely cold in the S. as one would be led to suppose from its geographical position. This may be attributed to the operation of the trade-winds, the influence of the lofty Andes, and other physical causes. The burning heat felt in the plains of Arabia is wholly unknown in the new continent. Throughout the entire basin of the Amazon the climate is greatly moderated by the breeze that is always blowing up the river. But in some of the deep recesses, where the dense forests ward off the breeze, it is almost suffocating. Brazil and all the countries west of it have an equable and temperate climate. The mean temperature of Rio Janeiro is 74° F. The southern portion of the continent is so acted on by the Antarctic breezes and immense tracts of surrounding ocean that its climate is rendered cool and moist. The strip of land on the W. coast lying between about 7° and 32° S. lat. and 65° and 68° W. lon. is an exception to this, as rain never falls there.

Geology.—The geology of South America is as yet but imperfectly known, but it may be briefly sketched as follows: In the southern part of the continent, E. of the Andes, the surface is mainly occupied by drift and the loess-like deposits of the Pampas, the latter containing the remains of the great edentates, *Megatherium*, *Glyptodon*, etc.—a fauna almost peculiar to South America, and now represented by her sloths, armadilloes, and ant-eaters. N. of Paraguay, and S. of the Amazon, is a broad area underlaid by crystalline and palæozoic rocks, a part of which are of carboniferous age. The valley of the Amazon forms a great plain, of which the longest diameter is E. and W., lying between the palæozoic highlands which have been referred to and a somewhat similar region of old metamorphic and probably palæozoic rocks in Northern Brazil and Venezuela. The immediate banks of the great river are composed of soft, horizontally stratified red sandstone and shales, shown by Prof. Orton to be of tertiary age, and not drift as supposed by Agassiz. Along the coast, near the mouth of the Amazon, cretaceous rocks were found by Hartt and others, containing *Ammonites*, *Inoceramus*, etc. of species common to the chalk of Europe. The country bordering the upper Orinoco, both by its geological structure and by its minerals (gold, itacolumite, etc.), shows a marked resemblance to the southern portion of the Alleghany belt in North America. At the northern end of South America we find near the mouth of the Magdalena tertiary rocks with beds of lignite; higher up, and near Bogotá, cretaceous strata, with ammonites of European species; still farther inland, crystalline rocks and the famous emerald-mines. The great chain of the Andes is composed mainly of granite and crystalline slates, with vast masses of trachyte, porphyry, basalt, and other rocks of purely igneous origin. On the W. flanks of the chain carboniferous, triassic, Jurassic, cretaceous, and tertiary strata have been recognized; all of which are more or less disturbed, and locally, like the underlying granite, are metalliferous. All the southern extremity of South America shows marks of glacial action, but the view advanced by Prof. Agassiz, that the valley of the Amazon was once occupied by a glacier, is not generally accepted by geologists. Many parts of South America contain rich deposits of the precious metals and gems, but the most precious minerals of all, coal and iron, are far less abundant here than in North America. Brazil furnishes gold from several districts. Beautiful topazes are also found there, and the most productive diamond-mines in the world are in Brazil. Gold and emeralds are obtained in Venezuela. Chili, Ecuador, and Peru are famous for their mines of silver, and Chili now produces half the copper consumed in the world. Extensive though not rich de-

posits of mercury are also found at various points on the W. coast.

Vegetation.—As there is such a variety of climate in South America, no special character can, with propriety, be given to its vegetation. The most distinguishing feature are the great forests. They cover the greater part of the entire continent, and in some places are so dense that to force an entrance, even with an axe, to any considerable distance, is almost an impossibility. Many of the largest trees are adorned with the most brilliant flowers. In almost every part of tropical America vegetation is exhibited on the grandest scale. In certain districts, that are specially favored with due proportions of heat and moisture, the magnitude of the trees and variety and beauty of the flowers are extraordinary. Fruits, such as oranges, lemons, limes, cocoanuts, pineapples, mangoes, bananas, pomegranates, mammoons, goyabas, jambas, aracas, mangabas, and others, grow in great profusion. Many of the most important and most widely known varieties of fruit are, however, naturalized, rather than strictly native products. The bitter quassia, rosewood, tonka-bean, indigo, coffee, sugar-cane, maize, and the cacao tree (from the seed of which chocolate is made) are important productions. Tapioca and cassava are also made from the root of the *Janipha Manihot*. Several medicinal plants of great value are natives of this country, among which are cinchona, or Peruvian bark, ipecacuanha, copaiba, the balsams of Peru and Tolu, and many others. Among the remarkable plants we may mention the wax-palm, the vegetable-ivory palm, the maté or Paraguay tea, and the guarana (both containing theine, the active principle of tea and coffee, and both similarly used); also the vanilla-plant; several caoutchouc-yielding trees; several cow trees, yielding a valuable milk-like latex or juice; varnish trees, and an immense number of orchidaceous epiphytes. In short, the botany of South America is very rich, and is by no means yet thoroughly known. Its palm trees are numerous and useful, but are not equal in commercial importance to those of the Old World. Towards the S. the character of the forests is greatly changed by the coldness of the climate.

Zoology.—South America has but few formidable beasts of prey. The most ferocious one peculiar to the country is *Felis onca*, or jaguar. It is larger and stronger than the panther, but inferior in both these respects to the Bengal tiger. The puma, or American lion, is also found. Monkeys of the family Cebidæ and of an inferior type are abundant both in species and individuals. Of the winged mammals the most remarkable are the vampire bats. These animals are mostly confined to Guiana, Colombia, and Brazil, where they are very troublesome, attacking and sucking the blood of both men and beasts while they are asleep. In the low, marshy places are found the anaconda and boa-constrictor. Lamas, alpacas, and vicuñas are peculiar: horses, asses, sheep, oxen, alpacas, goats, and swine are the chief domestic animals. Horses and cattle have greatly increased; the former can be bought for a few dollars, and the latter are mostly valued for their hides and tallow, the flesh being generally thrown away. South America is especially rich in birds; the most remarkable one in respect to size is the condor; one of the largest specimens yet captured measured about fourteen feet between the tips of the wings. It seldom exceeds eleven, however, the body being from three to three and a half feet in length. It frequents the most inaccessible cliffs of the Andes. Eagles, falcons, vultures, and other rapacious birds are found. Many birds of bright plumage also exist. Alligators, lizards, electric eels, and snakes are numerous. Fish abound in the seas, lakes, and rivers. Immense numbers of centipedes, scorpions, spiders, ants, termites, and locusts occur. The latter are especially numerous in Buenos Ayres, sometimes covering the earth for a distance of 200 miles, and eating every vestige of green substance that protrudes from the ground. The mosquito and chigoe are also much dreaded.

Races of Men.—Many of the aborigines still exist in South America. The aboriginal Araucanians of Chili are more advanced in civilization than the other Indians. They associate in small communities, are industrious workers, weave and dye cloth with much skill, have fewer vices than the other tribes, and are firm and courageous. They are fond of spirituous liquors, and manufacture a drink called chicha. Like other Indians of South America, they have long been acquainted with the art of working the metals, particularly gold and silver. The Indians of the Pampas have a dark complexion, are low in stature, and ill made, but they are muscular and athletic, and are remarkably good horsemen. They do not cultivate the soil or apply themselves to any sort of labor, but lead a roving life, are cruel and ferocious in disposition, and generally settle disputes with the knife. In the southern extremity of the peninsula, below the 38th parallel, is found the Patagonian, whose stature and bulk, though very remarkable, have been much exaggerated. The average height of this race is about six feet. The head and features are large, and the complexion of a dark copper-brown. They lead a nomadic life, and subsist on the flesh of the animals they kill.

History.—The first discoverer of South America was Columbus himself, who landed at the mouth of the Orinoco in 1498. Alonzo de Hojeda, an enterprising Spanish cavalier, with a fleet of four ships, soon followed in the track of Columbus, and having reached South America near the equator, passed the mouths of the Essequibo and Orinoco rivers, and examined the greater part of the coast of Venezuela. On this expedition Hojeda was accompanied by Amerigo Vespucci, who was a native of Florence. He (Vespucci), being an experienced mariner and a man of considerable talent, published in the year 1500, after their return, an account of their voyage and explorations, and thus his name became inseparably associated with the new continent. Nearly the whole of South America was until the beginning of the nineteenth century a dependency of Spain and Portugal. About 1810 the war of independence began in the Spanish colonies, which, after about ten years, ended in the complete overthrow of Spanish rule and the establishment of a number of republics. Brazil also became (in 1823) independent of Portugal, but retained the monarchical form of government, and now is the only monarchy on the entire American continent.

Literature.—See Humboldt, "Examen critique de l'histoire de la géographie du Nouveau Continent" (5 vols., 1836–39); Macgregor, "The Progress of America from the Discovery of Columbus to the year 1846" (2 vols., 1847); Squier, "The States of Central America" (1857); Wappäus, in the new edition of Stein's and Hörschelmann's "Handbuch der Geographie und Statistik" (1855 seq.); Kohl, "Geschichte der Entdeckung von Amerika" (1861); "Naturalist's Directory of North America and the West Indies" (published by the Essex Institute, Salem, Mass., 1865); J. Disturnell, "Influence of Climate in North and South America, etc." (1867); Dr. D. G. Brinton, "The Myths of the New World" (1868); B. F. de Costa, "The pre-Columbian Discovery of America by the Northmen, illustrated by translations from the Icelandic Sagas" (Albany, 1868). Revised by J. S. Newberry.

American, a township of Sacramento co., Cal. P. 416.

American Antiquities. Under this appellation are commonly included the various remains of aboriginal fortifications, mounds, etc., as well as those of architecture and art, whether existing in North, Central, or South America. This name is obviously too general and of too extensive an application for a work in which the various articles are designed to be distributed as much as possible under separate heads, so as to adapt it to convenient and ready reference. The various architectural and other remains, therefore, of Mexico and Central and South America will be noticed respectively under Mexican Antiquities, Copan, Palenque, Peruvian Antiquities, Tiahuanico, etc. But as there is no other more appropriate head under which the peculiar though widely extended remains found in the valley of the Mississippi and its tributaries can be treated, it is proposed to describe them in the present article.

Most of these monuments are mounds and walls of earth. They are usually found overgrown by the primeval forests, and in the living and decaying trees which cover them we have a record that they have been *abandoned* at least a thousand years. As they are plainly the relics of a sedentary people, very different in their habits and modes of life from the Indians who occupied all the country at the time of the advent of the whites, they have been generally regarded as the work of a distinct and now extinct race, to whom the name of Mound-Builders has been given. Besides the mounds and other earth-works left by the Mound-Builders, one occasionally finds very wide walls laid up of rough stones without mortar, some of which will be referred to farther on. We have proof also that the Mound-Builders worked the copper-mines of Lake Superior, lead-mines near Lexington, Ky., and oil-wells in Canada and North-western Pennsylvania. (*Newberry.*)

The remains of the Mound-Builders are spread over a vast extent of country. They are found on the sources of the Alleghany, in the western part of the State of New York, and in nearly all the Western States, including Michigan and Iowa. They were observed by Lewis and Clarke on the Missouri, 1000 miles above its junction with the Mississippi. They line the shores of the Gulf of Mexico from Texas to Florida, whence they extend through Alabama and Georgia into South Carolina. They are especially numerous in Ohio, Indiana, Illinois, Wisconsin, Missouri, Arkansas, Kentucky, Tennessee, Louisiana, Mississippi, Alabama, Georgia, Florida, and Texas. Many of these remains were evidently designed as works of defence

or as watch-towers in war. No inconsiderable number appear to have been formed as sepulchral monuments or places of burial for the dead; while others seem obviously to have been constructed as temples or places of worship and sacrifice. Among those evidently works of defence are the fortifications found in Ross co., O., near the village of Bourneville. These occupy the summit of a lofty hill, the sides of which are remarkably abrupt, so as to be at some points absolutely inaccessible. The defences consist of a wall of stone, now in ruins, carried around the hill a little below its brow, and extending across the neck which connects the hill with the range beyond. On the eastern side, where the declivity is least abrupt, the wall is stronger and higher than on the other sides, except across the neck (which is about 700 feet wide), where it is strongest of all. In this portion of the wall are three gateways about eight feet wide. In one place on the western side, where the abruptness of the hill makes it wholly inaccessible, the wall is discontinued for some distance. Everything, indeed, connected with these works clearly indicates that they were designed for purposes of defence. It may be added that the space enclosed within the wall is more than 140 acres, while the entire line of the fortifications measures about two and a quarter miles. The enclosure is abundantly supplied with water, which can readily be obtained at the depth of a few feet by digging, and is also found in two considerable ponds or small lakes, one of which covers about two acres. Another work of a similar character, in the southern part of Highland co., O., is known as Fort Hill. The fortifications are on the summit of a hill 500 feet high. They are composed of mingled earth and stone. Measured from the bottom of the ditch, from which the earth used in building the embankment has been excavated, the wall is in some places fifteen feet high, while the average breadth of the base is from thirty to forty feet. That these fortifications were constructed several centuries ago is rendered more than probable by the fact that a chestnut tree twenty-one feet in circumference was found growing some years since on the embankment, and an oak tree twenty-three feet in circumference, though now fallen and much decayed, had evidently grown upon the earth of the fortifications. The entire length of the wall at Fort Hill is more than a mile and a half: it encloses a space of about fifty acres. Among the remains, which give evidence of their having been constructed for religious purposes, are a large number consisting of an embankment or wall of earth in the form of a perfect circle, adjacent to which there is often a square or parallelogram made with an embankment similar to that of the circle. In Ross co., O., east of the Scioto River, near Chillicothe, are works of this description. The circle is 1050 feet in diameter, the side of the adjoining rectangle being about 900 feet. The wall of the latter is about twelve feet high, with a base of fifty feet, without any ditch on either side. The wall of the circle is somewhat lower. Nearly similar to the above, and of about the same extent, are the celebrated remains at Circleville, O., though they have (or rather had, for the lines have become almost obliterated by the repeated cultivation of the ground) this peculiarity, that the circle is formed by a double embankment, with a ditch between.

One of the most remarkable works of this kind is the Great Serpent, situated on the summit of a hill in Adams co., O. It extends 700 feet, terminating in a triple coil at the tail. The line of the body is gently and gracefully undulating, and the entire length, if extended in a straight line, would not be less than 1000 feet. Its jaws are widely distended, and it seems attempting to swallow an oval figure (perhaps designed to represent an egg) which is 160 feet long and 80 wide. The embankment which forms the body of the serpent is five or six feet high, with a base of from twenty to thirty feet. It would seem that it might have been designed as some mystical emblem. No small number of the remains consist of mounds, generally nearly conical in their form, at other times resembling a parallelogram. Of the former class is the great mound at Moundsville, in West Va., about twelve miles below Wheeling. It is about 70 feet high and 1000 feet in circumference at the base. In 1838 a shaft was sunk from the apex to the base; two sepulchral chambers were found constructed of logs, and covered with stones; the lower chamber contained two skeletons, the upper but one, in an advanced stage of decay. It is supposed that as a general rule each mound was raised over a single individual, although some may have been designed as general cemeteries.

Near Cahokia, in Illinois, is a very extensive earthwork in the form of a parallelogram, 700 feet long by 500 wide at the base, with a height of 90 feet. The top is level, having an area of near five acres.

Many implements and ornaments have been found in the mounds. They are usually composed of stone, though sometimes of copper, more rarely still of shell or bone. The copper is always in its native state—never alloyed, nor even cast—and shows specks of silver, such as are found only in the copper of Lake Superior. The stone implements—except the flint spear and arrow heads—are wrought with much care and skill. Pottery is found in most of the mounds; it is sometimes graceful in form and highly ornamented, oftener coarse and rude. Masses of galena, calc-spar, quartz crystals, sheets of mica, and marine shells found in the mounds, with copper and stone implements composed of materials brought from distant localities, indicate some internal but no foreign commerce. Fragments of coarse cloth have been discovered, but all fine fabrics are wanting, perhaps from the lapse of time. No bones taken from the mounds indicate that their builders had domestic animals. In many instances the human skeletons have almost entirely disappeared, attesting their great antiquity. No tablets or inscriptions yet discovered indicate that the Mound-Builders had a written language, and the inscriptions on rocks so common in the country they occupied, and usually referred to them, are of rude execution, mythical character, and of doubtful parentage; so that they throw little light on the history of this ancient race.

From all the facts before us, we can at present say little more than this: that the valley of the Mississippi and the Atlantic coast were once densely populated by a sedentary, agricultural, and partially civilized race, quite different from the modern nomadic Indians, though possibly the progenitors of some of the Indian tribes; and that after many centuries of occupation they disappeared from our country at least one thousand, perhaps many thousands, of years before the advent of the Europeans. The prehistoric remains found so abundantly in Arizona appear to be related to the civilization of Mexico; and the remnants of semi-civilized Indian tribes now found there are perhaps descendants of the ancient builders of the great houses and cities whose ruins are there found. (See SQUIER, "Memoir of the Ancient Monuments of the West," and "Aboriginal Monuments of the State of New York," 1849; BALDWIN, "Ancient America," 1872; DAVIS, "The Monuments of the Mississippi Valley;" FOSTER, "Pre-historic Races of the U. S." (1873). REVISED BY J. S. NEWBERRY.

American Institute. The American Institute was organized on the 19th of Feb., 1828, by a few prominent business-men of the city of New York, who were strongly impressed with the importance of fostering American manufactures; and they proposed to direct immediate attention to this subject by a public display of the best specimens of domestic skill and industry. In October of the same year the first exhibition was held in the Masonic Hall, then located on Broadway, and at its close gold and silver medals valued at more than $1000 were awarded to the successful competitors. As the expenses incurred at this exhibition were less than the receipts for the admission of visitors, the association wisely inferred that industrial expositions by judicious management could be made self-sustaining, and accordingly it took measures for ensuring a permanent organization.

By an act of the N. Y. legislature, passed May 2, 1829, the American Institute of the city of New York was incorporated "for the purpose of encouraging and promoting domestic industry in this State and in the U. S. in agriculture, commerce, manufactures, and the arts, and any improvements therein, by bestowing rewards and other benefits on those who shall make such improvements or excel in any of the said branches; and by such other ways and means as to the said corporation, or the trustees thereof, shall appear most expedient." Under this act, and without external aid, the Institute continued its operations, depending chiefly for support on the attractions of its annual fairs, yet from time to time enlarging the sphere of its usefulness, until its beneficial influence was felt and acknowledged throughout the whole country. Forty-one exhibitions have been held, a number far exceeding that of any other organization in the world. A single comparison will show the actual progress made in this department of the Institute. Its first exhibition (in 1828) was open for three days, and the number of entries of articles for competition was less than one hundred; its exhibition in 1872 continued for nearly three months, and the number of entries exceeded 1400, and embraced more than 5000 different articles.

Although several public displays illustrating progress in the useful arts had been made previous to the foundation of the American Institute, yet it is fairly entitled to the credit of having first inaugurated the system of self-sustaining annual exhibitions, which has since been success-

fully imitated by other associations. Its persistent efforts in fostering the genius of invention which has wrought such magical changes in the material condition of this and other lands, probably suggested the plan of international expositions. Doubtless these have accomplished much by their general diffusion of practical knowledge; nevertheless, as financial investments not one of them has been remunerative.

One feature peculiar to the competitive displays of the American Institute which deserves especial commendation is the requirement of satisfactory practical tests of steam-engines, pumps, and other working machinery, also of harvesters and other agricultural implements, in which the power expended in the operation of each is carefully measured, thus furnishing a criterion for impartial awards.

It was early found that the interests of agriculture required a free and frequent interchange of opinions as to the best methods of tilling the soil; accordingly the Farmers' Club was established. For many years it has held weekly meetings, at which communications from all parts of the Union are read and made the subjects of interesting discussions. Full reports of these discussions appear in leading metropolitan weekly journals, and by this means it is estimated that in the year 1872 each meeting interested not less than a million readers. Through the agency of this club many farmers, even in most remote States, have been supplied with improved varieties of cereals and other seeds, the number of packages gratuitously distributed by mail in a single year having reached 12,000.

The Polytechnic Association is another important branch of the Institute, which holds weekly sessions for the purpose of examining new inventions and discoveries, and of discussing all questions relating to technology. To these and other organizations under the control of the Institute the public have free access.

During each winter the Institute gives a course of scientific lectures, which is free to the members and their families. The high character of each course has been maintained by selecting as lecturers professors in colleges and other gentlemen of acknowledged ability and culture. The library of the Institute contains about 10,000 volumes, the most of which relate to science and its useful applications. By vote of the members works of fiction are now excluded.

Since the year 1841 the Institute has made annual reports of its transactions to the legislature. The volumes printed by their authority have been widely circulated throughout the State and among kindred associations in this country and Europe. Within the last ten years these volumes, containing an average of 1200 pages each, have been increasing in interest and value. It has been the aim of the corresponding secretary, under whose supervision they are prepared, to give in each a summary of progress in science and art, both at home and abroad, and at the same time to exclude from them all discussions on abstract questions or disputed points which might tend to excite religious, political, or social prejudices.

The Institute had about 3000 members in 1873, and the value of its property was then estimated at $300,000. It has never received a bequest or endowment, but in anticipation of such an event the legislature of New York, by an act passed April 21, 1806, enlarged its powers, and directed that all donations, bequests, and devises hereafter made for its benefit should be taken and held by a board of regents, among whom are the governor of the State and the mayor of the city of New York.

The exhibition buildings owned and occupied by the Institute in 1873 extend from Second to Third avenue, and from Sixty-third to Sixty-fourth street, their length being 610 feet, and the extreme width 200 feet. They are, however, of a temporary character, and it is proposed to erect at no distant day a permanent fire-proof structure of such ample dimensions as to accommodate under one roof all the departments of the Institute.

It will be seen by this brief sketch that the American Institute is exactly adapted to meet certain intellectual wants of almost every class of citizens, and at the same time to give material aid to the inventor and manufacturer. It does not seek to educate the young, but rather to diffuse among those who have arrived at maturity a knowledge of the latest triumphs of science, the most important improvements in the arts, and the best machines and methods for increasing material productions. Its mission is not limited to its own members, for its highest aim is the public good.

The names of those who have labored long and faithfully for its success are too numerous to be here enumerated. Prominent among its early friends were Thaddeus B. Wakemann, its first corresponding secretary, who held that office for twenty years, and Gen. James Tallmadge, for twenty years its president. Among those who have more recently increased its fame and influence by their pens and personal efforts we may mention the late Horace Greeley, president of the Institute from 1866 to 1871, and the distinguished scientist and divine, the Rev. F. A. P. Barnard, LL.D., who at this time (1873) most worthily fills the same responsible post. SAMUEL D. TILLMAN.

Amer'icanism, a term applied to certain peculiar expressions or forms of the English language prevailing in the U. S.; such as *fall*, for "autumn;" *clever*, for "kind" or "obliging;" to *fix*, instead of to "arrange" or "put in order," to "dress;" *go ahead*, etc., etc. It may, however, be remarked that some of the so-called "Americanisms" are nothing more than old English words, the original signification of which has become partly or wholly obsolete in England, while it is still retained in America; for example, *sick, sickness*, instead of the modern English "ill," "illness;" and *ride*, which originally signified to be conveyed either in a carriage or on horseback, but limited to the latter exclusively by the present English usage. Both of these words are often used in the common translation of the Bible in what we may call their American signification. Others are words which in England are provincial or local, but which are in extensive, if not universal, use in the U. S.; to *will*, in the sense of to "droop" or "wither," is an instance of this kind. It is an obvious error to call those words "Americanisms" which have been introduced as the name of something which does not exist or is comparatively little used in England, as *prairie, molasses*, etc.

The following are some of the most remarkable Americanisms extensively prevailing in the U. S.: *Baggage*, used instead of the English word "luggage" to denote the trunks or what contains the wearing apparel, etc. of one who is travelling.—*Boss* (a corruption of the Dutch *baas*, a "master"), one who has the employment or direction of a set of workmen.—*Creek*, which signifies in England a small arm or inlet of the sea, is used almost universally in the U. S. for a "small river."—*Hack*, signifying, according to English usage, a horse let out for hire, is employed in the U. S. for a "hackney coach," of which it is doubtless an abbreviation.—*Sleigh* is in universal use in the U. S. for what the English call a "sledge."—*Woods* is used in America instead of the English words "wood" and "forest."

Many expressions are reproachfully termed Americanisms which have the sanction of some of the best English writers; we may cite, among others, *talented*, which Coleridge condemned as an Americanism, but which is as legitimately formed as *gifted*, a word fully sanctioned by the usage of the best English authors; and *in this connection*, which, if not a very elegant expression, has at least the merit of brevity, and was used by Hazlitt long before the reproach of its being an Americanism was attempted to be fastened upon it. (See BARTLETT'S "Dictionary of Americanisms;" PICKERING'S "Vocabulary of Words and Phrases peculiar to the U. S.;" LOWELL'S Introduction to the "Biglow Papers," second series.) J. THOMAS.

American River, in the N. central part of California, formed by the union of its North and South Forks in the western part of El Dorado county; it flows in a S. W. direction, and empties into the Sacramento River a short distance above Sacramento City. Gold is found along the banks of this river and its forks.

Amer'icus, cap. of Sumter co., Ga., on South-western R. R., 70 miles S. S. W. of Macon, has 6 churches, 1 female college, 1 male high school, common schools, 1 weekly newspaper, 1 national bank, 1 carriage-factory, and 150 stores and shops. Pop. 3259.

J. R. WORRIL, FOR ED. OF "SUMTER REPUBLICAN."

Americus, p.-v., Washington tp., Tippecanoe co., Ind., 10 miles N. E. of Lafayette, on Toledo Wabash and Western R. R. and Wabash and Erie Canal. Pop. 143.

Americus, a post-village and township of Lyon co., Kan., on the Missouri Kansas and Texas R. R., 8 miles N. W. of Emporia. The Neosho River furnishes valuable water-power. Pop. of township, 884.

Americus, a post-village, capital of Jackson co., Miss., near Pascagoula River, about 150 miles S. E. of Jackson.

Americus Vespucius. See VESPUCCI.

A'mersfort', or **A'mersfoort',** a town and port of the Netherlands, in the province of Utrecht, on the river Eem, 12 miles N. E. of Utrecht. It has a Jansenist seminary, a Latin school, and manufactures of cotton and woollen stuffs. Tobacco, grain, and dried herrings are exported from this town. Pop. in 1867, 13,258.

Ames, a post-village of Washington township, Story co., Ia., on the Iowa division of the Chicago and North-western R. R. It has one weekly newspaper, and is the seat of the State Agricultural College. Pop. 636.

Ames, a post-village of Canajoharie township, Montgomery co., N. Y., is the seat of an academy. Pop. 150.

Ames, a township of Athens co., O. Pop. 1229.

Ames (Adelbert), an American officer, born Oct. 31, 1835, at Rockland, Me., graduated at West Point 1861, lieutenant-colonel Twenty-fourth Infantry July 28, 1866, and brigadier-general U. S. volunteers May 20, 1863; served in the artillery in the Manassas campaign 1861, engaged at Bull Run (wounded and brevet major), in defences of Washington 1861–62, in command of battery in the Virginia Peninsula 1862, engaged at Yorktown, Gaines' Mill, and Malvern Hill (brevet lieutenant-colonel), as colonel Twentieth Maine Volunteers Aug. 29, 1862, in Maryland campaign 1862, engaged at Antietam, in Rappahannock campaign 1862–63, engaged at Fredericksburg, Chancellorsville, and Beverly Ford, in Pennsylvania campaign 1863, engaged at Gettysburg (brevet colonel), in operations in the department of the South 1863–64, in command of a division in the operations before Petersburg 1864, engaged at Port Walthall Junction, Cold Harbor, and Darbytown road, in expeditions to Fort Fisher 1864–65, engaged in the assault and capture of the place (brevet brigadier-general U. S. A. and brevet major-general U. S. volunteers), and in operations in North Carolina 1865–66. Breveted major-general Mar. 13, 1865, for gallant and meritorious services in the field. Since the war was made provisional governor of Mississippi June 15, 1868, in command of fourth military district, department of Mississippi, 1869. Resigned Feb. 23, 1870, and was elected to the U. S. Senate from Mississippi on the reconstruction of that State, and took his seat April, 1870.

George W. Cullum, *U. S. Army.*

Ames (Edward R.), D. D., a bishop of the Methodist Episcopal Church, born at Athens, O., May 20, 1806. He was educated at Ohio University, was tutor at McKendree College (1823–29), began to preach in 1830, and was appointed a bishop in 1852. Since 1861 he has resided in Baltimore.

Ames (Fisher), LL.D., an eminent orator and statesman, born in Dedham, Mass., April 9, 1758. He graduated at Harvard College in 1774, after which he studied law in the office of William Tudor of Boston, and was admitted to the bar in 1781. In several political essays which he wrote for the newspapers of Boston about 1785 he displayed practical wisdom and literary ability of a high order. He was a member of the convention of Massachusetts which in 1788 ratified the Federal Constitution, and he advocated its adoption in an eloquent speech. Having identified himself with the Federal party, he was elected a member of Congress in 1789 by the voters of the district which included Boston. He supported the administration of Washington, spoke frequently in Congress, and soon acquired a national reputation as an orator of the foremost rank. Among the most memorable of his parliamentary efforts was a powerful speech in support of Jay's treaty with England, April, 1796, which has been preserved. At the close of this speech an opponent of the treaty moved to postpone the vote on the question, giving as a reason that the members were too much excited to make a just and rational decision. After he had served four terms in Congress he retired to private life in 1797, on account of his delicate health. He married Frances Worthington of Springfield in 1792. In 1799 he pronounced a eulogy on Washington before the legislature of Massachusetts. He was elected president of Harvard College in 1804, but he declined that position. He died on the 4th of July, 1808, leaving several sons. His character was eminently pure and honorable. He was distinguished for his wit, his colloquial powers, and his brilliant imagination. His orations abound in happy metaphors and illustrations. His works, consisting of orations, essays, and letters, were published by his son, Seth Ames, in 2 vols., 1854.

Ames (Joseph), born in Roxbury, N. H., in 1816, became an artist, studied in Rome, painted excellent portraits and genre pictures, became a resident of Boston, Mass., and afterwards of Baltimore, and died in New York City, Oct. 30, 1872. Among his best works are portraits of Pius IX., Rufus Choate, and Ristori as "Medea," "Maud Muller," and "The Old Stone Pitcher."

Ames (Nathan P.), an American machinist, born in 1803, was remarkable for his sound judgment and practical ability. He owned extensive manufactories of firearms, bronze statuary, cannon, machinery, and edge-tools at Chicopee Falls and Cabotville, Mass. Died April 23, 1847.

Ames (Oakes) was born in Easton, Mass., Jan. 10, 1804. His father was a blacksmith, and the son was brought up to the same trade. The elder Ames had established his reputation as a maker of shovels; and his two sons, Oakes and Oliver, Jr., continued the manufacture of these and other implements, chiefly agricultural, upon a large scale, and acquired great wealth. He was a member of Congress from Massachusetts (1862–73), and his opinion upon financial matters had great weight. Mr. Ames was largely interested in the building of the Union Pacific R. R. and in the Credit Mobilier enterprise. Died at North Easton, Mass., May 8, 1873.

Amesbury, a township of Washington co., Me. Since 1850 depopulated.

Amesbury, a post-township of Essex co., Mass., extending from the navigable Merrimack River, its southern boundary, to the State of New Hampshire, is 40 miles by rail N. of Boston. There is a horse railroad extending to Newburyport, 5 miles distant, and also a branch railroad connecting with the Eastern R. R. Here are extensive manufactures of flannels, carriages, boots and shoes, cassimeres, broadcloths, etc. It has two weekly newspapers and seven churches. Amesbury is the residence of the poet Whittier. It has a national and a savings bank. Pop. of township, 5581. W. H. B. Currier, Ed. "Villager."

Am'ethyst [Gr. ἀμέθυστος, from α, priv., and μεθύσκω, to "make drunk"], a purple variety of rock-crystal or quartz, colored by manganese, so named from its reputed virtue of preventing intoxication. It is found in Brazil, Ceylon, India, and many other places, and is worn in the form of seals and ornamental articles. The Oriental amethyst is a variety of spinel, and is a more valuable gem than the common amethyst.

Amha'ra, the central division of Abyssinia, capital Gondar. (See Abyssinia.)

Amhar'ic Lan'guage, so called from the province of Amhara, has been, since the extinction of the Ethiopic Language (which see), the chief language of Abyssinia, and is spoken by the majority of the population in the countries between the rivers Tacazze and Abai, and in the former kingdom of Shoa, while in the countries in the N. E. of Abyssinia, N. of the Tacazze, the Tigre language predominates. Among the Semitic languages, the Amharic is nearest related, both grammatically and lexicographically, to the Ethiopic, but is by no means a new form of the Ethiopic, but rather a descendant of the Old Amharic, which is closely allied to the Ethiopic. Although the Amharic has retained many peculiarities of the Old Semitic, it still represents a later stage of development of the southern Semitic than does the Ethiopic. In all its phonetic relations the Amharic has degenerated very much, while many of its grammatical forms have been abolished, and have been only in part replaced by new forms. After the Amharic language had been used for many centuries by the people, and after the extinction of the Ethiopic, it became a written language, the Ethiopic alphabet being employed, while for the sounds peculiar to the Amharic new characters were introduced by a modification of the Ethiopic characters. Although the Amharic cannot be called a literary language in the true sense of the word, still many works have been written in it within the last three centuries, partly translations and explanations of biblical and other Ethiopic books and vocabularies, partly short historical works, dogmatical and ethical compendia, formulæ for confession, etc. for the people, and partly medical and magical treatises. In the Ethiopic-Amharic books of the history of the native kings some of the older Amharic poems are given. But of these works very little is known in Europe. Up to the present time, only missionary works have been printed. The Amharic has been treated grammatically and lexicographically by Ludolf (1698), more completely by Isenberg (Lexicon, 1841; Grammar, 1842).

Am'herst, a town and seaport of British Burmah, is on the E. shore of the Bay of Bengal, 30 miles S. S. W. of Maulmain. It was founded in 1826. The harbor is exposed to the S. W. monsoon. Pop. about 30,000.

Amherst, a village of Cumberland co., Nova Scotia, is situated near the N. W. extremity of the Bay of Fundy, on the Intercolonial R. R. It has one weekly newspaper, a considerable lumber-trade, agriculture, coal-mining, manufacturing, and shipbuilding. Pop. about 2000.

Amherst, a county of the central part of Virginia, has an area of 418 square miles. It is bounded on the S. W. and S. E. by the James River, and on the N. W. by the Blue Ridge. The surface is diversified, and presents beautiful scenery where the James River passes through the Blue Ridge. Grain, tobacco, and wool are produced. Capital, Amherst. Pop. 14,900.

Amherst, a post-township of Hancock co., Me. P. 350.

Amherst, a post-village and township of Hampshire co., Mass., on the New London Northern R. R., 85 miles N. of New London, and on the Mass. Central R. R., 82 miles W. of Boston. It is the seat of Amherst College and of the Mass. Agricultural College. (See Amherst College.) The town has one high school, four grammar schools, four intermediate and nine primary schools. It has one national and one savings bank, nine churches, two newspapers, three paper and two planing mills, one manufactory of leather, four of children's wagons, one of palm-leaf hats,

and one of planes. Amherst is also one of the healthiest and best agricultural towns in Mass. The village is situated upon an elevation which affords a beautiful view of the fertile and picturesque valley of the Conn. and of the surrounding mountains—the Holyoke range to the S. W., and on the N. Mettawampe, Sugar Loaf, and others. Pop. of township, 4035. W. H. Hobbie.

Amherst, a post-township of Fillmore co., Minn. Pop. 1115.

Amherst, one of the three shire-towns of Hillsborough co., N. H., a beautiful village 48 miles from Boston, 11 from Nashua, and 30 from Concord, on the Wilton R. R. It has Congregational, Baptist, and Methodist churches, court and town-house, high school house and a fine hotel. The township contains Babboosuck Lake and a mineral spring. It is a fine summer resort. It has one weekly paper, and was the birthplace of Horace Greeley. Pop. of township, 1353.

E. D. Boylston, Pub. "Farmers' Cabinet."

Amherst, a township of Erie co., N. Y. It contains a copious sulphur spring, natural gas-works, which yield illuminating gas, and has also quarries of hydraulic limestone. Williamsville, the principal village, contains an academy, four churches, and a number of manufactories. Pop. 4555.

Amherst, a post-township of Lorain co., O. Pop. 2482.

Amherst, the county-seat of Amherst co., Va., 13 miles N. of Lynchburg, on the W. C. V. M. and G. R. R. It contains two churches (Episcopal and Methodist), a high-school, one newspaper, and a fine public hall. Pop. of township, 3632. Ed. "Enterprise."

Amherst, a post-township of Portage co., Wis. P. 982.

Amherst, Earls of, and Viscounts Holmesdale (1826, in the peerage of the United Kingdom) and Barons Amherst (1788, in the peerage of Great Britain), a noble family of Great Britain.

Amherst (Jeffery), called **Lord Amherst,** a British general, born in Kent Jan. 29, 1717. He entered the army in 1731, became a colonel in 1756, and a major-general in 1758. He rendered important services in the war against the French which resulted in the conquest of Canada in 1760, and at the end of that war was appointed commander-in-chief of the British army in America. He became governor of Virginia in 1763, was created Baron Amherst in 1776, and was commander-in-chief of the army in England from 1776 to 1782. In 1796 he obtained the rank of field-marshal. Died Aug. 3, 1797.

Amherst (William Pitt), first Earl of, a nephew of the preceding, was born in England Jan. 14, 1773. He was sent as ambassador to China in 1816, and reached Pekin, but he failed to effect the object of his mission, as he refused to comply with the degrading ceremonies which Chinese etiquette prescribed, and was not admitted into the presence of the emperor. He was governor-general of India in 1823–26, and was created an earl in 1826. Died Mar. 13, 1857.—His son, William Pitt, born Sept. 3, 1805, succeeded him as second earl.—His eldest son, William Archer, Viscount Holmesdale, born Mar. 25, 1836, was from 1859 to 1868 member of the House of Commons for West Kent, and was in 1868 re-elected as member for Mid-Kent.

Am'herstburg, a town of Essex co., Ontario, Canada, on the Detroit River, 5 miles from its entrance into Lake Erie, and 225 miles W. S. W. of Toronto. It contains a court-house, five or more churches, and one newspaper-office. Pop. in 1871, 1936.

Amherst College, one of the leading colleges in the United States, is situated in Amherst, Hampshire co., Massachusetts. It was founded in 1821, and at its semi-centennial in 1871 it had 1936 alumni, of whom 1450 are supposed to be living. Of the 1936 graduates up to the last triennial, 751 were ministers, 75 missionaries in foreign lands, 129 doctors of medicine, 186 lawyers, and 208 professors and teachers; 195 served in the late war, and 26 sacrificed their lives in the service. The college edifices, 12 in number, have been erected at a cost of $300,000. The pecuniary value of the scientific and archæological collections cannot be estimated at less than $125,000, and the whole property of the institution, including permanent funds, professorships, scholarships, prizes, etc., is more than a million of dollars. All this is the gift of private charity and munificence, with the exception of about $50,000 granted by the State. The donors have been the Christian men and women of Massachusetts. The largest benefactors are Hon. Samuel Williston and Dr. William J. Walker; the former has given $150,000, and the latter a quarter of a million. The Hitchcock Ichnological Cabinet, the Adams Collection in Conchology, and the Shepard Mineralogical and Meteoric Collections, are known the world over as of unsurpassed value and excellence. The Barrett Gymnasium, with its accompanying system of exercise and instruction, constitutes a feature peculiar to this institution; all the students, unless excused for special reasons, are required to exercise half an hour daily, chiefly in the light gymnastics, under the direction of a professor who is an educated physician, and who has charge of their health and physical culture. The faculty of Amherst College at present consists of 21 persons, including the president, 12 professors, 3 lecturers, 4 instructors, and an assistant librarian. The number of students in 1871, the year of jubilee, all in the four classes of the regular college course, was 261—65 seniors, 49 juniors, 76 sophomores, and 71 freshmen. The annual income is about $50,000. The presidents have been Rev. Z. Swift Moore, D. D. (1821–23); Rev. Heman Humphrey, D. D. (1823–45); Rev. Edward Hitchcock, D. D., LL.D. (1845–54); Rev. William A. Stearns, D. D., LL.D. (1854–76); and Rev. J. H. Seelye, LL.D.

The Massachusetts Agricultural College, although the offspring of Amherst College, and situated in the same place for the purpose of securing the advantage of its scientific treasures, has no organic connection with it, having a separate faculty and a distinct board of trustees, elected by the legislature of the State. It was opened for students in the fall of 1867, and held its first commencement, with the graduation of its first class, in the summer of 1871. It has three college halls, two boarding-houses, the Durfee Plant-house, and a botanic museum, besides the buildings pertaining to the farm, which consists of over 300 acres. The students work on the farm a certain number of hours each week, under the direction of the superintendent and the professor of agriculture. They also receive regular military exercise and drill under the professor of military science and tactics. The real estate of the college cost about $200,000. Its permanent funds, derived from the sale of lands given by Congress, from grants by the State, and from private donations, amount to half a million. The faculty, as exhibited in the catalogue of 1871, consists of 28 persons, including the president, Dr. William S. Clark, 7 professors, 2 instructors, 16 non-resident lecturers, a gardener, and a farm superintendent. There were then 147 students—30 seniors, 34 juniors, 27 sophomores, 32 freshmen, 22 select, and 2 resident graduates. (See "History of Amherst College," by Prof. W. S. Tyler, D.D., 1872.)

W. S. Tyler.

Amherst Islands, a group in the Yellow Sea, near the S. W. coast of the peninsula of Corea.

A'mia Cal'va, the scientific name of a species of fish found in the fresh waters of North America. It is one of the few living ganoids, is interesting from its relationship to the ancient fossil fishes, and remarkable for the cellular structure of its air-bladder, which somewhat resembles the lung of a reptile. It is known as the "dog-fish" or "lawyer," and is worthless as food.

Amian'thus [Gr. ἀμίαντος, "undefiled," from α priv., and μιαίνω, to "defile"], a delicate and fibrous form of serpentine, so called because cloth made of it can be purified by fire. It is sometimes called mountain flax. The cloths in which the ancients wrapped the bodies that were burned on the funeral pyre were sometimes made of amianthus.

Am'ic Ac'ids, acids in which a portion of the hydroxyl (OH) has been replaced by amidogen (NH_2). When dry ammonia gas is passed over a thin layer of sulphuric anhydride (SO_3), the gas is absorbed, and a white crystalline compound results which contains $N_2H_8SO_4 = (NH_4)_2SO_4 - H_2O$, or ammonic sulphate, less one molecule of water. On dissolving it in water it fails to give the reactions of sulphuric acid; it is the ammonium salt of a new acid, sulphamic acid. Its relation to sulphuric acid is thus shown:

$$\text{Sulphuric acid, } H_2SO_4 = \left.\begin{matrix}HO\\HO\end{matrix}\right\} SO_2,$$

$$\text{Sulphamic acid, } H.NH_2.SO_3 = \left.\begin{matrix}HO\\NH_2\end{matrix}\right\} SO_2.$$

Sulphamic acid is monobasic, and forms numerous salts:

Ammonic sulphamate,	$NH_4.NH_2SO_3$,	
Potassic	"	$K.NH_2SO_3$,
Baric	"	$Ba.NH_2SO_3)_2$.

Dry carbonic anhydride (CO_2) unites with dry ammonia (NH_3), forming ammonic carbamate, $NH_4.NH_2CO_2 = N_2H_6CO_2$, or equivalent to ammonic carbonate, $(NH_4)_2CO_3$, less H_2O. This salt contains carbamic acid, the relation of which to carbonic acid is thus shown:

$$\text{Carbonic acid, } H_2CO_3 = \left.\begin{matrix}HO\\HO\end{matrix}\right\} CO,$$

$$\text{Carbamic acid, } H.NH_2.CO_2 = \left.\begin{matrix}HO\\NH_2\end{matrix}\right\} CO.$$

Ammonic carbamate exists in common ammonic carbonate, and was formerly called anhydrous carbonate of ammonia. It dissolves readily in water, and by combining one mole-

cule of water passes into ammonic carbonate, $NH_4.NH_2.CO_2 + H_2O = (NH_4)_2CO_3$.

When both molecules of hydroxyl in a bibasic acid are replaced by amidogen, a neutral amide results. Carbamide or urea, $(NH_2)_2CO$, is such an amide. Bibasic acids may thus form an amic acid or a neutral amide, according as one or both molecules of hydroxyl are replaced by amidogen. Tribasic acids may form two amic acids and a neutral amide. Monobasic acids containing only one hydroxyl yield no amic acids, only neutral amides.

C. F. Chandler.

Am'ice, or Amic'tus, an upper garment worn by the Romans over the tunic: also a linen vestment worn over the shoulders of Roman Catholic priests during the celebration of the mass.

Ami'ci (Giovanni Battista), an Italian optician and savant, born at Módena Mar. 25, 1784. He was skilful in the fabrication of mirrors and lenses for telescopes and microscopes. He was for many years director of the observatory of Florence, where he gained distinction as an observer. He wrote on double stars and other topics of astronomy. The achromatic microscope which he constructed was considered a valuable improvement. Died April 10, 1863.

Am'ides, compounds derived from ammonia, NH_3, by the replacement of one or more atoms of H by a metal or by a compound radical, acid or basic. According to the character of the replacing body, they are either—

1. Amides proper, in which one or more hydrogen atoms are replaced by an acid radical; as,

Acetamide, $N.C_2H_3O.H_2$,
Diacetamide, $N.(C_2H_3O)_2.H$.

2. Amines, in which one or more hydrogen atoms are replaced by a basic radical; as,

Potassamine, $N.KH_2$,
Diamylamine, $N.(C_5H_{11})_2.H$.

3. Alkalamides, in which hydrogen is replaced by both acid and basic radicals; as,

Mercurobenzamide, $N.Hg.C_7H_5O.H$,
Ethylformamide, $N.C_2H_5.CHO.H$.

Monamides are derived from one molecule of ammonia, $NHHH$.
Diamides " " two " " $N_2H_2H_2H_2$.
Triamides " " three " " $N_3H_3H_3H_3$.

Amines and alkalamides present corresponding classes.

According as one-third, two-thirds, or all the hydrogen of the ammonia is replaced, the amide, diamide, or triamide is said to be primary, secondary, or tertiary. Amides are well illustrated by

$$\text{Acetamide. } N.C_2H_3O.H_2 = N\begin{cases} C_2H_3O \\ H \\ H. \end{cases}$$

It is a white crystalline solid, which melts at 172° F., and boils at 430° F. Heated with acids or alkalies, it unites the elements of water, forming acetic acid and ammonia, $N.C_2H_3O.H_2 + H_2O = NH_3 + H.C_2H_4O_2$. It is formed by the action of heat on ammonic acetate, and by other methods: $NH_4.C_2H_3O_2 = N.C_2H_3O.H_2 + H_2O$. It acts both as a base and as an acid. By uniting with hydrochloric and nitric acids it forms compounds analogous to ammonic salts, while by admitting silver in place of hydrogen, silver-acetamide is produced. (See Amines.) C. F. Chandler.

Amidine. See Starch.

Amid'ogen [contracted from *ammonia* and the Gr. *γεννάω*, to "produce"], a compound of one atom of nitrogen and two atoms of hydrogen. Its symbol is NH_2. It has not been obtained in a separate state, but may be traced in combination with other substances, with which it forms important organic compounds called *amides*. Potassiamide, NH_2K, is a compound of the metal potassium with amidogen. Ammonia is a compound of NH_2 with H. (See Amic Acids, Amides, and Amines, by C. F. Chandler.)

Amiens (anc. *Samarobri'va* and *Ambia'ni*), an ancient and important town of Northern France, capital of the department of Somme, is on the river Somme, and on the Paris and Boulogne R. R., 81 miles by rail N. of Paris. It was once very strongly fortified, and still has a citadel. It is the seat of a bishop, and contains a magnificent Gothic cathedral 145 feet long, 182 feet wide, having a spire 420 feet high, which was founded in 1220 and finished in 1288. Among its other fine edifices are the hôtel de ville, Château d'Eau, and the library, containing 60,000 volumes. Here are extensive manufactures of cotton velvet, serges, plush, and other cotton and woollen stuffs. The river, which is here divided into many canals, affords water-power for mills and manufactories. Amiens was the native place of Peter the Hermit and of Delambre. An important treaty, called "the Peace of Amiens," was signed here by the French and British in Mar., 1802. On Nov. 27, 1870, the German general Manteuffel obtained here a great victory over the French army of the Loire, and soon after the Germans took possession of the town. Pop. in 1866, 61,063.

Am'ines, amides in which the radical replacing hydrogen is basic, an alcohol radical. They are monamines, diamines, triamines, etc., according as they are formed from one, two, three, or more molecules of ammonia. The nitrogen may be replaced by phosphorus, arsenic, antimony, etc., giving rise to phosphines, arsines, stibines, etc.

The natural organic bases, alkaloids, found in plants, probably belong to this class of bodies. The amines have of late acquired great theoretical and practical importance. They are basic compounds, resembling ammonia to a greater or less degree in odor, alkaline reaction, and readiness to form salts with acids. A few examples will best illustrate the class: Ethylamine, $NC_2H_7 = NH_2(C_2H_5)$, a mobile liquid which boils at 66° F. It has a pungent odor, very like that of ammonia, turns reddened litmus blue, forms a cloud with hydrochloric acid, produces salts with acids very similar to the corresponding ammonic salts, is readily soluble in water. Diethylamine, $NH(C_2H_5)_2$, and triethylamine, $N(C_2H_5)_3$, are similar compounds. When triethylamine is mixed with ethyl iodide, C_2H_5I, a crystalline tetrethyl-ammonium-iodide, $(C_2H_5)_4I$, is formed, analogous to ammonium iodide, NH_4I. On treating this compound with precipitated silver oxide suspended in water, a tetrethyl-ammonium hydrate is formed, which resembles in many respects potassic and sodic hydrates. Its solution is strongly alkaline, very bitter, destroys the skin, saponifies the fats, decomposes many metallic salts, precipitating hydrates. With acids it forms neutral salts. Its chloride unites with platinic chloride, forming orange-yellow octahedra. The analogy with ammonia is shown by the following symbols:

Ethylamine, $NH_2(C_2H_5)$, ammonia, NH_3.
Diethylamine, $NH(C_2H_5)_2$.
Triethylamine, $N(C_2H_5)_3$.
Tetrethyl-ammonium, $N(C_2H_5)_4$, ammonium, NH_4.
" iodide, $N(C_2H_5)_4I$, ammonium iodide, NH_4I.
" hydrate, $N(C_2H_5)_4(OH)$, ammonic hydrate, $NH_4(OH)$.

Phenylamine or aniline, $C_6H_7N = N(C_6H_5)H_2$, is a very important member of this class. (See Aniline.)

Diamines represent two molecules of ammonia in which two, four, or six atoms of H are replaced by one, two, or three molecules of a diatomic radical:

Ethylen-diamine, $N_2(C_2H_4)''H_4$.
Diethylen-diamine, $N_2(C_2H_4)''_2H_2$.
Triethylen-diamine, $N_2(C_2H_4)''_3$.

(See Ethylene Bases.) Triamines, triglyceryl-triamine, $N_3(C_3H_5)'''_3$, tetramines, and pentamines are supposed to exist. (See Rosaniline.) C. F. Chandler.

Amite, a river rising in the S. W. part of Mississippi, enters Louisiana, flows southward to Ascension parish, where it turns towards the E., and falls into Lake Maurepas. Length, about 100 miles.

Amite, a county of Mississippi, bordering on Louisiana, has an area of about 700 square miles. It is traversed by the Amite River, and bounded on the N. W. by the Homochitto. The surface is somewhat diversified; the soil is adapted to cotton. Cattle, rice, wool, and corn are also produced. Capital, Liberty. Pop. 10,973.

Amite, a post-village, capital of Tangipaho parish, La., on the Amite River, and on the New Orleans Jackson and Great Northern R. R., 68 miles N. N. W. of New Orleans. It has one weekly newspaper. Pop. 910.

Am'ity, a post-township of Livingston co., Ill. P. 790.

Amity, a post-village of Page co., Ia., in a township of its own name, 115 miles S. W. of Des Moines. Pop. of township, 1010.

Amity, a post-township of Aroostook co., Me. P. 311.

Amity, a township of Allegany co., N. Y. It has considerable manufactures. Pop. 2087.

Amity, a township of Berks co., Pa. Pop. 1646.

Amity, a township of Erie co., Pa. Pop. 924.

Am'ityville, a post-village of Huntington township, Suffolk co., N. Y., is on the South Side R. R. of Long Island, 29 miles from the N. Y. ferries. Pop. 500.

Am'leth, or Ham'leth, an ancient prince of Jutland, who is considered a fabulous personage by some writers. He is said to have lived about 150 B. C. His story is related by Saxo Grammaticus, and was formerly considered the foundation of Shakspeare's "Hamlet."

Am'lwch, a seaport and parliamentary borough of North Wales, is on the N. coast of the island of Anglesey, 15 miles N. W. of Beaumaris. It owes its growth and prosperity to the Parys and Mona copper-mines. Pop. in 1871, 7034.

Am'man, or **Am'mon** (the ancient *Rabbah*, the capital of the Ammonites), a ruined city of Syria, in the pashalic of Damascus, is picturesquely situated on the Zurka, an affluent of the Jordan, 55 miles E. N. E. of Jerusalem. Here was an important city in ancient times, originally named Rabbah, which was besieged and taken by the army of King David. (See 2 Samuel xi. and xii.) After it had been once ruined, it was rebuilt by Ptolemy Philadelphus, and called Philadelphia. It has extensive ancient remains. As late as 300 A. D. it was a remarkable city, having a magnificent theatre and temples. It was one of the cities of the Decapolis.

Am'man (Johann Conrad), M. D., a Swiss physician, born at Schaffhausen in 1669, practised at Haarlem, in Holland. He acquired distinction by his successful efforts to teach the deaf and dumb to speak, and wrote on that subject an essay called "Surdus Loquens" (the "Deaf Speaking," 1692). Died in 1724.

Amman (Jost or Justus), an eminent Swiss engraver and designer, born at Zurich in 1535. He removed about 1560 to Nuremberg, where he worked for many years, and illustrated numerous books with his designs. He engraved on copper and on wood. Among his works are "Portraits of the Kings of France from Pharamond to Henry III." (1576), and wood-cuts of "Reinecke Fuchs." Died in 1591.

Ammana'ti, Ammana'te, or **Ammana'to** (Bartolommeo), an eminent Italian sculptor and architect, born at Florence in 1511, was a pupil of Sansovino. He was patronized by Pope Julius III., who employed him to adorn the Capitol (in Rome) with sculptures. He completed the Pitti palace of Florence. Among his best works are a bridge called Ponte della Trinità at Florence, and three statues which adorn the tomb of Sannazar at Naples. Died about 1590.

Am'meline, a white crystalline, feebly basic substance, resulting from the action of acids or alkalies on melam, is considered to be an amic acid of cyanuric acid. Its composition is $C_3N_3H_5O$.

Am'men (Daniel), U. S. N., born May 15, 1820, in Ohio, entered the navy as a midshipman July 7, 1836, became a passed midshipman in 1842, a lieutenant in 1849, a commander in 1863, a captain in 1866, a commodore in 1872. During the latter part of 1861, and all of 1862, he commanded the gunboat Seneca in the South Atlantic blockading squadron; he bore a conspicuous part in the battle of Port Royal, Nov. 7, 1861, where he gained the admiration of his officers and men for his skill, coolness, and intrepidity. He engaged afterwards in all the operations of Dupont's command on the coasts of Georgia and Florida. In an official report to Flag-officer Dupont of Dec. 6, 1861, Commander C. R. P. Rodgers writes: "I have to thank Lieutenant-commanding Stevens for the most earnest, cordial, and efficient co-operation, and also Lieutenants-commanding Ammen and Bankhead, whose vessels were always in the right place, and always well handled." And again in a despatch of Jan. 3, 1863, Rogers says: "Lieutenant-commanding Ammen will make a separate report of the Seneca and Ellen at Seabrook before I met him. It is unnecessary for me to say to you that his work was *thoroughly* done." He was engaged as commanding officer of the monitor Patapsco with Fort McAllister, Mar. 3, 1863, and complimented by his superior officer, Captain Percival Drayton, for his services during the action; in the ironclad attack on Fort Sumter, April 7, 1863, and commended by Flag-officer Dupont in his despatch of April 15, 1863, for "the highest professional capacity and courage;" in both attacks on Fort Fisher Dec., 1864, and Jan., 1865, and for the "cool performance" of his duty on these occasions recommended for promotion by Rear-admiral David D. Porter; in 1866 and 1867 a member of the board assembled to examine volunteer officers for admission into the regular navy; in 1869 appointed chief of the bureau of yards and docks, and on Oct. 1, 1871, chief of bureau of navigation, in the discharge of which duty he is now engaged.

Foxhall A. Parker, U. S. N.

Ammen (Jacob), an American officer and teacher, born Jan. 7, 1808, in Botetourt co., Va., graduated at West Point 1831, and became, July 16, 1862, brigadier-general U. S. volunteers. While a lieutenant of artillery he served at the Military Academy as an assistant instructor, 1831–32 and 1834–37; at Charleston harbor 1832–33, during South Carolina's threatened nullification, and at Fort Trumbull, Conn., 1833–34. After his resignation from the army, Nov. 30, 1837, he was professor of mathematics in Bacon College, Ky., 1837–39, of mathematics in Jefferson College, Miss., 1839–40 and 1843–48, of mathematics in the University of Indiana, 1840–43, and of mathematics and astronomy in Georgetown College, Ky., 1848–55; and civil engineer at Ripley, O., 1855–61. During the civil war he was captain and lieutenant-colonel of the Twelfth Ohio Volunteers, colonel of the Twenty-fourth, and brigadier-general U. S. volunteers, serving in the West Virginia campaign 1861; engaged at Cheat Mountain and Greenbrier, in the Tennessee and Mississippi campaign, engaged at battle of Shiloh and siege of Corinth, in various movements of the army of the Ohio, 1862–63, and in command of several districts in Illinois, Kentucky, and Tennessee, till he resigned, Jan. 14, 1865.

Grosvenor W. Cullum, U. S. Army.

Am'mergau' Mys'tery [Ger. *Ammergauer Passionsspiel*], the name given to the representation of our Saviour's Passion which since 1634 has taken place every ten years at the village of Ober-Ammergau, in Bavaria. The custom originated in a vow made by the inhabitants, on their deliverance from the plague, to celebrate the Passion Tragedy every tenth year. The last took place in 1870, but was interrupted by war, and finished in 1871. (See Hertland, "Das Ammergauer Passionsspiel im Jahre 1870," 1870.)

Ammia'nus Marcelli'nus, an eminent Roman historian, born at Antioch, was of Greek extraction. He served in the army in his youth (about 350 A. D.), and in the expedition which the emperor Julian conducted against Persia. Having abandoned the military profession, he settled at Rome, and there composed in Latin his "History of the Roman Empire," in 31 books, of which 13 are lost. The entire work comprised the period from 96 A. D. to 378 A. D. His history is highly prized for its impartiality and other merits. (Best ed. by Wagner and Erfurdt, 1808, 3 vols.) He is supposed to have been a pagan. Died about 395 A. D.

Ammira'to (Scipione), an Italian historian, born at Lecce, in the kingdom of Naples, Sept. 27, 1531. He became a resident of Florence in 1569, and was patronized by the grand duke Cosimo. In 1596 he obtained a prebend in the cathedral of Florence. He wrote, besides other works, a "Discourse on Cornelius Tacitus" (1594), and a "History of Florence" ("Istorie Fiorentine," 2 vols., 1600–41), which is regarded by some critics as the most accurate work on that subject. He has been styled the modern Livy. Died Jan. 30, 1601.

Ammod'ytes [from the Gr. ἀμμοδύτης, a "sand-burrower"], the name of a Linnæan genus of apodal fishes, characterised by a compressed head narrower than the body, and both elongated. The sand-eel is an example of this genus.

Am'mon, or **Ham'mon** [Gr. Ἄμμων], an ancient pagan deity worshipped in Egypt, Greece, and other countries, was called *Amun* by the Egyptians, and *Jupiter Ammon* by the Romans. He was sometimes represented in the form of a ram. There was a great temple of Ammon in the oasis of Siwah or Ammonium in the Libyan Desert, and another at Thebes, which city was called No-Ammon by the ancient Hebrews. Alexander the Great visited the temple of Ammon in the oasis (B. C. 331), and assumed the title of the son of Ammon. Remains of this temple still exist.

Ammon, von (Christoph Friedrich), an eminent German Protestant theologian and pulpit orator, born at Baireuth Jan. 16, 1766. He became professor of theology at Göttingen in 1794, obtained a chair at Erlangen in 1804, and removed in 1813 to Dresden, where he was appointed court-preacher to the king of Saxony. He was a man of great and varied erudition, and belonged to the Rationalist school in theology. His most important work is "Fortbildung des Christenthums zur Weltreligion" (4 vols., 1833–40). Died May 21, 1850.

Ammo'nia [for etymology see below], or **Volatile Alkali,** an important chemical compound in the form of a transparent, colorless, and pungent gas, is formed by the union of one atom of nitrogen and three atoms of hydrogen. Its symbol is NH_3. Priestley, who first obtained it in a separate state, called it *alkaline air*. The name *ammonia* is derived from *sal-ammoniac*, which was formerly procured near the temple of Ammon, in Libya, by burning camel's dung. It is now obtained as a by-product by the distillation of bituminous coal in making gas, and from refuse animal matter in preparing bone-black, etc. It combines with acids to form salts. As it supplies to plants the nitrogen they require, it is one of the most important ingredients in manures. (See Guano.) A solution of this gas in water is used in medicine, and is called spirits of hartshorn or *liquor ammonia*. One volume of water will dissolve or absorb 500 volumes of ammonia. Liquid ammonia has been employed as a motive-power by Tellier, and for the production of artificial cold by Carré. (See Ice.) This gas can also be liquefied by pressure and cold, and then becomes a colorless liquid, with the properties of ammonia much intensified. The smelling salt, or volatile salt of hartshorn, used as a restorative in faintness, is a carbonate of ammonia. Ammonic sulphate, $(NH_4)_2SO_4$, is manufactured in large quantities, by boiling "gas-liquor" with lime, and

conducting the ammoniacal gas which is liberated into sulphuric acid. On evaporating the solution, the sulphate is obtained as a white salt. It is extensively used in the manufacture of alum in place of potassic sulphate, as a constituent of artificial fertilizers, and for the preparation of other ammoniacal salts. Ammonic nitrate is used for the preparation of nitrogen monoxide (N_2O), laughing-gas. Ammonic chloride, NH_4Cl, has long been known as *sal-ammoniac*. The "ammonia type" is one upon which a few inorganic and many organic compounds are formed. (See AMIDES, AMINES, etc., by PROF. C. F. CHANDLER, PH. D., LL.D.)

Ammo'niac [Lat. *ammoni'acum*], a gum-resin used in medicine, is imported from Africa and India. It is obtained from the *Dore'ma ammoni'acum*, an umbelliferous plant containing a milky juice, which by drying is converted into this gum. It is used as an expectorant, and sometimes applied externally as a plaster.

Ammoni'tes [from *Am'mon*, and the Gr. λίθος, a "stone;" so named from their resemblance to the horns of Jupiter Ammon; English *Am'monite*], an extinct genus of mollusks belonging to the order Cephalopoda, and one of the most striking features in the fauna of the mesozoic ages. The ammonites were discoid, chambered, spiral shells, sometimes four feet in diameter, and often beautifully ornamented exteriorly.

Ammonite.

The internal structure was similar to that of the *Nautilus*, except that the siphon was external, and the septa (partitions between the chambers) were arched outward, and were convoluted at their margins, so that their intersecting with the walls of the shell produced beautiful foliated figures. The ammonites began in the trias, were immensely multiplied in the Jurassic and cretaceous ages, and became entirely extinct at the close of the latter. More than 500 species have been described, and they are found in the mesozoic strata of all parts of the world. Beautiful ammonites occur in the cretaceous rocks of the country bordering the upper Missouri, in the Indian Territory, and in Texas. The old genus *Ammoni'tes* has been lately much subdivided by Prof. Alph. Hyatt, Prof. von Hauer, and others. (See "Bulletin Mass. Comp. Anat. Cambridge," and article AMMONITIDÆ, by J. S. NEWBERRY.)

Am'monites, an ancient Semitic tribe or nation, descendants of Ben-Ammi, a son of Lot. They inhabited the east side of the Jordan, between the rivers Arnon and Jabbok, and adjoining the northern part of Moab. Their chief city was Rabbah. (See AMMAN.) They frequently waged war against the Israelites, and were conquered by Jephthah, and afterwards by King David. (See 2 Samuel xi. and xii.) About 164 B. C. they were defeated by Judas Maccabæus. They are called "the children of Ammon" in the Old Testament.

Ammonit'idæ, a family of cephalopodous mollusks, of which the genus *Ammoni'tes* is the type. The genera of this group are all extinct, beginning with *Goniati'tes* in the Devonian and carboniferous, followed by *Cerati'tes* and *Ammonites* in the trias; *Ammonites* in great development in the Jurassic and cretaceous; *Baculi'tes, Scaphi'tes, Ancylo'ceras, Crio'ceras, Helico'ceras, Hetero'ceras, Ptycho'ceras, Hami'tes, Turrili'tes*, etc., being exclusively cretaceous, and the family ending with them.

The shells of the Ammonitidæ are all chambered, and were generally, though not always, external; the animal inhabiting the last and largest, called the body-chamber. The series of smaller chambers are supposed to have served as a float, by which the specific gravity of the animal was harmonized with that of the surrounding medium, and this shell maintained in a position best suited to its movements.

The septa are arched outward at the centre, and ruffled at the margins; are nearly simple in the earliest stages of growth, most convoluted at full maturity, more simple again in old age. The ornamentation of the external surface, which consists of ridges, knobs, and spines, and is often very elaborate, follows the same law.

In most of the Ammonitidæ the shell is a discoid spiral, but the cretaceous genera exhibit great diversity of form; as *Ammonites*, with a symmetrical spiral coiled in the same plane; *Scaphites, Ancyloceras, Crioceras*, and *Toxo'ceras*, showing a gradual unrolling of the coil, until in *Baculites* the shell is quite straight. In *Helicoceras* it forms an open elevated spiral; in *Turrilites*, an elongated conical closed spire, like that of a gasteropod, but sinister, turned to the left.

The life-history of the Ammonitidæ is very peculiar and interesting. After a long term of existence, during which they show a modest simplicity of structure and little diversity of form, in the mesozoic ages the family is expanded and developed in the most wonderful way, their numbers being enormously increased, their size becoming gigantic, their forms being almost infinitely varied, their structure more complicated, their ornamentation more elaborate, diversified, and beautiful. The cretaceous period was the golden age of the Ammonitidæ, when they attained such numbers, size, variety, and beauty as to far eclipse all other tribes of shelled mollusks, living or extinct. Their greatness ended here, however. Like the flowering of a plant or the splendor and extravagance of an over-civilized nation, their extraordinary development seems to have been exhaustive of the vital energies, as in the age next succeeding their grand climacteric, so far as now known, they had no representative.

The peculiar features in the career of the Ammonitidæ are best seen in contrast with that of their nearest relatives, the Nautilidæ. The latter began their existence in the earliest palæozoic seas as mollusks, with straight (*Orthoceras*) or coiled (*Nautilus*) shells, of which the structure was very simple. Of this family the Orthocerata are extinct, but the genus *Nautilus* has held its undeviating way through all past ages, and is now represented by living species which can hardly be distinguished from those that lived millions of years ago. The full explanation of the difference in the history and fate of these two closely allied families is perhaps beyond our reach, but it seems probable that we have here another illustration of the truth which underlies the diversity of fate in human individuals and nations, as well as of species, genera, and orders in the life-history of the globe—viz., simplicity of structure and habit promotes longevity by its adaptation to general and prevailing circumstances in time and space, while a highly specialized organization will flourish only in special and rare conditions. J. S. NEWBERRY.

Ammo'nium (NH_4), a hypothetical metal which is supposed to exist in the salts of ammonia, and to be composed of one volume of nitrogen and four of hydrogen. It is the analogue of potassium and sodium, but has never been obtained in a separate state; a supposed amalgam of ammonium, however, may be formed by the action of the galvanic battery on a globule of mercury surrounded by a solution of ammonia, and by the action of sodium amalgam on a solution of ammonium chloride.

Ammo'nium Ba'ses, compounds analogous to NH_4.-H.O, ammonic hydrate, in which the H atoms are replaced to a greater or less extent by basic radicals, such as ethyl, C_2H_5, amyl, C_5H_{11}, etc. (See AMINES, by C. F. CHANDLER.)

Ammo'nium, or **Am'mon,** the ancient name of an oasis in the Libyan Desert, about 300 miles W. S. W. of Cairo. It is now called El Siwah. Here was a celebrated oracle and temple of Jupiter Ammon, in a grove of palms; also royal palaces and the "Fountain of the Sun," the water of which was cold at noon and warm at midnight. The ruins of the temple may still be seen.

Ammo'nius, surnamed SACCAS (because in his youth he was a porter and carried sacks), a Greek philosopher, born in Alexandria, was the founder of the school called Neo-Platonic about 193 A. D. Though born of Christian parents, he went over to paganism. Among his pupils were Longinus, Origen, and Plotinus. He left no writings, and died about 243 A. D.

Ammonoo'suc, Lower, a river of New Hampshire, rises in Coos county, near Mount Washington, and flowing south-westward through Grafton county, enters the Connecticut River. It is about 100 miles long.

Ammonoosuc, Upper, a river of Coos co., N. H., which empties into the Connecticut at Northumberland. It is about 75 miles long.

Ammoph'ila (*i. e.* "delighting in sand"), [from the Gr. ἄμμος, "sand," and φιλέω, to "love"], (the *Calamagrostis* of Gray), a genus of grasses nearly allied to *Arundo*, and distinguished by a spikelike panicle, and by the glumes being nearly equal, keeled, and longer than the palæ of the single floret. The *Ammophila arundinacea*, called sand-reed, mat-grass, or marum, grows on the sandy shores of Europe, and is of great utility in fixing the shifting sand. It is also used to make mats.

Ammuni'tion [from the Lat. *ad*, "for," and *munitio*, "defence"], a military term applied to cannon-balls, shells, bullets, fuses, cartridges, grenades, gunpowder, and all the projectiles and explosive substances used in war. The ammunition of field artillery consists of shot, loaded shells, case-shot, shrapnel, cartridges, priming-tubes, matches, and rockets. An infantry soldier generally carries sixty rounds in his cartridge-box.

Am'nesty [from the Gr. ἀμνηστία, "non-remembrance"], an act of oblivion of past misconduct granted by the gov-

ernment to those who have been guilty of some offence. It is usually granted to whole communities or classes of individuals who have taken part, or are supposed to have participated, in some movement against lawful authority; it may be granted either before or after conviction, and its effect is entirely to efface the crime and cause it to be forgotten by the law. An instance is an act of amnesty in England in the 20th Geo. II. c. 52, called "an act for the king's most gracious general and free pardon." This subject has recently excited much interest in the U. S., owing to a provision in the fourteenth amendment to the Constitution creating certain disqualifications as to holding office by persons who have participated in rebellion, and at the same time allowing their removal by a special vote of the Congress. Such a removal is in the nature of an act of amnesty.

Am'nion, or **Am'nios** [etymology doubtful], the soft, delicate, and most internal membrane containing the waters which surround the fœtus *in utero;* also called *agni'na tu'nica.* It secretes a fluid called *li'quor am'nii.* (See EMBRYOLOGY, by PROF. J. C. DALTON, M. D.)

Am'nios, in botany, a thin, semi-transparent, gelatinous substance in which the embryo of a seed is suspended when it first appears, and by which the embryo is probably nourished in its first stages.

Amœ'ba Dif'fluens, an organism of the order Rhizopoda, is one of the lowest animal structures with which zoologists are acquainted. It is a mere gelatinous mass of a rounded form, capable of emitting processes and lobes from all parts of its body, and retracting them at will. This animal abounds in the bottom of fresh-water ponds, and is well known to amateur microscopists under the name of *Proteus.* With the exception of a clear pulsating space, it appears to be a structureless mass of sarcode.

Amol', a city of Persia, in the province of Mazanderan, on the river Heraz, about 12 miles from its entrance into the Caspian Sea, and 85 miles N. E. of Teheran. A bridge of twelve arches crosses the river here. Pop. estimated at from 35,000 to 40,000.

Amo'mum [from the Gr. ἄμωμος, "blameless," "without fault"], a genus of plants of the order Zingiberaceæ or Scitaminæ, and of the Linnæan class Monandria. They are natives of the tropical parts of Asia and Africa, and produce aromatic seeds called cardamom and grains of Paradise.

Amoo', or **Amu,** also called **Amoo Darya** (anc. *Oxus;* Arab. *Gihon*), a river of Western Asia, rises on the Belur Tagh, nearly 15,000 feet above the level of the sea, receives many affluents from the mountains of Turkestan and the Hindukush, flows through Turkestan, and falls into the Aral Sea. The length of its course is 1610 miles. According to the treaty of peace concluded in July, 1873, between Russia and Khiva, this river will hereafter constitute the boundary-line between Khiva and Bokhara.

Amoor', Amur, or **Saghalien,** a large river of Eastern Asia, formed near lat. 53° N. and lon. 122° E. by the union of the Shilka and the Argoon, the latter of which forms for about 400 miles the boundary between Siberia and the Chinese empire. The Amoor flows alternately eastward and south-eastward, forming the boundary between China and Siberia, until it arrives at a point about lat. 48° N. It afterwards pursues a general N. E. direction through the Littoral province of Siberia, and enters the Sea of Okhotsk or Gulf of Saghalien. Its length, exclusive of the branches, is estimated at 1800 miles. It is stated that steamboats have ascended from its mouth to the junction of the Shilka and Argoon. The navigation is obstructed by ice until May. In the lower part of its course it traverses a fertile country, covered with extensive forests of oak, ash, elm, maple, pine, etc. The largest tributary of the Amoor is the Soongari, which enters it on the right.

Amoor, Country of the [Ger. *Amurland*], the name given to a part of Mantchooria which in 1858 was ceded by China to Russia. It includes the island of Saghalien and the whole tract on the left side of the Amoor lying between 43° and 54° N. lat., and containing an area of 276,000 square miles. It is divided into the province of the Amoor and the Littoral province. The area of the province of the Amoor is 109,000 square miles; and the pop. in 1867, 22,297. The winters are very severe, and navigation is generally closed from the end of October to the beginning of May. The soil is fertile, and in the more sheltered parts many plants of Southern Asia grow luxuriantly. The forests are magnificent, abounding in oaks and nut-bearing trees. Fur-producing animals are very numerous, and the rivers yield great quantities of fish. Gold fields have been recently discovered, and coal is abundant in the island of Saghalien.

Amoret'ti (CARLO), an Italian naturalist and writer, born at Oneglia, near Genoa, Mar. 13, 1741. He produced a good biography of Leonardo da Vinci (1784), and a work on the natural history and geography of Lakes Como, Maggiore, and Lugano, called a "Journey from Milan to the Three Lakes" (1794). In 1797 he became librarian of the Ambrosian Library of Milan. Died Mar. 24, 1816.

Amor'gos, or **Amor'go** [Gr. Ἀμοργός], a fertile island in the Archipelago, 18 miles S. E. of Naxos, belongs to the kingdom of Greece. It is 13 miles long and 6 miles wide, and contains a small town called Amorgos. The surface is mountainous. The poet Simonides was born here. It has a good harbor; lat. of E. end, 36° 54′ N., lon. 26° 6′ E. Pop. about 3700.

Am'orites ("mountaineers"), a powerful nation of Canaan that occupied the country on both sides of the Jordan in the time of Moses, and resisted the Israelites in their march towards the Promised Land. Moses defeated their two kings, Sihon and Og, who reigned at Heshbon and Bashan respectively. Og is said to have been the last "remnant of giants" (Deuteronomy iii. 11). The Amorites were afterwards subdued by Joshua, but he was not able to exterminate them. They appear to have been long hostile to the Israelites, but in Solomon's time were reduced to a tributary condition.

A'mos, one of the minor Hebrew prophets, was a contemporary of Isaiah, and lived about 785 B. C. He was a herdsman and a gatherer of sycamore fruit. He denounces the prevalent idolatry in vigorous and eloquent terms, using many images taken from rural and pastoral life.

Amoskeag', a manufacturing village of Hillsborough co., N. H., on the Merrimack River, which here falls 54 feet in a mile and a half, thus affording great water-power. It is now a part of the city of MANCHESTER (which see).

Amo'tion [from the Lat. *a* (*ab*), "away," and *moveo, motum,* to "move"], in law, the removal of an officer of a corporation from his office. It differs from disfranchisement, which refers to the removal of a member. Amotion may accordingly take place without disfranchisement.

A'moy, a seaport-town of China, on an island of the same name, in the province of Fo-Kien, and on the Channel of Formosa; lat. 24° 28′ N., lon. 118° 4′ E. It is situated at the mouth of a river which passes by the large city of Chang-Choo-Foo, of which Amoy is the port. Amoy is one of the chief commercial towns of China, and its merchants are noted for their enterprise. It was taken by the British in 1841, and has been open to the trade of all nations since 1843. Among the articles of import are cotton, cotton goods, iron, sugar, camphor, and pepper. The chief articles of export are tea, sugar, porcelain, silks, and paper. Amoy is one of the chief centres of the Protestant missions in China. Pop. estimated at 300,000.

Ampel'ic Açid, a white solid produced by the action of nitric acid on schist oils.

Am'pelin, a substance resembling creasote, obtained from schist oil.

Ampelop'sis [from the Gr. ἄμπελος, a "vine," and ὄψις, "resemblance"], a genus of creeping, vine-like, woody plants, to which the Virginia creeper or American woodbine (*Ampelopsis quinquefolia*) belongs. This is one of the most beautiful of our hardy creeping ornamental plants. It is highly esteemed in England, and is better adapted to the climate of America than the ivy, and is also more rapid in its growth, and has handsomer foliage. The leaves are deciduous, but they die in a blaze of crimson glory when touched by the frost, so that the plant is lovely even in death. It is of the order Vitaceæ.

Ampère (ANDRÉ MARIE), an eminent French natural philosopher and mathematician, born at Lyons Jan. 20, 1775. He produced in 1802 an interesting essay "On the Mathematical Theory of Games of Chance." He became inspector general of the University (1808), professor of analysis in the Polytechnic School (1809), chevalier of the Legion of Honor (1809), and a member of the Institute (1814). Having made important discoveries in electro-magnetism, he published in 1822 a "Collection of Observations on Electro-Dynamics," a work which displays remarkable sagacity. "The vast field of physical science," says Arago, "perhaps never presented so brilliant a discovery, conceived, verified, and completed with such rapidity." He further explained his discoveries in this department of science, to which he gave the name of electro-dynamics, in his "Theory of Electro-Dynamic Phenomena deduced from Experiments" (1826). Among his other works are treatises on optics and an "Essay on the Philosophy of the Sciences," etc. (1834). He was a man of genial disposition, and noted for simplicity of character. (See his "Journal et Correspondance," an interesting record of his domestic and private life.) Died in Marseilles June 10, 1836.

Ampère (JEAN JACQUES ANTOINE), an accomplished scholar and *littérateur,* a son of the preceding, born at

Lyons Aug. 12, 1800. He enjoyed in his youth the society of Madame Récamier, and devoted much attention to English and German literature. In 1833 he succeeded Andrieux as professor of French literature at the College of France. He became a member of the Academy of Inscriptions in 1842, and a member of the French Academy in 1847. He travelled extensively in Egypt, the Levant, and the U. S. Among his works are "Literature and Travels" ("Littérature et Voyages," 1833), "Literary History of France before the Twelfth Century" (3 vols., 1839), an "Essay on the Formation of the French Language" (3 vols., 1841), "Greece, Rome, and Dante" (1850), and "Roman History at Rome" ("Histoire Romaine à Rome," 4 vols., 1856–64). His style is very brilliant and pungent. Died Mar. 27, 1864.

Amphib'ia [Gr. ἀμφίβια, from ἄμφω, "both," and βιόω, to "live"], a term applied to animals that live both on the land and in the water. In the Linnæan system it included all reptiles and cartilaginous fishes, although some reptiles would be drowned if they remained very long under water. This classification has been modified by the removal of the cartilaginous fishes from the class of *Amphibia*. Cuvier applied the term to such mammals as the seal and walrus, which inhabit both the land and water.

Naturalists now divide the Reptilia of the olden zoologists into two classes—viz., Reptilia, which includes the lizards, snakes, and turtles; and Amphibia, which comprises the serpent-like cecilians, salamanders, and batrachians (frogs and toads). Most amphibians pass through a metamorphosis like that of the frog, which emerges from the egg as a tadpole, when it is fishlike in form and breathes by gills, being truly aquatic; subsequently the tail and gills disappear, legs and lungs are developed, and the mature animal, though perhaps inhabiting the water, is an air-breather. In some amphibians the first or embryonic condition continues unchanged through life, as *Menobranchus*, *Menopoma*, etc., the water-puppies and young alligators of the Western rivers. The largest of these aquatic carnivorous salamanders is *Sieboldtia*, which inhabits the lakes of Japan, and attains a length of three feet. Though now regarded as dull and disgusting creatures, this latter group of amphibians once stood at the head of all then existing members of the zoological series. The amphibians first appeared in the carboniferous age, and the lagoons in the coal-marshes swarmed with aquatic salamanders, some of which were six feet in length, very active, and predaceous, and the monarchs of the animal world of that age. More than twenty species of amphibians have been obtained by Dr. Newberry from the cannel coal of one mine in Ohio. The amphibians had their golden age in the trias, when *Labyrinthodon*, with a body as large as that of an ox, and teeth four inches long, ruled the animal kingdom. In the succeeding age (Jurassic) the sceptre passed from the amphibians to the true reptiles. J. S. Newberry.

Amphib'ole [from the Gr. ἀμφίβολος, "equivocal"], a name given by Haüy to hornblende, on account of its resemblance to augite. (See Hornblende.)

Amphic'tyon [Gr. Ἀμφικτύων], an ancient and perhaps fabulous hero and king of Attica, supposed to have been a son of Deucalion.

Amphictyon'ic Coun'cil, a celebrated congress or politico-religious court of the confederated tribes of ancient Greece, which met twice every year—in the temple of Apollo at Delphi in the spring, and at Thermopylæ in the autumn. It was composed of the deputies of twelve tribes—viz., Thessalians, Bœotians, Dorians (or Spartans), Ionians (or Athenians), Locrians, Dolopians, Magnetes, Malians, Achæans, Phocians, Ænianians, and Perrhæbians, who each sent one or two members. The predominance of northern and Pelasgic tribes proves the great antiquity of this institution, which in course of time declined, and in the age of Demosthenes had lost its authority. The members of this council bound themselves by an oath that "they would not destroy any Amphictyonic city nor cut off its streams in war or peace." One great object of the council was the protection of the temple at Delphi. (See Tittmann, "Ueber den Bund der Amphiktyonen," 1852.)

Amphil'ochus, a brother of Alcmæon, took part in the march of the Epigoni to Thebes, and of the Greeks to Troy. After his death he was raised among the gods.

Amphi'on [Gr. Ἀμφίων], in classic mythology, a Theban prince and musician, a son of Jupiter and the husband of Niobe. According to the poetic legend, he availed himself of his skill in music to build the walls of Thebes, and the stones, attracted by the sound of his lyre, moved and arranged themselves in the proper position.

Amphiox'us [from the Gr. ἄμφω, "both," and ὀξύς, "sharp"], the name of a genus of fishes (Leptocardii), so called because they are sharp at both ends. They are recognized as vertebrate animals only by their gelatinous dorsal cord, which supports a medullary spinal cord. They are without brain or true heart, and have various other exceptional characters. The genus is often called *Branchiostoma*. The popular name is lancelet. One species is found in the marine waters of the Southern U. S.

Amphip'olis [from the Gr. ἀμφί, "around," and πόλις, "city"], an ancient and important city of Thrace or Macedonia, was founded by an Athenian colony about 437 B. C. It was situated at the mouth of the river Strymon, which here enters the *Strymon'icus Sĭn'us*, the modern Gulf of Contessa. The waters of the river are said to have once surrounded the town (whence the name). In the Middle Ages it was called Popolia. Its site is now occupied by a small Turkish town called Yenikeui.

Amphisbæ'na [Gr. ἀμφίσβαινα, from ἀμφίς, "on both sides," and βαίνω, to "go"], a genus of serpent-like rep-

Amphisbæna Fuliginosa.

tiles, of which the head and tail are so similar in appearance that it is difficult on a cursory inspection to determine at which extremity the head is situated. They are found in Brazil, the West Indies, etc., and, according to the statements of respectable naturalists, are able to creep forward or backward with nearly equal facility. Several species are known. They burrow in the earth, have rudimentary eyes, and are usually classed with the saurians.

Amphis'sa, a town of ancient Greece, in Locris, was situated 7 miles from Delphi, on the site of the modern town of *Salona*. Here was a temple of Athena, containing an image of the goddess.

Amphithe'atre [Gr. ἀμφιθέατρον, from ἀμφί, "around," and θέατρον, a "theatre"], a spacious and uncovered edifice of an elliptical or circular form, in which the ancient Romans witnessed the exhibition of public games and the combats of gladiators and wild beasts. It was constructed so that all the spectators could behold the performance, which was exhibited in an open level space called the arena, surrounded on all sides by tiers of seats, which rose higher as they receded from the arena. The most famous of these edifices was the Flavian Amphitheatre, or Colosseum of Rome, which was built by the emperors Vespasian and Titus, finished about 80 A. D., and is still standing. It is about 620 feet long, 513 feet wide, and 157 feet high. The longest diameter of the arena was 287 feet. It is said to have had seats for 80,000 spectators, and standing-room for 20,000 more. The exterior was adorned by three rows of columns—Doric, Ionic, and Corinthian. The Colosseum is regarded by many as the most august and imposing ruin in the world.

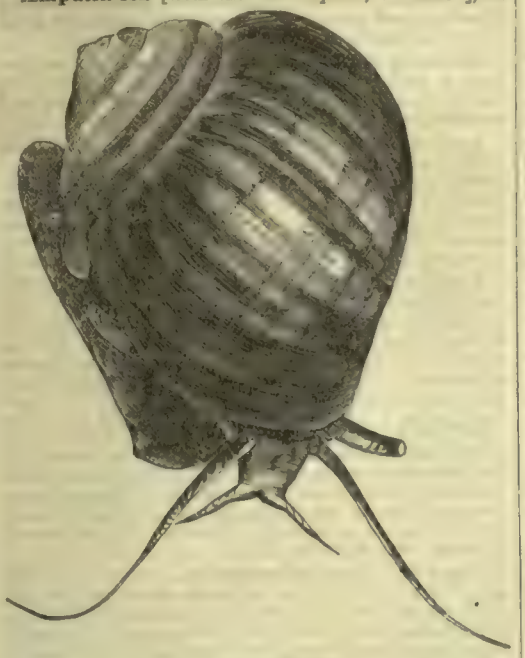
Amphithe'rium [from ἀμφίς, "on both sides," and θηρίον, "beast;" named probably in allusion to its double or doubtful character], a genus of fossil insectivorous mammalia found in the oolitic strata in Oxfordshire, England. It presents many points of analogy with the living marsupial genus *Myrmecobius*.

Amphitri'te [Ἀμφιτρίτη], in the Greek mythology, a Nereid, a goddess of the sea, the wife of Neptune and the mother of Triton. She is represented sitting in a car of shells drawn by tritons, or on a dolphin.

Amphit'ryon [Gr. Ἀμφιτρύων], in classic mythology, a son of Alcæus. Having accidentally killed his uncle Electryon, he was banished from Mycenæ. He married Alcmena, who was the mother of Hercules.

Am'phora [from the Gr. ἀμφί, "on both sides," and φέρω, to "bear," from its being borne by its two handles], the Latin name of a vase with two handles which was used by the ancient Greeks and Romans to hold wine and oil. It was also a liquid measure, containing about eight and a half gallons among the Greeks, and six among the Romans.

Amplifica'tion [Lat. *amplifica'tio*, from *am'plus*, "large," and *fa'cio*, to "make"], in rhetoric, is the enlargement and expansion of a subject or discourse by the use of epithets and illustrations and the enumeration of circumstantial accessories, with a view to produce a deeper impression. Cicero was much inclined to amplify his orations. Exaggeration is a vicious kind of amplification.



Am'plitude [Lat. *amplitu'do*, from *am'plus*, "large," "great"], in astronomy, is the angular distance of a heavenly body, when it rises or sets, from the east or west points of the horizon. The amplitude of a fixed star remains the same all the year, but that of the sun changes daily, and on a given day varies according to the latitude of the observer.

AMPLITUDE, in mechanics and physics, is used in reference to oscillating and vibrating bodies, to indicate the distance between the extreme positions assumed by the body. Thus the amplitude of oscillation of a pendulum is the angle between the extreme positions of the line joining the centres of suspension and oscillation.

Ampu'dia, de (PEDRO), a Mexican officer who obtained the rank of general in 1840. He fought against the Texans in 1842, and commanded the Mexican troops which defended Monterey in 1846 against Gen. Taylor, to whom he surrendered in September of that year.

Ampul'la, a Roman vessel of glass or earthenware, used for holding oil, wine, etc., was nearly globular in form. Many of these are preserved in the collections of antiquaries. In the Catholic Church an ampulla is a vessel which contains wine for the sacrament. *Ampulla Remensis* (in Fr. *la Sainte Ampoule*) was a famous vessel of holy oil which, according to tradition, was brought from heaven by a dove, and was used to anoint Clovis when he was crowned at Rheims in 496 A. D.

Ampulla'ria [from the Lat. *ampulla*, a "flask"], an

Ampullaria Dubia.

interesting genus of gasteropod molluska, called apple-shells, idol-shells, pond-snails, etc. Fifty or more species are known, mostly tropical, and all inhabiting fresh water and mud, though some are occasionally found in salt and brackish waters. They are remarkable for their tenacious hold on life, many being able to live away from the water for years. One species is occasionally found alive in hollow logs of mahogany and logwood from Honduras. The *Ampullaria dubia* is brought from the Nile.

Amputa'tion [from the Lat. *amputo, amputatum*, to "prune," to "lop off"], in surgery, is the removal, by operation, of any part of the body or limbs on account of disease or injury, such as would endanger life if the part were allowed to remain. The term of late denotes more especially such removal of a limb, but is still sometimes used for the excision of a tumor or gland.

Amputations are properly resorted to not only after severe and very dangerous injuries, but in such diseases as gangrene, cancer, etc., which are without rational prospect of cure by other means. In general, cases where the chances of cure will probably be much increased by this operation afford legitimate subjects for its exercise. This rule would include some cases of intractable ulcers of the leg, of aneurism, and of diseased bones and joints. Incurable and unsightly deformities, where they put the patient to great inconvenience, may in some circumstances be removed by the knife. An amputation in which a bone is cut off is said to be "in the continuity." An amputation at a joint, when no bones are divided, is in "the contiguity;" the latter operation is not often performed, though it has had recent advocates. Amputations are chiefly either "flap" or "circular" operations. The "flap" operation, in some of its many modifications, is probably the most frequently employed. One, two, or even three flaps have been employed, the size, shape, and thickness of these flaps of skin and flesh varying with circumstances. In general, they ought to be large enough to cover amply the end of the stump, and not so large as to be redundant after the wound shall have healed. The flap amputation, practised by certain mediæval surgeons, and revived by Lowdham of England nearly 200 years ago, was made general by Liston, and has since his time been variously improved and modified.

"Circular amputation" is performed by first dividing the skin and superficial fascia by a sweep of the knife around the limb, dissecting up the skin for two or three inches, and at that part dividing the muscles down to the bone. The flesh is removed from the bone to allow the saw to be applied.

The danger attending amputation is generally in proportion to the nearness of the operation to the trunk, as well as to the size of the limb. Thus, amputation at the hip-joint is the most doubtful of all in its results; but even this, in some cases, especially in military surgery, may improve the chances of life under severe injury. Amputations at the joints are by most surgeons considered as more serious than in the continuity of the limbs. Of the foot alone several different modes of amputation are in use, as Lisfranc's, Chopart's, Syme's, and Pirogoff's amputations.

Amrit', the richest place in ruins on the whole Phœnician coast (Syria), near the city of Tortosa. It is the ancient Marathus, and was discovered in the seventeenth century by Pococke, but was not explored until the present century, by Ernest Renan. The most important ruin found here is "El Maabed" (*i. e.* "the temple").

Am'rita [from the Sanscrit *a*, signifying "without," and *mrita*, "dead," also "death"], sometimes incorrectly written **Amreeta**, in Hindoo mythology, is the name applied to the water of immortality, which is said to have been obtained by the churning of the ocean. The term amrita or amrit is sometimes given to the food as well as the drink of the gods, and likewise to any delicious drink.

Amrit'sir, or **Amritsur**, written also **Umritsir**, the sacred city of the Sikhs, in the Punjâb, in Northern India, 40 miles E. of Lahore; lat. 31° 40′ N., lon. 74° 56′ E. It is said to contain 399 Hindoo places of worship. Here is a magnificent temple of the Sikhs, on an island, in a large tank or reservoir, called "the Pool of Immortality," which is visited by many pilgrims. Runjeet Singh built here the large fortress of Govindghur, which is one of the most remarkable objects in the place. Amritsir has manufactures of shawls, silk stuffs, and cotton goods; also an extensive transit trade with India and Central Asia. Pop. in 1866, about 180,000.

Am'rou Ben el As, a famous Arabian warrior, born about 600 A. D., at first opposed Mohammed, but became a zealous proselyte, aided in the conquest of Syria, conquered Egypt, of which he became emir, taking Alexandria in 640 A. D., and Tripoli three years later. He became an opponent of Ali. He was a man of energy and prudence. Died in 663.

Ams'dorf, von (NIKOLAUS), a Reformer, born in Saxony Dec. 3, 1483. He became a zealous Lutheran, and accompanied Luther to the Diet of Worms in 1521. He was afterwards an opponent of Melanchthon, and was much addicted to controversy about doctrines. In 1542 he was appointed bishop of Naumburg. He wrote numerous polemical works. Died May 14, 1565.

Ams'ler (SAMUEL), a skilful engraver, born in Switzerland in 1791. He became professor of engraving in the Academy of Fine Arts in Munich. He engraved many of the works of Raphael and Thorwaldsen, and reproduced the former with peculiar fidelity. Among his best works are the "Triumph of Alexander the Great," after Thorwaldsen, a "Holy Family," and a "Burial of Christ," both after Raphael; also a "Christ," after Dannecker. Died in 1849.

Am'sterdam', formerly **Amstelredamme**, or **Amsteldamme** ("the dike or dam of the Amstel"), [Lat. *Amsteloda'mum*], an important commercial city and capital of the kingdom of Holland, is situated at the junction of the Amstel with the Y, and near the Zuyder Zee, through which it has access to the ocean; lat. 52° 22′ N., lon. 4° 53′ E. It is the largest city of Holland and its constitu-

tional capital, but the royal court is at The Hague. Amsterdam stands on flat, marshy ground, into which piles, fifty feet long, are driven to form a foundation for the houses, which are mostly built of brick. The city is divided into ninety islands by a number of canals, which are crossed by 280 bridges. A part of the old ramparts have been pulled down, and twenty-eight windmills for grinding grain have been erected on the bastions. The principal streets are the Heerengracht, Keizergracht, and Prinzensgracht, each of which is about two miles long and describes a semicircle. Canals occupy the middle of these streets, which are scarcely surpassed in elegance by those of any capital in Europe. Among the grand public buildings of this metropolis is the palace or town-hall, a stone edifice 282 feet long and 235 feet wide, resting on 13,659 piles, driven into the ground to the depth of 70 feet. This palace contains a remarkable hall 120 feet long, 60 feet wide, and 100 feet high, lined with white Italian marble. The city has a beautiful justiciary hall, a modern building of Grecian architecture. The most beautiful church of Amsterdam is the Nieuwe Kerk (founded in 1408), which is 350 feet long and 210 wide. This Nieuwe Kerk and the Oude Kerk, which has a remarkable organ, belong to the Reformed Church. Much of the water-supply of Amsterdam now comes from the sand-dunes of the coast. Amsterdam is liberally supplied with hospitals and other charitable institutions. Among the important educational and literary institutions are the Athenæum Illustre, which has a botanic garden, a school of anatomy, and chairs of art, law, medicine, and theology; the city Latin school; the Royal Academy of Fine Arts, founded in 1820; the Arti et Amicitiæ society of painters; the naval school; the Royal Dutch Institution for science, literature, and art; the antiquarian society; and the society of literature and fine arts, called Felix Meritis. The Museum of Pictures, the Museum van der Hoop, and the Feodor Museum (since 1866) contain rich collections of the works of the Dutch masters. The Six collection of pictures belonging to the Six family is one of the finest private collections in Europe.

The chief manufactures are tobacco, soap, canvas, glass, jewelry, cordage, machinery, steam-engines, etc. Its commerce is more important than its manufactures. That great trade which in the sixteenth century placed Amsterdam at the head of the commercial cities of Europe gradually declined, partly from the rise of other ports, but principally from the difficulties of navigation caused by the silting up of the Zuyder-Zee, and, above all, the Pampus Bar. Large vessels were obliged to discharge their cargoes outside, and were then floated over the bar by means of *camels*, which, when the water was pumped out of them, raised the vessel with them. To remedy this, the North Holland Canal was cut to the Helder, a distance of 51 miles. It is 124 feet broad at the surface and 31 feet at the bottom, and is available for vessels drawing 18 feet of water. But even this great highway is now inadequate, and moreover is obstructed in winter by ice. To maintain the rank of Amsterdam as one of the great commercial entrepôts of Europe, one of the most remarkable engineering works of modern times was commenced in 1863, and is now far advanced towards completion—the *direct* connection of the port of Amsterdam with the North Sea, 15 miles distant, by a canal terminating in an artificial harbor on that sea. (See CANAL; also "Prof. Papers Corps of Engineers," No. 22.)

Amsterdam is the terminus of railways which connect it with Utrecht, the Helder, Haarlem, Rotterdam, and the cities of Prussia. The chief articles of export are butter, cheese, sugar, coffee, oil, spices, colors, etc. In 1868, 1465 vessels, of 430,739 tons, entered the port of Amsterdam, and 1508 were cleared.

Amsterdam was founded about 1250, before which it was a mere fishing-village, with a castle, the residence of the lords of Amstel. It was fortified in 1482, and became a part of the United Provinces in 1578, after which its commerce and population rapidly increased. Between 1630 and 1750 it was the foremost commercial city of Europe. This city was the native place of Spinoza, Admiral de Ruyter, Swammerdam, and other eminent men. Pop. in 1857, 259,873; in 1867, 267,627; and in 1870, 281,805, of whom about 59,000 are Catholics, 35,000 Lutherans, 4000 Mennonites, 1000 Remonstrants, and 30,000 Jews.

REVISED BY J. G. BARNARD, *U. S. Army.*

Amsterdam, a township of Hancock co., Ia. P. 259.

Amsterdam, a post-village and township of Montgomery co., N. Y., on the Mohawk River and on the Central R. R., 33 miles N. W. of Albany. It has 6 churches, 19 manufactories, 4 banks, 1 horse railroad, and 2 weekly newspapers. Pop. 5426; pop. of township, 7706.

C. P. WINEGAR, ED. OF "RECORDER."

Amsterdam, a post-village and township of Botetourt co., Va., 50 miles W. of Lynchburg. Pop. of township, 3828.

Amuck', or **Amook,** a word used among the Malays. Men who are rendered insane and desperate by the habitual use of opium or hasheesh run along the streets armed with a dirk, and kill or wound all persons in their reach. This is called "running amuck." It is generally deliberately planned, and is the Malay mode of suicide. Where a Japanese would commit hari-kari, the Malay runs *amuck*—*i. e.* by attacking all he meets he seeks and finds death at the hands of others.

Am'ulet [Lat. *amule'tum*], an object worn on the person as a charm, and supposed to have power to protect the wearer against evil spirits, sickness, and other real, or imaginary evils. Amulets were worn by the ancient Egyptians, Greeks, and Jews. The Greeks and Romans wore a variety of gems and small figures of heroes, deities, and animals. Amulets were also used by the early Christians, but that form of superstition was condemned by the Council of Laodicea about A. D. 360. They are common among the Turks at the present day. An astrological amulet called talisman was highly prized by the Arabs.

Am'urath, or **Mu'rad I.,** sultan of the Turks, born in 1326, succeeded Orkhan, his father, in 1359, took Adrianople in 1361, and waged with success long and bloody wars, chiefly with the Christians, in what is now European Turkey. He was assassinated June 15, 1389.

Amurath II. succeeded his father, Mohammed I., in 1421, attacked Constantinople in 1423, contended with varying success for many years against the Hungarians under Hunyady, and against Scanderbeg. He gained a great victory at Kosovo in 1488. Died Feb. 9, 1541.

Amurath III., one of the most cruel of the sultans, born in 1545, came to the sultanate in 1574. His reign was marked by long wars with Austria and Persia, and with the janizaries at home. Died Jan. 17, 1595.

Amurath (Murad) IV., sultan of Turkey, born about 1610, succeeded his uncle Mustafa in 1623. He had a passionate temper, which was rendered more violent and dangerous by habitual drunkenness. He amused himself by shooting from his palace windows at passengers in the streets. The most important event of his reign was the capture of Bagdad by his army in 1638. Died in 1640.

Amussat (JEAN ZULÉMA), a French surgeon and writer, born in Deux-Sèvres in 1796. He invented and improved several surgical instruments, and published some able professional treatises, among which are "Researches into the Nervous System" (1825), and a "Memoir on the Torsion of Arteries" (1829), which obtained a prize of the Institute. Died in 1856.

Amwell, a township of Washington co., Pa. Pop. 1879.

Amy'clæ [Gr. Ἀμύκλαι], an ancient town of Laconia, on the Eurotas, 20 stadia S. E. of Sparta, was famous in the heroic or legendary age as the abode of Tyndarus and Leda and Castor and Pollux, who were called *Amyclæi Fratres* (Amyclæan Brothers). This town was conquered by the Spartans about 775 B. C.

Amyg'dalin, or **Amyg'daline,** a white crystalline principle which is contained in the bitter almond, and under the influence of emulsine and water yields hydrocyanic acid and the volatile oil of bitter almonds. The symbol of amygdalin is $C_{20}H_{27}NO_{11}$. (See ALMONDS, OIL OF.)

Amyg'daloid [from the Gr. ἀμύγδαλον, an "almond," and εἶδος, a "form"], having the form of an almond; applied in geology to certain volcanic rocks in which once existed oval cavities or cells now filled with nodules of some crystalline mineral deposited from an infiltrated solution. These nodules are composed of agate, chalcedony, calcareous spar, etc., and are commonly found in a basis of basalt, greenstone, or other trap rock. Empty cells often occur in the same rocks that contain these nodules, the cavities in each case having been originally formed and filled with gas or steam.

Amyg'dalus [from the Gr. ἀμύγδαλος, the "almond tree"], a genus of plants of the order Rosaceæ, consists of trees whose fruit is a drupe. It comprises the almond (*Amyg'dalus commu'nis*) and the peach (*Amyg'dalus Per'sica*).

Am'yl (C_5H_{11}), a compound radical belonging to the alcohol series, exists in amylic alcohol, $C_5H_{11}.O.H$, or fusel oil. It forms a series of compound ethers (see ETHERS), some of which are used as substitutes for the essences of natural fruits. The nitrite of amyl is an ethereal liquid of agreeable odor, which has been recently brought to the attention of medical practitioners on account of its peculiar action on the circulation. A few drops inhaled causes a sudden acceleration of the pulse and flushing of the face.

Amyl'amines, organic bases formed on the ammonia type by the substitution of amyl, C_5H_{11}, for H. Amylamine is $N(C_5H_{11})H_2$, diamylamine is $N(C_5H_{11})_2H$, tri-

amylamine is $N(C_5H_{11})_3$, tetramylammonium is $N(C_5H_{11})_4$. (See AMINES, by PROF. C. F. CHANDLER, PH. D., LL.D.)

Am'ylene (C_5H_{10}), a diatomic radical homologous with ethylene. It is produced by the dehydration of amylic alcohol, and is a transparent liquid of a faint but offensive odor. It possesses anæsthetic properties, and has been used as a substitute for chloroform, but was abandoned after having produced fatal results. (See ETHYLENE.)

Amyot (JACQUES). See APPENDIX.

Amyot (JOSEPH), a French Jesuit missionary, born at Toulon in 1718. He sailed to China in 1750, was invited to Pekin by the emperor, and passed the rest of his life there. He learned the Chinese language, from which he translated several works into French, and compiled a "Mantchoo-Tartar-French Dictionary" (Paris, 3 vols., 1789–90). Few European authors have done so much to illustrate the history and customs of China. He wrote a large portion of the "Memoirs concerning the History, Sciences, Arts, and Customs of the Chinese" (16 vols., 1776–1814). Died in Pekin in 1794.

Amyrida'ceæ, a natural order of exogenous plants (trees or shrubs), natives of tropical regions, and abounding with balsamic and resinous juice. The type of the order is the genus *Am'yris*, which produces elemi. They have compound leaves, three to five petals, and stamens twice or four times as many as the petals. Among the products of this order are myrrh, frankincense, bdellium, elemi, olibanum, and balsam of Gilead. It comprises, besides *Amyris*, the genera *Balsamodendron*, *Boswellia*, *Icica*, and *Bursera*. Southern Florida has two trees of the order —the cachibou gum tree, *Bursera gummifera* (a large tree), and *Amyris Floridana* (torchwood), a small tree.

A'na [ἀνά], a Greek word signifying "upward," "through," "again." In medical prescriptions, *Ana*, or *aa*, denotes an equal quantity of each ingredient.

Ana, a suffix which often occurs as the termination of words which are the titles of books containing collections of the anecdotes, conversations, and sayings of eminent men. Among the most remarkable of these are "Scaligerana" (1666), "Menagiana," "Huetiana," "Walpoliana" (relating to Horace Walpole), and "Johnsoniana." They abound most in French literature. The "Scaligerana" was the first publication of this kind that ever appeared.

Anabap'tists [from the Gr. prep. ἀνά, "again," and βαπτίζω, to "baptize"], a name applied during the sixteenth century to various bodies of Swiss and German Christians, who, while differing widely in personal character, in social and political opinions, and religious faith, agreed in discarding infant baptism, and in re-baptizing (according to the popular notion) those who personally accepted of Christianity. While in this respect the German Anabaptists held a position similar to that of the Baptists of to-day, they did not, as a general thing, insist that immersion only is valid baptism. Indeed, they generally practised pouring or affusion.

Many of the early Anabaptists were men of irreproachable character and true Christian devotion. (See HUBMEYER, MENNO.) Some of them believed that it was wrong, in any circumstances, to bear arms. Others, however (whose vices and follies have been imputed to all who agreed with them in rejecting infant baptism), aspiring with a fanatical zeal to purify the Church and reform society, taught that, among men living under the gospel and having the Spirit of God to direct them, human government was not only unnecessary, but an unlawful encroachment on their spiritual liberty; that the distinctions of birth, rank, and wealth should be abolished; and that all Christians, throwing their possessions into one common stock, should live together as members of one family. Many of their leaders claimed to be enlightened and directed by supernatural visions and revelations. One of these, Thomas Münzer, claimed, it is said, a divine commission to establish a holy community, and to overthrow the then existing governments by the sword. He assembled a considerable force, which was totally defeated in May, 1525, near Mühlhausen, and Münzer, with the other leaders, was put to death. Many of his followers, however, survived, and spread their doctrines through Germany, Holland, and Switzerland. A numerous body of them, under John Matthias of Haarlem and John Boccold (or Bockholdt) of Leyden, established themselves in 1533 at Münster, deposed the magistrates, and having confiscated the property of many of the more wealthy citizens, they deposited it in a public treasury for the common use. The inhabitants were drilled to military duty, and vigorous preparations were made for the defence of Münster, which they styled Mount Zion. Count Waldeck, bishop and prince of Münster, having surrounded the city with an army, Matthias sallied from the gates, and was at first successful in several engagements. But having once gone forth with a small company, they were all killed. Boccold succeeded him, with the title of King John. He wore a crown, clothed himself in purple, and took to himself numerous wives, only one of whom, however, was honored as queen. Encouraged by the example of their monarch, many of Boccold's followers, it is said, gave themselves up to sensuality and license. At length, in 1535, Münster was taken, and Boccold and other leaders of the Anabaptists were put to death with torture. (See CORNELIUS, "Geschichte des Münsterischen Aufruhrs," Leipsic, 1855, and the "Dutch Martyrology;" BOUTERWEK'S "Literatur und Geschichte der Wiedertäufer;" WINTER'S "Geschichte der Böhmischen Wiedertäufer," CALVARY'S "Mittheilungen aus dem Antiquariate," vol. i., p. 111, *seq.*)

The word Anabaptist is sometimes applied, at the present day, to those who baptize by immersion, and on profession of their faith, persons who have been sprinkled in infancy; but the name is repudiated by modern Baptists, since they regard the immersion of a believer as the only valid baptism, and maintain that they do not rebaptize. As no historical connection can be established between the Baptists and the fanatics of Münster, the name "Anabaptist" ought not to be applied to them. J. H. GILMORE.

Anaba'ra, a river of Siberia, rises about lat 66° 30′ N., and lon. 107° E., flows northward about 300 miles, and enters the Arctic Ocean.

Anabas'idæ [from *An'abas*, one of the genera], a family of acanthopterygious fishes, in which the membrane of the pharynx is divided into numerous appendages and cells. These retain water sufficient to moisten the gills for a considerable time, so that when the pools which these fish inhabit dry up, they are able to move about on land in search of other water. They are all fresh-water fishes, and have spines on their fins. They are found in South-eastern Asia and Southern Africa. One of this family, the *An'abas scan'dens* (or *Per'ca scan'dens*), found in India, is especially remarkable for its climbing powers. Unlike the eel, which only passes over moist ground, the anabas takes its journey over hard, dry, and dusty roads, and frequently up steep ascents heated with the burning beams of the noonday sun, and does not seem to feel any serious inconvenience from these. It is even asserted by some writers that this fish is able to climb a tree.

Anabas scandens: Climbing Perch.

Anab'asis [from the Gr. ἀνά, "up," and βαίνω, to "go"], a Greek word signifying an "ascension," a march from a lower into a higher region. In medicine, it is sometimes applied to the increase of a disease or paroxysm. Also the title of two Greek historical works: 1. Xenophon's account of the expedition of Cyrus the Younger against his brother Artaxerxes, king of Persia, and of the retreat of the ten thousand Greeks who had served in the army of Cyrus. 2. Arrian's "Anabasis," in which are recorded the expeditions of Alexander the Great into Persia and India.

An'ableps [from the Gr. ἀναβλέπω, to "look up"], a genus of malacopterygian viviparous fishes, characterized by a remarkable projection of the eyes from the sides of the head, and by a singular structure of the cornea and iris, in consequence of which it has two pupils on each side, and seems to have four eyes. They are found in Guiana and Surinam.

Anacan'thini [from the Gr. ἀν, priv., and ἄκανθα, a "spine"], an order of fishes distinguished by an ossified endoskeleton, the surface covered in some cases with cycloid, in others with ctenoid, scales; fins supported by flexible or jointed rays; ventrals beneath the pectorals, or wanting; swimming-bladder without air-duct. This order includes the cod and other edible fishes.

Anacardia'ceæ [from *Anacar'dium*, one of the genera], a natural order of exogenous trees and shrubs, mostly natives of tropical regions, and often abounding in a resinous fluid of extreme acridity. The leaves are alternate and without dots, the petals perigynous, and the fruit is usually a drupe. The order is founded on *Anacardium occidentale* (cashew-nut), and contains many species, among which are poison ivy, mastic, sumac, pistachio-nuts, and the mango.

Anach'aris Canaden'sis, an herbaceous plant of the order Hydrocharideæ, is a native of North America, growing in ponds and slow streams, in which it is entirely submerged. It has a much-branched and slender stem, and is remarkable for the rapidity of its growth. It is naturalized in Great Britain, where it suddenly appeared in such abundance as to obstruct the navigation of the

Trent, Derwent, and other rivers. It was first observed in Great Britain about 1842. It causes no such trouble in the U. S.

Anachar'sis [Gr. 'Ανάχαρσις], a celebrated Scythian philosopher who lived about 600 B. C., and was a friend of Solon. He was the only "barbarian" admitted to the privilege of a citizen of Athens, and according to some authorities was reckoned among the Seven Wise Men of Greece. It is said that on his return to Scythia he was put to death, because he practised some Greek religious rites. Some of his pithy sayings have been preserved by Diogenes Laertius and others. A French author, Jean Jacques Barthélemy, published a popular work entitled "Travels of Anacharsis the Younger in Greece" (1788), which represents with considerable fidelity the life and customs of the ancient Greeks. It was translated into English.

Anach'ronism [Gr. ἀναχρόνισμος, from ἀνά, used for "against," and χρόνος, "time"], an error in chronology, an inversion or disturbance of the order of time. The use of cannon in Shakspeare's "King John" is an anachronism, as cannon were not employed in England until a hundred years or more after his reign. Painters who represent ancient patriarchs in modern costumes are censured for anachronism.

Anacla'che, a snowy peak of the Bolivian Andes, is supposed to be 22,000 feet or more above the level of the sea: lat. 18° 12′ S., lon. 69° 20′ W. It is covered with perpetual snow.

Anacle'tus, bishop of Rome, was a native of Athens. He was the successor (or, according to others, the predecessor) of Saint Clement. Died about 100 A. D.

Anacletus, an antipope, was elected by a party of cardinals in 1130 as a rival pope to Innocent II., who was recognized by the majority of the European powers. Anacletus was supported by the Romans. Died in 1138.

Anacon'da [*Eunec'tes muri'nus, Bo'a muri'na* of some naturalists], a large serpent allied to the *Boa constrictor,* is a native of tropical America, especially of Brazil and Guiana. It sometimes grows to the length of forty feet, and is the largest serpent of America. It passes much of the time in the water, preferring the shallow parts of a lake or stream. Among the generic characters that distinguish it from the boa are the small size and position of its nostrils, which open at the upper part of the end of the muzzle, and are directed upward. It is not venomous.

Anac'reon ['Ανακρέων], a famous Greek lyric poet, born at Teos, in Ionia, about 560 B. C. He emigrated from Teos when that town was taken by the Persians, about 540, and passed many years at Samos, where he was patronized by King Polycrates. After the death of this patron, 522 B. C., he became a resident of Athens, to which he was invited by Hipparchus. Love and wine were the favorite themes of his muse. Died in 476 B. C. According to tradition, his death was caused by a grape-stone which stuck fast in his throat. Some fragments of his poems are extant.

Anadir', or **Anadyr,** a river of Siberia, near the extreme N. E. part of Asia, rises north of Kamtchatka, flows nearly eastward, and enters the Sea of Anadir. Length, about 450 miles. The Sea or Gulf of Anadir is in Siberia, near the N. E. extremity of Asia, and is a large inlet of the Pacific Ocean. It is separated from the Arctic Ocean by a peninsula about 150 miles wide.

Anadyom'ene [Gr. 'Αναδυομένη], (the goddess "rising up out" of the sea), a surname given to Venus; also the name of a masterpiece of Apelles, representing Venus rising from the sea and wringing her flowing hair with her fingers. This picture was purchased by the people of Cos, who sold it to the emperor Augustus for one hundred talents, or more than $100,000 of our money.

Anæ'mia [from the Gr. *a,* priv., and αἷμα, "blood"], also called **Spanæ'mia** [from σπανός, "scarce," "rare," and αἷμα, "blood"], a morbid condition of the body in which the blood is of an abnormal composition, there being usually a deficiency in the normal number of red corpuscles, a poverty of albumen, and an excess of salts, the absolute amount of the blood being usually below that observed in health. This condition is not properly a disease, so much as a result of some disease or lesion, such as dyspepsia, hæmorrhage, excessive secretion from any gland or surface, insufficient nutrition, defective aëration of the blood, consumption, cancer, malarial or other slow poisoning, leucocythæmia, excessive labor, or long-continued mental troubles. The symptoms are, first, great debility, paleness of face, lips, and tongue, wasting of the tissues, various cardiac, arterial, and venous murmurs, a small and often rapid pulse, clearness and low specific gravity of the urine. Late in the disease the feet swell and sweating is observed. The treatment is, first, if possible, to remove the cause. Next, the proper conditions for recovery must be established, such as proper food, due exercise, and good air. Tonics, if they are well borne by the patient, are generally useful. Strychnia, quinia, and, above all, iron, are often extremely useful. The iron is generally thought to act as food, there being an actual deficiency of iron in the blood.

Anæsthe'sia [from the Gr. *av,* priv., and *αἰσθάνομαι,* to "perceive," to "feel"], in medical language, when used to designate a symptom, denotes a diminution or a complete loss of the sense of feeling, either general or much more frequently local. In this sense it is opposed to the term hyperæsthesia, which denotes an exaltation or excess of sensibility. Both these conditions are symptoms of disease of the nervous system. When feeling proper is abolished while pain exists, it is called "anæsthesia dolorosa;" when both pain and the sense of touch are absent, it is "analgesia." But of late the term commonly denotes a total or partial, local or general, suspension of all the senses as the result of the application or inhalation of some chemical agent. Local anæsthesia is produced by the rapid evaporation of some highly volatile substance, like ether or rhigolene, and consequent chilling of the part to be affected. The local application of certain drugs, such as aconitine, will also produce a degree of anæsthesia. General anæsthesia is, however, by far the most common result of this kind to which the physician directs his efforts. The Chinese have used preparations of hemp for this purpose for many centuries. The "Arabian Nights" contain numerous allusions to a similar use of this drug. Mandragora, opium, and many other soporifics were used by the ancients as anæsthetics, though such use is dangerous from the profound effects produced. Surgical operations in later times have been successfully performed while the patient was in the mesmeric sleep or condition of "hypnotism." Such a condition is, however, usually regarded as a diseased one, and its production is outside the province of the physician. The anæsthetics generally in use are common or ethylic ether, chloroform, and nitrous oxide gas, each of which is administered by inhalation. There is some reason to believe that the anæsthetic property of ether was not unknown in the sixteenth century, soon after the discovery of this agent by the alchemists. Several physicians in the eighteenth century recommended the use of ether by inhalation for the relief of pain. Sir Humphry Davy in 1800 observed the anæsthetic effect of nitrous oxide, and proposed its use in surgery, but it was not till 1844 that Horace Wells, a dentist of Hartford, Conn., successfully employed this gas for the prevention of pain in removing teeth. The subject, however, fell for the time into undeserved neglect, though at present this gas is extensively employed in dentistry and in some other surgical operations.

Between 1816 and 1846 several American physicians proposed the use of ether as an anæsthetic. In October of the latter year, Dr. W. T. G. Morton of Boston (who had successfully used ether in dentistry) administered it to a patient in the Massachusetts General Hospital during a surgical operation by the late Dr. Warren. In Nov., 1847, Sir J. Y. Simpson of Edinburgh first announced chloroform as an anæsthetic, it having been used for the relief of difficult breathing by Ives of New Haven, Conn., in 1832, and its anæsthetic effect upon the lower animals having been shown by Flourens ten months before Simpson's experiments. The use of both ether and chloroform has spread rapidly since the above discoveries. Various other agents (amylene, amyl hydride, carbon bichloride, Dutch liquid, methylene bichloride, etc.) have been proposed, but for the most part they have turned out to be more dangerous than the older and better known anæsthetics.

With regard to the relative superiority of the various agents used, opinions differ. It is claimed by some that ether is much safer than chloroform, while other practitioners of eminence assert that chloroform is pleasanter, cheaper, and more speedy in its effect, and equally safe if the requisite skill is employed in administration. The principal objections to nitrous oxide are, that it is not easily portable, and that its effects are very transitory. Experiments tend to show that ether produces anæsthesia by causing anæmia of the brain, while chloroform appears to act by producing hyperæmia. Further observations are constantly being made on these points, and these experiments may be fairly expected to throw great light on the subject.

CHAS. W. GREENE.

Anæsthet'ics, the name applied to certain preparations having the property of producing ANÆSTHESIA (which see).

Ana'gni (anc. *Anag'nia*), a town of Italy, 37 miles E. S. E. of Rome, is the seat of a bishop. It is the residence of several noble families, and was the birthplace of several popes, among whom were Innocent III. and Gregory IX. Anagnia was nearly as old as Rome, was the chief city of the Hernici, and was an important place dur-

ing the whole period of the ancient Roman history. Virgil mentions it as the wealthy Anagnia. Here are some of the finest cyclopean walls in existence. Pop. 6000.

An'agram [from the Gr. ἀνά, "backward," and γράμμα, a "letter" or "writing"], a word or sentence formed by the transposition of the letters of some word, phrase, or sentence. The most perfect or proper anagram, called palindrome, is formed by reading backward—*i. e.* reversing the order of the letters—as "evil," *live*. The making of anagrams was a fashionable exercise of ingenuity in the sixteenth and seventeenth centuries, as well as in the Dark or Middle Ages. A very curious specimen of anagram is the transmutation of Pilate's question, *Quid est Veritas* ("What is Truth?") into *Est Vir qui adest* ("It is the Man who is present"). Dr. Burney made the felicitous discovery that the Latin sentence *Honor est a Nilo* ("Honor is (or comes) from the Nile") is concealed in the name of Horatio Nelson. The opponents of the Dutch theologian Jacobus Arminius transformed his name into *Vani Orbis Amicus* ("A Friend of the Vain World").* Among recent examples of the anagram are —Florence Nightingale, "Flit on, cheering Angel;" Sir Robert Peel, "Terrible Poser;" French Revolution, "Violence, run forth."

An'aheim, the second town in size and importance in Los Angeles co., Cal., situated in the centre of the largest valley in California, is 12 miles from the sea, and is the head-quarters of the wine interest of Southern California. It produces over 1,000,000 gallons of wine annually. It has one weekly paper. Pop. 881.

Richard Melrose, Pub. "Southern Californian."

Anahuac', a Mexican word used vaguely or in various senses, sometimes applied to the great central table-land or plateau of Mexico, which comprises more than half of the Mexican republic, and lies between lat. 15° and 30° N. and lon. 95° and 110° W. It is elevated from 6000 to 9000 feet above the level of the sea, contains several lakes, and is bounded on the E. and W. by chains of high mountains. From this plateau rise several high volcanoes, one of which, Popocatepetl, has an altitude of 17,784 feet.

Anahuac Mountains, a branch of the Rocky Mountains, is a chain in the northern part of Mexico, W. of the Rio del Norte, with which it is nearly parallel, and connected with the Anahuac table-lands.

An'akim, the ancient race of giants who lived in the S. of Palestine at the time of the exodus of the Israelites. They are called "the children of Anak" in Numbers xiii. 28. "Joshua destroyed them utterly with their cities," but a remnant of them was left in Gaza, in Gath, and in Ashdod (Joshua xi. 21).

Anal'cime, or **Anal'cite** [from the Gr. ἀ, priv., and ἄλκιμος, "strong"], a hydrated silicate of soda and alumina, generally occurring in twenty-four-sided crystals, which are sometimes transparent. By friction it becomes *feebly* electrified, whence its name. It is found in the trap-rocks of Ireland, Scotland, Nova Scotia, and Lake Superior.

Analem'ma [Lat. *analem'ma*; Gr. ἀνάλημμα, a "support" or "object supported," from ἀνά, "up," and λαμβάνω, to "take"], in geometry, the projection of a sphere upon the plane of a meridian, the eye being supposed to be placed at an infinitely distant point of the radius perpendicular to that plane. In this projection (which is also called *orthographic*) all small circles whose planes are parallel to that of projection are represented by concentric circles of the same magnitude as the originals, all circles in planes perpendicular to that of projection are seen as chords or diameters of the meridian circle, and all other circles of the sphere are projected into ellipses.

A'nal Glands, in comparative anatomy, are organs for secreting substances which, though not always so, are generally repulsive in their character, and are commonly employed for purposes of defence. They present every grade of the glandular structure, nearly always opening into the termination of the intestine near the anus. The sweet fluid ejected by the aphides, and of which the ants are so fond, is the product of secerning tubules opening on the posterior part of the body; and the singular defensive acrid vapors discharged explosively by the insects called "bombardiers" are likewise the products of anal glands. In the mollusks the most remarkable example of these glands is presented by certain cephalopods, such as the cuttle-fish, in which there is sometimes a single and sometimes a bilobed or trilobed cyst, that secretes an inky fluid which these animals eject to blacken the water around them, for the purpose of concealment in time of danger. In reptiles the anal bags are either single, double, or triple, and in many species, as in frogs and tortoises, are developed to a great size, and serve for aquatic respiration. In birds the anal follicles consist of a single cavity, which is termed the *bursa Fabricii*. In quadrupeds the anal follicles generally consist of two sacciform cavities, each having an opening near the verge of the anus. In the skunk (*Mephitis varians*) the secretion of these glands furnishes to the animal its principal means of defence. In the civet (*Viverra civetta*) and the beaver (*Castor fiber*) the secretions from the anal glands have long been an article of commerce; the former is sometimes employed, when combined with other substances, as a perfume; the latter, under the name of castor, is used in medicine.

An'alogue [from the Gr. ἀνά, "according to," and λόγος, "ratio" or "proportion"], in comparative anatomy, a member or organ of an animal that performs the same function as a part or organ in a different animal. Thus, the wing of a bird is the analogue of the wing of an insect, though different in structure.

Anal'ogy [Lat. *analo'gia*; Gr. ἀναλογία, from ἀνά, "according to," and λόγος, "ratio" or "proportion"], literally, the state or circumstance of having proportion one to the other; used to denote a relation or agreement between different things in certain respects. The conclusions to which we are led respecting one thing, by reasoning from our experience concerning another similar thing, form what is termed analogical knowledge. The word analogy is generally employed to designate an imperfect degree of similarity. Thus, a physician, arguing from the effects which he had seen produced by a certain drug on one man to its probable effects on another man, would be said to reason from *experience;* but reasoning from the effects produced on an inferior animal to the probable effects on man, he would be, more properly, reasoning from analogy. Thus also, Bishop Butler, in his celebrated treatise on the "Analogy of Religion, Natural and Revealed," has argued that the same sort of difficulties which are found in the constitution of nature must be looked for in the spiritual world, and that the existence of this analogy is a good reason for believing that revealed religion proceeds from God, the Creator of the material universe.

In rhetoric, the word analogy designates, not the direct resemblance between two objects, but a resemblance between the relations in which they stand to other objects. For example, to term youth "the dawn of life" is said to be an analogical metaphor, because there is no direct resemblance between youth and morning, but the one may be said to bear the same relation to life that the other does to day. In grammar, analogy means a conformity in the principles of organization of different words or collections of words. In geometry, analogy signifies nearly the same thing as proportion, or the equality or similitude of ratios.

In zoology, the term analogy is usually restricted to the relation which animals bear to one another in the similarity of a smaller proportion of their organism; thus, the *Ascalaphus Italicus*, in the length and knobbed extremities of its antennæ, the coloring of its wings, and its general aspect, exhibits a striking resemblance to the butterfly, but in all the essential parts of its organization it conforms to the neuropterous type of structure; its relation to the Lepidoptera is therefore said to be one of analogy, while it is, in fact, connected with the ant-lions by affinity.

Reasoning from analogy consists in inferring that certain facts are true with reference to objects which have afforded us no examples of those facts, on the basis of the similarity of those objects to other objects better known. It warrants only probable conclusions, but the probability may often become very strong, and in the affairs of life it is often necessary to act upon conclusions thus attained. Even when its conclusions are very uncertain, they may often serve to guide inquiry and lead to discovery.

Revised by J. H. Gilmore.

Anal'ysis [Gr. ἀνάλυσις, from ἀνά, "throughout," and λύω, to "untie"], in geometry, a method of conducting geometrical inquiries, invented by the philosophers of the school of Plato, or, according to Theon of Alexandria, by Plato himself, and one of the most ingenious and beautiful contrivances in the mathematics.

"Analysis," says Pappus, "may be distinguished into two kinds: in the first, which may be called contemplative analysis, we propose to discover the truth or falsehood of an affirmed proposition: the other belongs to the solution of problems, or the investigation of unknown truths. In the first we assume the subject of the proposition advanced to be true, and proceed through the consequences of the hypothesis till we arrive at something known. If this result is true, the proposition is true also, and the direct demonstration is obtained by stating in an inverse order the different parts of the analysis. If the ultimate consequence at which we arrive is false, the proposition was also false. In the case of a problem, we first suppose it to be resolved,

* It is usual for anagrammatists to treat *i* as the same with *j*, and *u* as identical with *v*.

and deduce the consequences resulting from that solution till we arrive at something known. If the last consequence involves only something which can be executed, or is comprised among what geometers called *data*, the proposed problem can be solved; and the demonstration—or rather, in this case, the construction—is obtained, as in the former case, by taking the different parts of the analysis in an inverse order. If the last result is impossible, the thing demanded is also impossible."

The names of the ancient writers on the geometrical analysis are—Euclid, in his "Data and Porismata;" Apollonius, in his treatise "De Sectione Rationis" and in his "Conic Sections;" Aristæus, "De Locis Solidis;" and Eratosthenes, "De Mediis Proportionalibus;" but of these only the "Data" of Euclid and some fragments of Apollonius have come down to our times. A complete system of the ancient geometrical analysis may be found in the works of Dr. Simson of Glasgow. The reader may also consult with advantage Leslie's "Geometrical Analysis."

Analysis is directly opposed to synthesis, which advances step by step through known propositions, from the data to the quæsita in the case of a problem, or from the hypothesis to the predicate in the case of a theorem. Analysis is the chief though not the sole instrument of *discovery*, whilst synthesis adapts itself naturally to *instruction*. Euclid's direct demonstrations, for example, are all synthetical; his indirect ones, however, retain the analytical character. The methods of conducting analysis and synthesis are the same in kind, the only difference being that, in the hands of the investigator at least, the several steps of the former are experiments suggested by experience, for which no rule can be assigned, whereas in the latter these steps are suggested by previous knowledge, gained, in fact, very frequently from a preliminary analysis.

The ancient geometers conducted their analysis by means of ordinary language only; their successors, however, frequently availed themselves of the powerful resources of algebra. As a consequence of this habit the word analysis, until a very recent reaction set in, lost entirely its original meaning as a *method* of reasoning opposed to synthesis, and by a strange perversion of terms became synonymous with algebra and the calculus; that is to say, with the *instruments* employed in investigation. The fact that algebra may be, and often is, employed synthetically as well as analytically appears to have been overlooked.

Analytical Geometry. See GEOMETRY.

Anam′, or Annam′, Empire of, called also **Cochin China,** a country of South-eastern Asia, is bounded on the N. by China, on the S. and E. by the Chinese Sea, and on the W. by Laos, Siam, and the Gulf of Siam. Area, about 198,000 square miles. It lies between lat. 8° 40′ and 23° 22′ N. The length from N. to S. is about 800 miles, and the width is very unequal in different parts. It is traversed by a long range of high mountains, the direction of which is nearly N. and S. The principal river is the Mekong (or Cambodja), which is navigable, and flows southward into the Chinese Sea. The empire of Anam was formed at the beginning of the present century out of the former kingdoms of Tonquin and Cochin China (Ko-Tchin-Tching), to which were added the province of Champa and a part of the ancient kingdom of Cambodja. The population is variously estimated at from 9,000,000 to 27,000,000, the latter figure being given by the Catholic missionaries.

TONQUIN is the most northern part of Anam, and borders on the Gulf of Tonquin. It is intersected by the river Sang-koi, which enters the Gulf of Tonquin. The soil is fertile, and produces rice, cotton, and spices, with a variety of varnish trees and palms. Gold, silver, copper, and iron abound in Tonquin, which is the only part of Anam that is rich in metals.

COCHIN CHINA is a long and narrow district, bounded on the E. by the Chinese Sea, and on the W. by a range of barren mountains, which have not been explored. A large part of the soil is sterile. The scenery of the coast is grand and beautiful. The chief products are eagle-wood (*Aloex′ylon*), sugar, and cinnamon.

CAMBODIA, or KAMBOJA, is S. W. of Cochin China, and borders on the Gulf of Siam. (See CAMBODIA.)

CHAMPA, or TSIAMPA, is the most southern part of Anam, bordering on the sea. The soil is sterile, consisting of sandhills and granite formations, but yields one valuable product, the fragrant eagle-wood. Several good harbors occur on the coast of Champa.

The government of Anam is despotic. Mandarins appointed by the emperor govern the provinces, and are the commanders of the army. Buddhism is the religion of the majority of the people; among the higher classes Confucius has many adherents. Roman Catholic missions were planted in the seventeenth century, soon became prosperous, and have maintained themselves in spite of the most cruel persecutions. In 1862 the emperor engaged in a treaty of peace concluded with France to tolerate Christianity and protect the Christians in their lives and property throughout the empire. In 1872 the Catholic Church of Anam (inclusive of the French Cochin China) was divided into eight vicariates apostolic, of which four were in Tonquin, three in Cochin China, and one in Cambodja. The Christian population was in 1854 estimated at 500,000; and though from 1854 to 1862 it greatly decreased, it is now believed to exceed that number, as in 1865 the apostolic vicariate of Tonquin alone had 127,852, and that of Eastern Tonquin 43,315 Catholics. The commerce of Anam is to a large extent in the hands of Chinese merchants; the chief branch of industry is silk manufacture. The capital is Hue, at the mouth of the river of the same name.

The Anamese language is, like the Chinese, monosyllabic; the literature consists almost exclusively of imitations of Chinese works. About 214 B. C., Tonquin and Cochin China were conquered by a Chinese prince and settled by Chinese colonists. From that time to 1428 they were in turn sometimes subject to China, sometimes independent. In 1428 they threw off the Chinese yoke and formed an independent empire, under the dynasty Leh. But the authority of this house became soon merely nominal, Tonquin being ruled (since 1545) by the dynasty of the Trinh, Cochin China (since 1600) by that of Nguyen. A new dynasty, Tay-song, arose in 1765, and exterminated the dynasties of Leh, Trinh, and Nguyen. Only one scion of the latter, Nguyen-anh, escaped, was educated in France, and having returned to Anam, and conquered and exterminated the dynasty Tay-song, was under the name Gya-long proclaimed as the first emperor of Anam. His natural son and successor, Minh-menh (1820–41), and the son and grandson of the latter, Thien-tri (1841–47), and Tu-duc (since 1847), were all cruel persecutors of the Catholic Church, and thus became involved in hostilities with France and Spain. A four-years' war (1858–62) ended in a treaty of peace, by which the emperor of Anam ceded three provinces of Cochin China, Saigon, Bienhoa, and Mytho, to France. In 1867 three other provinces of Cochin China, Vinh-long, Chan-doc, and Ha-tien, were annexed to the French dominions, which have an area of 21,728 square miles, and a population of 1,204,287. (See VEUILLOT, "La Cochin Chine et la Tonquin," 1859; CORTAMBERT and DE ROSNY, "Tableau de la Cochin Chine," 1863; BASTIAN, "Die Völker des östl. Asiens," vol. iv., 1868; and the *brochures* of St. Garnier, 1864–69.) A. J. SCHEM.

Anam′boe, or Anamaboe, a seaport and British fort on the Gold Coast of Africa, 11 miles E. N. E. of Cape Coast Castle, is the residence of a governor. It exports palm-oil, gold-dust, ivory, etc. Pop. about 3000.

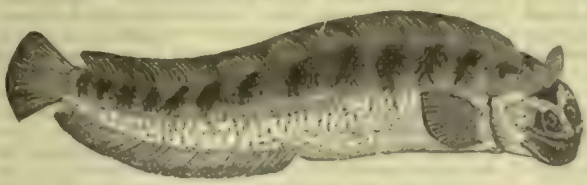
Anamirapucu′, a river of Brazil, in the province of Pará, enters the estuary of the Amazon after a course of about 200 miles.

Anamor′phosis [Gr. *ἀναμόρφωσις*, from *ἀνά*, "again," and *μορφόω*, to "form"], in natural history, denotes the ideal change of form or development which may be traced through the species or higher members of a natural group of animals or plants. Some naturalists adopt the theory that living species have been developed from extinct species by the process of anamorphosis. The term is sometimes applied in botany to an unusual development of an organ, as the calyx of a rose assuming the form of a fruit.

ANAMORPHOSIS, in perspective, denotes a drawing which when viewed in the usual way appears distorted or presents an image of something different, but when viewed from a particular point or reflected by a curved mirror, it appears in its proper form and just proportions.

Anamo′sa, a post-village, capital of Jones co., Ia., on the Wapsipinicon and Buffalo rivers, 50 miles S. W. of Dubuque, on the Dubuque and South-western and Iowa Midland R. Rs. It has two weekly newspapers, a national bank, excellent quarries of building-stone, and a State penitentiary. Pop. 2083. ED. "ANAMOSA EUREKA."

Ananassa Sativa. See PINEAPPLE.



Ananyev, a town of Russia, in the government of Kherson, 90 miles N. W. of Odessa. Pop. in 1867, 11,402.

Anapa′, a seaport and fortified town of Russian Circassia, on the N. shore of the Black Sea, near the mouth of the Kuban. The harbor is not safe in stormy weather. The town has been by turns the property of Turks and Russians, and now belongs to the latter. Pop. about 9000.

Anaph′ora [Lat. *anaph′ora*; Gr. *ἀναφορά*, from *ἀνά*, "again" or "back," and *φέρω*, to "carry"], in rhetoric, a repetition of a word or phrase at the beginning of two or more consecutive sentences or clauses, as, "It is sown in

corruption; it is raised in incorruption. It is sown in dishonor; it is raised in glory. It is sown in weakness; it is raised in power."

Anar'rhichas [from the Gr. ἀνά, "up," and ἀρρίχασθαι, to "clamber"], the name of a genus of spiny-finned osseous fishes, characterized by having their mandibular, palatine, and vomerine bones armed with large osseous tubercules bearing on their summits enamelled teeth. It includes the wolf-fish, which is common to both sides of the Atlantic.

Anarrhichas lupus, Sea Wolf.

A'nas [from the Lat. *a'nas*, a "duck"], a Linnæan genus of web-footed birds belonging to the order Palmipedes, has been divided by recent ornithologists into many genera—namely, *Anas* (the duck), *Anser* (the geese), *Cygnus* (the swans), *Aythya* (red-head), *Somateria* (eiders), etc. The anas in this restricted sense has a flattened bill, the base of which has a greater breadth than depth, and the bill is as wide (or wider) at the extremity as at the base.

Anas clypeata, or Shoveler Duck.

Anasarca. See Dropsy.

Anasta'sius I., emperor of Constantinople, was born at Durazzo about 430 A. D. He succeeded the emperor Zeno in 491. The orthodox, who considered him a heretic, revolted and defeated his army in 514. Died in 518 A. D.

Anastasius II. became emperor of the East in 713 A. D. Theodosius was chosen emperor by his army, which took Constantinople and deposed Anastasius in 716. Died in 720 A. D.

Anastasius I., Saint, a native of Rome, became pope about 398 A. D. He condemned the doctrines of Origen. Died in 402 A. D.—Anastasius II., Saint (Pope), a native of Rome, succeeded Gelasius I. in 496 A. D. Died in 498.—Anastasius III. was chosen pope in place of Sergius III. in 911. Died in 913.—Anastasius IV. succeeded Eugenius III. as pope in 1153. He died at an advanced age Dec. 2, 1154.

Anastasius, surnamed the Librarian, a Roman priest who was librarian of the Vatican, and lived about 860 A. D. He compiled an "Ecclesiastical History" in Latin, and wrote other works. Died about 890.

Anastasius, Saint, surnamed Astric, the apostle of the Hungarians, was born in 954. He converted the duke Stephen, and many other Hungarians. Died in 1044.

Anastasius Grün. See Auersperg.

Anastat'ica [from the Gr. ἀνάστασις, "resurrection"], the name of a genus of cruciferous plants, one species of which, called the rose of Jericho (*Anastatica Hierochuntina*), grows in Palestine and has singular hygroscopic properties. Under the influence of drought it rolls up into a ball, becomes detached from the ground, and is carried away by the wind. When it comes into contact with moisture it expands into its natural form. It retains for many years this property of expanding when moistened.

Anastat'ic Printing, a process by which printing and engravings may be transferred to metal, from which impressions exactly like the original can be taken. The printed sheet is moistened with dilute phosphoric or nitric acid, and pressed with great force upon a zinc plate, which is afterwards washed with an acid solution of gum, and then inked with a roller.

Anas'trophe [from the Gr. ἀνά, "up," "back," "over," and στρέφω, to "turn"], a term in rhetoric applied to a species of inversion or departure from the usual order of succession in words, as when Scott, in the "Lady of the Lake," says, "Clattered a hundred steeds along," for "A hundred steeds clattered along;" so Virgil in the "Æneid," lib. i., l. 32, has "*Maria omnia circum*" for "*circum omnia maria*" ("around all the seas").

An'atase [from the Gr. ἀνάτασις, "extension," so called from the length of its crystals], a name of titanic acid or oxide of titanium, which occurs in octahedral crystals, having a splendent and adamantine lustre. Some specimens found in Brazil resemble diamonds so much as to be mistaken for them. Called also *octahedrite*.

Anath'ema [ἀνάθεμα, from ἀνά, "up," and τίθημι, to "set" or "place"], a Greek word, the primary meaning of which was something "placed" or "hung up" in the temples of the gods, and hence "consecrated" or "devoted." Among the Jews and Christians it is a curse or denunciation uttered by ecclesiastical authority, and a form of excommunication of heretics and other offenders.

An'athoth, or **A'nata,** an ancient Jewish city of refuge, about 4 miles N. E. of Jerusalem, is supposed to have been the native place of the prophet Jeremiah.

Anat'idæ, the name of a family of web-footed birds, of which the genus *Anas* is the type. It includes the duck, goose, swan, and others. Cuvier gave them the name of Lamellirostres.

Anato'lia, Anado'li, or **Nato'lia** [from the Gr. Ἀνατολή, the "rising" or "orient"], the modern name of Asia Minor, which is a large peninsula, bounded on the N. by the Black Sea and the Sea of Mármora, on the S. by the Mediterranean, and on the W. by the Grecian Archipelago. The Euphrates forms part of its ill-defined eastern boundary. It lies between lat. 36° and 42° N., and between lon. 26° and 41° E. The length from E. to W. is about 700 miles, and the area is estimated at 204,434 square miles. The western coast is indented with numerous gulfs, and presents many high and precipitous cliffs. The interior is an elevated plateau, enclosed by two mountain-ranges—namely, Mount Taurus, which extends through the southern part from the Euphrates to the archipelago; and Anti-Taurus, which traverses the northern part. The general direction of these ranges is nearly E. and W. Some peaks of Mount Taurus attain a height of 10,000 feet or more. Between these two long ranges are several others which rise to a great height. The highest summit in Anatolia is the volcanic Argish Dagh, or Mount Argæus, which is situated 15 miles S. of Kaisareeyeh, and is 13,000 feet above the level of the sea. Mount Olympus, about 8 miles S. of Brusa, has an altitude of 8800 feet.

The largest river of Anatolia is the Kizil Irmak (anc. *Halys*), which rises in the E. part and enters the Black Sea. The western part of the peninsula is drained by the Meander and the Hermus (Sarabat), which flow westward into the Ægean Sea. In the central part are a number of salt lakes and barren steppes of large extent. The Katakekaumene, or "burnt country," a volcanic waste, is the best known of these regions.

The rocks which underlie the upper regions of Anatolia are mostly granite, serpentine, and schist. Along the southern and western coasts calcareous rocks predominate, and marble is abundant. Numerous extinct volcanoes and rocks of volcanic origin occur in different parts of the country. The climate presents a great diversity in consequence of the inequality of the surface. The western shores have been celebrated in all ages for their mild and genial climate, and the coast of the Black Sea is favored in that respect. The central plateau is very hot in summer and cold

in winter, partly because it is not well watered and is generally destitute of forest trees. The northern region and the other sea-coasts are covered with extensive forests of oak, ash, beech, plane, and other trees good for timber. The coasts of the Ægean and Black seas have a very luxuriant vegetation and a fertile soil. Among the chief products are sugar, wine, opium, tobacco, olives, figs, wheat, barley, and silk. The flora of Southern and Western Anatolia is extremely beautiful. The mountains are infested by panthers, bears, and wolves.

Anatolia, which forms a part of the dominions of the sultan of Turkey, comprises the pashalics of Anatolia, Itchelee, Karamania, Marash, Sivas (or Room), and Trebizond. The population, which is estimated at 10,970,000, consists of Ottoman Turks (who are a large majority), Turkomans, Greeks, nomadic Koords, and Armenians. The cultivation of the soil is generally neglected here, and the principal branches of industry are the production of opium, wine, and oil, and weaving shawls and carpets. The chief cities are Smyrna, Brusa (or Bursa), Sinope, Angora, Konieh, Kutaieh, and Trebizond. In ancient times this peninsula was occupied by many powerful kingdoms and famous cities. (See Asia Minor, Ionia, Lydia, Pontus, etc. Hamilton, "Researches in Asia Minor," 1842; Tchihatcheff, "Asie Mineure," 1853–60; and Barth, "Reise von Trapezunt bis Skutari," 1860.)

A. J. Schem.

Anatolia is also a pashalic of Asiatic Turkey, forming the western portion of the peninsula called Asia Minor. It is the largest and richest province in the Turkish empire, and the most populous in Western Asia, comprising nearly half of the Anatolia described above.

Anat'omy [from the Gr. *ἀνά*, "up," "through," and *τέμνω*, to "cut"], the science of the structure of organized bodies; so called because its results are attained and its investigations are pursued by "cutting up" or dissecting organisms. The widest and most general knowledge of organized structures is to be attained only by the examination and comparison of the structure of all species of animals and vegetables. Such a comparison has given name to the science of Comparative Anatomy (which see)—a science embracing in its field all the other branches of anatomical knowledge. That branch of comparative anatomy which seeks to trace the unities of plan which are exhibited in diverse organisms, and which discovers, as far as may be, the principles which govern the growth and development of organized bodies, and which finds functional analogies and structural homologies is denominated "philosophical" or "transcendental" anatomy. The study of the structure of animals is called zootomy, or animal anatomy; vegetable anatomy is known as phytotomy, or more frequently as structural botany. That branch of anatomy which describes the organs or viscera, etc. of any one species, and the relations of these organs to each other, is called descriptive or special anatomy, or organography. Histology treats of the "tissues" or *immediate* structural elements. Microscopic anatomy is minute histology, or the science of the more *remote* structural elements of which the body is built up. The examination of the *ultimate* structural elements is the province of organic chemistry, but between that science and histology there is yet an uncrossed, perhaps an impassable, barrier. (See Histology, by Col. J. J. Woodward, M. D.)

Vegetable anatomy is, and must be, chiefly histological, since the various parts of plants are structurally much less differentiated from their typical histological elements than those of most animals. Indeed, the organography of plants is very simple, the philosophical anatomist being able to show that all the proper organs of the vegetable are modifications of the leaf.

Human anatomy, the science of the structure of the human body, is not only a subject of interest and vital importance to the physician and the surgeon, but should be understood in its general outlines by parents and teachers, and by every one who recognizes the importance of the knowledge of that self of which the body is so important a part. To the painter and sculptor the study of the superficial muscles and bones is considered indispensable. Such knowledge is primarily sought in the dissecting-room; but the slowly accumulated results of the practical anatomist's work have been minutely recorded; and for ordinary instruction the published text-books are sufficient; while for the surgeon, and even for the artist, practical work with the scalpel is all important, as substituting certainty and familiar personal knowledge for the less valuable knowledge that is acquired by reading and tradition. Practical anatomical work is pursued and legalized in most civilized nations; and the (much exaggerated) abuses to which it has led in former times are now for the most part prevented by law.

Human anatomy is "general," "special," "topographical," or "surgical." "General anatomy" applies the result of philosophical anatomy to the human body, assigns various organs to appropriate groups, and divides the whole subject into suitable branches or heads; "special anatomy" describes the constituent parts; "topographical" or "regional anatomy" studies the relations of parts in important portions of the body; "surgical anatomy" is the application of regional anatomy to parts peculiarly liable to surgical operations, and its study is entered into as a preparation for such operations. "Pathological anatomy," or the study of organs as modified by disease, is also an important branch of the science.

As the leaf and its appendages in the organography of the vegetable kingdom, and as the segment with its appendages in articulate animals, are regarded as the single structural elements upon which the whole organism is built, so in man and in all vertebrates the vertebra with its apophyses or branches is the typical element of which the osseous framework is composed, and all the symmetrical or bilateral parts are in a manner dependencies of the osseous system.

This great truth was first fully grasped by Oken. Another remarkable generalization was made by the great Bichat—that all non-symmetrical parts, such as the digestive and circulatory systems, are of a character resembling the vegetative growth, and not directly subject to the will. Such parts have in general non-striated muscles, and are largely supplied with nerves of the so-called sympathetic system; while, on the other hand, bilateral and symmetrical parts, as the limbs and the most important muscles, are largely under the direction of the will, and are supplied by cerebro-spinal nerves. Two hundred and twenty-nine pairs of voluntary muscles are recognized by anatomists.

The muscles, in accordance with this theory, are divided into—1, striated muscles, or "muscles of animal life," which are symmetrical or found alike on both sides; and, 2, non-striated muscles, those of "organic life," which are found chiefly in non-symmetrical parts, or if in symmetrical parts they always exist as parts of some special organ, while striated muscles are never so found.

We have seen incidentally that there are likewise two systems of nerves—the cerebro-spinal and the sympathetic or ganglionic systems, which are somewhat analogous to the two classes of muscles. Some theorists, perhaps rather fancifully, make a similar twofold division in almost all the animal tissues.

Anatomists divide their science into osteology, which treats of the skeleton; myology, the science of the muscles; angiology, which describes the blood-vessels or the circulatory system; splanchnology, relating to the viscera or organs concerned in the digestion of food; and into other branches which relate to the respiratory, nervous, and reproductive systems and the organs of special sense. These minor sciences, however, treat of the physiology (functions) as well as the anatomy (structure) of the various parts. (For descriptions of the various organs and tissues, see Eye, Ear, Heart, Bone, Muscle, etc.)

History.—It is said that the priests of ancient Egypt were familiar with the facts of human anatomy. The ancient Greeks practised the dissection of animals, and gained considerable knowledge of their structure. Alcmæon, Democritus, Hippocrates, Diocles, and Aristotle were zootomists, but no ancient Greek seems to have suspected the existence of a nervous system or of the circulation of the blood. Erasistratus (300 B. C.) is said to have been the first to dissect the human body. Herophilus and Parthenius followed him. Later, Galen, Soranus, and Moschion practised dissection of the human body. The science of anatomy, except so far as taught by Galen, perished with the old Roman empire. Its restorers were Mundinus (born 1315), Guy de Chauliac, Vigo (1516), Sylvius (1539), Ingrassias, Herman, Fallopius (1523–62), Eustachius (1500–75), but especially the Flemish Vesalius (1514–64). Leonardo da Vinci (1452–1519) had practically studied anatomy in its relations to art. Servetus (1509–53) is believed to have first announced the circulation of the blood; Cæsalpinus, Paolo Sarpi, and others soon after made the same announcement, but its truth was first shown by Harvey (1578–1657), a pupil of Fabricius. The later names of Asellius, Bartholine, Wharton, Willis, Ruysch, Pachionius, Malpighi, Valsalva, Cotunni, Monro, and Meckel are among the most brilliant; but the number of eminent anatomists is very great. In recent times microscopical and pathological anatomy have been the fields of numerous and important discoveries. Drs. John Bard and Peter Middleton of New York are said to have made the first dissection in America in 1750. Chas. W. Greene.

Anaxag'oras [*Ἀναξαγόρας*], an eminent Greek philosopher of the Ionic School, was born at Clazomenæ, near Smyrna, about 500 B. C. He passed nearly thirty years at

Athens, to which he removed about 480, and enjoyed the friendship of Pericles. He wrote a "Treatise on Nature," of which small fragments are extant. In 450 B. C. he was accused of impiety, and, though defended by Pericles, was condemned to death or banishment, and retired to Lampsacus, where he died in 428 B.C. He appears to have maintained the eternity of matter. Combining great sagacity and close reasoning with diligent observation, he rendered important services to physical science. He ascribed the origin of the world and the order of nature to the operation of an eternal self-existent and infinitely powerful principle which he termed Nous (Mind). He taught that generation and destruction are only the union and separation of elements which can neither be created nor annihilated, demonstrated that air is a substance, explained the theory of eclipses, and refuted the doctrine that things may be produced by chance. (See RITTER, "History of Philosophy," 1838.)

Anaxar'chus [Ἀναξάρχος], a Greek philosopher, born at Abdera, in Thrace, accompanied Alexander the Great in his expedition against Persia in 334 B. C. He gained the favor of that prince, whom he survived a short time.

Anaximan'der [Ἀναξίμανδρος], an eminent Greek philosopher, born at Miletus about 610 B. C., was a disciple of Thales. He is said to have discovered the obliquity of the ecliptic, and to have invented the sun-dial. According to tradition, he taught that the earth is a cylinder, that the sun is a globe of fire as large as, or larger than, the earth, and that infinity is the beginning and end of all things. He appears to have been the first Greek who wrote any work in prose on geometry or philosophy. Died about 546 B. C.

Anaxim'enes [Ἀναξιμένης], a Greek philosopher of whom little is known, was born at Miletus, in Asia Minor, about 550 B. C. He taught that the original principle or primary form of things was air, or a subtle ether which is in perpetual motion.

Anaximenes (or LAMPSACUS), a Greek historian and preceptor of Alexander the Great, about 340 B. C. He wrote a history of the reign of Philip of Macedon, and another of the exploits of Alexander, neither of which is extant.

An'cach, a department of Peru, is bounded on the N. by the department of Libertad, on the E. by the littoral province of Loreto and the department of Junin, on the S. by the department of Lima, and on the W. by the Pacific. Area, estimated at 43,100 square miles. The department extends from the Andes to the Pacific, and contains all climates and their products. The chief occupations of the inhabitants are agriculture and the raising of cattle. The rich silver-mines in the mountains, as well as the rivers containing gold, are but very little worked at present. Chief town, Huaraz. Pop. about 190,000.

Ancelot (JACQUES ARSÈNE FRANÇOIS POLYCARPE), a French dramatic poet, born at Havre Feb. 9, 1794, produced in 1819 a tragedy entitled "Louis IX.," which was warmly applauded, and procured for him a pension of 2000 francs. Among his other works are an epic poem called "Marie de Brabant" (1825), "Fiesque," a tragedy (1824), and "Olga," a drama (1828). He was admitted into the French Academy in 1841. Died Sept. 7, 1854.

His wife, Marguerite Virginie Chardon, born at Dijon Mar. 15, 1792, was a novelist and an artist. She wrote several dramas and tales which are worthy of commendation.

An'cestor [remotely from the Lat. *an'te*, "before," and *ce'do*, to "go"], one who has preceded another in the direct line of descent. In law it signifies one from whom an estate has been derived by inheritance: a deceased person from whom, on account of his decease, an estate has passed to another, called an heir, by operation of law. Ancestor and heir are correlative terms. In this sense a brother may be the ancestor of a brother, or a child of a father, wherever those persons can take land from such relatives by inheritance.

Anchi'ses [Gr. Ἀγχίσης], a Trojan prince related to Priam, was, according to tradition, a favored lover of Venus, and the father of Æneas, with whom he escaped from Troy. He is said to have died in Sicily.

Anchithe'rium, an equine quadruped of which the remains are found in the lower miocene strata, supposed to be the progenitor of *Hipparion* in the upper miocene, and hence of *Equus* in the pliocene. It is also regarded as a connecting link between the tapiroid *Palæotherium* of the eocene and our modern horses. In *Anchitherium* the foot was composed of three toes, all of which rested on the ground; in *Hipparion* the lateral toes were dwarfed, but present; in *Equus* they are obsolete, or represented only by the internal splint-bones.

Anch'or [Lat. *an'chora*; Gr. ἄγκυρα], an iron implement used to fasten a vessel to the ground in comparatively shallow water. It consists of a round straight bar called the *shank*, at the upper end of which is a transverse piece called the *stock*, and of two curved arms at the lower end of the shank, each of which arms terminates in a triangular plate called a *fluke* or *palm*. The lower end of the shank is the *crown*. The stock is at right angles to the plane of the flukes. The cable is fastened to a ring in the upper end of the shank. When the anchor is cast from the ship into the sea, the crown first strikes the ground. The anchor then falls over, so that one end of the stock rests upon the ground, and the movement of the ship causes one of the flukes to enter the ground, and to penetrate deeper in proportion as the strain or traction on the cable increases. Mr. Porter invented an improved form of anchor, the arms of which are pivoted to the stock, instead of being rigidly fixed. Men-of-war and large ships carry two large anchors of equal size at the bows, thence called bower anchors, and two of smaller size, called the sheet anchor and spare anchor. For particular and special services they have also the "stream" and the "kedge" anchor. Smaller vessels have fewer anchors and of inferior size. When one anchor is down, the ship is said to be at single anchor. When the anchor is dragged out of the ground by the movement of the vessel, it is said to come home, and when the cable becomes twisted around the anchor or stock, the anchor is said to be foul. *To weigh anchor* signifies to heave or raise the anchor out of the ground into the ship.

Anch'orage, ground fit to hold a ship's anchor, so that she may ride safely. Hard sand or stiff clay forms the best anchorage. A landlocked harbor is also a requisite of good anchorage. The water should not be too deep, as in that case the cable, extending nearly vertically, will be apt to pull the anchor out of the ground. The term is also applied to the toll or harbor-dues which the owner or captain of a ship pays for permission to cast anchor.

Anch'orite, or **Anch'oret** [from the Gr. ἀναχωρητής, from ἀνά, "up," "back," and χωρέω, to "retire"], a hermit or person who has retired from the world and devoted himself to ascetic religion in solitude. The term was first applied to Christians of the third century who retired to caves and solitary places in the deserts of Palestine, Egypt, and Syria, to which, in some cases, they were driven by persecution. They often subjected themselves to painful privations and various forms of penance. The first of these anchorites was Paul of Thebes, who died in 340, aged 104 years. The so-called "father of monachism" was Antony of Coma, in Upper Egypt, who was born in 251 and died in 356, aged 105 years. One anchorite, Simeon Stylites, is said to have lived many years on the top of a pillar in Syria, about 420–450 A. D. The chief difference between an anchorite and a monk is that the former lived alone, and the latter associated with other monks. The first monastery was founded by Pachomius, on the island of Tabanna in the Nile, about the year 340; the first nunnery, some eight years later.

Ancho'vy (the *Engrau'lis encrasich'olus* of the natural-

Anchovy.

ists), a small fish, from five to seven inches long, which abounds in the Mediterranean Sea and the Atlantic shores of Europe. It belongs to the Clupeidæ, or herring family, and is distinguished by a sharp-pointed head, the upper jaw longer than the lower, and the deeply cleft mouth extending behind the eyes. It is salted and packed in small barrels for exportation, and used for sauces, pastes, etc. The *Engraulis vittatus*, an anchovy of the Atlantic shores of the U. S., might easily be taken in immense quantities. Anchovies also abound on our Pacific coast.

Anchovy Pear (*Gri'sar candida'ta*), a tree which grows in the West Indies in moist ground or shallow water, and is allied to the Myrtaceæ. It bears a fruit (a drupe) which is pickled and used for food.

Anchylosis. See ANKYLOSIS.

Ancienne Lorette, a post-village of Quebec co., province of Quebec, Canada, 7 miles S. W. of Quebec. About 240 Huron Indians live here, descendants of those who settled here after the dispersion of the Hurons by the Iroquois in the seventeenth century. Pop. in 1871, 256.

An'cients [Lat. *antia'nus*, from *an'tea* or *an'te*, "before"], those persons who lived in former ages; a term

applied somewhat indefinitely to men of all generations except those that are modern, but there is no exact line of demarcation between the ancient and the modern. The term is also applied to gentlemen of the Inns of Court and Chancery in London.

Ancients, Council of, in French history, one of the two assemblies composing the legislative body in 1795–99. It consisted of 250 members, each of whom had to be at least forty years old. It was dissolved by the revolution of the 18th Brumaire.

Anci'le (plu. **Ancil'ia**), the shield of Mars, which, according to tradition, fell from heaven in the reign of Numa, when an oracle declared that Rome could never be taken while this shield remained in that city. Numa committed it to the custody of the Salii or priests of Mars, and had eleven other shields made precisely like it, in order to prevent the genuine shield from being stolen.

Ancillon (Johann Peter Friedrich), an able German historian and statesman of French extraction, was born at Berlin April 30, 1766. He was the pastor of a Protestant church in that city in the former part of his mature life. In 1801 he published "Mélanges of Literature and Philosophy." His principal historical work is a "View of the Revolutions of the Political System of Europe since the Fifteenth Century" (in French, 4 vols., 1803–05), which was very successful. He was soon appointed royal historiographer and councillor of state. In 1831 he became minister of foreign affairs. His policy was prudent and moderate. Died April 19, 1837.

Anc'karswärd (Karl Henrik), a Swedish statesman, born at Sweaborg in 1782. He was elected a member of the Diet in 1817, and soon became the leader of the opposition party, but retired to private life in 1829. Died in 1865.

Anco'na, a province of Central Italy, is bounded on the N. by Pesaro and Urbino, on the E. by the Adriatic Sea, on the S. by Macerata, and on the W. by Perugia. Area, 740 square miles. The country is chiefly mountainous, and is traversed by the Esino and Musone. The chief articles of export are grain, oil, wine, and hazel-nuts. The chief branch of industry is the silk manufacture. Chief town, Ancona. Pop. in 1871, 262,359.

Ancona, an important city and seaport of Central Italy, on the Adriatic, 132 miles by rail N. E. of Rome, capital of the province of Ancona. It is built on the slope of a hill, and presents a picturesque appearance from the sea. It is supposed to have been founded about 400 B. C. Among the remarkable public buildings are a cathedral, the government palace, the town-house, and a triumphal Corinthian arch, which was built by Trajan of white marble. It has a college, ten churches, and several convents. The harbor is one of the best on the Adriatic. In 1732 it was declared a free port. Ancona is connected by railways with Rome, Bologna, and Brindisi. It has considerable trade, carried on by steamships which ply between this point and the Levant. The chief articles of export are wool, grain, silk, oil, alum, sulphur, fruit, and soap. Ancona was taken in 1832 by the French, who occupied it until 1838. Lat. 43° 38′ N., lon. 13° 30′ E. Pop. in 1871, 45,741.

Anco'na (Sydenham E.), born at Warwick, Lancaster co., Pa., Nov. 20, 1824, became connected with the Reading R. R., and was a member of Congress from Pennsylvania (1860–66).

An'cram, a post-township of Columbia co., N. Y. Iron ores are obtained here, and lead was formerly mined. Pop. 1793.

Ancre, d' [It. *D'Ancora*], (Concino Concini), Le Maréchal, an Italian courtier, born at Florence. He formed a part of the retinue of Maria de Medici (queen of Henry IV. of France) when she went to Paris in 1600, and he married Eleonora Galigai, who had much influence with that queen. His talents for intrigue and the favor of the queen (who in 1610 became regent) raised him suddenly to power. In 1613 he was appointed a marshal of France and prime minister. Having excited general odium by his rapacity, he was assassinated at Vitry April 24, 1617, by De Luynes and other conspirators.

An'cus Mar'tius, fourth king of Rome, a grandson of Numa, succeeded Tullus Hostilius about 636 B. C. He promoted the religious institutions of Numa, and is considered the founder of the plebeian order. He waged war against the Latins, whom he subdued, founded Ostia, and built the Pons Sublicius (Bridge of Piles). Died about 612 B. C.

An'cylus, a genus of small, patelliform, fresh-water gasteropod mollusks, of which several species inhabit the streams and lakes of North America.

Ancy'ra [Gr. Ἄγκυρα], an ancient city of Galatia, in Asia Minor, said to have been built by Midas, was about 30 miles W. of the river Halys. Under the Roman empire it was an important city and the capital of Galatia. Its site is occupied by the modern city of Angora (which see). Two councils of the Church were held here—one in 314, and the other in 358 A. D.

An'da, a genus of plants of the order Euphorbiaceæ. The only known species is the *Anda Brasiliensis*, a Brazilian tree, the fruit of which contains two seeds, called *Purgados Paulistas*. These afford a valuable fixed oil, which is used in medicine as a cathartic, and as a drying-oil by painters. The bark is astringent.

Andalu'sia [formerly called *Vandalusia*, from the Vandals; Sp. *Andaluci'a*], the southern portion of Spain, is bounded on the N. by Estremadura and La Mancha, on the E. by Murcia and the Mediterranean, on the S. by the Mediterranean, and on the W. by Portugal and the Atlantic Ocean. Area, 33,665 square miles. It is supposed to correspond to the *Tarshish* (the western) of the Bible and the *Bætica* of the Romans. The Sierra Morena extends along the northern border, and the southern part is traversed by the Sierra Nevada, the highest summits of which rise about 11,000 feet above the sea. The largest river is the Guadalquivir, which flows south-westward and enters the Atlantic. The soil of the valleys and plains is fertile. Silver, copper, iron, lead, and mercury are found here. The chief products are grain, cotton, wine, wool, sugar, olives, oranges, and figs. The climate is delightful. The Andalusian breed of horses has long been celebrated. Andalusia is divided into eight provinces—viz., Almería, Granada, Jaen, Cadiz, Córdova, Málaga, Huelva, and Sevilla, in each of which is a town of the same name. Pop. in 1867, 3,200,944.

Andalusia, a post-village, capital of Covington co., Ala., 30 miles E. of Sparta.

Andalusia, a post-township of Rock Island co., Ill. Pop. 878.

Andalu'site, an anhydrous silicate of alumina, which is found in Andalusia and other places, and occurs in four-sided prisms. It may be distinguished from felspar by its greater hardness and infusibility. A peculiar variety called chiastolite or macle is very abundant at South Lancaster, Mass. It occurs in stout crystals, having the axis angles of a different color from the rest, exhibiting a tessellated appearance on the cross section. (See Dana's "System of Mineralogy," 5th ed.)

Andaman' Islands, a group of small, densely-wooded islands in the Bay of Bengal, between lat. 10° and 13° N., and about 93° E. lon. Area, 2550 square miles. They are 180 miles S. W. of Cape Negrais. The inhabitants are in the lowest stage of barbarism, and are said to resemble none of the races of the adjacent parts of Asia. It has been used as a penal colony for Hindoos by Great Britain. The earl of Mayo, the governor-general of India, was murdered here by a convict on Feb. 8, 1872. The native population does not exceed 1000, and is dying out. They wear no clothing except a coating of mud. The number of convicts in 1868 was 7230, and the number of free inhabitants (inclusive of officers, soldiers, etc.), 1400. The chief settlement is Port Blair.

Andan'te [the present participle of the It. verb *anda're*, to "walk," to "go"], an Italian musical term directing the time, or rather the style, in which a piece is to be performed. It denotes a movement that is moderate, rather slow and sedate, but distinct and flowing.

Andaquies Wax, a peculiar beeswax from South America.

Andelys, Les, là zônd'le', a town of France, in the department of Eure, near the Seine, 20 miles N. E. of Evreux. Pop. in 1866, 5161.

Andennes, a town of Belgium, in the province of Namur, on or near the Meuse, and on the railroad from Namur to Liege, 12 miles by rail E. of the former. Porcelain is made here. Pop. in 1866, 6278.

An'derlecht, a market-town of Belgium, in the province of Brabant, 10 miles S. W. of Brussels. It has breweries and large dyeing establishments. Pop. in 1866, 11,663.

Anderlo'ni (Pietro), a skilful Italian engraver, born near Brescia Oct. 12, 1784. He lived at Milan, and engraved some works of Raphael, Titian, and Poussin. Died Oct. 13, 1849.

An'dersen (Hans Christian), an eminent Danish poet and novelist, born at Odense, in the island of Fünen, April 2, 1805, was a son of a poor shoemaker, who died when Hans was nine years old. In 1819 he went to Copenhagen to seek employment in the theatre, but was rejected because he was too lean. Before this period he had written

several tragedies and poems, among which was the "Dying Child." He made various unsuccessful efforts to obtain employment, and passed several years in adversity, until he found generous friends, who in 1828 placed him in the university, where he was educated at the public expense. In 1830 he published a volume of his collected poems. Having received a gift of money from the king, he visited Germany, France, and Italy in 1833, and produced in 1834 a romance called "The Improvisatore," in which the scenery and manners of Italy are described with admirable fidelity. He related some episodes of his early life in a book entitled "Only a Fiddler" (1857). Among his other works are "The Poet's Bazaar" (1842); "Ahasuerus," a drama; "The Two Baronesses," a tale in English; and several volumes of tales, which display original genius and a rich imagination. His works have been translated into many languages. (See HANS ANDERSEN, "True Story of my Life," new edition, 1871.) D. Aug. 4, 1875.

Anderson, a county in the S. E. of Kansas. Area, 576 square miles. It is drained by the three forks of the Pottowatomie Creek, which rise within its limits, and by Sugar Creek. The surface is undulating or nearly level; the soil is fertile. It is traversed by the Leavenworth Lawrence and Galveston R. R. Grain, tobacco, cattle, wool, hay, and butter are produced. Capital, Garnett. Pop. 5220.

Anderson, a county in N. Central Kentucky. Area, 300 square miles. The Kentucky River, here navigable, bounds it on the E. The county is intersected by Salt River. Gold and lead have been found. The surface is mostly undulating; the soil is fertile. Grain, tobacco, wool, hay, and butter are produced. Capital, Lawrenceburg. Pop. 5449.

Anderson, a county in the N. W. of South Carolina, on the Savannah River. Area, 800 square miles. It is bounded on the N. E. by the Saluda River, and intersected by the Kiowee. The surface is diversified; the soil is generally fertile and well watered. The Greenville and Columbia R. R. passes through it. Cattle, grain, cotton, tobacco, and wool are produced. Capital, Anderson. Pop. 24,049.

Anderson, a county in the N. E. of Tennessee. Area, 600 square miles. It is intersected by the Clinch River, and also drained by Powell's River. Between the Cumberland Mountain, which extends along the N. W. border, and Chestnut Ridge, is a large and fertile valley. The county has abundance of timber and valuable salt springs. Coal is found here. Grain, tobacco, and wool are produced. Capital, Clinton. Pop. 8704.

Anderson, a county in E. Central Texas, containing 1098 square miles. It is bounded on the E. by the Neches, and on the W. by Trinity River, which flows through a rich valley covered with good timber. The surface is undulating; the soil is fertile. Iron ore is abundant. Petroleum has been found. It is intersected by the International R. R. Cattle, wool, corn, rice, and cotton are produced. Capital, Palestine. Pop. 9229.

Anderson, a township of Clarke co., Ark. Pop. 504.

Anderson, a post-township of Mendocino co., Cal. Pop. 679.

Anderson, a township of Clarke co., Ill. Pop. 947.

Anderson, a city, capital of Madison co., Ind., on the West Fork of White River, and at the crossing of the Cleveland Columbus Cincinnati and Indianapolis and the Pittsburg Cincinnati and St. Louis R. Rs. It is a manufacturing city, having a hydraulic canal with 44 feet fall. It has three banks (one national) and two newspapers. Owing to increase in manufacturing interests, it increases rapidly in population. Pop. 3126; of Anderson township, 4713. HARDESTY & METCALF, PUBS. "HERALD."

Anderson, a township of Perry co., Ind. Pop. 1136.

Anderson, a township of Rush co., Ind. Pop. 1452.

Anderson, a township of Warrick co., Ind. Pop. 842.

Anderson, a township of Mills co., Ia. Pop. 531.

Anderson, a post-township of Pope co., Minn. P. 74.

Anderson, a township of Hamilton co., O. Pop. 4077.

Anderson, capital of Anderson co., S. C., on the Greenville and Columbia R. R., 127 miles W. N. W. of Columbia. It is prosperous, and has a thriving, industrious population. It is the seat of Carolina High School for boys and girls. It has a national bank and two weekly newspapers. Pop. 1432. J. A. HOYT, ED. "INTELLIGENCER."

Anderson, a township of Williamsburg co., S. C. P. 576.

Anderson, a post-village, capital of Grimes co., Tex., 140 miles N. E. of Austin and 9½ miles from the Texas Central R. R. It has excellent schools, and is the seat of Patrick Academy, a first-class institution. It has manufactures of wagons, carriages, etc., and one weekly paper. Pop. 495. J. A. KIRGAN, ED. "GRIMES CO. JOURNAL."

Anderson (ALEXANDER), M. D., born in New York City in 1774, graduated as M. D. at Columbia College, and became the earliest wood engraver in the U. S. He made the cuts for Webster's "Spelling Book," illustrations for an edition of Shakspeare, and published an illustrated "General History of Quadrupeds" (1804). Died at Jersey City Jan. 16, 1870.

Anderson (CHRISTOPHER), pastor of a Baptist church in Edinburgh from 1808 till 1830, published sacred works, of which the most important is "The Annals of the English Bible" (2 vols. 8vo, 3 editions—1845, 1848, and 1852; the last two enlarged and improved), characterized by Allibone as "by far the best book on the subject." Died in 1851.

Anderson (Rev. GALUSHA), D. D. See APPENDIX.

Anderson (HENRY JAMES), M. D., LL.D., born in New York Feb. 6, 1799, graduated at Columbia College, N. Y., 1818, at the College of Physicians and Surgeons 1824, professor of mathematics and astronomy at Columbia College 1825, trustee 1851, and emeritus professor 1866, published "Geology of Lynch's Expedition" and "Geological Reconnaissance of the Holy Land" (1848). D. at Lahore, India, Oct. 19, 1875.

Anderson (Rev. H. T.), born in 1811, was an eminent scholar of the denomination known as the "Disciples" and "Campbellites," and was the author of an interlinear translation of the New Testament. Died in Washington, D. C., Aug. 19, 1872.

Anderson (HUGH J.), born in Maine in 1801, became a lawyer, was a member of Congress from Maine (1837–41), governor of Maine (1844–47), a presidential elector in 1849, U. S. commissioner of customs (1853–58), and in 1860 became sixth auditor of the U. S. treasury.

Anderson (ISAAC), D. D., an American Presbyterian minister, born in Rockbridge co., Va., Mar. 27, 1780. He emigrated in his youth to Tennessee, and was noted as a pioneer preacher in the West. He founded a theological seminary at Maryville, Tenn. Died Jan. 28, 1857.

Anderson (JAMES), LL.D., an able Scottish writer on political and rural economy, was born near Edinburgh in 1739. He was a practical as well as a scientific farmer, and invented an improved form of plough. In 1777 he published "Essays relating to Agriculture and Rural Affairs" (3 vols.). He removed to London in 1797, and there issued a monthly periodical called "Recreations in Agriculture, Natural History," etc. (1799–1802), in which he anticipated the famous theory of rent afterwards adopted by Malthus and Ricardo. Died Oct. 15, 1808.

Anderson (JOHN), F. R. S., a Scotch naturalist, born in Dumbartonshire in 1726, was educated in the University of Glasgow. He became in 1760 professor of natural philosophy in that institution. In 1786 he published a valuable work entitled "Institutes of Physics." He gave gratuitous scientific lectures to the working-classes for many years. By his last will he founded a useful institution (in Glasgow) called ANDERSONIAN UNIVERSITY (which see). Died Jan. 13, 1796.

Anderson (JOHN JACOB), born in New York City in 1821, was long at the head of a public school of that city, and has published numerous works, chiefly educational.

Anderson (JOSEPH) was born in New Jersey Nov. 5, 1757, was an officer in the Revolutionary war, became a lawyer, was appointed a territorial judge by Washington (1791), was U. S. Senator from Tennessee (1797–1815), and first comptroller of the U. S. treasury (1815–36). Died April 17, 1837.

Anderson (MARTIN BREWER), LL.D., of Scotch-Irish descent on his father's side, was born in Brunswick, Me., Feb. 12, 1815, graduated at Waterville College (now Colby University), Waterville, Me., in 1840, was tutor in the college two years, and then professor of rhetoric nearly seven years. In 1850 he removed to New York City, and became editor-in-chief, and in part proprietor, of the "New York Recorder." In 1853 he was chosen president of the Rochester (N. Y.) Baptist University, which position he still (1875) holds. He has published numerous review articles, addresses, and educational papers.

Anderson (RICHARD CLOUGH, JR.), born in Louisville, Ky., Aug. 4, 1788, graduated at William and Mary College, was a member of Congress from Kentucky (1817–21). He was appointed minister to the republics of Colombia in 1823, and envoy extraordinary to the Congress at Panamá in 1826. Died July 24, 1826.

Anderson (RICHARD HENRY), born in South Carolina about 1822, graduated at West Point in 1842, and served with honor in the Mexican war. He became a brigadier-general of the Confederate States in 1861, major general in 1862, and commanded a division at Gettysburg July, 1863.

Anderson (ROBERT), M. D., a Scottish biographer, born in Lanarkshire Jan. 7, 1750, became a resident of Edin-

burgh in 1784. He wrote a "Life of Dr. Johnson," and published a good edition of "The Works of the British Poets; with Prefaces Biographical and Critical" (14 vols., 1792–1807). Died Feb. 20, 1830.

Anderson (Robert), an American officer, born June 14, 1805, near Louisville, Ky., graduated at West Point, 1825, and May 15, 1861, brigadier-general U. S. A. His father was colonel in the Revolutionary army, and his mother a cousin of Chief-Justice Marshall. He was private secretary 1825–26 to a relative upon his mission as U. S. minister plenipotentiary to the republic of Colombia, served at artillery school for practice 1826–28, chiefly on ordnance duty 1828–35, assistant inspector-general of Illinois volunteers in the Black Hawk war 1832, engaged at the battle of Bad Axe, at Military Academy as instructor of artillery 1835–37, in Florida war 1837–38 (brevet captain), in several actions, as aide-de-camp to Major-General Scott while removing Cherokees to the West 1838, as assistant adjutant-general eastern department 1838–41, chiefly in garrison 1845–53, in war with Mexico 1847, engaged at Vera Cruz, Cerro Gordo, Amozoque, and Molino del Rey (severely wounded and brevet major), member of artillery boards 1841–60, governor of Harrodsburg Military Asylum 1853–54, inspector of iron-work for public buildings 1855–59; in command of defences of Charleston harbor, S. C., 1860–61. In the civil war, after evacuating Fort Moultrie, he moved to Fort Sumter, which he surrendered, after a heavy bombardment, April 12–13, 1861 (brevet major-general); in command of department of Kentucky and of the Cumberland 1861, which his shattered health compelled him to relinquish. Till he was retired from active service, Oct. 27, 1863, he performed but little duty. He translated "Instructions for Field Artillery, Horse and Foot," 1840, and "Evolutions of Field Batteries," 1860. In vain he sought restoration of health abroad, his strength gradually failing till he died Oct. 26, 1871, at Nice, France, aged sixty-six.

George W. Cullum, *U. S. Army.*

Anderson (Rev. Rufus), D. D., LL.D., born in North Yarmouth, Me., Aug. 17, 1796, graduated at Bowdoin College in 1818. He studied theology at Andover from 1819–22. In 1824 he became assistant secretary, and in 1832 secretary, of the American Board of Foreign Missions, which position he filled with distinguished ability for thirty-four years. He visited the Mediterranean missions (1843–44), the Indian missions (1854–55), and the Sandwich Islands in 1863. At the age of seventy he resigned his position in the Board of Missions (1866), at which time, without any previous knowledge on his part, he was presented, as a testimonial to his faithful and meritorious services, with $20,000 (contributed chiefly by the merchants of New York and Boston), which sum he made over to the Board, reserving to himself the right to draw from it whatever might be necessary for his support. Among Dr. Anderson's numerous publications may be named—"Observations on the Peloponnesus and Greek Islands" (Boston, 1830); "The Hawaiian Islands, their Progress and Condition under Missionary Labors" (Boston, 1864); "A Heathen Nation Evangelized: History of the Mission, etc. to the Sandwich Islands" (1870); "History of the Missions of the American Board of Commissioners for Foreign Missions to the Oriental Churches" (2 vols. 12mo, 1872).

Anderso'nian University, an institution of Glasgow, in Scotland, was founded in 1795 by John Anderson, noticed above. His design was to impart by popular lectures a knowledge of the sciences to mechanics. He bequeathed to it his valuable library and apparatus. It has a high reputation, especially in the medical department. The number of professors is about fifteen.

An'derson's, a township of Caswell co., N. C. Pop. 1544.

An'dersonville, a post-village of Sumter co., Ga., on the South-western R. R., 11 miles N. E. by N. of Americus. During the civil war it was the site of a Confederate military prison for captured Federal soldiers. The mortality at this prison was very great, 12,926 prisoners of war having died here. One Henry Wirz, a Swiss adventurer, was the superintendent of the prison, and after the close of the war he was tried and convicted by a military commission on charge of excessive cruelty to the prisoners, and was executed Nov. 10, 1865. The Confederate authorities, in at least two official reports, attributed the excessive mortality to the bad management of the prison. Andersonville is now the site of a national cemetery, in which the deceased Union soldiers are buried. The cemetery is well laid out, trees have been planted, and the names, rank, etc., of most of the dead have been ascertained and inscribed on head-boards.

Andersonville, a village of Fine township, St. Lawrence co., N. Y., on Oswegatchie River, has manufactures of oars, tubs, lasts, etc. Iron ore is found in the vicinity.

An'derssen (Adolf), a German chess-player, born at Breslau in 1818. At the London chess tournament in 1851 he defeated the famous player Staunton, but he was defeated by Paul Morphy in Paris in 1858.

An'dersson (Charles John), a Swedish traveller, born in 1827, was the natural son of an Englishman. He went to Southern Africa in 1850, and passed several years in the exploration of the natural history and geography of that region. He published a narrative of his travels, "Lake Ngami" (1855), and "Okawango River" (1859). Died in Southern Africa July 5, 1867.

An'des [Sp. *Cordille'ra de los An'des*], a grand South American range of mountains which is one of the most prominent features in the physical geography of the globe. It extends along the western border of the entire continent, nearly parallel to the Pacific coast, from the Strait of Magellan to the Isthmus of Darien, a distance of about 4500 miles. In length it far exceeds every other mountain-chain on the earth. The general direction of this chain is nearly N. and S. The southern part of the Andes, for a distance of about 2500 miles, consists of a single range or ridge, extending through Patagonia and along the eastern border of Chili. The Patagonian Andes rise to the height of 8000 feet. The Chilian Andes, which are included between lat. 24° and 42° S., have an average width of about 130 miles, and in some places are not more than 100 miles from the Pacific. The highest summit of the Chilian Andes (but not of the whole chain, as formerly believed) is the porphyritic Nevado of Aconcagua, which rises 22,422 feet above the level of the sea, and is about 100 miles N. E. of Valparaiso. In Chili also occur the volcanic peaks of Tupungato, 20,270, and Maypu, 17,764 feet high. The line of perpetual snow in the Andes of Northern Chili is about 14,000 feet above the sea.

About lat. 19° S. the chain is divided into two parallel branches called the Cordillera of the Coast and the Cordillera Real. The former extends north-westward along the coast of Peru, the summits of the range being about 100 miles from the ocean. The Cordillera Real, which traverses Bolivia and is about 250 miles from the other range, is nearly equal in height to the Chilian Andes. The peak of Illampu, in Bolivia, has an altitude of 24,800 feet. These two parallel cordilleras are connected at several points by transverse ranges or groups called *knots*, and enclose the table-land of Desaguadero and Lake Titicaca, which is 12,800 feet above the level of the sea. The highest summit of the Peruvian Andes is the volcano of Arequipa, 20,000 feet high, and 55 miles from the Pacific Ocean.

Proceeding northward, we come next to the Andes of Ecuador, or Andes of Quito, which extend from lat. 5° S. to the table-land of Quito, enclosed between two ranges of enormous volcanoes. Among these the highest are Chimborazo, 21,424 feet, and Cotopaxi, 18,875 feet (Humboldt says 19,069). The form of the latter is almost a perfect cone. "Among all the volcanoes that I have seen," says Humboldt, "the conical form of Cotopaxi is the most beautifully regular." (See Cotopaxi.)

There are a number of passes which cross the Andes, but all at a great elevation, and mostly dangerous as well as arduous. Several passes among the Peruvian and Bolivian Andes are about 15,000 feet above the sea, and the lower passes are not less than 12,000 feet.

Minerals.—The rocky foundations of these grand barriers are granite, gneiss, mica-slate, greenstone, porphyry, quartz, limestone, red sandstone, and metamorphic rocks. Humboldt saw in Peru vast masses of quartz 7000 or 8000 feet in height. The Andes are celebrated for their mineral riches, consisting of large quantities of gold and silver. Platina, mercury, copper, tin, and iron are also found among them. The most productive gold-mines are in Peru and New Granada; the silver-mines of Potosi are among the richest in the world. Few parts of the globe are subject to so frequent and destructive earthquakes as the countries adjacent to the Andes and enclosed between its different ranges. The cities of Quito, Lima, Callao, and Valparaiso have been nearly ruined by them in recent times. The number of volcanoes among the Andes is about fifty, thirty-six of which are classified as active, and the others are doubtful, not having been seen in a state of eruption by any European. "It is but rarely," says Humboldt, "that the elastic forces at work within the interior of our globe have succeeded in breaking through the spiral domes which, resplendent in the brightness of eternal snow, crown the summits of the Cordilleras; and even where these forces have opened a permanent communication with the atmosphere through circular craters or long fissures, they rarely send forth currents of lava, but merely eject ignited scoriæ, steam, sulphuretted hydrogen gas, and jets of carbonic acid." (*Cosmos.*) This illustrious traveller states that he found pelagic shells on a ridge of the Andes more than 15,000 English feet above the sea.

The geological structure of the Andes is as yet but imperfectly known, and is probably not the same in all parts of the chain. Like all great mountain-systems, the Andes have been produced by elevatory forces acting at different, and in some instances widely separated, periods. Carboniferous, triassic, Jurassic, and tertiary rocks have been recognized on their flanks; and the older palæozoic will undoubtedly be found to make up a part of their mass.

Climate.—The limit of perpetual snow on the Andes that are near the equator is about 15,000 feet, and among the Bolivian Andes, about lat. 20° S., it is said to be 17,000 feet. Glaciers rarely if ever occur in the central or tropical portions of the Cordilleras. Between the equator and lat. 30° S. the prevailing wind blows from E. to W., and the eastern side of the Cordillera intercepts nearly all the moisture, so that little or no rain falls in Peru and Northern Chili on the western slope, or on the narrow tract between the Andes and the ocean. The changes of weather among these mountains are sudden and violent, and the electric storms are very terrific. Here are exhibited greater variations and contrasts of climate than in any other region of the globe. The elevated plains within the tropics have a cool and salubrious climate, and the fruits of the temperate zone here flourish under the equator. Although the Andes are inferior to the Himalayas in altitude, they present a more remarkable variety of phenomena. "This portion of the surface of the globe," says Humboldt, "affords in the smallest space the greatest possible variety of impressions from the contemplation of nature. Among the colossal mountains of Cundinamarca, of Quito, and of Peru, furrowed by deep ravines, man is enabled to contemplate alike all the families of plants and all the stars of the firmament. There at a single glance the eye surveys majestic palms, humid forests of bambusa, and the varied species of Musaceæ, while above these forms of tropical vegetation appear oaks, mediars, the sweetbrier, and umbelliferous plants, as in our European homes. . . . There the depths of the earth and the vaults of heaven display all the richness of their forms and the variety of their phenomena. There the different climates are ranged the one above the other, stage by stage, like the vegetable zones whose succession they limit; and there the observer may readily trace the laws that regulate the diminution of heat as they stand indelibly inscribed on the rocky walls and abrupt declivities of the Cordilleras." (See also Humboldt's "Travels.")

A. J. Schem.

Andes, a post-village and township of Delaware co., N. Y. It has a collegiate institute, a national bank, one weekly newspaper, and one furnace. Pop. 2840.

F. G. Barclay, Ed. "Andes Recorder."

And'esin, or **And'esite,** a mineral resembling felspar in appearance, is essentially a silicate of soda, lime, and alumina. It was originally brought from the Andes, but is found also in the Vosges, Canada, etc.

Andi'ra, a genus of plants of the natural order Leguminosæ. The *Andira inermis*, called cabbage tree or cabbage-bark tree, is a native of the West Indies, and bears a pod containing a single seed. The bark of the *Andira*, called worm-bark, is a powerful anthelmintic.

An'diron [a corruption of *hand iron*], a term applied to the metallic utensils used to support the wood which is burned in an open fireplace. They are called firedogs in some parts of Great Britain. They are often called "dog irons" in many parts of the U. S. The andiron consists of a horizontal bar, supported by three feet, and having an upright standard at one end. This was sometimes silver, and ornamented with arabesques or a human figure.

And'law, von (Heinrich), a German politician and zealous Catholic, born in 1802. He was chosen a member of the legislature of Baden in 1833, and opposed all liberal movements and reforms. He published in 1864 "The Priesthood and Christian Life, with Regard to the Great Questions of the Present." Died in Mar., 1870.

Andoc'ides [Gr. Ἀνδοκίδης], an Athenian orator, born about 467 B. C. He took an active part in public affairs, and was banished several times. He went into exile when the Thirty Tyrants became masters of Athens, in 404 B. C., and returned when they ceased to rule. Died about 390 B. C. Several of his orations are extant.

Andor'ra, a valley and small republic among the Eastern Pyrenees, between the French department of Ariège and the Spanish province of Lérida. Area, 149 square miles. It is surrounded by high mountains, and has rich mines of iron and a lead-mine. It has been independent since the time of Charlemagne, and is governed by twenty-four consuls. The inhabitants are a hospitable and industrious people, and are mostly farmers and cattle-raisers. Capital, Andorra. Pop. in 1865, estimated at 12,000.

An'dover, a market-town and parish of England, in Hampshire, 63 miles W. S. W. of London. The origin of the town is very ancient. It has a handsome church, which cost about $150,000. Pop. in 1871, 5501.

Andover, a post-twp. of Tolland co., Conn., on the Hartford and Providence R. R., 5 miles W. of Willimantic. P. 964.

Andover, a post township of Henry co., Ill. P. 1767.

Andover, a post-township of Oxford co., Me. It has manufactures of starch, lumber, etc. Pop. 757.

Andover, a post-township of Essex co., Mass., on the S. bank of the Merrimack River. The village of Andover is pleasantly situated on the Shawsheen River and on the Boston and Maine R. R., 23 miles N. of Boston. It has a national bank, a savings bank, an insurance company, a free public library of over 5000 volumes and an endowment of $20,000. It also has extensive water-power, and manufactures of shoe-thread, woollen goods, rubber goods, printers' ink, lampblack, etc. Here are Abbot Female Academy, founded in 1829, and Phillips Academy, a well-endowed institution founded in 1778. It is also the seat of Andover Theological Seminary, founded in 1807, and under the direction of the Congregationalists. It has a library of about 30,000 volumes. The buildings of the above institutions stand on an eminence which commands a fine prospect. Two quarterlies are published here, one of which is the "Bibliotheca Sacra," an able religious periodical, edited by professors of the seminary. It has nine churches, and a good system of public schools. Pop. 1873.

W. F. Draper, Pub. "Bibliotheca Sacra."

Andover, a post-township of Merrimack co., N. H., on the Northern R. R., 21 miles N. W. of Concord. It has manufactures of woollens, hosiery, lasts, etc. Pop. 1206.

Andover, a post-twp. of Sussex co., N. J. Pop. 1126.

Andover, a post-village and township of Allegany co., N. Y., has seven manufacturing establishments, five churches, one furnace, one graded school, one weekly paper, and a good trade. It is in a good farming region, and is on the Erie R. R., 110 miles E. of Dunkirk. Pop. of township, 1873.

E. S. Barnard, Ed. "Andover Enterprise."

Andover, a post-township of Ashtabula co., O., at the junction of two railroads, has a weekly paper, cheese-factories, and mills. Pop. 921.

D. L. Calkins, Ed. "Andover Advertiser."

Andover, a post-township of Windsor co., Vt. P. 588.

Andover (North Surplus), a township of Oxford co., Me. Pop. 38.

Andover (West Surplus), a township of Oxford co., Me. Pop. 4.

Andover Theological Seminary. See Andover.

Andra'da e Sil'va, or **Sylva** (José Bonifacio), a distinguished Brazilian, born at Santos June 13, 1765. He acted a prominent part in the revolution by which Brazil became independent in 1822, and was prime minister in 1822–23. He wrote some scientific treatises and poems. Died April 3, 1838.

Andral (Gabriel), M. D., a celebrated French physician, born in Paris Nov. 6, 1797, married a daughter of Royer-Collard. He published an able work called "Clinique Médicale" (4 vols., 1824–27). In 1839 he succeeded Broussais as professor of pathology and therapeutics in Paris, and in 1842 became a member of the Institute. Among his works is a "Summary of Pathological Anatomy" (3 vols., 1829).—His father, Guillaume Andral, was a celebrated physician.

Andrássy (Julius), Count, a Hungarian statesman, born Mar. 8, 1823, of an ancient and noble family. He took a prominent part in the revolution of 1848 as an adherent of the popular cause, and was condemned to death in 1849, but he escaped and went into exile. When the right of self-government was restored to Hungary, in Feb., 1867, Andrássy was appointed premier of a new Hungarian ministry by the emperor. He succeeded Von Beust in Nov., 1871, as minister of foreign affairs in the common ministry of the whole empire.

An'dré (John), a British officer, born in London, of Swiss parents, in 1751, entered the army in 1771. Having obtained the rank of lieutenant, he was sent to America in 1774. His superior talents and fine personal qualities procured for him a rapid promotion to the important position of adjutant-general, with the rank of major (1779). He was a good scholar, an artist, a versifier, and a man of varied accomplishments. Benedict Arnold having offered to betray West Point, Major André was selected by Sir Henry Clinton, the British commander, to make the necessary arrangements for carrying out the plot. André, assuming the name of Anderson, ascended the Hudson, and, having had a private interview with Arnold, by whom he was furnished with maps and plans of West Point and a

pass through the American lines, was, while returning to New York City by land, intercepted near Tarrytown by three armed Americans, who, discovering by incautious remarks on his part that he was a British officer, took him prisoner. On searching his person, they found the plans in his boots. He made an unsuccessful effort to bribe his captors, who conducted him to Lieut.-Col. Jameson, who, with singular obtuseness, resolved to send him to Gen. Arnold, but was dissuaded by Major Tallmadge. Major André was tried as a spy, and condemned to be hung, by a board of six major-generals and several brigadier-generals. Sir Henry Clinton made earnest efforts to save his life, but they were unavailing, and he was executed at Tappan Oct. 2, 1780. He behaved with dignity and fortitude on this occasion, and his fate excited deep and general sympathy. The day before his death he drew with a pen and ink a portrait of himself, which is now in the Trumbull Gallery of Yale College. A monument was erected to his memory in Westminster Abbey.

Andre'æ (Jacob), D. D., a German Protestant theologian, born at Waiblingen, in Würtemberg, Mar. 22, 1528. He became professor of theology at Tübingen in 1562, and distinguished himself by his learning and eloquence. He wrote against the Calvinists and Roman Catholics, and was a principal author of the "Formula Concordiæ" which was adopted by the Lutherans in 1580. Died Jan. 7, 1590.

Andreæ, or **Andreä** (Johann Valentin), an eminent German writer, born at Herrenberg, in Würtemberg, Aug. 17, 1586, was a grandson of Jacob, noticed above. He became pastor at Calw in 1620, and chaplain or court-preacher at Stuttgardt in 1639. Among his chief works, which evince a liberal philosophical spirit, are a "Hundred Satirical Dialogues" (in Latin, 1617), a "Mythologica Christiana" (1619), an Autobiography, and an allegory in verse called "Die Christenburg." He has been regarded as the founder of the order of Rosicrucians, but without sufficient evidence. Died May 1, 1654. "Andreæ," says Hallam, "was a man above his age, and a singular contrast to the pedantic herd of German scholars and theologians."

Andre'æ (Laurentius), [Sw. *Lars Anderson*], a Swedish Reformer, born in 1482. He was converted to Protestanism, and in 1523 was appointed chancellor of Sweden by Gustavus Vasa. He produced in 1526 a Swedish translation of the New Testament. Died in 1552.

Andrea'ni (Andrea), a skilful Italian engraver, surnamed Il Mantua'no (*i. e.* "the Mantuan"), was born at Mantua in 1560. He improved the art of engraving on wood in chiaroscuro. Among his works is an engraving of a Deluge, after Titian. Died in 1623.

Andre'a Pisa'no, or **Andre'a da Pi'sa,** a distinguished Italian sculptor and architect, born at Pentedera, near Pisa, in 1270, was prominent in the effort to turn the attention of artists of his time from Gothic to Grecian art. Few relics of his work remain, his famous gates of the Baptistery at Florence having been displaced by those of Ghiberti and others. Andrea was one of the revivers of bronze sculpture. He worked at Venice, Florence, Pistoia, and Orvieto, but there are few architectural works or sculptures that can with any certainty be ascribed to him. Died after 1349.

An'dree (Karl Theodor), a German writer, born in Brunswick Oct. 20, 1808, was from 1838 to 1853 editor of several periodicals, as the "Deutsche Reichszeitung" and "Bremer Handelsblatt," and was 1858 appointed consul to Chili. Among his principal works are "Nordamerica" (2d ed. 1854), "Buenos Ayres und die Argentin. Republik" (1856), "Geographische Wanderungen" (2 vols., 1859), and "Geographie des Welthandels" ("Geography of the World's Commerce," 2 vols., 1863–69).

Andréossy (Antoine François), Count, an eminent French military engineer, born at Castlenaudary Mar. 6, 1761. He served in Egypt as general of brigade in 1798, and became a member of the Institute of Egypt. He was the chief of Bonaparte's staff on the 18th of Brumaire, 1799, obtained the rank of general of division, and was sent as ambassador to England in 1802. Between 1804 and 1814 he represented France at the courts of Vienna and Constantinople. In 1826 he was chosen a member of the Academy of Sciences. He wrote, besides other works, "Constantinople and the Thracian Bosphorus during the years 1812–14" (1828). Died Sept. 10, 1828.

An'drés (Juan), a Spanish Jesuit distinguished for learning, was born at Planes Feb. 15, 1740. He was versed in Hebrew, Greek, Latin, Italian, and French. On the expulsion of the Jesuits from Spain in 1767 he removed to Italy. He produced in 1776 an able "Essay on the Philosophy of Galileo," in Italian. His principal work is "On the Origin, Progress, and Present State of All Literature" (in Italian, 7 vols., 1782–99). He was appointed keeper of the royal library at Naples in 1806. Died Jan. 13, 1817.

An'drew, a county of Missouri, on the Missouri River, which separates it from Kansas. Area, 425 square miles. It is bounded on the W. by the Nodaway River, and intersected by the Platte River and the Kansas City St. Joseph and Council Bluffs R. R. The soil is fertile. Wheat, corn, oats, and tobacco are the products. Coal is found. Capital, Savannah. Pop. 15,137.

Andrew, the county-seat of Jackson co., Ia., at the "geographical centre" of the county, is the only direct post point between Maquoketa and Bellevue, the two commercial cities in the county. It is 8 miles N. E. of Maquoketa, and 12 miles S. W. of Bellevue. It has one weekly paper. The citizens of the township (Perry) have voted a tax and subscribed $20,000 in aid of a railroad from Maquoketa to Andrew, to be completed in the fall of 1873. Pop. 352.

Ed. "Picket."

Andrew [Lat. *An'dreas*], Saint, one of the twelve apostles, was, like his brother Simon Peter, a fisherman of Galilee. He is supposed to have been the first disciple of Christ. The latter part of his life is involved in obscurity. According to tradition, he preached the gospel in Greece and Scythia, and suffered martyrdom in Patræ, in Achaia. He is the patron saint of Scotland. A cross formed by oblique beams, thus, ×, is called Saint Andrew's cross.

Andrew (or **András**) **I.,** king of Hungary, was of the family of Arpad. He began to reign in 1046, and waged war against the emperor Henry III. Died in 1058.

Andrew II. of Hungary was born about 1176, and became king in 1205. He conducted an unsuccessful crusade against the Mohammedans in 1217. In 1222 he convoked a diet, to which he granted the Golden Bull, called the Magna Charta of Hungary. It confirmed the rights and privileges of the Hungarian bishops and nobility, whose revolts had disturbed his reign. Died Mar. 7, 1236.

Andrew III. of Hungary, a grandson of the preceding, was born in Venice. He succeeded Ladislas III. in 1290, and was the last king of the dynasty of Arpad. His claim to the throne was opposed by the pope, who supported Charles Martel (son of Charles II. of Naples) as the rival of Andrew. The latter defeated Charles Martel in battle in 1291. Died in 1301.

Andrew (James Osgood), D. D., bishop of the Methodist Episcopal Church South, was born in Wilkes co., Ga., May 3, 1794. He entered the itinerant ministry in the South Carolina Conference of the Methodist Episcopal Church Dec. 12, 1812, and was consecrated bishop at Philadelphia in May, 1832. Having become connected with slavery by marriage, the General Conference of 1844 took such action in his case as led to the division of the Methodist Episcopal Church, and the organization of the Methodist Episcopal Church South; in which he continued to exercise his episcopal functions efficiently till the session of the General Conference in New Orleans April, 1866, when he was placed on the retired list. He died at the residence of his son-in-law, the Rev. John W. Rush, in Mobile, Ala., Mar. 2, 1871. He was an eloquent, devout, and successful minister. He resided during a part of his episcopate in Oxford, Ga., and then in Summerfield, Ala. He published a work on "Family Government," which is highly esteemed, and a volume of "Miscellanies."

Andrew (John Albion), LL.D., an American statesman, born at Windham, Me., May 31, 1818. He graduated at Bowdoin College, studied law, and was admitted to the bar of Boston in 1840. Having distinguished himself as an opponent of slavery, he was elected governor of Massachusetts by the Republicans in 1860. In answer to the President's call for volunteers, April 15, 1861, he despatched five regiments in one week from that date. He was again elected governor in 1861, and was afterwards thrice annually re-elected. During the civil war he rendered important services to the cause of the Union by his eloquent speeches and messages, and gained great popularity by his assiduous attention to the welfare of the soldiers. Died Oct. 30, 1867. A meeting of the members of the legislature of Massachusetts adopted a resolution "that in his decease the commonwealth and the nation alike have suffered an irreparable loss; that his reputation had become national, and we might well have hoped for him the highest national offices and honors."

Andrew, Saint (or **The Thistle**), Order of, a Scottish order of knighthood, named in honor of Saint Andrew, the patron saint of Scotland. It was founded in the reign of James V., was revived by James II. of England in 1687, and re-established by Queen Anne in 1703. The star of the order of the Thistle consists of a Saint Andrew's cross of silver embroidery, with rays emanating between the points of the cross, in the centre of which is a thistle of gold and green. On a circle which surrounds this thistle is inscribed the motto "Nemo me impune lacessit" (literally, "No one provokes me with impunity").

Andrew, Saint, Order of (Russian), founded by Peter the Great in 1698, is the highest in the empire, bestowed only on the imperial family, princes, generals in-chief, and persons of high rank. The badge of this order bears on one side a cross enamelled in blue, and in the four corners of the cross the letters S. A. P. R. (*Sanctus Andreas Patronus Russiæ*). On the reverse is a spread eagle, with a legend signifying "For Religion and Loyalty."

Andrews (Alexander), born Aug. 4, 1824, in England, began in youth to contribute to the periodicals of London, and was the author of several books, the best known of which is a "History of British Journalism" (1856). Died Nov. 8, 1873.

Andrews (Annie M.), an American lady, born about 1835. She volunteered to nurse the sick at Norfolk, Va., during the prevalence of yellow fever in 1855. In acknowledgment of her great services the Howard Association of New York presented her with a gold medal.

Andrews (C. C.), an American general of volunteers during the civil war (1861–66), born in New Hampshire, appointed brigadier-general of volunteers Jan. 5, 1864, honorably mustered out Jan. 15, 1866. At present is U. S. minister to Sweden.

Andrews (Edward Gayer), D. D., an eminent preacher and bishop of the Methodist Episcopal Church, was born in New Hartford, N. Y., Aug. 7, 1825, graduated at the Wesleyan University, Conn., in 1847, entered the ministry in 1848, became teacher in the Oneida Conference Seminary, Cazenovia, N. Y., in 1854, was elected its president in 1855, resumed the pastorate in New York East Conference in 1864, and was elected bishop in 1872.

Andrews (Ethan Allen), LL.D., an American scholar, born at New Britain, Conn., in 1787. He graduated at Yale College in 1810. He published, besides a number of school-books, a good Latin-English lexicon (1850). Died Mar. 25, 1858.

Andrews (Gen. George L.) was born at Bridgewater, Mass., in 1827, and graduated first in his class at West Point in 1851. He was acting assistant professor of engineering at West Point (1851–55), and for distinguished services in the army of the Potomac became brigadier-general and brevet major-general of volunteers. In 1871 he was appointed professor of French at West Point.

Andrews (James Petit), an English historical writer, born near Newbury, in Berkshire, in 1737. He published, besides other works, an amusing "Collection of Anecdotes, etc., Ancient and Modern" (1789). His most important work is a "History of Great Britain in connection with the Chronology of Europe" (1 vol., 1794, unfinished). Died Aug. 5, 1797.

Andrews (Joseph), born at Hingham, Mass., Aug. 17, 1806, was apprenticed to an engraver in 1821, studied his art in London (1836–37), and subsequently became a fine engraver in Boston, Mass. His reputation is very high.

Andrews, or **Andrewes** (Lancelot), a learned English theologian, born in London in 1555, was educated at Cambridge. He was one of the chaplains of Queen Elizabeth, who appointed him dean of Westminster. He was one of the divines selected to translate the Bible under the auspices of James I., and became bishop of Chichester in 1605. In 1609 he was translated to the see of Ely, and appointed a privy councillor; was considered the most learned English theologian of his time, except Ussher, and had a high reputation as a pulpit orator, but his style was pedantic and artificial. He became bishop of Winchester in 1618; he was the author of religious works, among which was a "Manual of Private Devotions." Died Sept. 25, 1626.

Andrews (Rev. Lorin P.), D. D. See Appendix.

Andrews (Rev. Lorrin), born in East Windsor, Conn., April 29, 1795, was educated at Jefferson College, Pa., and at Princeton, sailed as a missionary to Hawaii in 1827, founded in 1831 the Lahainaluna Seminary, which became the Hawaii University, in which he was a professor. He was long a judge and privy councillor under the government, and published parts of the Bible in the native tongue, wrote a Hawaiian dictionary, and various works on the history, etc. of the Sandwich Islands. Died at Honolulu Sept. 29, 1868.

Andrews (Stephen Pearl), born in Massachusetts in 1812, devoted himself to the study of social questions, the civil and common law, theories of government, a universal language, etc., and has written numerous works on these and kindred subjects.

Andrews (Timothy P.), an American officer, born in Ireland, died at Washington, D. C., Mar. 11, 1868. He was appointed paymaster in the U. S. army May 22, 1822, and served as such till April 9, 1847, when he was appointed colonel of a regiment of voltigeurs raised for the war with Mexico, and served in command of his regiment till July 20, 1848, when it was disbanded and he was restored to the pay department: deputy paymaster-general Dec. 17, 1851, and paymaster-general, with the rank of colonel, Sept. 6, 1862, brevet brigadier-general Sept. 13, 1847, for gallant conduct at the battle of Chapultepec, Mex.; retired from active service on his own application Nov. 29, 1864, but continued on special duty till the day of his death.

G. C. Simmons, Clerk Board of Engineers.

Andrews (William D.), born at Grafton, Mass., in 1818, removed to New York in 1840, and became distinguished as the inventor of an oscillating engine, and especially of a centrifugal pump of great excellence.

An'dria, a town of Southern Italy, in the province of Bari, 14 miles by rail E. of Canosa. It is the seat of a bishop, and has a fine cathedral, built in 1046, also a college. In the vicinity are numerous caverns (in Latin, *antri*), from which the name is said to be derived. Pop. in 1871, 34,034.

Andrieux (François Guillaume Jean Stanislas), a popular French dramatic poet, born at Strasburg May 6, 1759. He produced in 1787 a comedy called "Les Etourdis" ("The Giddy heads"), which was performed with applause. In 1798 he was chosen a member of the Council of Five Hundred. He became professor of belles-lettres in the Polytechnic School in 1804, and professor of French literature in the College of France in 1814. He was admitted in 1816 into the French Academy, of which he was chosen perpetual secretary in 1829. Among his works are "Brutus," a tragedy, and a drama called "Molière with his Friends." He belonged to the classical school of literature. Died May 10, 1833.

An'dro, or **An'dros,** an island of Greece, in the archipelago, about 10 miles S. E. of Eubœa, is the most northern of the Cyclades. Length 21 miles, width 8 miles. The surface is hilly, the soil is fertile. Andros is also the name of a town and port on the eastern coast. Lat. of Cape Guardia, its N. W. point, 37° 58′ N., lon. 24° 43′ E. Pop. of the island in 1870, 19,074.

An'drocles, or **An'droclus,** a Roman slave, whose adventures and friendship with a lion are mentioned by Aulus Gellius. He ran away from his master into Africa, and there entered a cave, in which he met a lion that was lame. The lion presented to him a paw, from which Androcles extracted a thorn. To recompense him for this service the lion afterwards supplied the man with food as long as he remained in that region. Androcles finally was captured, and was condemned to fight with a lion in the amphitheatre of Rome. This lion proved to be the same that he had met in the cave, and, though purposely kept from food to increase his ferocity, he instantly recognised his benefactor as a dog would his master. The man was then pardoned and liberated.

Androm'ache [Gr. Ἀνδρομάχη], a celebrated and beautiful Trojan lady, was the wife of Hector, and one of the most admired characters of the "Iliad." After the destruction of Troy she became the captive of Pyrrhus, and finally the wife of Helenus, a son of Priam. She is the subject of a tragedy of Euripides.

Androm'eda [Gr. Ἀνδρομέδη], in classic mythology, was a daughter of Cepheus, king of Ethiopia, and of Cassiopeia. She boasted that she was more beautiful than the Nereids. Neptune, to avenge this affront, sent a sea-monster to plague the Ethiopians. The oracle of Ammon having declared that the sacrifice of Andromeda would appease Neptune, she was chained to a rock, but was rescued by Perseus, and after death was transformed into a constellation.

Andromeda, a genus of shrubs of the order Ericaceæ, found in America, Europe, and Asia. The *Andromeda polifolia*, common to both hemispheres, has fine rose-colored flowers. The *Andromeda Ferruginea* of the U. S. also has abundant and very fine flowers, appearing in April. The *Andromeda nitida* of the Southern States has fragrant blossoms. The U. S. have at least eight species, some of which are reputed poisonous to cattle.

Androni'cus I., Comnenus [Gr. Ἀνδρόνικος Κομνηνός], a Byzantine emperor, was a grandson of Alexis I., Comnenus. He had superior talents, but was profligate and cruel. In his youth he engaged in treasonable intrigues against the emperor Manuel, who confined him in prison many years. Having been appointed regent during the minority of Alexis II., he murdered that prince and usurped the throne in 1182. He secured his power by the execution of many Greek nobles, victims of his revenge or jealousy, and carried his cruelty to such excess that his subjects revolted and tortured him to death in 1185.

Andronicus II., Palæologus, a son of the emperor Michael, was born about 1260. He began to reign at Con-

stantinople in 1283. He waged war against the Turks without decisive result. His reign was inglorious, and he was dethroned in 1328 by his grandson, Andronicus III. Died Feb. 13, 1332.

Andronicus III., Palæologus, was a grandson of the preceding. He became emperor of Constantinople in 1328, and was defeated by the Turks in 1330. His reign was disastrous, and the Turks conquered several of his provinces. Died June 15, 1341.

Androni'cus Cyrrhes'tes, a Greek architect and astronomer, who is supposed to have lived about 100 B. C., and to have erected at Athens the octagonal building called the Tower of the Winds, which is still standing. It was intended to indicate the direction of the wind.

Androni'cus Rho'dius (*i. e.* "of Rhodes"), a Greek Peripatetic philosopher who lived about 60 B. C., and is said to have invented the word Metaphysics. He collected and arranged the works of Aristotle.

Andropo'gon [from the Gr. ἀνήρ, a "man," and πώγων, a "beard," alluding to the bearded rhachis and flowers], an extensive genus of grasses, mostly coarse and many of them tropical. The U. S. have about fifteen species E. of the Mississippi. The most important of the genus is the *Andropogon Schœnanthus*, extensively cultivated in Ceylon and other Oriental regions for its oil. Ceylon exports several tons of this oil annually. It is called oil of citronella, and is chiefly used in perfuming the so-called "honey soap." Several foreign species are cultivated for their oils, which are sold as "oil of verbena," "lemon-grass," "geranium," etc.

An'dros (Sir Edmund), an English governor, born in London Dec. 6, 1637. He was governor of New York from 1674 to 1682, and was appointed governor of New England in 1686. His arbitrary and oppressive conduct rendered him very unpopular. Recent historians, however, have asserted that his private character was excellent, and that he had to contend with the unjust prejudices of the colonists. In April, 1689, the people of Boston revolted and deposed him. He governed Virginia from 1692 to 1698. Died Feb. 24, 1714.

Androscog'gin, a river which rises in Umbagog Lake, and flows southward through Coos co., N. H., to the western boundary of Maine, which it crosses. Running then in a general S. E. direction, it passes through Oxford and Androscoggin counties in Maine, and enters the Kennebec River 4 miles above Bath. Its length is 145 miles.

Androscoggin, a county in the S. W. central part of Maine, drained by the Androscoggin and Little Androscoggin rivers, which furnish extensive water-power. There are also several lakes in the county. It has an area of 400 square miles, and is traversed by the Maine Central R. R. Manufactures and agriculture are both prosperous. Grain, potatoes, and dairy products are largely exported. Capital, Auburn. Pop. 35,866.

Andujar', or **Anduxar** (the ancient *Illitur'gis*), a town of Spain, in the province of Jaen, on the Guadalquivir, at the foot of the Sierra Morena, 27 miles N. W. of Jaen. It has a trade in grain, fruit, and porous jars and pitchers, of which great numbers are made here for the purpose of cooling water. Pop. 12,605.

Anduze, a town of Southern France, in the department of Gard, 7 miles S. W. of Alais. It has manufactures of silk, hats, and leather. Pop. in 1866, 5303, principally Protestants.

Anel (Dominique), an eminent French surgeon and oculist, born at Toulouse in 1678, practised in Paris. He invented a probe and syringe, and was skilful in the treatment of aneurism and *fistula lachrymalis*. Died about 1728.

Anemom'eter [from the Gr. ἄνεμος, the "wind," and μέτρον, a "measure"], an instrument used for measuring the force or velocity of the wind. Several different kinds of anemometers have been invented, but the one most generally used was devised by Dr. Robinson of Armagh, and made by Casella of London. It consists of four hemispherical cups affixed to the ends of two horizontal cross-rods, which are attached to a vertical axis. The cups are so arranged that their diametrical planes catch any passing current, and are caused to rotate. Motion is thus communicated to a combination of wheelwork, and by two indices the velocity of the wind is shown. Dr. Robinson found that the cups, as well as the vertical axis to which they were attached, revolve with a velocity equal to one-third of the wind's velocity. Lind's anemometer is also used. Whewell and Casella have devised instruments for registering the direction and velocity of the wind. (See Meteorological Instruments.)

Anem'one [from the Gr. ἄνεμος, "wind"], a genus of herbaceous plants of the natural order Ranunculaceæ, natives of Europe, Asia, and North and South America. The species of anemone are numerous, and mostly have beautiful flowers, the size of which is increased by cultivation. The *Anemone hortensis*, or garden anemone, is highly prized and is extensively cultivated in Holland. It prefers a light soil. Among the other beautiful species are the *Anemone coronaria*, sometimes called poppy anemone; the *Anemone Japonica*, a native of Japan; the *Anemone pratensis*, which has blue flowers; the *Anemone pulsatilla* (pasque flower), which grows wild in England, and has purple flowers; and the *Anemone nemorosa* (wood anemone), which has white flowers. In North America are found several species peculiar to this hemisphere, besides some which are common also in the Old World. Pulsatilla, a favorite remedy with homœopathists, is produced by a plant of this genus.

Anemone, Sea, a popular name of marine radiated

Sea Anemone.

animals belonging to the order Actinaria. They are polypes of a soft gelatinous texture, and have numerous tentacles disposed in circles and extending like rays around the mouth. When they are expanded in the water they resemble a polypetalous flower, and are admired for beauty of form and color. They abound on the shores of the sea, and are generally attached to rocks, stones, or shells, but have some power of locomotion. When they are left dry by the receding tide they contract into a mass of jelly. They are very voracious, and will seize by their tentacules and swallow animals as large as themselves. Some species of the Actinaria can be kept in an aquarium, and can be fed on fish or other animal food. Among the most beautiful of the sea anemones are the *Actinia mesembryanthemum*, which is common on the British shores, and has around the margin of its mouth a circle of azure tubercles; the *Actinia crassicornis*, which is also found on the British shores, and displays a variety of colors; and the *Actinia dianthus*, which is found in deep water.

Anem'oscope [from the Gr. ἄνεμος, "wind," and σκοπέω, to "look"], an instrument which indicates the direction of the wind, as a vane or weathercock. Sometimes the vane turns a spindle which descends through the roof of the house into the chamber of the observer. An index fixed to the spindle indicates the direction of the wind on a compass-card fixed to the ceiling.

Aneroid Barometer. See Barometer.

Anet, a town of France, in the department of Eure-et-Loir, 9 miles N. E. of Dreux. Near it is the plain of Ivry, where Henry IV. gained a decisive victory over the army of the League in 1590. Pop. about 1400.

An'eurism [Gr. ἀνεύρυσμα, a "widening"], a pulsating tumor filled with blood, and communicating more or less directly with an artery, the tunics of which are wholly or partially destroyed. A "true" aneurism has one or more arterial coats in its wall. A "false" aneurism has a wall of condensed areolar tissue, the arterial coat having disappeared. A "traumatic" aneurism originates in a wound or other accidental injury. A "varicose" aneurism communicates with both an artery and a vein, but the term sometimes signifies a mere symmetrical dilatation of an artery. When such dilatations occur in groups or knots, it is a "circoid" aneurism. When the blood gets between the coats of an artery, and thus forms a tumor, it is a "dissecting" aneurism. The heart and its valves are liable to aneurismal dilatations.

Aneurisms not traumatic are frequently traceable to the degeneration of the arterial coats known as atheroma. In general, aneurism of the extremities, when sufficiently near the surface, as when it occurs in the "popliteal space" (the hollow of the knee), may be treated with a fair prospect of success by long-continued compression, mechanical or digital. "Ligation," or tying the artery, sometimes succeeds. Galvano-puncture has its advocates as a means of cure. The injection of powerful astringents has succeeded in some cases, but is not to be regarded as a safe proceeding.

The prospect, especially in aneurisms of the aorta and its great branches, is that the disease will prove fatal, though there are very unfrequent cases which spontaneously recover by the formation of a clot within the tumor, which gradually shrinks into a hard, sometimes a chalky, mass. The administration of sedatives and medicines which increase the proportion of fibrine in the blood has been often advocated. Prolonged fasting has been recommended; but in general the safest way is for the patient to avoid all excesses, and to make use of a nutritious diet, without attempting a cure. One of the most remarkable effects of aneurism is the absorption of neighboring tissues, and even of bones, from the continual pressure. The aneurism sometimes finally bursts internally, causing almost immediate death. REVISED BY WILLARD PARKER.

Angara', or **Upper Tungus'ka**, a river of Siberia, rises in Lake Baikal, about 30 miles S. of Irkutsk. Passing by that town, it flows first northward and afterwards in a westerly direction, and enters the Yenisei, of which it is the principal tributary. Length, about 1000 miles.

An'gel [from the Gr. ἄγγελος, a "messenger"], a ministering spirit; a spiritual, intelligent being employed by God to carry commands, to announce glad tidings, and administer comfort to men. The Scriptures record many instances in which angels became visible to men. The ancient Hebrews believed in the existence of several orders of angels, among which were the seraphim and cherubim, and archangels. The only angels mentioned by name in the Bible are Michael and Gabriel. Raphael is mentioned in Tobit, a book of the Apocrypha. The popular notion that angels have wings is rather a poetical invention than a revealed truth. The belief in guardian angels has been cherished by Jews and Christians of all ages.

ANGEL, an ancient English gold coin, so called from the figure of the archangel Michael piercing the dragon, which was on its obverse. The value of the angel (which continued to be coined until 1650) varied from 6s. 8d. to 10s.

Angel-Fish (*Squati'na*), called also **Monk-Fish** and **Shark-Ray**, a fish allied to the shark, is found on the coasts of England and France and the southern coasts of the U. S. It is about seven feet long, and is remarkable for its ugliness of form. The body is nearly four feet wide, and is flattened horizontally.

An'geli (FILIPPO), an eminent painter of the early seventeenth century, was born in Rome and patronized by Cosimo, grand duke of Florence. His aërial perspectives are famous, and his works are highly prized.—GIULIO CESARE ANGELI (1570–1630), and GIUSEPPE ANGELI of Venice (born 1715), were also successful painters.

Angel'ica [so called from its supposed angelic virtues], a genus of plants of the natural order Umbelliferæ, natives of the north temperate zone. They are mostly herbaceous and perennial, having bipinnate or tripinnate leaves. The *Angelica archangelica* (garden angelica) grows to the height of six feet, has greenish flowers, is aromatic, and contains resin and essential oil. Its root is used in medicine as an aromatic stimulant and tonic. This plant was formerly cultivated for the table, being blanched and used as celery. The U. S. have several species of *Angelica* and *Archangelica*, a kindred genus. It yields angelica balsam and angelic acid.

Angelica, a half-shire village and township of Allegany co., N. Y., on Angelica Creek. The village is 262 miles W. by S. from Albany, 5 miles N. of the Erie R. R., and on the line of the Rochester Nunda and Pennsylvania R. R. It has five churches, a newspaper printing-office, a paper-manufacturing establishment, a national bank, excellent water-power, and a beautiful park. Pop. 991; of the town, 1643.

P. S. NORRIS, ED. "ANGELICA REPUBLICAN."

Angelica, a post-township of Shawanaw co., Wis. P. 233.

Angelica Tree, or **Hercules' Club,** a small tree or large shrub, found from Florida to Pennsylvania and westward. It is the *Aralia spinosa* of the order Araliaceæ. It has a stout trunk, covered, like the branches, with prickles, and its leaves are very large and decompound. Its flowers appear in July and August in great clusters, composed of very numerous umbels. This tree is common in cultivation.

Angelico, Fra. See FIESOLE.

Angeli'na, a county in the E. part of Texas. Area, 1059 square miles. It is bounded on the N. E. by the Angelina River, an affluent of the Neches, and on the S. W. by the Neches River, both navigable. Petroleum is abundant. Cotton, beef, pork, and sugar-cane are produced. The surface is heavily timbered. Capital, Homer. Pop. 3985.

Ange'lio, or **de'gli An'geli** (PIETRO), [Lat. *Petrus An'gelus*], an eminent Italian scholar and Latin poet, born at Barga, near Lucca, in 1517. He was professor of belles-lettres at the University of Pisa for many years. His chief works are a poem on hunting called "Cynegeticon vel de Venatione" (1562), and a mediocre Latin epic poem entitled "The Syriad" (1591), the subject of which is the Crusades and the conquest of Palestine. This poem was admired by his contemporaries. Died Feb. 29, 1596.

Angelis (PIERRE), a French painter of landscapes and conversation-pieces, was born at Dunkirk in 1685. He worked in England, and his productions were praised by H. Walpole. Died in 1734.

Angel Island, California, is in the bay of San Francisco, 5 miles N. of San Francisco. It has an area of 800 acres, and extensive quarries of brown sandstone, valuable for building.

An'gell (JAMES BURRILL), LL.D., born at Scituate, R. I., Jan. 7, 1829, graduated at Brown University, studied two years in Europe, was professor of modern languages and literature at Brown University (1853–60), editor of the "Providence Daily Journal" (1860–66), president of the University of Vermont (1866–71), and president of the University of Michigan since 1871. He is the author of various articles in the "North American Review" and other quarterlies.

Angell (JOSEPH KINNICUT), an American lawyer and able legal writer, born at Providence, R. I., April 30, 1794, graduated at Brown University in 1813. Among his works are a "Treatise on the Right of Property in Tide Waters" (1826) and "The Limitation of Actions." Died May 1, 1857.

An'gelo, a township of Monroe co., Wis. Pop. 461.

An'gelo (or, more correctly, **Ag'nolo**) **Buonarro'ti** (MICHAEL), a sculptor, born probably at Settignano, 13 miles from Florence, on Mar. 6, 1475. The Buonarroti (or Buonarroti Simoni, as they designated themselves) were a distinguished Florentine family. The name is often found in connection with offices in the state. They held fast to a tradition that the Simoni were descended from the counts of Canossa, in whose veins flowed imperial blood; but modern historians attach no value to the tradition. The child was entrusted to a nurse, wife of a stone-mason, and Michael used in after years to say in jest that it was no wonder he had such love for his profession, since he had imbibed it with his mother's milk. He began to draw as soon as he could use his hands. They used to show his early paintings on the walls of the house in which he grew up. He was destined to be a scholar, but gained little from his teachers, preferring to lounge in the studios of the artists and try his hand at drawing. His father and uncles protested against his pursuing the artist's career, but he persevered till he carried his point. On the 1st of April, 1488, the lad being fourteen years old, he was apprenticed for three years to David and Domenico Ghirlandajo, the latter being one of the first masters at Florence. He agreed to pay him six gold florins the first year, eight for the second, and ten for the third. While with him, Michael produced his first painting, a copy of a plate of Martin Schöngauer representing the temptation of St. Anthony. The copyist colored the animals from nature. The pupil left the studio before the three years had expired—some say because the master was jealous of his ability. The gardens of Lorenzo the Magnificent, richly stored with works of art, were tempting and accessible to a youth of his promise, and soon the attention of the merchant prince was attracted by a fawn modelled by his hand. Lorenzo took the young Michael into special favor, showed him his treasures, and introduced him, among others, to Poliziano, at whose suggestion the group of Hercules and the Centaurs was executed. At this time, too, he made a Madonna, after the manner of Donatello. Such advantages as these were of the rarest, and they were improved to the utmost. On the death of his patron and the overthrow of the Medici, the artist left the city and hastened to Venice; thence to Bologna, where he stayed about a year. In July, 1496, he was again in Florence, executing works for the Medici, a Sleeping Cupid among others, which became the occasion of his going to Rome under strong inducements from an agent of the cardinal San Giorgio, who had purchased the Cupid, but whose after-promises were finer than his performance.

The first great work executed in Rome was the statue of the Drunken Bacchus, a naked youth intoxicated with wine. Next came a *pietà*, the mourning Mary with the dead Christ in her lap, now placed in a side-chapel of St. Peter's, near the entrance. On the completion of the "pietà" in 1499, the artist was induced by a change in the government to return to Florence. Two years later he received an order to cut a statue from an immense block of

marble, eighteen feet long, which had been brought from Carrara for a figure of colossal size designed for the church of Santa Maria del Fiore. The order had not been executed, and the block, the despair of architects, lay in the workshop yards adjoining the cathedral. From this block Michael Angelo evoked the "David" of the Piazza del Gran Duca. The statue was finished early in 1504. Owing to its enormous weight, 18,000 pounds, three days were required to transport it from the studio to the square in front of the Palazzo Vecchio, where it stood till 1873. The erection of the "David" was an event in Florence; occurrences were dated from it; a superstitious feeling even attached to it in the minds of citizens, who apprehended disaster to their city in case it should be disturbed.

The fame of the great sculptor had by this time reached the ears of Pope Julius II., who was meditating the erection of a colossal mausoleum for himself in St. Peter's, which was already enriched with costly monuments of art. A dispute arising between the pope and the sculptor, the high spirited artist abruptly left Rome for Florence. It was there that he designed the great painting for the ducal palace, of which the cartoon only was finished, representing soldiers startled by the trumpet while bathing in the Arno. At present only a copy of small size remains, but this discloses the wonder of the work, the drawing of so many naked bodies in the various attitudes required by such a subject. A reconciliation with the pope having been effected, his next work was a bronze statue of Julius II., placed at the principal portal of San Petronio in Bologna. The unveiling took place Feb. 21, 1508. On All Saints' Day, 1509, so swiftly did this extraordinary man work, all Rome was gazing enraptured at the ceiling of the Sistine Chapel, which he literally covered in twenty months with frescoes by the order of Julius, the astonished but impatient pope admiring with the rest. In 1513 the sumptuous pontiff died, mentioning the mausoleum in his will, with directions for its completion; and Michael resumed work on it. New plans were drawn on a reduced scale, and a new contract was made, with higher estimates of cost. For three years the architect was completely absorbed in this task. It was estimated that the bronze ornaments for the tomb would require more than 22,400 pounds of metal. The blocks of marble were conveyed from his studio near the Vatican to the neighborhood of the Capitol, where were the sculptor's workshops, and where he himself took up his abode. He seems to have begun with the "Moses," with which the photograph has made all men familiar. Then, perhaps, come the two chained youths which now stand in the Museum of the Louvre in Paris.

The construction of the façade of San Lorenzo was the next great task proposed to the sculptor by Leo X., the pope undertaking that the work should not interfere with the completion of the mausoleum, which he was under contract to finish. The new work required not only a sculptor, but an architect, and besides these an engineer and a superintendent of authority. Angelo undertook the whole, would accept no aid, passed a spring and summer in the mountains, discovered and opened marble-quarries, directed workmen in several places, arranged for transportation, manufactured figures in wax; in a word, made himself felt in every department of the enterprise. Buonarotti possessed prodigious powers, and tasked them to the utmost, but it seemed to be his destiny to complete none of his gigantic enterprises. Partly through the impetuosity of his own nature, partly from the multitude and splendor of his ideas, and partly by reason of the caprices of his princely employers, his career was full of abortive schemes. The designing of the façade of San Lorenzo, the work at which he had toiled for years as he had at no other —a work the magnitude whereof threw the mausoleum into the shade—was brought to a stand still finally by the disasters which befell the family of Medici. Instead of it, the construction of the Medicean chapel in Florence was assigned to him by Clement VII. But neither was this completed. The two statues of Lorenzo, duke of Urbino, and of Giuliano, duke of Nemours, the two famous figures which all the world are familiar with, attest the grandeur of the design. The efforts of the sculptor were amazing; he worked with passion; the toil would have killed another man. In a few months the colossal statues Morning, Evening, Day, and Night, which are regarded as his greatest conceptions, were placed in their niches.

In 1533, at the age of fifty-eight, and after a rest from similar labor of thirty years, Angelo, at the instance of the pope, took up his brush to paint the "Last Judgment" on the altar-wall of the chapel whose ceiling had been covered with the creations of his hand. The mausoleum was perforce discontinued again. The artist wished to resume it on the completion of the Last Judgment, but was again overruled by papal authority; a new chapel, the Capella Paolina, had been added to the Vatican, and no one but Michael Angelo must adorn it. The dilemma was painful, for he felt bound in honor to complete the mausoleum; but being released finally, he went forward with the decorations of the chapel. The two vast paintings representing the "Crucifixion of Peter" and the "Conversion of Paul" were finished, but they no longer exist as he left them.

Michael Angelo was an old man when Antonio di San Gallo, the director of St. Peter's church, died, and the responsible office was conferred on him. Other architects were talked of. Had Rafael been living, the post would doubtless have been his. Giulio Romano declined being a candidate for the position, on account of his ill-health. Bramante had laid the foundation of the present structure in 1506. After him several architects submitted plans and made alterations—Rafael, Fra Giacondo, Peruzzi, Antonio di San Gallo succeeded him. But Angelo took the work up as from the beginning, with full power to do as he would; and though his designs were never carried out, the main credit for what was done afterwards belongs to him. The front façade was not his work; the colonnades surrounding the square were not his design; the obelisk and the fountains were placed where they are by later hands; in other points his designs were crippled; but to him belongs the glory of the great dome, which he never saw suspended, but which he lived to model. What the whole would have been could his conceptions have been put into stone, none can tell, for his inward vision alone contemplated it.

The touch of the mighty hands was felt on other Roman buildings. It converted the Baths of Diocletian into the magnificent church "Degli Angeli." His brain teemed with ideas. He would have rebuilt half Rome had he possessed the power. His actually-formed plans would have transformed a conspicuous portion of the city if they could have been executed. But years impaired even his prodigious force. He drew till his hand could no longer hold a pencil; he carved as long as he could guide a tool; but he felt old; to use his own language, "Death often pulls me by the coat to come with him." His last group, a Christ lying dead in his mother's lap, was unfinished; a flaw in the marble condemned it, and nearly sacrificed it. The artist gave it to one of his pupils. It is now in Florence, beneath the dimly-lighted dome of the Santa Maria del Fiore. Urgent solicitations to return to his native Florence might have prevailed with him at this time but for his unwillingness to leave the milder climate of Rome, and his deeper unwillingness to abandon his great labor on St. Peter's, now running through five pontificates, which political disturbances, and failing funds, and continual misunderstandings had suspended. Saddened and solitary from the loss of friends, shadowed by the disappointment of unrealized hopes, he dwelt in Rome, his thoughts turning sometimes gloomily to things immortal and invisible.

"The fables of the world have robbed my soul
Of moments given me for thoughts of God."

He pours out his heart in sonnets which betray a spirit of fatigue and passionate longing for rest. The end came on the 18th of Feb., 1564, when he was ninety years old. He sank exhausted under the weight of three laborious generations.

The above is the barest possible outline of the career of this great man. An attempt to characterize his work even thus baldly would be impossible here; nor is it necessary, for the main features of his genius are familiar to all who are in the smallest degree acquainted with the productions of his hand. He was architect, sculptor, painter, poet, eminent in each, skilful in anatomy, a master of mechanics. In poetry, Dante was his model for style, the delight of his kindred spirit. He entreated the pope's permission to erect a worthy monument to Dante at his own expense in an honorable place. The finer monument he is said to have actually erected—a book of drawings illustrating the "Inferno"—was lost.

Michael Angelo was rather short of stature, with broad shoulders, firm and strong limbs, thin but robust frame. Habits of abstemiousness, continence, frugality, and industry steeled his constitution. The wealth his genius brought him did not spoil his simplicity. "Rich as I am," he once said in his old age, "I have always lived like a poor man." His head was wide, his forehead prominent, his eye small and light. His face was disfigured in early life by a blow dealt him by a fellow-student in the Medici gardens, which broke his nose. The disfigurement had its effect on a temper inclined to melancholy; but by nature he was kind, gentle, generous, self-reliant, independent, ambitious, proud, but magnanimous; too tenacious of his own rights, but not unready to concede the claims of others. His family position, his genius, and his fame gave him every social advantage, but he lived in retirement, rarely appeared on public occasions, avoided the companionship of

artists, wrote Italian, the language of Dante, instead of Latin, and was satisfied to stand on his merit as an artist. The great sculptor lies buried in Santa Croce, in Florence. In the same church the duke had a monument erected in his honor.

Many points relating to the life and works of Michel-agnolo, as he signed himself, have been left obscure from the withholding of important family papers—first, by the count Buonarroti, and afterwards by the city of Florence, to which the count bequeathed them. Even yet all is not known.

The Life by Herman Grimm, translated into English by Miss Bunnett (reprinted in Boston, 1866), contains much new matter of interest. A list of Michael Angelo's works may be found in the shorter biography by Richard Duppa, LL.B. (Bohn's "European Library"). An edition of the "Poems" was published in Florence about ten years ago. O. B. FROTHINGHAM.

An'gels' Camp, a post-village of Calaveras co., Cal., 25 miles E. of Stockton, has one weekly paper.

An'gelus Dom'ini ("the angel of the Lord"), a form of prayer which Roman Catholics repeat at sunrise, noon, and sunset, when they ring a bell called the Angelus bell.

An'gelus Sile'sius, one of the most prominent German poets of the seventeenth century, whose proper name was JOHANN SCHEFFLER, was born at Breslau, in Silesia, in 1624, and in 1652 joined the Roman Catholic Church. He wrote several mystical devotional works, among which are the "Cherub's Guide-Book" and the "Angelic Book of Wonders" (1674). Died July 9, 1677. Special works on him have been written by Kahlert and Schrader (1853).

An'germann, a navigable river of Sweden, rises in the mountains between Sweden and Norway, collects the water of several lakes, and flowing south eastward enters the Gulf of Bothnia near Hernösand. Length, about 250 miles. Its banks abound with beautiful scenery.

An'germannland, or **Angerma'nia,** an old province of Sweden, is now included in the province of Hernösand or Westernorrland.

Ang'ermün'de, a town of Prussia, in the province of Brandenburg, on Lake Münde, and on the Berlin and Stettin Railway, 44½ miles by rail N. E. of Berlin. Pop. in 1871, 6412.

Angers, formerly **Angiers** (the ancient *Juliom'agus*), a fortified city of France, capital of the department of Maine-et-Loire, and once the capital of the province of Anjou. It is on the Mayenne River, 4 miles N. of the Loire, and on the railway which connects Tours with Nantes, 60 miles by rail S. W. of Le Mans. The old walls are converted into boulevards lined with handsome houses. It has a cathedral, a college, a library of about 35,000 volumes, a museum, and a school of arts and trades; also manufactures of linen and woollen stuffs, hosiery, silk twist, leather, etc. Here are the ruins of an ancient castle of the dukes of Anjou, and the Hospice of St. Jean, founded by Henry II. of England. Lord Chatham and the duke of Wellington attended a military school in Angers. Pop. in 1866, 54,791.

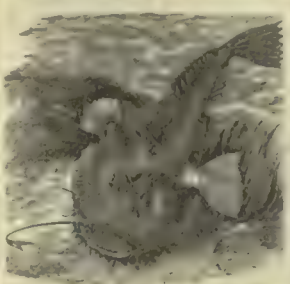
Anghie'ra, de (PIETRO MARTIRE), [Lat. *Petrus Martyr Angle'rius*], an eminent Italian scholar and historian, born of a noble family at Arona, on Lake Maggiore, in 1455. He emigrated to Spain in 1487, and became a priest. In 1501 he was sent by King Ferdinand on a mission to the sultan of Egypt, and in 1505 he was appointed prior of the church of Granada. He was also a member of the Council of the Indies. His most important work is a history of the New World and American discovery, entitled "De Rebus Oceanicis et Orbe Novo Decades" (1530), which is highly esteemed. Died in 1526.

An'gilbert, or **En'gilbert** [Lat. *Angilber'tus*], SAINT, an eminent statesman and Latin poet, was born in Northwestern Gaul. He married Bertha, a daughter of Charlemagne, and became a confidential minister of that monarch. In the latter part of his life he entered a monastery. He wrote several short poems, and was called the Homer of his time. Died Feb. 18, 814 A. D.

Angi'na [from the Gr. ἄγχω: Lat. *an'go*, to "strangle"], applied to diseases attended by a sense of suffocation. (See next article.)

Angi'na Pec'toris ("angina of the breast"), called also **Breast Pang** and **Heart Stroke,** an intense pain occurring in paroxysms, and usually commencing in the region of the heart or at the lower end of the breast-bone, and extending along the left arm, more rarely going towards the right side. It is characterized by a sense of suffocation, faintness, and often by the apprehension of approaching death. This symptom has been called the "spasm of a weakened heart," and is very seldom experienced by any but persons with an organic disease of that organ. The exciting cause is not unfrequently a strong and sudden emotional disturbance. Men over fifty years of age are most frequently attacked. Valerian, gentle aromatic stimulants, and saline cathartics are considered useful in the attack, which is usually, but not always, short. Between paroxysms the patient should lead a tranquil, retired life, and make use of a plain, nutritious diet.

Ang'le [from the Lat. *an'gulus*, a "corner"], in popular language is a point formed by the meeting of two lines whose direction is not the same. In geometry a *rectilineal angle* is the inclination of two straight lines which meet, but have not the same direction. The point of meeting is called the *centre* of the angle, and the lines are its *sides* or *legs*. Angles are measured by degrees of a circle, as their magnitude depends on the quantity of rotation round the vertex which would be required to make the lines coincide. An angle of ninety degrees is called a *right angle;* if it is more than ninety, it is *obtuse*, and if less than ninety, it is *acute*. When three or more planes meet at the same point, the corner thus formed is a *solid* angle.



ANGLE, CURVILINEAR, is the angle formed by the tangents to two curves at the point where the latter meet.

ANGLE, DEAD, in fortification, an angle of the wall so formed that a small piece of ground in front of it can neither be seen nor defended from the parapet.

ANGLE, FACIAL, in zoology, is regarded as an important indication of the relative intelligence and sagacity of men and other animals. It signifies the angle made by the meeting of two straight lines, drawn, the one from the most prominent part of the frontal bone to the anterior margin of the upper jaw; the other from the external auditory foramen to the same point. The facial angle of a European is about eighty degrees; of an African negro, about seventy; of an ape, about fifty. (See FACIAL ANGLE.)

ANGLE, VISUAL, in optics, is the angle formed by two rays of light, or two straight lines drawn from the extreme points of an object to the centre of the eye. The apparent magnitude of an object depends on the magnitude of the visual angle which it subtends.

Ang'ler (*Lo'phius America'nus*), a fish found on the American coasts, and called the sea-devil or goose fish. It belongs to a family of acanthopterygious fishes called Lophiadæ. It is from three to five feet long, has an enormous head and a very large mouth, furnished with worm-like appendages. By means of these, and the filaments which rise from the top of its head, it is supposed to attract the fishes on which it preys. The Lophiadæ are remarkable for the elongation of the carpal bones, by which they are enabled to leap up suddenly and to seize fish that are above them.

Angler, or Fishing-Frog.

Ang'les [Lat. *An'gli*], an ancient Low German tribe from which England derives its name (*Angle-land*, Englland). They occupied a narrow district in the S. of Sleswick, between the Schlei and Flensburg, whence some of them passed over, in the fifth century, in conjunction with other Saxon (or Low German) tribes, into Britain, where they conquered the native Britons and established the Anglo-Saxon Heptarchy. That the Anglian settlers of Britain should have given their name to the island is due, possibly, to the fact that the tribal name "Angles" had come to be used as a generic term for the Saxon (or Low German) tribes: just as the word "Yankee" has come to signify, to a European, any citizen of the U. S.; but, more probably, to the fact that the Anglians were the first of the Low German settlers of Britain to accept Christianity, and hence to be recognized in the Latin literature of the period. (See ANGLO-SAXON, by PROF. J. H. GIVEN, A. M.)

Ang'lesey, or **Ang'lesea** (*angle's-ey*, or "island:" anc. *Mo'na*), an island and county of North Wales, in the Irish Sea, about 1 mile from Caernarvon, from which it is separated by the Menai Strait. It is about 20 miles long and 17 miles wide. The surface is nearly level and the scenery rather tame; the soil is generally fertile, producing wheat, barley, oats, and potatoes. The principal rocks are mica-schists and limestone. Here are rich mines of copper and lead. The island is connected with the mainland by the Menai suspension bridge and the great Britannia tubular bridge, over which the Chester and Holyhead Railway passes. The ancient *Mona* was an important seat of Druidical power. Pop. in 1871, 50,090.

Anglesey, Earls of, and Barons Newport-Pagnell, in the English peerage (1661), Viscounts Valentia and Barons Mountnorris in the Irish peerage. The earldom was established in the Annesly family by Charles II., but became extinct 1761 in Richard Annesly, the sixth earl of this family. The title had been borne by Christopher Villiers, brother of the duke of Buckingham, and his son Charles.

Anglesey (Henry William **Paget**), Marquis of, a British general and statesman, born May 17, 1768, was the eldest son of the earl of Uxbridge. He entered the army, gained distinction as a cavalry officer, and became a major-general in 1808. He inherited the title of earl of Uxbridge on the death of his father in 1812, and entered the House of Lords. At the battle of Waterloo, 1815, he commanded the British cavalry, and lost a leg. Soon after this event he received the title of marquis of Anglesey. In 1828 he was appointed lord lieutenant of Ireland, but having become an advocate of Catholic emancipation, he was removed by Wellington in 1829. He held the same office from 1831–33, and was raised to the rank of field-marshal in 1846. Died April 29, 1854.

Anglesey, Marquesses of (1815, in the United Kingdom), earls of Uxbridge (1784, in Great Britain), Barons Paget (1550, in England) and baronets (1730, in Ireland).—Henry William George Paget, the third earl, was born Dec. 9, 1821, and succeeded his father in 1869. He was a member of Parliament for South Staffordshire from 1854 to 1857.

Ang'lesite, a sulphate of lead produced by the decomposition of galena, was so named because first observed in Anglesey. It occurs in rhombic prisms with dihedral terminations, and of a white, gray, or yellowish color.

Ang'lican Church, a name of the Established Church of England, sometimes called the Anglo-Catholic Church. The creed of this Church is legally defined in the Thirty-nine Articles, first adopted in 1562. The term is also sometimes used as a collective name for all the religious denominations comprised under the name of Episcopalians. (See England, Church of, by Rev. B. R. Betts, A. M.)

Ang'ling [from the Lat. *an'gulus*, a "corner" or "angle," a "hook"], catching fish by means of a hook attached to a line and rod, the hook being furnished with bait, which is either some object upon which the fishes naturally prey, or is a counterfeit of such an object. The practice has prevailed through all ages and in almost all countries. In 1496, Wynkin de Worde "emprented at Westmestre a 'Treatise of Fysshinge with an Angle,' by Dame Juliana Berners." Izaak Walton in 1653 gave to the world his "Complete Angler," afterwards enriched with additions by his friend Charles Cotton, highly esteemed for correctness of details and happy humor. In angling the first consideration is what is termed "fishing-tackle," which consists of the rod, line, and hook, with the requisite baits, worms, flies, etc. The line should be strong, smooth, or even, flexible, and of a material not easily injured by wet. To the rod is attached a reel, on which a part of the line is wound when it is too long for the occasion, but especially when, having caught a strong fish, it is necessary to draw it in gradually and cautiously, lest the line should be broken. The reel should be made so as to wind or unwind freely. The baits may consist of various kinds of worms or flies, little fishes, small pieces of fish, meat, etc. Artificial lures are much used, particularly for catching the trout and salmon. They are variously made; usually the feathers of some bird (as the cock or pheasant) are so disposed as to resemble insects on which the fish are wont to feed. (See G. C. Scott, "Fishing in American Waters;" H. W. Herbert, "Fish and Fishing in the U. S.," 1850; Hallock, "The Fishing Tourist," 1873; Roosevelt, "Superior Fishing," 1865.)

Anglo-Cath'olics, a party of High Church Anglicans, often called **Puseyites,** from one of their leaders, Dr. Pusey, otherwise known as **Tractarians,** from the series of ninety tracts issued by them between 1833 and 1841. They emphasize these four "Catholic principles:" apostolic succession, baptismal regeneration, the real presence in the Eucharist, and the authority of tradition.

Anglomania [from the Lat. *An'glus*, "English," and the Gr. μανία, "madness" or "infatuation"], a term applied among the French and Germans to an indiscriminate admiration of English institutions and national peculiarities, or a propensity to imitate English customs and conventionalities. An Anglomania prevailed in France just before the revolution of 1789. The opposite state of feeling is called *Anglophobia*.

An'glo-Sax'on, a name given to the people and language which resulted from the consolidation of the different Low German tribes which in the fifth century overran Southern Britain. The name would seem to point to a blending of two distinct races, the Angles (which see) and the Saxons; but according to Latham ("Ethnology of the British Islands"), there is no distinction to be made between the Angles and the Saxons on the ground of the difference in name. "If," says he, "the Saxons of Anglo-Saxon England were other than Angles under a different name, they were North Frisians." According to the "Saxon Chronicle," which is, with reference to these events, a mere paraphrase of Bede's "Ecclesiastical History of Britain"—the latter work being written about 150 years after the last of the Saxon invasions, which the "Chronicle" records as if it were contemporaneous with them—there were seven distinct Teutonic "invasions" of Britain, beginning A. D. 449, and including parties of Jutes, Frisians, Saxons, and Angles. That Jutes, in the sense of people from Northern Denmark or people of Scandinavian stock, were the first of the Gothic invaders to land in Southern Britain, is highly improbable; and the topographical nomenclature of Kent, where Hengist and Horsa, with their party of Jutes, are said to have settled, bears no traces of Danish influence. By "Jutes" we are probably to understand, generically, "Goths." Indeed, in Alfred's Anglo-Saxon translation of the passage in Bede which the "Chronicle" manifestly follows, the Latin *Jutis* is rendered by *Geatum* (Goths), a term which is elsewhere applied to Alfred himself. The "Chronicle" itself, by the way, explicitly asserts (Bohn's ed., p. 341) that 787 was the first year when ships of Danish men sought the land of the English nation; one manuscript of the "Chronicle" says that Hengist landed with a party of *Angles;* while tradition calls him a Frisian, which he probably was.

The Saxon settlement of Britain was probably participated in by all the Low German tribes between the Elbe and the Schlei, although, on the ground of linguistic affinity, the Frisians would seem to have been most prominent. (See Latham's "Ethnology of the British Islands;" Marsh's "Origin and History of the English Language;" Nicholas's "Pedigree of the British People;" "Proceedings of the London Philological Society," vol. v.) As soon as the Saxons had subjugated the Keltic inhabitants of Britain (who resolutely opposed the invaders, and many of whom were driven before them into the fastnesses of Wales, and across the sea into Armorica, though most of them were, doubtless, amalgamated with the invading race), they began to contend with each other. The various kingdoms forming the famous "Heptarchy" (or, to speak more correctly, the "Octarchy"*) were at length, in 827, reduced by Egbert, king of Wessex, into a single monarchy, which attained its highest point of power and glory under Egbert's grandson, Alfred the Great (871–901). The Saxon power was completely overthrown by William the Conqueror at the battle of Hastings, in 1066. (For a full account of the Anglo-Saxons, their history, their laws, customs, etc., see Sharon Turner, "History of the Anglo-Saxons;" J. M. Kemble, "The Saxons in England;" also, Lappenberg's "History of the Anglo-Saxon Kings," and Freeman's "Old English History.") J. H. Gilmore.

Anglo-Saxon Language and Literature. The pagan conquerors of England described in the article Anglo-Saxon spoke many dialects, but all of them were Low German. Missionaries were sent from Rome (A. D. 597) to convert them to Christianity. The Roman alphabetic writing was thus introduced, and a single tongue gradually came into use as a literary language through the whole nation. It was at its best in the reign of Alfred the Great (A. D. 871–901). It continued to be written till the colloquial dialects, through the influence of the Normans, had changed so much as to make it unintelligible to the people; then there grew out of these dialects of mingled Anglo-Saxon and Norman a new literary language, the English. The old language was long called Anglisc, Englisc (English), and some scholars insist that it should still be called so, and that it is nothing but Early English. But it differs more from English than Latin does from Italian, and it needs a separate name, and has come to be called Anglo-Saxon. It belongs to the Indo-European family—has similar roots and grammatical structure with German, Latin, Greek, and Sanskrit. It was the most highly cultivated of the Germanic languages of its time; it attained the capacity of translating the Latin classics with accuracy and ease; and it has original literature worthy of study. Its chief interest, however, is as the mother-tongue of the English. It has given us the names of the objects, relations, and affections which we speak of most, the words laden with the dearest associations, the idioms on which the beauty of our poetry and the power of eloquence, wit, and humor depend. From it almost all our grammatical forms are derived. The following sketch of its grammar has been made full enough to explain our English grammar.

* See on this particular subject, Sharon Turner's "History of the Anglo-Saxons," vol. i., book ii., chap. 4.

PHONOLOGY.—The alphabet has twenty-four letters.

Old Forms.		Roman.		Names.
Ā	a	A	a	â
Æ	æ	Æ	æ	æ
B	b	B	b	bê
C	c	C	c	kê
D	d	D	d	dê
Đ	ð	DH	dh	edh
E	e	E	e	ê
F	f	F	f	ef
G	g	G	g	gê
H	h	H	h	hâ
I	ı	I	i	ee
L	l	L	l	êl
M	m	M	m	êm
N	n	N	n	ên
O	o	O	o	o
P	p	P	p	pê
R	ꝛ	R	r	êr
S	ſ	S	s	êss
T	t	T	t	tê
Þ	þ	TH	th	thorn
U	u	U	u	oo
Ƿ	ƿ	{VV (W)	vv (w)}	wên
X	x	X	x	ex
Y	ẏ	Y	y	ypsilon

The vowels sounded nearly as in German: *a* as in *far*; *á* as in *fall*; *æ* as *a* in *glad*; *é* as *a* in *dave*; *e* as in *let*; *ê* as in *they*; *i* as in *dim*; *í* as *ee* in *deem*; *o* as in *opine*; *ó* as in *holy*; *u* as in *full*; *û* as *oo* in *fool*; *y* nearly like *u* in *music*, or the French *u*; *ŷ* the same sound prolonged. There were many dialectical variations of the vowels, and there are also certain regular variations which are carefully represented in the Anglo-Saxon writing. Words originally spelt with *a* sometimes appear with *æ*, sometimes with *ea*, sometimes with *e*, sometimes with *o*, showing that the sound of *a* was as seldom pure, and as variously flattened and broken, as it is in the Middle and Southern States of America. When *a* or *i* would come before *l*, *r*, or *h*, the broken sound produced by those letters, such as we make in *hear*, *leer*, is written as *ea* and *eo*. So after *e* and *g* the breaking heard in our Southern States in *cear* for *car*, *yearden* for *garden*, is carefully represented by the same *ea*, *eo*. Before *m* or *n*, *o* often appears for *a*; as *mon* for *man*.

A vowel is also modified by the vowel of the following syllable, the German umlaut: *a* followed by *i* changes to *e*: man, *man*, meni, *men*; **ó to *é*:** gôs, *goose*, gêsi, *geese*; **û to *ŷ*:** mûs, *mouse*, mŷsi, *mice*; and the like.

Many of the niceties of pronunciation were neglected in the Norman spelling, but they were long kept up in the folk-speech. The changes of the old to the present sounds of these vowels have been made in modern times, mostly during the Elizabethan age and since. These changes have an important peculiarity. All through the Indo-European languages, beginning with Sanskrit and coming down through Greek, Latin, Gothic, Anglo Saxon, and the like, there is a regular gradual weakening of the vowels: *a* weakens to *o*, *e*, *i*; *u* to *o*, *e*: *i* to *ê*. But in English there is a vigorous strengthening of accented vowels. The weakest vowels, *u* and *i*, change to strong diphthongs: mûs becomes *mouse*, hûs, *house*, and the like; lîf becomes *life*, which is pronounced *läife*, or nearly so: and *a*, though it becomes oftenest the mixed sound of *a* in *fate*, yet in words from Anglo-Saxon *â* is *aw* or *ô*: þâs becomes *thaw*; hâm, *home*; brâd, broad (brawd): and the like. Unaccented vowels weaken or disappear. This gravitation of our words to accentual centres indicates a special vigor of utterance accompanying the new manly vigor of the English race. Similar changes are found in modern German, French, and most vigorous modern tongues, but only in particular words, or within very narrow limits, compared with the English.

The consonants were pronounced in general as in English, but *c* was always pronounced as *k*: *g* like German *g*, as in *give*, or nearly enough to alliterate with it—never as in *George*: *i* consonant like *y*: þ like *w*: *qu* was represented by cþ; *wh* by hþ, in which a strong *h* was heard before the *w*, as a weak one now is in New England: the two sounds of *th*, as in *thin* and *thine*, had two characters, þ *thin*, and ð *thine*, which, however, are not found in any manuscript uniformly so used. *Hl*, as in blátherd, *lurd*; *hr*, as in hráther, *rather*; *hl*, as in plátting, *loathing*; *hs*, as in práttan, *write*; *cn* as in cnáht, *knight*, had the first letter distinctly sounded, as the two last had in the Elizabethan age. The weakening of *c*, *æ*, and *g*, and of the combinations here mentioned, mostly occurred at the first mixture of Norman and Anglo-Saxon, several of the sounds being unpronounceable to the Normans.

INFLECTION.—The Anglo-Saxon has three genders, three numbers, and five cases. The dual number and the instrumental case are rare, except in the pronouns.

THE NOUN.—There are four declensions distinguished by the endings of the genitive singular—ES, E, A, and AN. The three first are from the old vowel declensions, and are called strong; the fourth is from the N-declension, and is called weak. Most nouns of the masculine or the neuter gender belong to the first or fourth declension, and are thus declined:

FIRST DECLENSION.

SINGULAR.	*Anglo-Saxon.*	*English.*	*Latin.*	*German.*
Nominative,	fisc,	*fish*,	sol,	Sohn.
Genitive,	fisces,	*fish's, of a fish*,	solis,	Sohnes.
Dative,	fisce,	*to* or *for a fish*,	soli,	Sohne.
Accusative,	fisc,	*fish*,	solem,	Sohn.
Instrumental,	fiscê, *or* ŷ,	*by* or *with a fish*,	sole (ablative).	
PLURAL.				
Nominative,	fiscâs,	*fishes*,	solês,	Söhne.
Genitive,	fiscâ,	*of fishes*,	solum,	Söhne.
Dative,	fiscum,	*to* or *for fishes*,	solibus,	Söhnen.
Accusative,	fiscâs,	*fishes*,	solês,	Söhne.
Instrumental,	fiscum,	*by* or *with fishes*,	solibus (ablative).	

FOURTH DECLENSION.

SINGULAR.	*Anglo-Saxon.*	*English.*	*German.*
Nominative,	oxa,	*ox*,	Knabe.
Genitive,	oxan,	*of an ox*,	Knaben.
Dative,	oxan,	*to an ox*,	Knaben.
Accusative,	oxan,	*ox*,	Knaben.
PLURAL.			
Nominative,	oxan,	*oxen*,	Knaben.
Genitive,	oxena,	*of oxen*,	Knaben.
Dative,	oxum,	*to oxen*,	Knaben.
Accusative,	oxan,	*oxen*.	Knaben.

From the first declension the English endings of the possessive case and of the plural number are derived. In Anglo-Saxon, as in German, most secondary formations and new words were declined according to the N-declension, and that seemed likely to be the leading one; but the Normans formed their plural in *-s*, and in English the Norman *-s* joined with the Anglo-Saxon *-s* to kill it, and *oxen*, with the irregular *children*, *brethren*, is almost its only memorial in current speech.

The possessive *-es* is a distinct syllable, and is so in English as late as Shakspeare. Many persons imagined it to be a contraction of *his*, and we often find *his* written in its place in Early English and Semi-Saxon: *Anak his children* for *Anak's children*; and Bacon, carrying out the mistake, has *Pallas her glass* for *Pallas's glass*.

The plural *-as* is also a separate syllable, and the English *-es* remains so in words ending with a hissing sound: *glass*, *glasses*; *church*, *churches*; *box*, *boxes*; in other words it is now contracted: *king*, *kings*.

Words from Anglo-Saxon ending in *f* change it to *v*: *wolf*, *wolves*; while those from French mostly retain *f*: *chief*, *chiefs*; *gulf*, *gulfs*.

Some words in Anglo-Saxon from stems in *-i* have umlaut, as described under *Phonology*, in the dative singular and in the nominative and accusative plural. Thus, man, *man*, is declined: Nom. man; Gen. mannes; Dat. menn; Acc. man; Plural Nom. menn: Gen. manna; Dat. mannum; Acc. menn. The *i* is dropped, and hence our plural *men*; so fôt, *foot*, plu. fêt; *fect*: gôs, *goose*, plu. gês; *geese*; tôð, *tooth*, têð; *teeth*; mûs, *mouse*, plu. mŷs; *mice*; brôðer, *brother*, brêðer, whence *brethren*, with the *-en* of the fourth declension irregularly added.

Neuters generally have no plural sign: sceap, *sheep*, for example, is the same in the singular and plural. Hence several English words from such neuters remain without any plural sign: *sheep*, *deer*, *swine*; and some are used with or without one: as *folk*, *hair*, *head*, *hundred*, *pound*, *nail*, *score*, *year*, *yoke*.

A few neuters end in *-ru*: cild, *child*, plu. cildru, whence first *childer*, and then, with a second plural ending from the fourth declension, *childeren*, *children*.

GENDER has two aspects: (1.) It represents a tendency to use different sounds for relations to males from those to females; long vowels and liquids are oftenest used for females. (2.) A tendency to couple words agreeing in their

endings. From the first point of view there can be but three genders; some languages have two, some one, some none. From the second point of view there may be as many genders as there are sets of endings. Some languages have none; some (*e. g.*, Congo and Caffer) have many.

In Anglo-Saxon the endings control the gender; þîf-man, *woman*, is masculine, because it ends in *man;* þif, *wife*, is neuter, as in German.

Many stems have pairs of endings—one masculine, the other feminine. Remains of these in English are sang-ere, masc., *singer*. sang-estre, fem., *songster;* bæc-ere, m., *baker*, bæc-estre, f. (whence the old bakster), a female baker: pehb ere, m., *weaver*, pehb-estre, f., whence webster, a female weaver. Such pairs are also: fox, m., *fox*, fixen, f., *vixen;* hlâford, m., *lord*, from hlâf, *loaf*, and peard, *keeper*, hlâf(or)dige, f., *lady:* gans, gôs, *goose*, gandra, m., *gander*.

Many compounds are formed whose first part marks sex, and last part gender. þæpned-, *weaponed*, carl-, man-, are common for males: þîf-, *wife*, mægden-, *maiden*, cpên-, *queen* or *quean*, for females: þæpned-man, m.: carl-cat, not now *Charles-*, but *Tom-cat:* man-cild, n., *man-child:* þîf-man, m., *woman:* mêden-cild, n., *girl:* cpên-fugol, m., *queen-bird:* so also the expressions spere-healf, f., *spear-half*, on the male side; spindel-healf, f., *spindle-half*, on the female side.

Man in his various relations and the common domestic animals have pairs of words from different roots in use through many of the Indo-European languages. The English come mostly from Anglo-Saxon: fæder, môdor, *father, mother;* sunu, dôhtar, *son, daughter:* oxa, cû, *ox, cow;* for *sheep*, ram, m., côpu, f.; for *dogs*, hund, *hound*, bicce, f.; for *poultry*, coc, m., heu, f.; for *bees*, drân, *drone*, m., beô, f.; and the like.

The gender adopted for objects without life, when personified in English, often differs from the Anglo-Saxon gender: sunne, *sun*, is feminine; mônа, *moon*, is masculine; scip, *ship*, is neuter. The German generally agrees with the Anglo-Saxon. English literature has rather taken these genders from the mythology of Greece and Rome.

The Adjective.—The Anglo-Saxon adjective, like the Greek, Latin, and others, is declined; and, like the German, has two sets of endings for each gender. The common forms are called the strong, or indefinite, or pronominal declension, and are like those of the demonstrative pronoun. When an adjective is preceded by a definite article, demonstrative, or like word, or is in the vocative case, it is declined like a weak noun (see *oxa*, above), and this is called the weak or definite declension. Thus blind, *blind*, is commonly declined in the masculine thus: Nom. blind; Gen. blindes; Dat. blindum; Acc. blindne; Instrumental, blindê; Plural Nom. blinde; Gen. blindrâ; Dat. blindum; Acc. blinde; Instr. blindum; but "the blind man" would be thus declined: Nom. se blinda man; Gen. þæs blindan mannes; Dat. þam blindan men; Acc. þone blindan man; Vocative, blindan man; Instrumental, þŷ blindan men, etc. English adjectives, especially monosyllables, sometimes in Chaucer have an *-e* added, a relic of the definite declension or the plural number; but they are now undeclined.

Comparison.—Adjectives are generally compared by adding *-ir, -er, -ôr* for the comparative, *-ist, -est, -ôst* for the superlative. The *i* of the endings works umlaut like that of *man, men* described in the declension of nouns: strang, *strong*, compar. streng(i)ra, superl. strengest: ald, *old*, compar. eld(i)ra, superl. eldest, whence the English *elder, eldest*.

Some words form their superlative in *-ma:* for-ma, *first*. Some of these form a double superiative, fyr-m-est, from forma; æfte-m-est, which the English has converted into *aftermost*, as though compounded with *most*. In the same manner are to be explained *hindmost, uttermost, southmost*, and the like.

The irregular comparison of *good, bad, much, little*, is already in Anglo-Saxon. The comparison by *more* and *most* is not used.

Pronouns.—The personal pronouns are thus declined:

First Person.

Singular.	*Anglo-Saxon.*	*German.*
Nominative,	ic,	[ich], *I.*
Genitive,	mîn,	[meiner or mein], *mine*, or *of me.*
Dative,	mê,	[mir], *me*, or *to me.*
Accusative,	mec, mê,	[mich], *me.*
Dual.		
Nominative,	pit,	*we two.*
Genitive,	uncer,	*of us two.*
Dative,	unc,	*to us two.*
Accusative,	uncit, unc,	*us two.*
Plural.		
Nominative,	pê,	[wir], *we.*
Genitive,	ûser, ûre,	[unser], *our*, or *of us.*
Dative,	ûs,	[uns], *us*, or *to us.*
Accusative,	ûsic, ûs,	[uns], *us.*

Second Person.

Singular.	*Anglo-Saxon.*	*German.*
Nominative,	þû,	[du], *thou.*
Genitive,	þîn,	[deiner or dein], *thine*, or *of thee.*
Dative,	þê,	[dir], *thee*, or *to thee.*
Accusative,	þec, þê,	[dich], *thee.*
Dual.		
Nominative,	git,	*ye two.*
Genitive,	incer,	*of you two.*
Dative,	inc,	*to you two.*
Accusative,	incit, inc,	*you two.*
Plural.		
Nominative,	gê,	[ihr], *ye.*
Genitive,	eôper,	[euer], *your*, or *of you.*
Dative,	eôp,	[euch], *you*, or *to you.*
Accusative,	eôpic, eôp,	[euch], *you.*

The dual was rare, and has disappeared. The English pronouns are plainly from the Anglo-Saxon. It is worth notice that gê, *ye*, is nominative, eôp, *you*, always objective in the English Bible. The first person plural is used for the singular by authors, preachers, and chiefs in Anglo-Saxon sometimes; *ye* and *you* appear first as pronouns of reverence for *thou* in Old English.

Third Person, Singular.

	Anglo-Saxon.	*German.*
	Masculine.	
Nominative,	he,	[er], *he.*
Genitive,	his,	[seiner or sein], *his*, or *of him.*
Dative,	him,	[ihm], *him*, or *to him.*
Accusative,	hine,	[ihn], *him.*
	Feminine.	
Nominative,	heô (or hie),	[sie], *she.*
Genitive,	hire,	[ihrer or ihr], *her*, or *of her.*
Dative,	hire,	[ihr], *her*, or *to her.*
Accusative,	heô (or hie),	[sie], *her.*
	Neuter.	
Nominative,	hit,	[es], *it.*
Genitive,	his,	[seiner or sein], *its*, or *of it.*
Dative,	him,	[ihm], *it*, or *to it.*
Accusative,	hit,	[es], it.

Plural for all the Genders.

Nominative,	hî, hie (or heô),	[sie], *they.*
Genitive,	heorâ (hyrâ, or hirâ),	[ihrer], *their*, or *of them.*
Dative,	him,	[ihnen], *them*, or *to them.*
Accusative,	hî, hie (or heô),	[sie], *them.*

The article and demonstrative *se* is thus declined:

Singular.

	Masculine.	*Feminine.*	*Neuter.*
Nom.,	se,	seô,	þæt, *the*, or *that.*
Gen.,	þæs,	þêre,	þæs, *of the*, or *of that.*
Dat.,	þam,	þêre,	þam, *to the*, or *to that.*
Acc.,	þone,	þa,	þæt, *the*, or *that.*
Instr.,	þŷ,		þŷ, þê, *by the*, or *that.*

Plural of all the Genders.

þâ, *the*, or *those.*	þâm, *to the*, or *to those.*
þêrâ, *of the*, or *of those.*	þâ, *the*, or *those.*

þis, "This."

Singular.

	Masculine.	*Feminine.*	*Neuter.*
Nom.,	þis,	þeos,	þis, *this.*
Gen.,	(þisses),	þisse,	þises (or þisses), *of this.*
Dat.,	(þissum),	þisse,	þisum (or þissum), *to this.*
Acc.,	þisne,	þas,	þis, *this.*
Instr.,	þŷs,		þŷs, *by this, thus.*

Plural for all Three Genders.

Nom., þâs, *these.*	Dat., þisum, *to these.*
Gen., þisserâ (or þissâ), *of these.*	Acc., þâs, *these.*

Interrogative.

	Masculine. Singular	*Feminine is wanting. (Plural wanting).*	*Neuter. Singular.*
Nom.,	hpâ, *who.*		hpæt, *what.*
Gen.,	hpæs, *whose.*		hpæs, *of what.*
Dat.,	hpam, *to whom.*		hpam, *to what.*
Acc.,	hpone (or hwænc), *whom,*		hpæt, *what.*
Instr.,	hpŷ,		hpŷ, *by what, why.*

In the third personal pronoun it will be noticed that the feminine heô has given place in English to *she*, from seô, the demonstrative, and the plural throughout to *they, their, them*, from the same demonstrative. This personal pronoun is a weak demonstrative. Hit, *it*, has lost its *h;* the neuter genitive his has given way to *its*, a late English growth, not in the first edition of our Bible, and seldom used by scholars even as late as Milton. The English objectives come from the old datives, and *him, them*, etc. are still datives in some idioms: *I gave him the book, I taught them grammar*, and the like.

The origin of English *that, this, these, they, there, those* (þâs), *who, what, whom,* is obvious: *which,* hpyle, German *welcher,* is from hpâ, *who,* and lic, *like,* and means *of what kind.* Hpâ and hpæt are interrogatives in Anglo-Saxon; whas, *whose,* and wham, *whom,* appear as relatives in Semi-Saxon; the nominative *who* is not a full relative till the fourteenth century, and *what* does not now admit of an antecedent.

From these pronouns are derived a large number of ADVERBS in Anglo-Saxon, which have come into English: *where,* at *what* place; *there,* at *that* place: *here* (from *he*), at *this* place: *so whither,* to *what* place: *thither,* to *that* place; *hither,* to *this* place; and *whence,* from *what* place; *thence; hence; when,* at *what* time; *then; how, why* (from hû, hpŷ), in *what* way; *thus,* in *this* way.

The DEFINITE ARTICLE *the* is a weakened form of the demonstrative *that,* like French *le* from Latin *ille;* it is common in Anglo-Saxon. The indefinite article *an, a,* is a weakened form of the numeral ân, *one,* like French *un* from Latin *unus;* though not uncommon, it is not as frequent as in English.

The personal pronouns are used as REFLEXIVES. *Self* is sometimes added, and then the pronoun and *self* are both declined: ic selfa, *I self,* not *my self;* Gen. min selfes, *of my self,* etc. The English *him-self, it-self, them-selves, her-self,* preserve the old construction.

NUMERALS.—The cardinals are like the English: ân, *one;* tpâ, *two;* þreô, *three;* . . . endleofan, *eleven;* tpelf, *twelve;* þreô-tŷne, *thirteen;* . . . tpêntig, *twain ten, twenty;* . . . from seventy to one hundred and twenty, the great hundred, *hund* is prefixed: hund seofon-tig, *seventy;* . . . hund-teôn-tig, or hund alone for *hundred;* hund-endleofan-tig, *one hundred and ten;* hund tpelf-tig, *one hundred and twenty;* then hund and þrittig, *one hundred and thirty.*

The ordinals are—fyrsta, *first;* ôðer, *other, second;* þridda, *third;* feôperða, *fourth;* and so on as in English, except fift, sixt, twelft, which have only lately changed to *fifth, sixth, seventh;* and except that a modern *-teenth* has taken the place of the old -teôða in *thirteenth, fourteenth,* etc.

VERBS.—The CONJUGATIONS are determined by the past tenses, the old perfects. The old way of forming the perfect in the Indo-European languages was by repeating the root, a process familiar in Greek and Latin under the name of reduplication: tan, *to extend,* has its perfect tan-tan; these two syllables tend to run together, either by weathering out the unaccented one or by contraction. In Sanscrit we have *ta-tan,* in Greek *te-ta(n)-ka,* Latin *te-tin-i,* Gothic *than* and *thên.* In this way grew up five conjugations in Anglo-Saxon, called ancient or strong conjugations:

1. Root vowel *a* unchanged in the past tense; as, gife, *give;* geaf, *gave;* gifen, *given:* bidde, *bid;* bæd, *bade;* beden, *bidden.*

2. Root vowel *í* changed to *á* in the past tense; as, drîfe, *drive;* drâf, *drave;* drifen, *driven:* rise, *rise;* râs, *rose;* risen, *risen.*

3. Root vowel *u* changed to *eó* in the past tense; as, cleôfe, *cleave;* cleâf, *clave;* clofen, *cloven.*

4. Root vowel *â* changed to *ô* in past tense: as, tace, *take;* tôc, *took;* tacen, *taken.*

5. Root long or diphthong contracting with reduplication to *eó, é* in the past tense; as, feallen, *fall;* feôl, *fell;* feallen, *fallen.*

In this classification the variations produced on the root vowel by adjacent vowels and consonants, as described above under *Phonology,* are not taken into account: and they are so numerous as to leave few verbs exactly alike to serve as models for new forms. Hence all new forms took the sixth or weak conjugation:

6. Past formed by suffixing *-de,* from dide, *did;* lufe, *love;* lufô-de, *loved;* lufôd, *loved.*

English verbs which change their vowel in the past tense come from Anglo-Saxon, and generally from verbs of the strong conjugations: but there are a few from weak verbs which had umlaut or breaking: thus selle, *sell,* sealde, *sold,* where the root *a* has umlaut to *e* in *sell,* as in *man, men,* and has breaking to *ea* before *ld;* so sêce, *seek;* sôhte, *sought,* where root *á* has umlaut to *é,* like *goose, geese,* and the *-de* is changed to *-te.* Similar are *tell, told; bring* from brengen, *brought; think, thought; buy, bought; work, wrought.* The vowels are pretty badly mixed up in English irregular verbs, and it is an inviting field for the grammarian to clear them up one by one.

Some of our auxiliaries come from old perfects used as presents, on which new past tenses are formed: mæg, *may,* meahte, *might;* can, cûðe, *could:* the *l* is bad spelling, in analogy with *would* from *will, should* from *shall.*

Verbs without a connecting vowel are eom, *am;* dôn, *do:* gân, *go,* past êode, *yode.* Stande, *stand,* stôd, *stood,* has an *n* inserted, a relic of an old Sanscrit conjugation.

INDICATIVE MOOD.

Present and Future.	*Past*
ic hŷre, *I hear.*	ic hŷrde, *I heard.*
þû hŷrest, *thou hearest.*	þû hŷrdest, *thou heardest.*
hê hŷreð, *he heareth,*	hê hŷrde, *he heard.*
pê hŷraþ, *we hear.*	pê hŷrdon, *we heard.*
gê hŷraþ, *ye hear.*	gê hŷrdon, *ye heard.*
hi hŷraþ, *they hear.*	hi hŷrdon, *they heard.*

SUBJUNCTIVE MOOD.

ic, þû, *or* hê hŷre.	ic, þû, *or* hê hŷrde.
pê, gê, *or* hi hŷren.	pê, gê, *or* hi hŷrden.

IMPERATIVE.

hŷr þû.
hŷraþ gê.

INFINITIVE.

hŷran.

Gerund, tô hŷranne.

PARTICIPLES.

Present, hŷrende, *hearing.* Passive, hŷred, *heard.*

The *-s* of *hears* is a softening of *-ð,* used already in Anglo-Saxon in the northern dialect. The same *-s* is found in the plural. In the Midland Counties the plural *-ð* changed to *-s* to conform with the past tense and the subjunctive: forms like *thase loves, they love, they loveth* and *they loven,* are found as late as Shakspeare and Spenser. There are said to be 168 plurals in *-e,* and 46 in *-th* in the Shakspeare folio of 1623.

The subjunctive is used for our potential and imperative, as well as the subjunctive. Relics of these uses are in English: *It were a grievous fault.* It *would be* a grievous fault: *Be it so. Let it be so.* But a periphrastic potential, with the auxiliaries *may, can, must, might,* etc., is used in **Anglo-Saxon as in English. The infinitive is regularly without *tô,* hence forms with auxiliaries still reject it, and familiar idioms in which the infinitive is the object of a verb, and *to* is not needed to express purpose or the like.**

There was a verbal noun ending in *-ing, -ung,* which seems to have been confused with the participle in *-ende,* and given form to our present participle.

The participle (hŷred or gifen) is the only passive form. All the modes and tenses of the passive voice are made by joining auxiliaries with it, as in English, German, and other like languages.

The two tenses given above answer for all times—one for all past times, the other for present and future; but forms **with auxiliaries are also used.** Habbe, *have,* for the perfect, and hæfde, *had,* for the pluperfect, are in full use: hê hæfð mon geportne, *he has made sport,* in which it is to be noticed that mon is the object of hæfð, and geportne a participle in the accusative masculine, agreeing with mon.

Some intransitives form these tenses by the verb *to be*: hê is hider getered, *he is* (has) *come hither:* hê pæs âgân, *he was* (had) *gone.* These forms, which are like the German, are common in Shakspeare, Bunyan, and some of them **still in conversation. *Have* with an intransitive does not bear analysis, but we do not want two tense signs for the** same tense.

For the future, sceal, *shall,* and pille, *will,* are common, though seldom free from some meaning of *duty, promise, determination,* such as indeed goes with them in English. The present distinction between *shall* and *will* in the different persons is not established in Anglo-Saxon: *will* is **more common in Northumbrian, as now in Scottish. The future perfect is not discriminated.**

Other ways of expressing the future occur: hê gêð rîðan, *he is going to ride*—French, *Il va lire:* ic tô drincenne hæbbe, *I have to drink = I shall drink:* is tô sylleenne, *is to be betrayed = will be betrayed.*

The progressive form is common, with also a slightly different use from the English: is feohtende, *is fighting, continues fighting:* beôð teohtende, *will continue fighting,* etc. The passive progressive *is being fought* does not occur: an ambiguous verbal noun in *-ing* answers the purpose: he pæs on huntinge, *he was a hunting,* said both of the hunter and the game.

Of the emphatic form in *do* only rare examples are found, perhaps only when the verb is repeated.

PARTICLES.—Most English prepositions and conjunctions are from Anglo-Saxon, and the forms are often so full that we can easily connect them with corresponding words in other languages, and trace their origin and primary meaning. Most of those which look most primitive are from pronouns.

SYNTAX.—**There is nothing in which Anglo-Saxon differs** more from English than in syntax, which is that of a highly inflected language like Latin or Greek. The most general **laws are common to all speech;** a much larger number are common to all Indo-European tongues. The frequency with which different combinations are used by each makes the great difference between them. Apparent anomalies of English syntax may often be easily understood by study of the Anglo-Saxon from which they sprang: "*Mr. thinks*"

saw him," seems strange; but in Anglo-Saxon the *thinks* is found to be a different verb from the common English *think*, and to mean *seem*, and govern a dative; *it seems to me*—*methinks*. "*He taught me grammar*"—tæ̂can, *teach*, governs an accusative and dative, *taught to me*. "*I asked him a question*"—âcsian, *ask*, governs an accusative of the person asked. "*He went a-hunting*"—*a* is the preposition *on* in Anglo-Saxon. "*I loved him the more*"—*the* is in Anglo-Saxon the instrumental case of the demonstrative (þỳ, þê), more *for that*, or *by that*. And so examples might be given without end. No difficult point in English syntax can be safely discussed by one who does not know its history.

For study of the language the English books are—MARCH'S "Comparative Grammar of the Anglo-Saxon," New York, 1870; HADLEY'S "Brief History of the English Language," in Webster's Dictionary, 1865; KLIPSTEIN'S "Anglo-Saxon Grammar," New York, 1853; RASK'S "Grammar," translated by Thorpe, London, 1865; BOSWORTH'S "Anglo-Saxon Dictionary," London, 1837; MARSH'S "English Language, and its Early Literature," New York, 1862; CORSON'S "Hand-book of Anglo-Saxon and Early English," New York, 1871; SHUTE'S "Manual," New York, 1867; MARCH'S "Introduction to the Study of Anglo-Saxon," New York, 1870. In German: HEYNE, "Kurtze Laut- und Flexionslehre," Paderborn, 1862; KOCH, "Historische Grammatik der Englishen Sprache," Weimar, 1863; MAETZNER, "Englische Grammatik," Berlin, 1865; ETTMÜLLER, "Lexicon cum Synopsi Gram.," Qued. & Lips., 1851; GREIN, "Sprachschatz der Angelsächs. Dichter," Cassel and Göttingen, 1864; GRIMM, "Deutsche Grammatik," Göttingen, 1840.

ANGLO-SAXON LITERATURE.—The pagan Anglo-Saxons had their poets and orators, and after their conversion to Christianity there was an unbroken succession of good scholars in England. Most of their writings are, however, in Latin.

The *prose* writings in the Anglo-Saxon language may be classified as follows:

1. *Theological.*—The Gospels were read in the native tongue as part of the church service, and several manuscripts are preserved. Editions have been printed by Parker, 1571, Marshall, 1665, Thorpe, 1842, reprinted in America by Klipstein, Bouterwek, 1857, Surtees Society, 1854–63, Bosworth, 1865. Ælfric's translation of the Heptateuch was published by Thwaites, 1698. We have also versions of the Psalms. There are many *Homilies*. Ælfric, an eminent scholar, compiled or translated a series of eighty of them about A. D. 990, which were edited by Thorpe for the Ælfric Society, 1844–46. Others are promised by the Early English Text Society.

2. *Philosophical.*—King Alfred translated Boethius, "De Consolatione Philosophiæ." It is freely rendered, with large additions and omissions by the royal author. Editions are by Rawlinson, 1698, Cardale, 1829, and Fox in Bohn's Library, 1864.

3. *Historical.*—The most illustrious of the Anglo-Saxon scholars, Beda, known to many generations as "the Venerable Bede," wrote in Latin an "Ecclesiastical History of the Angles and Saxons," translated by King Alfred into Anglo-Saxon, abounding in picturesque details of the heroic adventures and characters of his time, which has been often reprinted, and its best scenes repeatedly rendered into verse. (See, for some of them, WORDSWORTH'S "Ecclesiastical Sonnets.") The Anglo-Saxon translation was edited, with a Latin translation, by Abraham Wheloc, folio, 1644, and by Dr. John Smith, 1722.

"The Anglo-Saxon Chronicle" gives an outline of the history of Britain from the earliest times to Henry II., A. D. 1154. Copies were kept at the monasteries as early as the time of Alfred. As far as Beda's history extends, the Chronicle has been drawn from it or a common source. It is in general a meagre affair. There are many editions: Thorpe's, 1861, has seven parallel texts, a translation and indexes.

The general "History of the World," by Orosius, was translated by Alfred, with additions of some value. It has often been printed. Thorpe's edition in Bohn's Library has a translation and glossary, 1857.

Many brief biographies are found in Beda and the Homilies, and some separate lives. That of St. Guthlac (see WRIGHT'S "Biographia Literaria") has been several times printed; Goodwin, London, 1848.

4. *Law.*—A considerable body of laws has been got together. They begin with those of Æthelbirht, who was king of Kent at its conversion. Those of Alfred have an introduction on the history of law, the laws of Moses, and their relations to Christ and Christian nations. The laws are full of valuable knowledge. The ecclesiastical rules relating to confession, penance, and the like are particularly suggestive. The best editions are Thorpe's and that of Schmid, Leipsic, 1858. The latter has translations into Latin and German, and valuable notes and a glossary.

5. *Natural Science and Medicine.*—Such are in "Popular Treatises of Science," Wright, 1841, and Leechdom's, Cockayne, 1864–66.

6. *Grammar.*—There is a grammar by Ælfric in Somner's Dictionary, 1659: A Colloquy and glossaries, Wright, 1857.

ANGLO-SAXON POETRY is very different in metrical structure from the English. It is like the Old Icelandic, the Old Saxon, and the Earliest German. It is marked off into verses by alliteration, the recurrence of the same initial sound in the first accented syllables of words. A perfect verse of the common narrative kind has three alliterating syllables—two in the first section, and one in the second; but the first section has but one in many verses. A very artificial rhythm is used. Each section has four beats or metrical accents. Every root-syllable has its beat, and so has the final syllable of each section, and almost any syllable may have a beat if the poet chooses.

þǽr′ wæs *h*æl′eðâ *h*leah′tor′; *h*lyn′ spyn′sôde′,
*w*ord′ þǽr′on *w*yn′sume′, Eôd′e Wealh′ðeôþ′ forð′,
cpên′ Hrôð′gâr′es′ cyn′nâ′ gemyn′dig′,
*g*rêt′te *g*old′-hrod′en′ *g*um′an′ on heal′le,′
and′ þâ *fr*eð′lic′ þíf′ *f*ul′ ge′seal′de′,
ǽr′est *E*ást′-Den′â′ ǽð′el′-pear′de′,
*b*æd′ hin′e *b*líð′ne′ æt þǽr′e *b*eôr′-þeg′e′.

There was *l*ordly *l*aughter; there the *l*ute's vibration,
*w*ords were *w*insome. Forth yode Wealhtheow.
queen of Hrothgar, of courtesies mindful,
*g*reeted in *g*old-array the *g*uests in the hall,
and then the *g*ladsome wife *g*ave the beaker
first to the sovereign *l*iege, *l*ord of the East-Danes,
*b*lithe she *b*ade him be at the *b*eer-drinking.

Knowledge of the popular poetry was universal. It was disgraceful not to be able to chant in turn at the feasts. Beda, Aldhelm, Alfred learned and loved the old ballads, and made verses. Most of the poetry has perished. The early Christians condemned whatever was mixed with the old superstitions, and the Normans despised or neglected all Anglo-Saxon literature. But we have specimens of various kinds:

1. *The Ballad Epic.*—The old ballads are brought together, beautified, exalted, and fused into a long poem. "Beowulf" is the "Iliad" of the Anglo-Saxons. The exploits celebrated in it are for the most part combats with monsters after the manner of Hercules, but it has the usual epic variety—the wrath of the monster, the rousing of the hero, the fitting out of the ship, the voyage, the banquet, the wordy war of rivals, woman's graceful presence, the arming for fight, and desperate and long-drawn struggles. Only one manuscript of it remains. Little notice of it was taken till the late revival of Anglo-Saxon scholarship; but the interest in it has risen to a great height, and many editions, translations, and essays of elucidation and interpretation have appeared in Germany, England, and Denmark. We may mention Kemble, 1833–37; Ettmüller, 1840; Thorpe, 1855; Grein, two editions, 1857–67; Gruntvig, 1861; Heyne, two editions, 1863–68.

There are a few fragments to be classed with "Beowulf." Such are the "Traveller's Song" and the "Fight at Finnsburg," both which are given with "Beowulf" in many editions.

2. *The Bible Epic* is a treatment of the Bible narrative similar to that of the ballad epic. The great master in this sphere is Cædmon, who is often called the Anglo-Saxon Milton. Beda, who lived in the same region, and may have seen him, tells us that he was an unlearned man, who could not sing the common secular ballads, and that a vision appeared to him and directed him to sing the Creation, and that his success was esteemed inspiration. He had many imitators, and whether the poems which remain are his is not known. These are four poems, called, by Grein, Genesis, Exodus, Daniel, Christ and Satan. Similar are a fragment of Judith, Cynewulf's "Christ," "The Harrowing of Hell," and some fragments. Of all these we have a critical edition and translation by Grein, and of Cædmon editions by Thorpe, 1832; Bouterwek, 1849–54. The manuscript is illuminated, and the illuminations were copied and published in 1833.

3. *Ecclesiastical Narratives.*—These are versified lives of saints and chronicles. We have Andreas (1724 lines), Juliana (731 lines), Guthlac (1353 lines), Elene (1321 lines).

4. *Psalms and Hymns.*—Translations of a large part of the Hebrew Psalms, and a few Christian hymns and prayers.

5. *Secular Lyrics.*—A few from the "Chronicle," celebrating the kings or others.

6. *Allegories, Gnomic Verses, and Riddles.*—"The Phœnix" (677 lines), "The Panther" (74 lines), "The Whale" (89 lines), Gnomic Verses and Riddles; "Dialogue between Solomon and Saturn," in Grein, vol. ii., pp. 339–407—a favorite style with the Anglo-Saxons.

7. *Didactic, Ethical.*—Alfred's "Metres of Boethius" are versifications of parts of Boethius referred to under Prose Writings above. The best edition is Grein, vol. ii., pp. 295–339. Grein's "Bibliothek der Angelsächsischen Poesie," Göttingen, 1857, with his translations and complete glossary, gives the apparatus for the study of all these poems. His "Bibliothek der Angelsächsischen Prosa," now in process of publication, promises to render an equal service for Anglo-Saxon prose.

(Outlines of this literature are to be found in MARCH'S "Introduction to Anglo-Saxon," New York, 1870; MORLEY'S "English Writers," London, 1867; WRIGHT'S "Biographia Brit. Literaria," London, 1842; ETTMÜLLER'S "Scopas" and "Boceras," Qued. and Lips., 1850.)

F. A. MARCH.

Ango'la (formerly **Don'go** or **Ambonde**), a country in the S. W. part of Africa, bordering on the Atlantic Ocean, is bounded on the N. by Congo, from which it is separated by the Danda River, and on the S. by the Coanza River. It is included between lat. 8° and 10° S. The interior is said to be mountainous or hilly; the land is well watered, and produces a luxuriant tropical vegetation. Angola is rich in minerals, among which are gold, silver, copper, and iron. Lions, leopards, elephants, and hippopotami abound here. The chief articles of export are ivory, gold, wax, and slaves. This country is subject to the Portuguese, who have several forts on the coast. Nominally, a large proportion of the population belongs to the Roman Catholic Church, which, since the middle of the sixteenth century, has had a bishop in the capital; but their Christian belief is still largely mixed with pagan notions and practices. Pop. of the colony, about 600,000. Area, 25,500 square miles. Capital, San'Paulo de Loando; pop. about 12,500.

Angola, the county-seat of Steuben co., Ind. It has a large school building, a machine-shop, two foundries, a flouring-mill, two saw-mills, two planing-mills, two weekly papers, ten dry goods stores, three drug stores, two hardware stores, and two printing-offices. Pop. 1072.

W. C. MCGONIGAL, ED. "REPUBLICAN."

Angola, a post-village of Evans township, Erie co., N. Y., on Big Sister Creek and on the Lake Shore R. R., 21 miles S. W. of Buffalo. It was the scene of a memorable railroad accident Dec. 18, 1867, when 40 persons were wounded and 70 killed, many of them burned alive. Pop. 600.

Ango'ra (the ancient *Ancy'ra*; in Turk., *Engoor'*), a town of Asiatic Turkey, about 217 miles E. S. E. of Constantinople. It is situated on an elevated plain adapted to pasturage, and is celebrated for its breed of goats, having long silky hair which is manufactured into shawls and a stuff called mohair. Large quantities of this hair are exported, and goats of this breed have been successfully introduced into the U. S. Here are remains of Greek and Byzantine architecture. In 1402 a decisive victory was gained near Angora by Tamerlane over Bayazeed (Bajazet), who was taken prisoner. The pop. is estimated at 50,000. (For a notice of the ancient city, see ANCYRA.)

Angor'no, or **Angornu,** a town of Central Africa, in Bornu, is near the W. bank of Lake Tchad and 15 miles S. E. of Kuka. It has an extensive trade in cotton, amber, and slaves. Pop. estimated at 30,000.

Angostu'ra, or **Bol'ivar City,** an important city of Venezuela, capital of the province of Guiana, is on the right bank of the Orinoco River, 263 miles S. E. of Caracas. It is advantageously situated for trade, and exports cotton, indigo, coffee, tobacco, cattle, etc. It contains a college, a hospital, and a fine hall in which the congress of Angostura met in 1819. Pop. about 7000.

Angostura Bark, or **Angustura Bark,** the aromatic bitter bark of certain trees of the natural order Rubiaceæ, natives of the tropical parts of South America. The bark is so named because it is imported from Angostura. It is tonic and stimulant, and has been used in the cure of fever, dysentery, diarrhœa, etc. It is obtained chiefly from the *Galipæ'a officina'lis* or *Cuspa'ria febri'fuga*.

Angoulême (anc. *Inculis'ma* or *Iculis'ma*), a city of France, capital of the department of Charente, on the river Charente and on the Paris and Bordeaux Railway, 83 miles by rail N. E. of Bordeaux. It is situated on a hill, and has a cathedral, college, theatre, public library, and several paper-mills. Linen and woollen stuffs are manufactured here. This town was the birthplace of Marguerite de Valois and Balzac. Pop. in 1866, 25,116.

Angoulême, d' (CHARLES DE VALOIS), DUKE, a natural son of Charles IX. of France, born April 28, 1573. Having formed a plot against King Henry IV., he was imprisoned from 1604 to 1616. He had the chief command of the royal army when it began the famous siege of Rochelle in 1628. Died Sept. 24, 1650.

Angoulême, d' (LOUIS ANTOINE DE BOURBON), DUKE, born Aug. 6, 1775, was the eldest son of the Comte d'Artois, afterwards Charles X. of France. He emigrated with his father in 1789, and in 1799 married his cousin, Marie Thérèse Charlotte, a daughter of Louis XVI., with whom he lived in exile until 1814. He commanded the French army which intervened against the Spanish liberals in 1823, and restored Ferdinand VII. to absolute power. His abilities were mediocre. Died at Görtz June 3, 1844.

Angoulême, d' (MARIE THÉRÈSE CHARLOTTE), DUCHESS, the wife of the preceding, was born Dec. 19, 1778, and was a daughter of Louis XVI. In Aug., 1792, she was confined in the Temple with the king and her mother, Marie Antoinette. She was released in 1795, and exchanged for Camus and others who had been captured by the Austrians, after which she passed many years in exile. She appears to have had more energy than the other Bourbons. She became again an exile in 1830. Died Oct. 19, 1851.

Angoumois, a former province of France, included the present department of Charente and part of Dordogne. Its capital was Angoulême.

An'gra,* a seaport-town, and the capital of Terceira, one of the Azores; lat. 38° 39′ N., lon. 27° 12′ W. It has a beautiful situation and a good harbor. It contains a cathedral, a military college, and an arsenal. Wine, grain, honey, etc. are exported from this town. Pop. in 1863, 11,839.

An'gri, a town of Italy, in the province of Salerno, on the railway from Naples to Eboli, 15 miles by rail N. W. of Salerno. Pop. in 1861, 6921.

Anguil'la, or **Snake Island,** an island in the Leeward group, in the West Indies, 4 miles N. of St. Martin. Area, 34 square miles. The island is low and covered with forests, and belongs to Great Britain. The staple products are sugar, tobacco, and cotton. Pop. about 3100.

Anguil'lula (*i. e.* "little eel," from the Lat. *anguil'la*, an "eel"), a genus of minute animals allied to the nematoid worms. Best known are those called "vinegar eels," found abundantly in cider vinegar. They are remarkable for tenacity of life. *Anguillula fluviatilis*, after being dried until it becomes brittle, will recover its activity when placed in water. *Anguillula tritici*, found on blighted wheat, has been known to revive after being kept dry for five years.

An'guis [a Latin word signifying "serpent"], a systematic name of a genus of serpent-like reptiles having the maxillary teeth compressed and hooked, and the palate not armed with teeth. (See BLIND WORM.)

Anguiscio'la, or **Angusso'la** (SOFONISBA), an eminent Italian painter, born at Cremona about 1534, excelled in portraits. Invited by Philip II. of Spain, she went to Madrid, and painted portraits of the queen and others. In the latter part of her life she became blind. It is said that Van Dyke acknowledged he had derived much benefit from her conversations on art. Died in 1626.

Angular Motion of a point or a body is the same as that of the line or radius vector joining the moving point to some fixed point. The *angular velocity* of the body in reference to the fixed point is the ratio of the angle described by the radius vector to the time occupied by its description.

Angus, EARL OF. See DOUGLAS.

An'gus (Rev. JOSEPH), D. D., born Jan. 16, 1816, educated at the University of Edinburgh, president of Regent's Park College (Baptist), London, and author of "The Bible Handbook," "Handbook of English Literature," "Handbook of the English Tongue," and other works, and editor of the best edition of Butler's "Analogy" (1855, 12mo, pp. 551). He is one of the revisers of the English New Testament for the American Bible Union, a member of the committee of the convocation of Canterbury for revising the New Testament, and a prominent member of the Evangelical Alliance, as a delegate of which he visited the U. S. in 1873.

Angus (SAMUEL), a naval officer born at Philadelphia in 1784. He became a captain in the U. S. navy, and commanded the vessel which in 1814 conveyed Adams and Clay to Ghent on a diplomatic mission. He served with distinction in the French troubles of 1800, in the war of 1812, and was four times wounded. Died May 29, 1840.

An'halt, a duchy of Germany, almost completely surrounded by the Prussian province of Saxony, consists of two larger parts and four enclaves, having together an area of 897 square miles. The duchy is traversed by the Saale, the Elbe, and the Selke. While the eastern part is level, the western is mountainous and wooded. The soil is

* *Angra* in Portuguese denotes a "creek," "bay," or "station for ships."

generally fertile. Cattle-raising is extensively and successfully carried on here. Here are also mines of silver, copper, iron, and lead. The duchy has five gymnasia and three seminaries. Pop. in 1871, 203,354. Capital, Dessau. According to the budget of 1872, the receipts and the expenses were both estimated at 2,231,000 thalers. The public debt in 1871 amounted to 2,259,219 thalers. The dukes of Anhalt claim to have descended from the celebrated ALBERT THE BEAR (which see), the first margrave of Brandenburg. In 1212 Anhalt was divided into three parts; it was united in 1570 by Joachim Ernst, and again divided into four branches—Dessau, Bernburg, Köthen, and Zerbst—upon his death in 1586. In 1793, after the extinction of the house of Anhalt-Zerbst, its dominions were divided by the remaining three. In 1807 the three houses joined the Confederation of the Rhine, and in 1814 the German Confederation. In 1847 the house of Anhalt-Köthen became extinct, and the duke of Anhalt-Dessau took the administration of its dominions upon himself; and when, in 1863, the house of Anhalt-Bernburg also became extinct, Anhalt was again united under one ruler. (See the works of HEINE, 1865; KRAUSE, 5 vols., 1861–66; and SIEBIGK, 1867.)

An'halt-Bern'burg (CHRISTIAN), PRINCE OF, a German general, born in 1568, was a man of superior abilities. He was the chief promoter of a league of Protestant princes formed against the emperor in 1608. He commanded the army of Frederick elector Palatine, which was defeated at Prague in 1620. Died in 1630.

An'halt-Des'sau (LEOPOLD), PRINCE OF, an able German general, born in 1676, commanded the Prussian troops under Prince Eugène in Italy and Flanders in 1706–12, and was second in command of the Prussian army which opposed Charles XII. of Sweden in 1715. Died in 1747.

Anhandu'hy-Mirim' and **Anhandu'hy-Guazu'**, two rivers of Brazil, in the province of Matto-Grosso. They rise in the Serra Galhano, and enter the Rio Vermelho. The former is about 150 miles, and the latter about 200 miles, in length.

An'holt, an island of Denmark, in the Cattegat, is 7 miles long and about 4 miles wide; lat. of the lighthouse, 56° 44′ N., lon. 11° 39′ E. It is surrounded by dangerous shoals. Pop. 200.

Anhy'dride, an oxygen compound formed by the abstraction of water from an acid. Thus, for instance, by taking (new notation) water, H_2O, from carbonic acid, H_2CO_3, we have carbonic anhydride, CO_2. (See CHEMISTRY.)

Anhy'drite [from the Lat. *adhy'drus*, and the Gr. λίθος, a "stone"], a mineral composed of anhydrous sulphate of lime. It is harder and heavier than common sulphate of lime (gypsum), into which it is slowly converted by the absorption of water. It occurs in several varieties—viz. granular, fibrous, radiated, and translucent, sparry anhydrite or cube-spar, and compact anhydrite.

Anhy'drous [from the Gr. ἀν, priv., and ὕδωρ, "water"], "without water," a chemical term applied to a compound which contains no water, as pure and absolute alcohol, which is called *anhydrous alcohol;* quicklime as it comes from the kiln is *anhydrous lime*, but when it comes into contact with water, the lime and water combine and form *hydrated* lime.

Anice'tus, SAINT, was bishop of Rome about 155 A. D. The time of his death is uncertain.

An'il, one of the plants from which indigo is obtained; a kind of indigo said to be a native of America, but now cultivated in the East Indies. It is very similar to *Indigof'era tincto'ria.*

An'iline [from *anil*, "indigo"], **Phenyl'amine,** or **Am'ido-benzol',** discovered in 1826 by Unverdorben as a product of the distillation of indigo, and called by him *crystalline*, on account of the ready crystallization of its salts. It attracted much attention from chemists, and was made the subject of many researches, which contributed greatly to enlarge the facts and theories of modern chemistry. It did not acquire any commercial importance till 1856, when Perkin prepared from it the beautiful purple dye *mauve*. The brilliancy and intensity of this color attracted the attention of chemists and dyers, and in a short time an entirely new series of colors was discovered, by which the art of dyeing has been almost revolutionized.

Aniline is found among the products of the distillation of bituminous coal (in "coal-tar"), of peat, bones, etc. It is prepared, however, from benzol derived from the more volatile portions of coal-tar. The benzol, C_6H_6, is converted by the action of nitric acid into nitrobenzol, $C_6H_5NO_2$, and this compound is changed by the action of ferrous acetate, produced by iron filings and acetic acid, into aniline:

$$\underset{\text{Nitro-benzol.}}{C_6H_5NO_2} + 6FeO + H_2O = \underset{\text{Aniline.}}{C_6H_7N} + 3Fe_2O_3.$$

Aniline is a colorless, mobile, oily liquid, having a faint vinous odor and aromatic burning taste. Its specific gravity is 1.002; boiling-point, 182° C. It is very poisonous. It dissolves very slightly in water, in all proportions in ether, alcohol, wood-naphtha, bisulphide of carbon, and in oils, fixed and volatile. The aqueous solution is faintly alkaline, and precipitates many metallic bases from solutions of their salts. With bleaching-powder it produces a violet-blue color, with sulphuric acid and potassic bichromate, a bluish-black precipitate, and when treated with arsenic acid, stannic chloride, etc., it is converted into rosaniline. When exposed to the air, aniline acquires a yellow or red color, which is always noticed in commercial "aniline oil." It forms a numerous class of salts, most of which crystallize readily.

Aniline is an amine, a monamine, or an ammonia, in which one atom of hydrogen is replaced by a radical *phenyl*, C_6H_5:

$$\text{Ammonia, } N\begin{cases}H\\H\\H\end{cases};\ \text{Aniline, } N\begin{cases}H.\\C_6H_5.\\H.\end{cases}$$

Aniline is now manufactured in enormous quantities for the preparation of the different colors. (See AMINES, BENZOL, PHENYL.)

C. F. CHANDLER.

Aniline Colors. In 1835, Runge noticed the violet-blue color produced by chloride of lime with aniline, and Fritzsche subsequently showed that chromic acid formed with aniline a blackish-blue precipitate. In 1853, Beisenhirtz obtained a blue by acting upon aniline with potassic dichromate and sulphuric acid. It remained for W. H. Perkin to develop this reaction, and to lay the foundations of the great aniline industry which is now so extensive. In 1856 he isolated the color found in the last-mentioned reaction, called it mauve, and showed that it could be used as a dye. Many chemists at once turned their attention to the subject, and a great number of new colors of almost every tint and shade were discovered, which have taken the place in dyeing, and to a considerable extent in calico-printing, of the animal and vegetable colors in previous use. The chemical composition of many of these colors has been established, and many chemical facts of great importance have been developed by their study.

ANILINE REDS.—*Rosaniline* salts are the most important of all the aniline colors. They are not only used for the production of brilliant tints on cotton, wool, and silk, but they constitute the material from which many of the other colors are prepared. Rosaniline has been shown by Hofmann to be a colorless base, a triamine (see AMINES), having the formula $C_{20}H_{19}N_3$, or $N_3\begin{cases}(C_6H_4)''.\\2(C_7H_6)''.\\H_3.\end{cases}$ It is produced by the union of one molecule of aniline with two molecules of toluidine, and the abstraction of six atoms of hydrogen:

$$\underset{\text{Aniline.}}{C_6H_7N} + 2\underset{\text{Toluidine.}}{C_7H_9N} - \underset{\text{Rosaniline.}}{C_{20}H_{19}N_3} + H_6.$$

A great variety of dehydrogenizing agents may be employed to effect this reaction. It is found that the best results are obtained when an aniline oil is employed which contains about 25 per cent. of toluidine. Hofmann in 1858 prepared rosaniline by treating aniline with tetrachloride of carbon, but on a manufacturing scale Medlock's process with arsenic acid is now in most general use. The aniline oil, 1 part, is heated with 1½ parts of a 75 per cent. solution of arsenic acid in a closed iron still provided with a stirrer. The product is boiled with water and filtered, and on adding to the solution common salt in excess, the crude hydrochlorate of rosaniline is precipitated. This is dissolved in boiling water, filtered, and allowed to crystallize. This salt of rosaniline, $C_{20}H_{19}N_3.HCl$, is known as *aniline red, magenta, fuchsine, solferino, roseine, azaleine*, etc. It appears in magnificent green crystals, with a metallic lustre like that of the wing-covers of Brazilian beetles or cantharides. It is soluble in water and in alcohol, with a color varying from a beautiful cherry-red to a crimson.

Verguin and Rénard of Lyons, who first made aniline red on a manufacturing scale, used tetrachloride of tin, $SnCl_4$. Gerber-Keller prepared rosaniline nitrate, *azaleine*, by the action of mercuric nitrate. Lauth and Depouilly heat aniline with nitrate of aniline. Laurent and Castelhaz prepare aniline red directly from the crude nitrobenzol, which contains nitrotoluol, by heating it with iron filings and hydrochloric acid. The first reaction of the FeCl on the nitrobenzol results in the removal of oxygen from the nitrobenzol and nitrotoluol, and the addition of hydrogen, producing aniline, toluidine, and Fe_2Cl_6. On heating this mixture further, the Fe_2Cl_6 removes hydrogen from the aniline and toluidine, and rosaniline is the result. Coupier heats together aniline, nitrotoluol, hydrochloric acid, and

a little iron. Rosaniline hydrate, $C_{20}H_{19}N_3.H_2O$, may be precipitated from the solutions of its salts by alkalies; it is rose-red and somewhat crystalline, but by proper care may be obtained colorless.

Ammonic sulphide, or zinc-powder, converts rosaniline salts into leucaniline, $C_{20}H_{21}N_3$, which is colorless; by adding H_2, oxidizing agents change it back to rosaniline. Advantage is taken of this fact to produce discharge patterns, the zinc-powder, thickened with gum, being printed upon goods previously dyed with aniline red. Silk and wool take up aniline red very readily, but cotton must be previously mordanted. For dyeing cotton the mordant generally used is tannate of tin, produced by subjecting the cotton first to a solution of sumach, then to sodic stannate, and finally to dilute sulphuric acid. In calico-printing the color is mixed with albumen or the preparation of Perkin and Schultz, a solution of aluminic arsenite in aluminic acetate. On drying and steaming the goods the color is rendered insoluble or fixed.

Other reds of less importance are di-hydriodate of trimethyl chrysaniline, $C_{20}H_{14}(CH_3)_2N_3.(HOI)_2$, called chrysaniline red; nitrosophenyline, $C_6H_6N_2O$; toluidine red, xylidine red, etc.

Aniline Pink.—*Safranine* is a coloring-matter produced by the oxidation of aniline. It is supposed to be $C_{21}H_{20}N_4$. It forms crystallizable salts.

Aniline Violets and Blues.—These colors shade into each other so gradually that they cannot well be separated.

1. *Mauve*, or aniline purple (of Perkin), was the first of the aniline products used as a dye. It is the sulphate or other salt of the base mauveine, $C_{27}H_{24}N_4$. It may be prepared from pure aniline, free from toluidine, by the action of potassic dichromate and sulphuric acid. It may also be prepared by the action of cupric chloride (Dale and Caro), or by chloride of lime. This dye has been entirely superseded by other preparations. It was known while in commerce as mauve, aniline purple, Perkin's violet, indisine, aniline harmaline, violine, and mauve rosolane.

2. *Hofmann's Violets and Blues.*—Rosaniline contains, as shown in the formula given above, three atoms of replaceable hydrogen. By substituting for one, two, or all of these, various alcohol radicals, as *methyl*, *ethyl*, *amyl*, etc., a great variety of colors, ranging from the red of rosaniline salts through purples and violets to the purest blue, are obtained. Hofmann's violets are produced by heating rosaniline, alcohol, and the iodide of methyl, ethyl, or amyl under pressure. A violet syrup results, containing the hydriodate of the new substitution product; for instance, hydriodate of trimethyl rosaniline, $C_{20}H_{16}(CH_3)_3N_3.HI$. To recover the iodine, the solution may be boiled with caustic potash, which precipitates trimethyl rosaniline, which may be washed, and redissolved in alcohol containing hydrochloric acid, or in acetic acid and water. The following are some of the more important colors of this group: Hydrochlorate of methylrosaniline, $C_{20}H_{18}(CH_3)N_3HI$; hydriodate of methylrosaniline, $C_{20}H_{18}(CH_3)N_3HI$; hydrochlorate of dimethylrosaniline, $C_{20}H_{17}(CH_3)_2N_3.HCl$; hydrochlorate of trimethylrosaniline, $C_{20}H_{16}(CH_3)_3N_3.HCl$; hydrochlorate of monethylrosaniline, $C_{20}H_{18}(C_2H_5)N_3.HCl$, called also Hofmann's red violet; hydriodate of ethylrosaniline, $C_{20}H_{18}(C_2H_5)N_3.HI$, called also Hofmann's red violet: ethyliodate of ethylrosaniline, $C_{20}H_{18}(C_2H_5)N_3.C_2H_5I$, called also fuchsine with a blue tint, and Hofmann's violet red; hydrochlorate of diethylrosaniline, $C_{20}H_{17}(C_2H_5)_2N_3$, HCl, called also Hofmann's blue; ethyliodate of diethylrosaniline, $C_{20}H_{17}(C_2H_5)_2N_3.C_2H_5I$, called also Hofmann's red violet and ethylic rosaniline violet; hydrochlorate of triethylrosaniline, $C_{20}H_{16}(C_2H_5)_3N_3.HCl$, called also Hofmann's blue; ethyliodate of triethylrosaniline, $C_{20}H_{16}(C_2H_5)_3N_3(C_2H_5I$, called also Hofmann's blue and ethylic rosaniline violet; ethylbromate of triethylrosaniline, $C_{20}H_{16}(C_2H_5)_3N_3.C_2H_5Br$, called also brimula. Wauklyn used isopropyl iodide in a similar manner.

As the successive atoms of hydrogen are replaced by the alcohol radical, the shade passes farther and farther from the original red, giving first a reddish-purple, then a full purple, then violet, then reddish-blue, finally a full blue. The picrate of triethylrosaniline yields a fine green tint.

3. *Phenyl-rosanilines.*—By heating rosaniline salts with aniline (phenylamine) the radical phenyl, C_6H_5, is introduced in the place of H, giving rise to a series of purples and violets, terminating in the most beautiful blue triphenylrosaniline—*bleu de Lyon*, the only blue which has come into extensive use. This blue is insoluble in water, which rendered its application somewhat troublesome, as an alcoholic solution was necessary. Nicholson found that sulphuric acid produced a compound analogous to sulphindigotic acid, soluble in water; this is now extensively manufactured under the name of "Nicholson's blue" or "soluble blue." The following are the more important compounds of this series: Hydrochlorate of monophenylrosaniline, $C_{20}H_{18}(C_6H_5)N_3.HCl$, called also rosaniline violet, red monophenylrosaniline, and Hofmann's violet; hydrochlorate of diphenyl rosaniline, $C_{20}H_{19}C_6H_5)_2N_3$. HCl, also known as rosaniline violet and Hofmann's violet; triphenylrosaniline or triphenylic rosaniline, $C_{20}H_{16}(C_6H_5)_3N_3$, called also aniline blue, rosaniline blue, Hofmann's blue, bleu de Paris, bleu de Lyons, bleu de Mulhouse, bleu de Mexique, bleu de nuit, bleu lumiere, bleuine, azurine, and night blue; hydrochlorate of triphenylrosaniline, $C_{20}H_{16}(C_6H_5)_3N_3.HCl$, known also by the same names as the above; acetate of triphenylrosaniline, $C_{20}H_{16}(C_6H_5)_3N_3.H,CH_3O_2$, known also by the same names as the above; bisulphotriphenyl rosaniline acid, $C_{20}H_{16}(C_6H_4SO_3H)_3N_3$, $(H_2SO_4)_2.H_2SO_4$, called also Nicholson's blue and soluble blue. In this acid the last H_2 are replaceable by metals with the formation of salts.

4. *Tolyl-rosanilines* correspond to the phenyl-rosanilines. The most important is tritolyl-rosaniline, $C_{20}H_{16}(C_7H_7)_3N_3$, known as toluidine blue.

5. Many other derivatives of aniline, rosaniline, etc. have been introduced, which exhibit shades from red to blue, passing through purple and violet, as dahlia-colored salts of ethylmauveine, $C_{27}H_{23}(C_7H_5N_4$; the violet salts of methylaniline, $C_6H_6(CH_3)N$; salts of violanile, $C_{15}H_{15}N_3$, and of mauvaniline, $C_{19}H_{17}N_3$. Besides these there are many colors the composition of which is not known, such as regina blue, opal blue, regina purple, bleu de Fayolle, violet de Mulhouse, Britannia violet, geranosine, violet imperial.

Aniline Greens.—1. *Aldehyde green*, called also *aniline green*, *viridine*, and *emeraldine*.—In 1861, Lauth obtained a beautiful but fugitive blue by the action of aldehyde on a solution of a rosaniline salt in sulphuric acid. A young chemist, Cherpin, endeavored to fix the color, and was advised by a photographer's apprentice to use sodic hyposulphite, a salt used for fixing photographs, on account of its property of dissolving argentic chloride, bromide, and iodide. Cherpin followed the unscientific advice, and obtained the most beautiful green. The original process of Lauth and Cherpin is still pursued, and is so simple that many dyers prepare the color for themselves. Aldehyde green is principally employed in silk-dyeing.

2. *Iodine green*, known also as *iodide of methyl green*.—It is produced by heating trimethyl or triethyl rosaniline violets (Hofmann's violets), or methylaniline violets, with the iodide of methyl, ethyl, or amyl. The color is a salt of a new base, which may be separated by the action of sodic hydrate. It is extensively used for cotton and silk. Its tint is bluer than that of aldehyde green, and it is more useful, as it yields a greater variety of shades in connection with picric acid.

3. *Perkin's green*, or *iodide of ethyl green*.—This dye resembles iodine green, but differs in solubility; it is much used, especially in calico-printing.

4. *Emeraldine.*—A green which may be produced in the fibres of cotton cloth by printing on a mixture of an aniline salt and potassic chlorate, and allowing it to dry for twelve hours, when the green color will have been developed. Hot dilute alkalies or boiling soap solutions change it to blue.

Aniline Yellows.—Aniline yellows are little used in dyeing or printing.

1. *Chrysaniline*, $C_{20}H_{17}N_3$, called also *phosphine*, *aniline yellow*, *yellow fuchsine*, is a secondary product in the manufacture of rosaniline. Owing to the insolubility of its nitrate, it has been proposed to use its acetate or hydrochlorate as a reagent to precipitate nitric acid.

2. Other yellows are chrysotoluidine, $C_{21}H_{21}N_3.H_2O$, the isomeric compounds diazo-amidobenzene and amido-diphanylimide, $C_{12}H_{21}N_3$, and zinaline, $C_{20}H_{19}N_3O_6$.

Aniline Browns and Maroons.—Several browns have been produced directly or indirectly from aniline. De Laire obtained a maroon by adding rosaniline hydrochlorate to fused aniline hydrochlorate. Schultz prepared a fine garnet color by passing nitrous vapors through a solution of soda holding rosaniline in suspension. Jacobsen prepares a rich brown by heating picric acid and aniline together, dissolving the product in hydrochloric acid, and precipitating with caustic soda. He obtains another by heating ammonium chromate with aniline formate. Koechlin produces a brown on wool by printing on a mixture of rosaniline hydrochlorate (fuchsine), oxalic acid, and potassium chlorate, and on cotton by adding to this mixture some cupric sulphide. Browns are generally made from the residues of rosaniline.

Aniline Gray.—Castelhaz has patented a process by which a beautiful gray is produced, which has, however, found little favor among dyers on account of its high cost. He subjects mauveine (Perkin's violet) to the action of sulphuric acid and aldehyde. Carves and Thierault prepare a rich gray, called by them *murein*, by mixing aniline,

hydrochloric acid, potassic dichromate, copperas, and sulphuric acid.

Aniline Black.—No one has yet succeeded in producing a good black dye from aniline, though the color produced on cotton, silk, or wool by immersing first in a solution of an aniline salt, and then in potassic dichromate, is very near a black. In calico-printing, however, blacks of great intensity and durability have been discovered, which are now extensively used; in fact, except for mourning goods, in which the black predominates over the white, the aniline black is now used almost exclusively. Lightfoot discovered the first aniline black in 1863. He printed on the cotton a mixture of aniline hydrochlorate, potassic chlorate, cupric chloride, sal-ammoniac, acetic acid, and starch paste; exposed the cloth to the air for two days, and fixed the color with an alkali. Lauth improved the process by substituting cupric sulphide for the cupric chloride. Cordillot substituted potassium ferridcyanide for the copper salt. Alfred Paraf in 1865 introduced a mixture of aniline hydrochlorate, potassic chlorate, and hydrofluosilicic acid, properly thickened. On exposing the goods in the "ageing-room" to a temperature of 32° to 35° C., the chloric acid is liberated, and oxidizes the aniline to a black. In 1867, Paraf patented the use of a new agent, the "chromium chromate." His mixture for printing contained aniline hydrochlorate, potassic chlorate, chromium chromate, starch, and water. In the ageing-room chromic acid is set free to act upon the aniline salt.

Application of Aniline Colors in Dyeing and Calico-printing.—In silk-dyeing no mordant is required; to produce an even color, however, it is found best to use a weak soap solution with the dye; and sometimes a little acid is added, sulphuric or tartaric. For printing on silk the colors are thickened with gum-senegal, printed from blocks, and when dry the goods are steamed and washed. A discharge style may be produced by dyeing silk with a rosaniline salt, then printing on zinc-dust thickened with gum. The rosaniline is reduced to colorless leucaniline, producing white figures on a colored ground. By mixing colors with the zinc which are not affected by it, colored figures are produced. For dyeing wool no mordant is required; the goods are simply handled in hot solutions; except in the case of Nicholson's blue, which is dissolved in an alkali, the goods after passing through the solution being subjected to an acid bath. For dyeing cotton, mordants are necessary. By subjecting the goods to (1) a decoction of sumach, (2) to sodic stannate, and finally (3) to dilute sulphuric acid, a stannic tannate is produced on the fibre which has a great affinity for aniline colors. For printing, the colors are thickened with albumen, or a solution of aluminum arsenate in aluminum acetate, and fixed by steaming.

Aniline colors are also used for inks, for coloring leather, soaps, vinegar, candies, ivory, horn, etc.; and lakes are prepared from them for paper-staining, printers' ink, etc. etc.

The high cost of aniline colors is counterbalanced by the brilliancy of their tints and the simplicity of dyeing. The aniline color industry has acquired greater proportions in Germany than in any other country. In the U. S. manufacturers chiefly confine their attention to rosaniline salts. Although coal-tar is extensively distilled here, and benzole is exported, all the aniline is imported.

(For further details see Watt's "Dictionary of Chemistry" and supplement, Wurtz, "Dictionnaire de Chimie," and specially "Die Farbstoffe," von M. P. Schutzenberger: "Deutsche Uebertragung," von Dr. H. Schröder, Berlin, 1868–73. Special works on the subject are Becker's "Anilin-Färberei," Berlin, 1871; Reimann's "Aniline and its Derivatives," New York, 1868; Krieg's "Theorie und practische Anwendung von Anilin in der Färberei und Druckerei," Berlin, 1866. Wagner's "Jahresbericht der chemischen Technologie," from 1858 to date, contains the record of the progress of this important branch of chemical industry.) C. F. Chandler.

An'imal [Lat. *animal*, from *animus*, "spirit;" Gr. *ἄνεμος*, "wind," "breath"], an organized being, distinguished from plants, at least in the higher and more developed groups, by the power of voluntary motion, the faculty of digesting food, which is usually, not always, received into an alimentary canal, and the possession of a nervous system, which regulates the acts of the animal and receives impressions from without. An organism, according to Kant's felicitous definition, is that structure wherein each part is at the same time the means and the end of all the rest. The distinction is not easily made out between some of the lower animals and plants; but recent observers claim to have made the discovery that all plants, even the most minute, have the power of taking up nitrogen from ammonia compounds—a power which, it is asserted, is possessed by no animal. The power possessed by green plants of taking up carbon from carbonic acid, and by other plants of taking it from hydrocarbons, is probably not shared by animals.

(The structure and functions of animals are treated of under the heads Comparative Anatomy, Physiology, Embryology, etc. See also Zoology, and the names of the various groups of animals.)

Animal'cule [Lat. *animal'culum*, the diminutive of *animal*], literally, a "minute animal," commonly denoting one whose figure can only be discerned by the aid of a microscope. In popular language it is mostly applied to the microscopic animals which zoologists call Infusoria and Protozoa. Many of the so-called animalcules are now known to belong to the lower ranks of the vegetable kingdom.

Animal Electricity. See Electricity, Animal.

Animal Heat is the persistent and uniform elevation of temperature which a great proportion of living animals possess. This elevation does not appear to be a constant factor of animal any more than vegetable life; for in those animals which are fixed and almost motionless there is often great difficulty in detecting any animal heat. But even in the so-called cold-blooded animals there is a normal range of elevated temperature. Infusoria, earthworms, snails, fishes, and especially reptiles, possess an appreciable amount of animal heat, and the temperature in health of some species has been pretty accurately determined, though it appears to vary decidedly in these animals with seasons of functional activity or rest. In all animals there seems to be a relation between the temperature and the habitually fast or slow rate of motions.

Mammals, birds, and insects have special powers of maintaining heat. In insects it is scarcely discernible in the pupa state, except when the pupa is about to enter the condition of perfect development. Hymenopterous insects especially have a high range of temperature. Humble-bees' nests have been observed with a heat 18° above that of the surrounding earth. Mr. Newport in one instance found a bee-hive with a temperature of 102° F. while the bees were aroused, though in a neighboring hive with quiet bees the thermometer stood at 48½°. It would appear that the variation of heat within the limits of health is greater in insects than in birds and mammals.

The heat of birds is in most species much higher than that of mammals; that of the swallow, an extreme example, reaching 111½° F. The temperature of mammals varies from 94° to 107°, that of man being 98° F. in health, while in some fevers it exceeds 105°. It appears that any excess over the latter temperature is a bad symptom in fevers, while any long-continued depression of even a very few degrees below the normal range is also a prognostic of approaching dissolution. The thermometer of late has become an important means of diagnosis and prognosis in disease. Many of the Rodentia and Cheiroptera during a part of the year lose a great proportion of their ordinary heat, the temperature falling nearly to the freezing-point, while many of the vital functions pass into a state of abeyance. This condition is called *hibernation*.

The principal direct source of animal heat is generally believed to be the slow oxidation of carbon (perhaps also hydrogen, sulphur, and phosphorus), the material thus slowly burnt being introduced in the food, while the oxygen comes in from the air by the lungs; but it is objected by many physiologists that the amount of material consumed, with all possible economy of heat, seems inadequate to the effect produced. It is observed that the cutting of certain nerves in vivisection (notably those belonging to the sympathetic system) leads to great temporary increase of heat in the parts which had been supplied by the wounded nerve, the increase being followed by a permanent decrease of heat. This appears to show that the production of animal heat is, to some extent at least, under control of the nervous system. Chas. W. Greene.

Animal Magnetism. See Mesmerism.

Animal Mechanics. See Locomotion of Animals.

Animals, Worship of, a form of worship prevalent in many ancient lands, as once in Egypt and Persia, and even now in India, where the earlier and purer knowledge of God had become obscure, and the likeness of the Deity was sought, and supposed to be found, in the forms of animated nature. The historical fact is exactly sketched by Paul in Romans i. 21–23.

An'ima Mun'di is a Latin phrase signifying "soul of the world." It was used by ancient philosophers, who supposed that nature or all matter was pervaded by an ethereal essence and vital force, which organized and actuated created beings, but was inferior to the Divine Spirit. The Atmăn (Atmâ) or Părămâtmâ of the Hindoos was also regarded as the soul of the world in a somewhat different sense. The Atmăn was supposed to be the original life-principle from which the universe was evolved.

An'imé, a resin which exudes from *Hymenæa Courbaril*, a tree of the natural order Leguminosæ, and a native of Brazil. It has been used as a medicine and as incense. In England the name animé is applied to a resin known in India as copal, and obtained from the *Vateria Indica*.

A'nio (the modern *Tevero'ne*), a river of Latium (Italy), flowed nearly westward, passed by Tibur, and entered the Tiber 4 miles N. of Rome. Length, about 55 miles. Ancient Rome was in part supplied with water from the Anio by two aqueducts, respectively 43 and 62 miles long.

Anion. See ANODE.

An'ise, Oil of, an essential oil obtained by distilling anise seeds or star anise with water. Oil of fennel, from *Anethum fœniculum* and *Artemisia Dracunculus*, is of a similar chemical composition. Oil of anise and of fennel contain a hydrocarbon oil, said to be isomeric with oil of turpentine, and an oxidized oil, $C_{10}H_{12}O$, called anethol or anise camphor, which solidifies at temperatures below 10° C.

An'ise Seed, the fruit of the *Pimpinel'la Anï'sum*, an annual herbaceous plant of the order Umbelliferæ, is a native of Egypt. It is cultivated in Syria, Malta, Spain, and Germany, and is used in medicine as a stimulant and a carminative. It is also used to flavor liqueurs and as a condiment. Anise seed contains a volatile oil which is employed for similar purposes. A large part of the anise oil of commerce is from star anise, the fruit of *Illicium anisatum*, a small tree of the order Magnoliaceæ. The whole plant is carminative, and is used by the Chinese as a spice. Its properties are those of the *Pimpinella*. It is imported from Anam and China.

An'ise Tree [so named from the smell, which resembles that of anise], a name applied to two small trees or large shrubs of the order Magnoliaceæ, growing in the Gulf States—the *Illicium Floridanum* and the *Illicium parviflorum*. Both are evergreen, the former with dark purple and the latter with small yellow flowers, appearing in May and June. The star anise oil of commerce is the product of the *Illicium anisatum* of Eastern Asia; and it is believed that the same oil might be obtained from the *Illicium Floridanum*. The *Illicium parviflorum* has a taste and smell resembling those of sassafras. The *Illicium religiosum* of China yields a fragrant incense for temple-worship.

Anis'ic Ac'id ($H.C_8H_7O_3$), produced by the oxidation of anise-camphor and of the oils of anise and fennel. Hydride of anisyl, $C_8H_7O_2.H$, is formed at the same time.

Anis'ic Al'cohol ($C_8H_9O.H.O$) is formed by heating hydride of anisyl with potash.

Anisodac'tyls, or **Anisodac'tylæ** [from the Gr. ἄνισος, "unequal," and δάκτυλος, a "finger" or "toe"], the term applied to an order of birds, including those insessorial species the toes of which are of unequal length, as in the nuthatch. The name has been also applied to the odd-toed section of ungulate Mammalia, in which the toes are of unequal number, more often called perissodactyls.

An'isol, or **Phe'nate of Me'thyl,** ($C_7H_8O = CH_3.C_6H_3O$), a colorless aromatic liquid formed by the action of caustic baryta on anisic acid.

Anisson-Duperron (ALEXANDRE JACQUES LAURENT), a French political economist, born in 1776. He became director of the imperial printing-office in 1809, and was created a peer in 1844. He wrote, besides other works, a treatise in favor of free trade.

Aniu'y, or **Aniuj** (GREATER), a river of N. E. Siberia, rises about lat. 67° N., and, after a course of 270 miles, enters the Kolyma near lat. 68° N. The LESSER ANIUY rises in lat. 66° 30′ N., and falls into the Kolyma near the mouth of the Greater Aniuy. Length, about 250 miles.

Anjier', a seaport of Java, on the Sunda Straits, 69 miles W. of Batavia, is often touched at by vessels bound for Batavia, to take in provisions, and to land the mails and passengers, which go to Batavia overland.

Anjou, a former province and duchy of France, intersected by the river Loire, was inhabited in ancient times by the Andegavi, who were conquered by Cæsar. It now forms the department of Maine-et-Loire and part of Sarthe, Mayenne, and Indre-et-Loire. Its capital was Angers. Geoffroy, count of Anjou, married Matilda, a daughter of Henry I. of England, and was the founder of the royal house of Plantagenet. His son Henry was count of Anjou and king of England. Anjou was annexed to the crown of France about 1204, and was bestowed as a fief on Charles (a brother of Saint Louis), who became king of Naples. Louis, a son of King John, was the first duke of Anjou, which was erected into a duchy about 1360. Anjou was finally annexed to the French crown in 1480, after which the younger sons of several kings bore the honorary title of duke of Anjou. Pop. about 550,000.

Ank'arström (JOHAN JAKOB), a Swedish regicide, born in 1761, was a partisan of the aristocracy. Having formed a conspiracy with Count Horn and others, he assassinated Gustavus III. at a masked ball, Mar. 16, 1792. He was condemned to death, and, after he had been publicly whipped, was beheaded April 29 of that year.

An'ker, the name of an old European liquid measure of capacity, now disused everywhere except in Denmark and Norway, and having different values in different countries. The anker of Copenhagen is a little more than 9¼ U. S. gallons, or a little less than 8¼ imperial gallons. The anker of Hamburg was 9.54 gallons; of Bremen, 9.57 gals.; of Lubec, 9.89 gals.; of Amsterdam, 10¼ gals.; and of Berlin (old measure), 12.45 gals.; later measure, 9.07 gals.

Ank'lam, or **Anclam,** a town of Prussia, in Pomerania, is on the Peene, 109 miles by rail N. of Berlin. It has manufactures of linen and woollen goods. It belonged formerly to the Hanseatic League. Pop. of the town in 1871, 16,739.

Anko'ber, Ankobar, or **Ancober,** a town of Abyssinia, the capital of Shoa, is situated 8200 feet above the level of the sea, and about 265 miles S. E. of Góndar. It contains a royal palace, and is a favorite residence of the monarch. Pop. estimated at from 12,000 to 15,000.

Ankylo'sis, or **Anchylosis** [from the Gr. ἀγκύλος, "bent"], in surgery, a stiffened and more or less fixed and immovable joint, so called from the crooked position often seen in limbs with such joints. Ankylosis may result from suppurative inflammation, as in "white swelling" of the knee, and is to be regarded as a favorable termination of such disease. These cases result often in neo-plastic exudations—new tissues—adhering to the cartilages of both articulating bones; and not unfrequently these new growths are partly or completely ossified, converting the two bones into one. The cartilages or ligaments of a joint may become shrunken from disease, the opposing synovial membranes may adhere to each other, or other important structural changes may prevent motion. "Spurious ankylosis" is a case in which a spasm or cicatricial contraction of the muscles, or even of the skin, prevents motion, while the joint itself is not the seat of disease. Cases of so-called hysteria sometimes are accompanied by a stiffness of one or more joints; but such cases are readily detected after the administration of an anæsthetic, when the joint at once becomes movable.

The prospect of recovery of motion in an ankylosed joint is small indeed. Joints stiffened at an inconvenient angle may be put into better shape during anæsthesia, and then be allowed to become ankylosed again in the desired position. Excision of joints has been considerably practised, and with some success as a means of cure.

An'na, a post-village and township of Union co., Ill., 37 miles N. of Cairo. Pop. of village, 1269; of township, 2697.

Anna, SAINT, is supposed to have been the mother of the Virgin Mary, but she is not mentioned in the Bible. The Roman Catholic Church in Austria and other countries celebrates an annual festival in her honor on the 26th of July.

An'naberg', a mining-town of Saxony, in the Erzgebirge, 18 miles S. of Chemnitz. It has mines of silver, cobalt, and tin, and manufactures of lace and silk ribbons. Pop. in 1871, 11,693.

An'na Carlov'na, regent of Russia, born in 1718, was a daughter of the duke of Mecklenburg, and a niece of Anna Ivanovna, empress of Russia. She was married in 1739 to Anton Ulrich, duke of Brunswick-Wolfenbüttel, and had a son, Ivan, whom Anna Ivanovna designated as her successor. Soon after the death of that empress, in Oct., 1740, Anna Carlovna assumed the office of regent. She was deprived of power by a conspiracy which raised Elizabeth to the throne in Dec., 1741. Died Mar. 18, 1746.

An'na Comne'na, a learned Byzantine princess and writer, born Dec. 1, 1083, was a daughter of Alexis I., emperor of Constantinople. She became the wife of Nicephorus Bryennius. On the death of her father, in 1118, she conspired against her brother John, and attempted to usurp the crown or to place it on the head of her husband, but failed. She wrote in Greek a life of her father, entitled the "Alexiad," which is an important historical document. The style is rather affected. Died in 1148.

An'nadale, a flourishing village of Richmond co., N. Y., on the Staten Island R. R. It has good school and hotel accommodations.

An'na Ivanov'na, empress of Russia, born at Moscow Jan. 25, 1693, was a daughter of Ivan, a brother of Peter the Great. She was married in 1710 to the duke of Courland, who died in 1711. She succeeded Peter II. on the throne in 1730, and permitted her favorite Biren to control the empire. He abused his power with great cruelty, and

executed and banished many thousand persons. She died Oct. 28, 1740, and was succeeded by Ivan.

An'naly, a township of Sonoma co., Cal. Pop. 2374.

An'nandale, a post-village of Red Hook township, Dutchess co., N. Y., the seat of St. Stephen's College (Episcopalian). Pop. 347.

Annap'olis, a county in the W. S. W. part of Nova Scotia, bordering on the Bay of Fundy. Area, about 1100 square miles. The county contains much excellent land, and has beds of valuable iron ore. Pop. 18,121.

Annapolis, or **Annapolis Royal,** a seaport of Nova Scotia, at the mouth of the river Annapolis (which enters the Bay of Fundy), 95 miles W. of Halifax. It is the western terminus of the Windsor and Annapolis R. R. It was founded in 1604 by the French, who called it Port Royal. The harbor is good, but difficult of access. This town was the capital of the province until 1750. Pop. of census sub-district in 1871, 2127.

Annapolis, a city and port of entry, capital of Maryland and of Anne Arundel county, is on the S. bank of the Severn River, 2 miles from its entrance into Chesapeake Bay, 20 miles S. by E. of Baltimore, and 22 miles E. by N. of Washington, 40 miles by rail to either of these cities, and 30 miles by water (steamboat) to Baltimore. The Annapolis and Elkridge R. R., 21 miles long, connects it with the Washington branch of the Baltimore and Ohio R. R. Annapolis contains a state-house, governor's mansion, court-house, jail, two national banks, two hotels, three

Maryland State-house, at Annapolis.

newspapers, six churches, an Episcopal mission, colored Bethel, and Catholic college. There are several oyster-packing houses—a business which is assuming some proportion. It is also the seat of St. John's College and the U. S. Naval Academy, which was founded here in 1845. (See NAVAL ACADEMY, by PROF. R. S. SMITH.) The railroad building from Baltimore to Drum Point (mouth of Patuxent River) crosses the A. and E. R. R., 3 miles from the city, making the distance to Baltimore by rail 22 miles. The harbor, or Annapolis Roads, is one of the finest in the country, there being a depth of 60 feet in the channel up to Round Bay in the Severn River, 7 miles from the city. The city has both gas and water works. Lat. 38° 58′ 50″ N., lon. 76° 29′ W. Pop. 5744.

A. P. SOUTHWICK, FOR ED. "GAZETTE."

Annapolis, a post-village of Penn township, Parke co., Ind. Pop. 279.

Ann Ar'bor, a city, capital of Washtenaw co., Mich., on the Huron River and on the Toledo Ann Arbor and Northern and Michigan Central R. Rs., 38 miles W. of Detroit. The situation is elevated and pleasant. Here is the State University, a flourishing institution, founded in 1837. (See MICHIGAN UNIVERSITY.) Ann Arbor contains ten churches, a national bank, a publishing-house, one monthly, one semi-monthly, and three weekly papers, and manufactures of wool, iron, ploughs, and furniture. It has a valuable mineral spring. Pop. 7363; of Ann Arbor township, 8746.

ED. "CHRONICLE."

An-Nâ'sir (or **Al-Nassir**) **Ledinil'lah** (*i. e.* "the defender of the religion of God"), one of the Abasside caliphs, began to reign at Bagdad in 1180. He was a liberal patron of learning, and successfully defended his dominions against several aggressive enemies. Died in 1225.

An'nates (plu.), [Late Lat., from *annus*, a "year" (*i. e.* a "year's wages")], the tax of "first-fruits," a tax imposed by the popes on all bishops on their accession, and equal to one year's revenue of the benefice. The Council of Pisa (1409) complained of the custom; that of Bâle (1435) called it simony; that of Trent (Nov. 11, 1563) prohibited it, but it was recognized by concordat with Naples in 1818. In England, annates were first levied in 1213. In 1534 they were made payable to the king (Henry VIII.) instead of the pope. (See QUEEN ANNE'S BOUNTY.)

Annatto. See ANNOTTO.

An'nawan, a post-township of Henry co., Ill. Pop. 1261.

Anne of Cleves, the fourth queen of Henry VIII. of England, who married her, to please the Protestants, in Jan., 1540. She was divorced in July of the same year. She was daughter of John, duke of Cleves, and was born Sept. 22, 1515. Died at Chelsea July 16, 1557.

Anne, queen of Great Britain and Ireland, the last sovereign of the house of Stuart, was born at Twickenham, near London, on the 6th of Feb., 1664. She was the second daughter of James II. and Anne Hyde, who was a daughter of the famous Lord Clarendon. She was educated in the Protestant religion, to which she afterwards manifested a constant devotion, although her father, after his accession to the throne, attempted to convert her to the Roman Catholic faith. In 1683 she was married to Prince George of Denmark, a brother of Christian V. At an early age she formed an intimacy with Sarah Jennings (afterwards the duchess of Marlborough), who exercised an almost unbounded influence over her, both before and after her accession to the throne. Anne was the mother of many (seventeen) children, all of whom died young and before she became queen. In the revolution of 1688 she supported the cause of the prince of Orange, but she was afterwards implicated in intrigues for the restoration of her father. Anne succeeded William III., who died Mar. 8, 1702, at a time when the strife of parties was extremely violent. She pursued the foreign policy of the late king, which involved England in the long war of the Spanish succession as the ally of Austria and the enemy of France. Among the important events of her reign were a number of signal victories gained by the duke of Marlborough over the armies of Louis XIV., and the union of England and Scotland in 1707. Her political principles, if she had any, were favorable to royal prerogative rather than constitutional liberty, and rendered her partial to the Tories. Anne became gradually alienated from the duchess of Marlborough, who was a Whig, and transferred her favoritism to Mrs. Masham, whose intrigues undermined the Whig party so effectually that the Tory statesmen, the earl of Oxford and Lord Bolingbroke, came into power in 1710. The queen and these Tory ministers concurred in designs and intrigues to secure the succession to her brother, the Pretender. The European war was ended by the treaty of Utrecht, April 11, 1713. Lord Bolingbroke became prime minister in place of the earl of Oxford in July, 1714. Anne died of apoplexy on the 1st of Aug., 1714, and was succeeded by George I. The period of her reign, illustrated by the genius of Newton, Addison, Pope, Bolingbroke, Swift, De Foe, and Arbuthnot, was almost as celebrated in literature as the Augustan age of Rome. (See OLDMIXON, "Life of Queen Anne," 1716; STRICKLAND, "Lives of the Queens of England.")

Anneal'ing [from the Saxon *on-ælan*, to "set on fire," to "make hot," to "burn"], a process of tempering glass and certain metals by heating them and then cooling them slowly, in order to render them less brittle and more tenacious. The extreme brittleness of glass that has not been annealed is seen in the glass toys called "Prince Rupert's Drops," which if scratched with a file will collapse into powder or small fragments. Glass vessels are annealed in a long oven, one end of which is hotter than the other, and the trays in which the vessels are placed are slowly drawn into cooler and cooler parts. The operation of annealing large vessels requires several days. Iron, brass, and other metals which are hammered into plates or drawn into wire become brittle during the process, and require to be annealed by cooling them slowly in water or air. Steel is tempered and hardened by a process of annealing, being placed in an oil-bath or surrounded by a metallic compound which has a low fusing-point.

Anne Arun'del, a county in the central part of Maryland, having an area of 750 square miles. It is bounded

on the N. by the Patapsco River, on the E. by Chesapeake Bay, and on the S. W. by the Patuxent River. It is also drained by the river Severn. The surface is undulating: the soil is generally fertile. The staple products are wheat, maize, and tobacco. Among its mineral resources are red sandstone, copper, and iron. The county is intersected by the Baltimore and Washington R. R. Capital, Annapolis. Pop. 24,457.

Annecy, a town of Eastern France, in Upper Savoy, is pleasantly situated at the N. W. extremity of Annecy Lake, 42 miles by rail S. of Geneva. It has a cathedral, a bishop's palace, an old castle, glass-works, cotton-mills, etc. Pop. in 1866, 11,554.

Annecy, Lake of, is in Upper Savoy, 22 miles S. of Geneva, about 24 miles W. of Mont Blanc, and 1426 feet above the sea. It is about 9 miles long and from 1 to 2 miles wide. Its waters are discharged through the Fieran into the Rhone.

An'nelides, or **Annel'ida** (plu.), [Lat. *annel'lus*, a "little ring"], an order of articulate animals belonging to the class Vermes, comprising those true worms which have red blood circulating in a complicated double system of vessels. As at present constituted, the order contains three families—1, the Serpuladæ, or Tubicolæ; 2, the Arenicolæ, or sand-worms, called Dorsibranchiatæ; 3, Lumbricidæ, or earth-worms—but writers variously expand or limit the order; some making it to include a part or all of the Brachiopoda and other molluscoids.

An'ni, or **Ani** (anc. *Ab'nicum*), a ruined city of Asiatic Turkey, on the Arpa-Chai River, 28 miles E. by S. of Kars. It was the capital of the Bagratian kings of Armenia until 1064, when it was taken by Alp-Arslân, and was destroyed by an earthquake in 1319. Here are ruins of an ancient palace and citadel; also some Armenian churches nearly entire.

An'nin, a township of McKean co., Pa. Pop. 760.

An'nius of Viter'bo [It. *An'nio da Viter'bo*], a learned Italian Dominican monk, whose proper name was Giovanni Nanni, was born at Viterbo about 1432. He wrote a Latin "Treatise on the Empire of the Turks" (1471). He published at Rome, in 1498, "Seventeen Volumes of Various Antiquities, with Commentaries," containing extracts from the lost works of Berosus, Manetho, and other ancient historians, which proved to be forgeries. D. in 1502.

Anniver'sary [from the Lat. *an'nus*, a "year," and *ver'so*, to "turn"], the annual return of a memorable day; the day on which some remarkable event is annually celebrated. Among the Jews the Passover was an anniversary in commemoration of the exodus from Egypt. The principal religious anniversaries of Christians are Christmas, Epiphany, and Easter. Anniversary days in the Roman Catholic Church are days on which an office is annually performed for the souls of the deceased. The most popular anniversary of the U. S. is the Fourth of July.

Annonay [Lat. *Annonæ'um* or *Annoni'acum*], a town of France, in the department of Ardèche, is situated 37 miles S. S. W. of Lyons, at the junction of the rivers Cance and Déaume. It has a suspension bridge, and large manufactories of glove-leather. Paper of fine quality is made here. The Montgolfiers, who invented balloons, were natives of the town. Pop. in 1866, 18,445.

Annot'to, or **Annat'to,** a red coloring-matter, is the pulp of the seeds of the *Bixa orellana*, an exogenous shrub which grows in South America and the West Indies, and belongs to the natural order Flacourtiaceæ. It is soluble in alcohol, ether, and in potash and soda, either caustic or carbonated. It contains a yellow principle called bixin. It is used as a dye, but its colors are fugitive. The pulp is used to color cheese, is an ingredient in some varnishes, and is employed in medicine to color ointments and plasters. In South America annotto is mixed with chocolate to improve the flavor.

Anns'ville, a township of Oneida co., N. Y. It is a fine dairy-town, and has four churches and several manufactories. Pop. 2716.

Annuaire [from the Lat. *an'nus*, a "year"], a name given to certain French publications which appear annually, as the "Annuaire historique" or "Annuaire des Deux Mondes," which corresponds to the English "Annual Register." The "Annuaire" published by the bureau of longitudes is a celebrated scientific periodical.

An'nual [Lat. *annua'lis*, from *an'nus*, a "year"], a botanical term applied to a plant which lives only one year; a plant which within the space of a year passes from a seed into a perfect plant, bears its fruit, and perishes. The duration of the life of annuals is generally much less than a year. Some plants which are annuals in one climate are perennial in another, as the castor-oil plant.

Annual, a name given by the English to a class of illustrated publications which were designed for Christmas gifts and birthday presents, and enjoyed for some years extraordinary popularity. They contained contributions in verse and prose from distinguished living authors, and were illustrated with engravings by the best artists of the time. The first of these annuals was the "Forget me Not," edited by Frederick Shoberl, in 1822. "The Literary Souvenir," edited by A. A. Watts, appeared in 1824; and the "Keepsake" was commenced by Charles Heath in 1827. It was afterwards edited by the countess of Blessington. Among the other remarkable annuals was Heath's "Book of Beauty," first issued in 1833. After 1849 the demand for annuals diminished and their quality deteriorated. They have all been long discontinued.

Annu'ity [Lat. *annu'itas*, from *an'nus*, a "year;" Fr. *annuité*], a rent or sum of money which a person is entitled to receive every year. If the payment is to be continued through a period of uncertain length, it is called a *contingent annuity;* if it is payable for a definite number of years, it is an *annuity certain.* A person who has unemployed capital may find it advantageous to convert it into an annual income, which he is entitled to receive as long as he lives, and which is called a life annuity. The person who receives an annuity is called an annuitant. An annual income which is not to be paid until a number of years have elapsed is a deferred annuity. Those who invest money in the national debt of England are entitled to an income which is virtually a perpetual annuity, so that when each annuitant dies he may leave it to his heir. The accurate determination of the value of annuities in present money is a complex question of great importance and considerable difficulty, for the solution of which correct tables of vital statistics are requisite. The rate of interest is also an important element in the calculation of annuities. Great labor has been expended by several learned men in the formation of tables of the value of life annuities at all the different ages of human life.

Annuity, in the law of England, is a sum of money payable every year, and charged on the person or personal estate of the individual who is bound to pay it; thus differing from a rent-charge, which is charged on real estate. Annuities are often paid by a person who borrows money (who is called the grantor) to the person who lends the money (who is the grantee). An annuity is either for a term of years, for a life or lives, or in perpetuity; and the last, although charged on personal property, may descend as real estate.

An'nulus [Lat., a "ring"], a botanical term used in several senses. In mosses it denotes a rim external with respect to the peristome; in ferns it is an elastic rib which girds the theca or spore-case, and by its contraction disperses the spores: the collar which surrounds the stipes of some fungi just below the hymenium is also called an annulus.

Annuncia'da (the Order of Knights of the Annunciation) was founded by Amadeus VI. of Savoy in 1362, and was originally called the Order of the Collar. The reigning king of Italy is grand master of the order.

Annuncia'tion, Feast of, a festival of the Church in commemoration of the announcement of the conception of the Saviour to the Virgin Mary by the angel Gabriel. It is celebrated on the 25th of March, which is called Lady Day.

Ann'ville, a post-village of Lebanon co., Pa., in North Annville township, on the Lebanon Valley R. R., 5 miles W. of Lebanon. It is the seat of Lebanon Valley College.

Ano'a, a species of ruminating animal of the genus *Bu'balus*, having the horns erect; it is considered by some to be a connecting link between an antelope and a buffalo. It lives in Celebes.

An'ode [from the Gr. ἀνοδος, a "way up"], a term used in the science of electrolysis to denote the positive pole, or that surface by which the galvanic current enters the body (electrolyte) undergoing decomposition. The negative pole, or the surface by which the current goes out, is called *cathode.* The elements of electrolytes are called *ions*, and those which go to the anode are named *anions.* Thus, in the decomposition of water by a galvanic battery, water is the electrolyte, the platinum plate connected with the positive pole is the anode, and the oxygen is the anion.

An'odyne [from the Gr. ἀν, priv., and ὀδυνη, "pain"], a medicine which diminishes pain. Opium, morphine, the anæsthetics, belladonna, cannabis Indica, etc. are the chief anodynes—most of which tend actively to cause sleep. Some hypnotics, or sleep-producers, however, like chloral, are not anodynes.

Anoint'ing [from the Lat. *in*, and *un'go, unc'tum* (Fr. *oindre*, part. *oint*), to "anoint"], an Oriental custom of

pouring aromatic oil on the head as a mark of honor. It was practised at the coronation of kings and the consecration of high priests and prophets, as in the case of Saul, David, Aaron and his sons. Spikenard, myrrh, and olive oil were sometimes used for this purpose. Anointing forms a part of the ceremonial of various sacraments in the Roman Catholic and the different Oriental churches.

Ano'ka, a county in the E. part of Minnesota, bounded on the S. W. by the Mississippi River, and intersected by Rum River. Area, 420 square miles. The surface is diversified, the soil fertile. Wheat, corn, oats, and potatoes are staple crops. The county is well wooded, and contains several small lakes which abound in fish. Capital, Anoka. Pop. 3940.

Anoka, a post-village, capital of Anoka co., Minn., on the left bank of the Mississippi, at the mouth of Rum River, or Mille Lac, and on the St. Paul and Pacific R. R., 27 miles N. N. W. of St. Paul. Two weekly newspapers are published here. It has a valuable water-power. Pop. of Anoka township, 1498.

Ano'lis [from *ano'li*, the name of a lizard found in the Antilles], a genus of saurian reptiles, natives of the warm parts of America. It comprises the iguanoid species of lizard, which have teeth on the palate of the mouth, as well as on the interior jaw-bones, and are remarkable for their power of inflating the skin of the throat. They move with great agility, and exceed all other saurians in brilliancy of color.

Anomalis'tic Year, the interval of time in which the earth completes a revolution with respect to any point in its orbit, or the interval which elapses between two successive passages of the earth through its perihelion. It is four minutes and thirty-nine seconds longer than a sidereal year, and its length is 365 days, 6 hours, 13 minutes, and 45 seconds.

Anom'aly [from the Gr. ἀν, priv., and ὁμαλός, "level," "even," "regular"], an irregularity; an exception to, or deviation from, a general rule. In astronomy it denotes the angular distance of a planet from its perihelion, as seen from the sun. It is so called because it was in it that the first irregularities of planetary motion were discovered. There are three different anomalies—the true, the mean, and the eccentric.

Ano'mia [from the Gr. ἀ, priv., and νόμος, a "law," so called because it does not conform to the law of structure characterizing other mollusks], a Linnæan genus of the Vermes Testacea. Modern naturalists have limited the term to a genus of acephalous mollusks having two unequal, irregular thin valves, of which the flatter one is deeply notched at the cardinal margin. The central muscle traverses this opening to be inserted into a third piece (calcareous or horny), which is always attached to foreign bodies. Numerous species, living and fossil, are found in nearly all parts of the world.

Ano'na [from *ano'na*, the Sp. name of the custard-apple], a genus of exogenous trees of the natural order Anonaceæ, natives of hot climates. *Anona squamosa* bears an edible fruit called the custard-apple, because its seeds are surrounded by a whitish, sweet, cream-like pulp. The cherimoya, an excellent fruit of Peru, is produced by the *Anona Cherimolia*.

Anona'ceæ [so called from *Ano'na*, one of its genera], an order of exogenous trees or shrubs, mostly natives of tropical countries, and evergreen, having simple, alternate leaves. They are generally aromatic and fragrant. The distinguishing mark of the order is that they have trimerous polypetalous flowers and a ruminated albumen. This order comprises about 300 species, some of which bear delicious fruits. The fruit of the *Xylopia aromatica* is used as pepper by the natives of Africa. The order is represented in the U. S. by four species of pawpaw (*Asimina*) or custard-apple.

Anon'ymous [from the Gr. ἀν, priv., and ὄνυμα, a "name"], nameless; a term applied to books published without the name of the author. Those which appear under an assumed name are called *pseudonymous*. The political articles of the English journals are generally anonymous, and so are the critical articles in the great quarterly reviews. Anonymous books cause much difficulty and perplexity to bibliographers and the compilers of catalogues. The best account or catalogue of such works is Barbier's "Dictionnaire des Ouvrages Anonymes et Pseudonymes" (3 vols., 1822–24).

Anoplothe'rium [from the Gr. ἄνοπλος, "unarmed," and θηρίον, a "beast"], a genus of extinct artiodactyle quadrupeds, found in the strata of the upper eocene formation near Paris, and in Lapland, India, etc. They are characterized by the shortness and small size of the canine teeth, and have teeth arranged in a continuous series without vacant interspaces—a structure which occurs in no existing animal except man. The *Anoplotherium commune* was about the size of a wild boar.

Anor'thite, a felspathic mineral found at Vesuvius and elsewhere; essentially an anhydrous silicate of lime and alumina.

Anotto. See ANNOTTO.

Anquetil-Duperron (ABRAHAM HYACINTHE), an eminent Orientalist, was born in Paris Dec. 7, 1731. Having studied Arabic and Persian, his desire to visit India was so strong that he enlisted as a private soldier in an expedition which was sent thither in 1754. He traversed a great part of Hindostan, collected MSS., procured the religious books of the Parsees, and returned to France in 1762. In 1763 he became a member of the Academy of Inscriptions. He published in 1771 his "Zend-Avesta," the first translation of the sacred books of the Parsees that ever appeared in any European language. It is not esteemed very accurate. He wrote "India in Relation with Europe" (2 vols., 1798) and other works. Died Jan. 17, 1805.

Ansaries. See NUSAIRIYEH.

Anscha'rius, or **Ans'gar,** SAINT, called the "Apostle of the North," was born in Picardy Sept. 8, 801 A. D. He propagated Christianity with success in Denmark and Sweden, and became the first archbishop of Hamburg in 832. Died Feb. 3, 865 A. D.

An'schütz (KARL), born at Coblentz, Germany, in Feb., 1813, became royal musical director at Coblentz, and was afterwards director in Nuremberg, Amsterdam, London, etc. In 1857 he came to America, founded the German opera in New York in 1862, and became a leading conductor and teacher of music. Died Dec. 30, 1870.

Ans'dell (RICHARD), an English painter of animals, born at Liverpool in 1815. He obtained the gold medal in Paris in 1855.

Anse de Panier [literally, "handle of a panier"], a French term applied to arches which are the result of elliptical curves in section. This is the most elegant form of arch for bridges.

An'selm, SAINT [Lat. *Sanc'tus Ansel'mus*], archbishop of Canterbury, was born at Aosta, in Piedmont, in 1033. He is regarded as the originator of scholastic theology. In 1060 he became a pupil of Lanfranc, and an inmate of the abbey of Bec in Normandy, of which he was chosen prior in 1063, and abbot in 1078. Under his direction Bec became a celebrated school. He was appointed archbishop of Canterbury in 1093, after which he was involved in a long contest with King William Rufus. He was distinguished as a philosopher, and is considered as the reviver of metaphysics. Among his principal works are his "Monologium," his "Proslogium alias Fides quærens Intellectum," and "Cur Deus Homo." He surpassed his contemporaries in acuteness of intellect, originality of mind, and dialectical skill. Died April 21, 1109.

An'son, a county of North Carolina, bordering on South Carolina. Area, 650 square miles. It is bounded on the N. by the Rocky River, and on the E. by the Yadkin. The surface is undulating, and the soil productive, cotton, wheat, corn, and oats being the chief staples. Capital, Wadesborough. Pop. 12,428.

An'son, a post-township of Somerset co., Me., 10 miles N. W. of Skowhegan. The Somerset R. R. is graded nearly to Anson. It has a weekly newspaper, academy, 3 churches, savings bank, 14 stores, and mills, shops, hotels, etc. Principal business, farming and lumbering. Pop. 1745.

ALBERT MOORE, OF "UNION ADVOCATE."

Anson, a township of Chippewa co., Wis. Pop. 455.

Anson (GEORGE), LORD, born in Staffordshire April 23, 1697, became a post-captain in the royal navy in 1724, after which he passed several years on the Carolina station. In 1740 he was appointed commander of an expedition to the South Sea, in which he exhibited great prudence and courage amidst disasters and dangers caused partly by the unseaworthiness of his vessels. Having circumnavigated the globe and made some important discoveries, he returned in 1744 with several Spanish prizes. He defeated a French fleet in May, 1747, and for this service was rewarded with the title of Baron Anson of Soberton. He was first lord of the admiralty from 1751 to 1757, and admiral of the fleet in 1761. Died June 6, 1762. A narrative of his voyage round the world was published.

Anso'nia, an incorporated borough in the town of Derby, New Haven co., Conn., on the Naugatuck River, at the junction of the Naugatuck and New Haven and Derby R. Rs., 10 miles W. N. W. of New Haven. It is a manufacturing village, and has 1 national bank, 1 savings bank, 4 churches, 3 brass rolling-mills, 1 brass-foundry, 1 iron-

foundry, 2 clock-shops, 1 copper-mill, 2 wire-mills, 1 hardware factory, 2 hoop-skirt factories, 1 woollen mill, 1 weekly newspaper, and 2 water companies. Pop. 2749.

ED. "NAUGATUCK VALLEY SENTINEL."

Ansonians, or **Ansyreeh.** See NUSAIRIYEH.

Ans'pach, or **Ans'bach,** a fortified city of Bavaria, on the Rezat, 27 miles S. W. of Nuremberg. It has a castle, the former residence of the margraves of Anspach-Baireuth, a public library, and manufactures of cotton and half-silken stuffs, tobacco, earthenware, cutlery, etc. Pop. in 1871, 12,635.

Anspach (ELIZABETH BERKELEY), MARGRAVINE OF, a daughter of Augustus, earl of Berkeley, was born in 1750. She was accomplished, and remarkable for versatility of genius. In 1767 she was married to Mr. Craven, who became earl of Craven, and died in 1791. She was married in that year to the margrave of Anspach. She wrote and performed dramas, and published entertaining autobiographic memoirs. Died at Naples Jan. 13, 1828.

An'sted (DAVID THOMAS), F. R. S., an English geologist, born in London in 1814, was educated at Cambridge. He became in 1840 professor of geology in King's College, London, travelled in America and other countries, and published a great number of works, among which are "Geology, Introductory, Descriptive, and Practical" (2 vols., 1844), "The Ancient World, or Picturesque Sketches of Great Britain," "The Great Stone Book of Nature" (1863), and "The World we Live in" (1869).

An'ster (JOHN), LL.D., born in Cork county, Ireland, 1798. He was a friend of Coleridge, and regius professor of civil law in the University of Dublin. He produced "Poems and Translations from the German" (1819), and contributed many articles to "Blackwood's Magazine." His translation of Goethe's "Faust" (1835) was praised by the "Edinburgh Review." Died June 9, 1867.

An'swer [Ang.-Sax. *and*, "against," and *swarjan*, to "swear," to "affirm"], in the law of evidence, is the reply of a witness to a question put to him. It also means a pleading interposed in a court of equity by the defendant to the bill or information of the plaintiff. In New York, since the adoption of the code of procedure, and in a number of the other States, it is the name given to the defendant's pleading in all cases, except where he resorts to a demurrer. (See DEMURRER.)

Ant, or **Emmet** [Lat. *formi'ca*], a genus of hymenopterous insects remarkable for their industry, ingenuity, and muscular strength. It comprises numerous species, which are widely distributed in temperate and tropical countries. They have geniculate antennæ; strong jaws; a small, rounded, spoon-like ligula; a thorax compressed at the sides; an abdomen nearly oval. They live in societies composed of males, females, and neuters, the last of which are workers and are destitute of wings. Some of the neuters, it is said, serve the community as soldiers. The males and females have wings, and are larger than the neuters, but less numerous. After the pairing season is past the females are deprived of their wings to prevent their escape, as they have a propensity to desert their home and go astray. It appears that ants realize the advantages of a division of labor, as well as those of co-operation. In winter most species remain dormant, and neither work nor eat, although it is a popular notion that they collect in summer a hoard of grain for their subsistence during the winter. They are mostly carnivorous, and will attack a living animal many times larger than themselves, as a mouse, for example. Another favorite food of some species is honey-dew, the sweet excretion of aphides. According to some authorities, they confine these aphides in stables, as man does his milch cows, and obtain from them, by a process like milking, a regular supply of honey-dew. Perhaps the most remarkable of all this interesting group of insects are the "honey ants" of Mexico. The honey ants inhabit Mexico, New Mexico, and Arizona. They live in colonies, of which the greater number closely resemble the common brown ant of the United States. Certain members of the community, however, during the summer secrete honey in the abdominal cavity, and soon become incapable of locomotion. They are then placed in rows in subterranean galleries set apart for that purpose, and are systematically fed by the others. In time the distension of the abdomen becomes so great that the victim ants resemble small, spherical, pellucid grapes, the head and thorax simulating the grape-stem. Later in the season, when food is scarce, these fattened ants are in turn devoured by the other members of the colony. Ants appear to be endowed with greater muscular strength than almost any other insect of equal size. They display great ingenuity in the construction of their habitations, called ant-hills, which are mostly placed on the surface of the ground. The large ants of South America raise their ant-hills to the height of fifteen feet or more. Some species, called mason ants, perforate galleries in the clay, and support by pillars and arches the roof of their house. Others, called carpenter ants, excavate cells and labyrinthine galleries in the trunks of living trees. Ants are supposed to have a faculty of conversing or communicating with each other by means of their antennæ, which, according to some naturalists, are organs of hearing. These insects are generally very pugnacious, and often fight pitched battles with other ants. The Swiss naturalist Huber has given a detailed account of their battles, martial exploits, and predatory expeditions. Still more marvellous and paradoxical is the well-attested fact that some species, as the *Formica rufa* and the *Formica rufescens* (or amazon ant), reduce other ants to slavery, and that the principal motive of their wars and piratical excursions is to capture larvæ and pupæ or nymphs, which they carry home for slaves. "At the head of these daring slave-makers," says Pouchet, "we must put the red ant or amazon, the military expeditions of which have been most carefully observed by the naturalists of our epoch. They are so frequent that one may enjoy the sight of them any fine day during the summer season." After describing the siege and capture of a nest by these amazons, he adds: "Then the whole army, laden with booty, and sometimes stretching out in a line forty mètres in length (150 feet), triumphantly returns to its city in the same order as at its departure." (*The Universe.*) These slaveholding ants have a great aversion to labor, and when they perform a journey are carried by their slaves. These are darker colored than their masters, and are called *Formica fusca*. The fact that ants work all through the night, and seem never to sleep, was noticed more than one hundred and fifty years ago in the "Guardian" (vol. ii., No. 156). It is asserted that certain ants in warm countries (one species in Texas) actually plant grass-seeds, and cultivate, harvest, and store the grain. Some also construct, and even pave their roads. A battle of ants has been described by Huber in these terms: "I shall not say what lighted up discord between these two republics, the one as populous as the other. The two armies met midway between their respective residences. Their serried columns reached from the field of battle to the nest, and were two feet in width. . . . The field of battle, which extended over a space of two or three square feet, was strewn with dead bodies and wounded; it was also covered with venom, and exhaled a penetrating odor. The struggle began between two ants, which locked themselves together with their mandibles while they raised themselves upon their legs. They quickly grasped each other so tightly that they rolled one over the other in the dust." At the approach of night the two armies effected a retreat, but the next day the carnage was renewed with equal or greater fury. Some species of *Formica* eject from their abdomen a peculiar volatile, acrid, and pungent liquid called *formic acid*, the offensive odor of which defends them against other animals. The carnivorous species of ants perform a useful service by devouring the carcasses of dead animals. Their voracity is such that a clean skeleton of a small animal may be obtained by burying it for a short time in an ant-hill. The termites of tropical countries, sometimes called white ants, are not properly ants, but belong to another genus. (See TERMITES.) (See P. HUBER, "Traité des Mœurs des Fourmis Indigènes.")

REVISED BY J. S. NEWBERRY.

Antaç'id [*anti* and *acid*], a remedy for acid in the stomach or in the blood. The alkalies, lime-water, magnesia, etc., are mostly used for this purpose, vegetable acids, like the citric (lemon juice, etc.), being often administered with them. These acids become carbonic acid in the blood, forming bicarbonates with the alkalies. This antacid treatment is much resorted to in acute rheumatism.

Antæ'us [Gr. Ἀνταῖος], a fabulous Libyan giant, a son of Neptune and Terra, was a famous wrestler. He was invincible as long as he continued in contact with the earth (Terra), but he was conquered by Hercules, who raised him into the air and strangled him to death.

Antagonist Muscles. Every muscle and set of muscles in the animal body is opposed in its action either by some other muscle or muscles, or by elastic ligaments. Generally it is the former; thus, in the human arm we have the *triceps extensor* muscle antagonized by the *biceps flexor* and the *brachialis anticus;* in the forearm, there are the *flexor* and *extensor* muscles of the hand and wrist, as well as the *pronators* and *supinators* of the hand. Similarly in the lower extremity opposed muscles exist, although not always of corresponding names. The great *adductor* muscles of the thigh, whose action draws the limbs together, are antagonized by the *glutei* and *obturator* muscles and others. The diaphragm, the contraction of which aids in expanding the cavity of the chest, is opposed by the ex-

ternal abdominal muscles, whose action is perceptible in expiration. So constant is this provision of muscular antagonism in the animal kingdom that there is no well-ascertained example of *active dilatation* of any muscle. The *diastole* of the heart in man and other vertebrates can be explained best by elasticity only, as it exerts very little power. In Myriapoda each section of the elongated aortic heart has triangular muscles connected with the sides of the body, by which the *diastole* after contraction is effected. The *predominance* of power in opposing groups of muscles determines the position of different parts of the body when at rest; hence, in man the naturally bent position of the fingers during sleep, from the prevailing power of the flexors. Disease sometimes disturbs the natural balance of the muscles.

Anta'kia, a city of Syria, on the Orontes, is situated on the site of the ancient ANTIOCH (which see).

Antal'cidas [Gr. Ἀνταλκίδας], a Spartan diplomatist, who was sent on a mission to Persia when Sparta was in a critical position, and negotiated a treaty called the Peace of Antalcidas, in 387 B. C. This treaty excited general indignation among the Greeks, whose interests the Spartans sacrificed to gratify their enmity to Athens and Thebes. One of the articles of this treaty stipulated that all the Greek cities of Asia Minor should be subject to the king of Persia.

Antanacla'sis [Gr. ἀνταν*άκλασις*, from ἀντί, "against" (and hence implying contrast), and *ἀνάκλασις*, a "bending back"], in rhetoric, a figure in which a word is repeated, but in a different sense or different inflection from the first, which gives a kind of antithetical force to the expression; as, "Learn some *craft* when young, that when old you may live without craft."

Antanana'rivo', or **Tananarivo',** the capital and chief city of Madagascar, is situated in a mountainous region in the middle of the island, 166 miles S. W. of Tamative. It is about 7000 feet above the level of the sea. It is reported to be a large city, and to have manufactures of gold chains and silk stuffs. The private houses are mostly of wood. Pop. estimated at 80,000.

An'tar, An'tara, or **An'tarah-Ibn-Sheddâd',** a celebrated Arabian prince, poet, and warrior who lived about 550 A. D. He was the author of one of the seven poems which are called Mo'allakat, and were suspended in the Kaaba or temple at Mecca. His martial exploits were a favorite theme of Arabian poetry and romance. He is the hero of a celebrated romance, translated into English by T. Hamilton, entitled "Antar, a Bedouin Romance" (1819).

Antarc'tic [from the Gr. ἀντί, "against," "opposite," and ἀρκτικός, "pertaining to the north"], opposite to Arctic. The Antarctic Circle is one of the small circles of the sphere parallel to the equator, and distant 23° 27½′ from the South Pole.

Antarctic Current. This drift-current commences on the shores of Victoria Land, in the region of perpetual frost. It carries vast quantities of ice and cold water towards the N. E. and E., and becomes converted into a coast-current, washing and cooling the western shores of South America, thus performing a work nearly the converse of that performed by the Gulf Stream on the shores of Europe. It conveys drift ice to the latitude of about 55°.

Antarctic Ocean, or **Southern Ocean,** the name applied to that large body of water around the South Pole included within the Antarctic Circle; and also a general term designating that vast sea S. of the Atlantic, Pacific, and Indian oceans. It has not been explored so thoroughly as the Arctic Ocean, and was long considered impenetrable for ships, on account of the ice, which extends much farther from the Pole (about 10°) than in the Arctic Ocean. Sir James Ross has explored the Antarctic Ocean as far as 79° S. In Jan., 1841, he discovered in lat. 77° 32′ S. and lon. 167° E. a volcano 12,400 feet high, which he called Mount Erebus. The portions of land which have been discovered in this ocean are called New Georgia, Sandwich Lands, New Orkneys, Enderby's Land, Sabrina, Victoria Land, etc.

Antarctic Researches. The first navigator who explored these regions was Capt. Cook, who in Jan., 1774, reached lat. 71° 10′ S. in lon. 106° 54′ W. In 1823, Capt. Weddell penetrated to lat. 74° 15′ S. in lon. 34° 16′ 15″ W., and found there an open sea. In 1839, Capt. Wilkes, of the U. S. navy, conducted an exploring expedition towards the South Pole. He discovered in Jan., 1840, a portion of a large continent in lat. 61° 30′ S. and lon. 161° E. He traced the coast westward to lon. 101° E., but was prevented from landing by an impassable barrier of ice. Capt. James Ross, who commanded a British expedition in 1841, penetrated as far as 78° or 79° S. He computed the position of the southern magnetic pole to be in Victoria Land, lat. 75° 5′ S., lon. 154° 8′ E.

Anta'res [from the Gr. ἀντί, in a sense implying "comparison," and Ἄρης, "Mars," because this star was thought to resemble Mars], a ruddy double star, the most conspicuous in the constellation Scorpio. It is important in navigation in computing longitude.

Ant-Catcher and **Ant-Thrush,** names given to birds of tropical and sub-tropical countries that feed upon

Giant Ant-Catcher.

ants, and are nearly allied to the thrushes. They have very powerful voices, a straight, sub-cylindrical bill, hooked at the tip, slender legs, and short tail. Some of them belong to the genera *Pitta* and *Grallaria*. The giant ant-catcher of Sumatra (*Pitta gigas*) is of a fine green color.

Ant-Eater, a South American family of mammals, animals of the order Edentata. Ant-eaters have no teeth,

Manis laticaudata, the Asiatic Ant-Eater.

and feed on ants and other insects, which they catch by thrusting among them the long tongue covered with a viscid saliva. The head is much elongated, and the tail is about as long as the body, which is covered with long hair. The toes are united as far as the base of the claws, which are very large and strong, adapted for the purpose of tearing open ant-hills. The great ant-eater (*Myrmecophaga jubata*), sometimes called the ant-bear, is about four and a half feet long, exclusive of the tail, which is about two and

a half feet. It has four toes on the fore feet, and five on the hind feet. It is a sluggish animal, whose movements are not much more rapid than those of a sloth. The little ant-eater (*Cyclothu'rus didac'tylus*) is not more than twenty or twenty-one inches in entire length. It is remarkable for a peculiar structure of the skeleton. On a side view the cavity of the chest is completely hidden by the ribs, which are greatly flattened and overlap each other, so that on a hasty glance the ribs appear to be formed of one solid piece of bone. It has two claws on the fore feet and four on the hind feet; these claws are compressed, curved, and very sharp. The name ant-eater is sometimes given to the aard-vark (*Orycteropus Capensis*) of South Africa, to the pangolins, the *Echidna*, and other mammals which subsist on ants and other insects. One of the best known of these is the *Manis laticaudata*, or pangolin of Hindostan. (See PANGOLIN.)

Antecc'dent [Lat. *antece'dens*, from *an'te*, "before," and *ce'do*, to "go"], that which goes before or precedes in time or in place. In grammar, the noun to which a relative pronoun refers; in logic, the first of two propositions in an enthymeme, and the first member of a hypothetical proposition; opposed to the consequent; in mathematics, the first of two terms composing a ratio. Thus, in the ratio A : B, A is the antecedent, and B is the consequent.

The word in the plural is used in a different sense, as in speaking of a person's *antecedents—i. e.* his previous conduct and character, his early history or primordial relations.

Antedilu'vian [from the Lat. *an'te*, "before," and *dilu'vium*, the "deluge"], a term applied to any person or thing that existed before the Flood—*i. e.* the Noachian Deluge. According to the chronology of the Hebrew text of the Bible, this flood occurred 1656 years after the creation of man. The date of this event, according to the Septuagint version, is several centuries later. Chevalier Bunsen adopted the theory that the Flood occurred about ten thousand years ago. Geologists do not recognize that the earth was ever inundated by a simultaneous universal deluge since it was inhabited by man.

An'telope [Lat. *antil'ope* and *antel'aphus*; Fr. *antilope*], a family of Mammalia, of the order Ruminantia, characterized by hollow horns, which are annulated and permanent, not annually renewed (except the *Antilocapra*), and not longitudinally rigid. The family comprises numerous genera and species, the genus *Antilope* being the typical one, natives of Europe, Asia, Africa, and America, remarkable for their elegant figure and extreme agility. They are mostly gregarious, inoffensive, and timid animals, and vary greatly in size as well as form. The greater numbers of them are found in Southern and Central Africa. Asia produces numerous species. Among the various species are the gazelle (*Gazella dorcas*), the beauty of whose eye is proverbial; the addax or Nubian antelope; the stein-boc, eland, and spring-boc of South Africa; and the chamois of Europe. The antelopes are probably the fleetest of all

Antilope bezoartica, the Common Antelope.

quadrupeds. Their flesh is a favorite article of food. Great numbers of the prong-buck (*Antilocapra America'na*) roam over the plains between the Mississippi River and the Rocky Mountains. The Rocky Mountain goat is another antelope (*Aplocerus montanus*). "Born in the scorching sun," says Sir S. W. Baker, "nursed on the burning sand of the treeless and shadowless wilderness, the gazelle is among the antelope tribe as the Arab horse is among its brethren—the high bred and superlative beauty of the race. Entirely free from fat, and nevertheless a mass of muscle and sinew, the gazelle is the fastest of the antelope tribe."

The "common" or bezoar antelope (*Antilope bezoartica*) is found in India and throughout Southern Asia. It is a very beautiful animal, and is distinguished for its nimbleness and swiftness. Its flesh, like that of most antelopes, is dry and rather unpalatable. The Oriental bezoar, a phosphatic concretion prized in the East for its supposed medicinal virtues, is derived from the intestines of this animal. (See ANTILOCAPRA.)

Antelope, a township of Mono co., Cal. Pop. 162.

Antelope, a township of Tehama co., Cal. Pop. 320.

Antelope, a county in the N. E. part of Nebraska. Area, 864 square miles. Capital, Oakdale. This county has been constituted since the Federal census of 1870.

Antelope, a post-township of Jefferson co., Neb. Pop. 296.

An'te Na'ti [a Latin term signifying "born before"] was a term applied to such of the Scotch as were born before the accession of James I. to the throne of England, and who were considered as aliens by the English.

An'tennæ, singular **Anten'na** [a Latin word meaning the "yard of a ship"], jointed filaments or tubular sensiferous organs attached to the heads of insects and crustaceans. They are sometimes called feelers, and are supposed to be organs of touch (or, according to some naturalists, organs of hearing). An insect has two antennæ, which are very flexible, and are composed in some species of a great number of joints. A crustacean has four antennæ.

Anteque'ra, a city of Spain, in the province of Malaga, 22 miles N. N. W. of Malaga, on the left bank of the Guadalhorce. It has many monasteries and convents, and large factories of flannel, paper, silk, and soap. The population of Antequera consists largely of hidalgos, with whom the vendetta was a common practice as late as 1845. Pop. in 1860, 25,581.

Ant'eros [Ἀντέρως], in the Greek mythology, a being opposed to Eros or Cupid; also the deity who avenges unrequited love.

An'tes, a township of Blair co., Pa. Pop. 1893.

Anthe'lia [from the Gr. ἀντήλιος or ἀνθήλιος, "opposite the sun"], luminous colored rings observed under certain conditions around the shadow of the spectator's own head. The conditions of the phenomenon are two: first, that the sun be near the horizon, and secondly, that the shadow be projected on a surface covered with dew-drops, as a field of grass, or on a dense fog-bank distant about fifty yards. They occur chiefly in the polar regions.

Anthelmin'tics [Gr. ἀντί, "against," and ἕλμις, a "worm"] are medicines which either destroy or drive out intestinal parasites; the former are called vermicides, the latter vermifuges. The last named are most commonly employed. Against the ordinary lumbricoid worm (*Ascaris lumbricoi'des*) an infusion or fluid extract of senna and spigelia (pink-root) is safe and efficacious. To drive out the worrying seat-worms or thread worms (*Oxyu'ris* or *Ascaris vermicula'ris*) nothing is better than santonin, introduced into the bowels in the form of a suppository. For the more formidable tape-worm (*Tæ'nia*) oil of turpentine, oil of fern, kousso, pumpkin seeds, and pomegranate seeds are used. It is important that the *head* of the tape-worm shall pass away, as, till that happens, the joints continue to be reproduced. In all cases of worms attention is needed to the general condition of the digestive organs.

An'them [Gr. ἀντίφωνος, "returning a responsive sound"], a mixture of motett and cantata, with instrumental accompaniment, adapted to scriptural words. It was carried to great perfection by Handel.

Anthe'mion, the ornament or ornamental series used in Greek and Roman decoration which is derived from floral forms, more especially the honeysuckle, very common in the early period of Greek art.

Anthe'mius [Ἀνθέμιος], an eminent Greek architect and mathematician, surnamed TRALLIANUS, from his native place, Tralles, in Lydia, was a brother of Alexander Trallianus. He was patronized by Justinian at Constantinople, and designed the celebrated church of St. Sophia, which was finished about 537 A. D., and is sur-

mounted by a dome in the Byzantine style, of which it is probably the original type. It is now a Turkish mosque. Died in 534 A. D.

Anthe'mius, or **Anthe'mius Proco'pius,** a Roman emperor, who began to reign at Rome in 467 A. D., before which he was a favorite general of Leo, the emperor of the East. He was the father-in-law of Ricimer, who became his enemy. Anthemius was defeated in battle by Ricimer, and put to death in 472 A. D.

An'ther [Lat. *anthe'ra*, from the Gr. ἄνθος, a "flower"], the essential part of the stamen, is the case which contains the pollen, and is the male organ of a plant. Theoretically considered, the anther is the lamina of a transformed leaf divided into two lobes or cells by the connective, which corresponds to the midrib of the leaf. When the anther is attached by its base to the apex of the filament, it is called *innate*, as in the carex; when it grows to the face or side of the filament, it is *adnate*, as in the magnolia; and when the apex of the filament is attached to the middle of the anther, the latter is *versatile*, as in the grasses. The anther generally opens, for discharging pollen, a longitudinal slit from top to bottom of each cell, but sometimes only at the apex or some other definite point.

Antherid'ium, plural **Antherid'ia** [from Lat. *anthera*, an "anther," and the Gr. εἶδος, "likeness"], a name applied to organs of cryptogamous plants supposed to be analogous in functions to the anthers of the phanerogamous flowers. They are variously situated on the surface of plants or within their tissue, and are in some cases collections of cells containing small bodies called *phytozoa*, which at certain periods exhibit rapid movements.

Antho'dium [from the Gr. ἄνθος, "flower," and εἶδος, "likeness"], a head of flowers, the same as a capitule, applied to the flower of the thistle and other Compositæ, in which a number of florets are combined in a head and surrounded by a common involucre.

Anthology [from the Gr. ἀνθολογία, a "collection of flowers"], a term applied metaphorically in ancient literature to a collection of short pieces of poetry on amatory, convivial, or moral subjects, or a selection of beautiful thoughts and sentences in prose or verse, mostly epigrams. The first collection in Greek entitled an Anthology was made by Meleager, a Syrian poet who lived about 80–60 B. C. Another collection, compiled by Constantine Cephalas in the tenth century, was discovered by Salmasius, and is now extant. This anthology, augmented by epigrams found on ancient monuments, was edited by Brunck, under the title of "Analecta Veterum Poëtarum Græcorum" (1776). A revised edition of the same was published by Jacobs, entitled "Anthologia Græca sive Poëtarum Græcorum Lusus ex Recensione Brunckii" (Leipsic, 1794–1814). Scaliger published a Latin anthology in 1573 entitled "Catalecta Veterum Poëtarum" ("Selections from the Old Poets"). Collections of poetry which may not inappropriately be termed anthologies are also found in the literatures of Arabia, Turkey, Persia, and China.

An'thon (Charles), LL.D., an American classical scholar, born in the city of New York Nov. 19, 1797, graduated at Columbia College in 1815. He studied law, and was admitted to the bar in 1819, but he never practised that profession. In 1820 he became adjunct professor of ancient languages in Columbia College, and in 1835 principal professor of the classics in that institution. He published, besides other works, an edition of Horace with notes (1830), a "Dictionary of Greek and Roman Antiquities," and a "Classical Dictionary" (1841). His works have been reprinted in England. Died July 29, 1867.

Anthon (John), LL.D., a brother of the preceding, born in Detroit in 1784, graduated at Columbia College in 1801. He was a very eminent lawyer, and was president of the Law Institute of New York. He published several legal works of importance. Died in New York City Mar. 5, 1863.

An'thony, a township of Lycoming co., Pa. Pop. 543.

Anthony, a township of Montour co., Pa. Pop. 959.

Anthony (Henry B.), a statesman, was born at Coventry, R. I., April 1, 1815, graduated at Brown University in 1833, was editor of the "Providence Journal" (1838–59), governor of Rhode Island (1849–51), and U. S. Senator since 1859.

Anthony (Susan Brownell), born at South Adams, Mass., Feb. 15, 1820, was the daughter of a Quaker. She was for fifteen years a teacher in New York. Since 1852 she has been an active leader of the woman's right movement; she has also been long distinguished for her zeal and eloquence in the temperance and anti-slavery causes. Since the civil war she has given most of her labors to the cause of woman's suffrage.

Anthony, Saint. See Antony, Saint.

Anthony's Creek, a township of Greenbrier co., West Va. Pop. 632.

Anthony's Nose, a mountain in the Highlands, E. of the Hudson River, is partly in Philipstown township, Putnam co., and partly in Cortlandt township, Westchester co., N. Y. It rises 1228 feet above the river. In making the railroad cutting through its base many beautiful minerals were found.

Anthony Village, a post-village in Coventry township, Kent co., R. I., has a national bank and important manufactures. It is on the Hartford Providence and Fishkill R. R., 13½ miles S. W. of Providence.

Anthoph'yllite, a silicate of magnesia and iron from Norway. A fibrous mineral of similar composition, called *hydrous anthophyllite*, is found on New York Island, near the corner of Fifty-ninth street and Tenth avenue, which is supposed to be an altered hornblende.

Anthosid'erite [from the Gr. ἄνθος, a "flower," and σίδηρος, "iron"], a hydrated silicate of iron occurring in fine fibrous tufts, with a radiated structure. It is found at Antonia Pereira, in Minas Geraes, in Brazil.

Anthoxan'thum [from the Gr. ἄνθος, a "flower," and ξανθός, "yellow"], a genus of plants of the natural order Graminaceæ, natives of Europe. The flowers are a dull yellow when ripe. It includes the sweet vernal grass (*Anthoxanthum odoratum*), which grows in meadows and perfumes the air with an exquisite fragrance. It is naturalized in the U. S.

An'thracene, or **Paranaph'thaline** ($C_{14}H_{10}$), a hydro-carbon existing in coal-tar, and extracted from the last portions of the distillate from this substance. The products of the distillation of coal-tar as ordinarily conducted are: (1) Crude coal-tar naphtha, containing benzol, toluol, etc., lighter than water. (2) Heavy oil of coal-tar, or "dead oil," heavier than water, and containing about 10 per cent. of Phenol (which see) and cresol, and much naphthaline. (3) Green oil, which becomes semi-solid on cooling, owing to the crystallization of anthracene. (4) Pitch, which remains in the still. Versemann and Fenner have patented the further distillation of pitch till only coke remains in the still. They thus obtain a much larger yield of green oil, and increase the product of anthracene from one-half of 1 per cent. to 2 per cent. of the original tar. The semi-solid green oil has been used in England to some extent as a cheap lubricator or wheel-grease, under the name of "green grease." The anthracene is separated from the green oil by chilling and pressing. In its crude state it contains considerable oil, naphthaline, pyrene, chrysene, chrysogen, retene, anthraflavic acid, etc. To purify the crude anthracene cake, it may be subjected to distillation, the first and last portions being rejected, the intermediate portion being recrystallized from benzol or coal-tar naphtha; or the crude cake may be washed with petroleum naphtha to remove oils, etc., and then recrystallized from benzol. Thus obtained, anthracene is always colored yellow by chrysogen, which may be destroyed by exposing its solution to the direct rays of the sun. Graebe and Liebermann prepared anthracene by the action of zinc-dust on alizarine, the coloring-matter of madder, and were from this led to devise a method for preparing alizarine from anthracene—an operation which is now the basis of a very important industry. (See Alizarine.)

Anthracene may also be formed artificially by benzyl chloride (C_7H_7Cl) with water, and by exposing to a red or white heat mixtures of ethylene with benzol, cinnamene, diphenyl, chrysene, or naphthaline. Anthracene is obtained in beautiful white crystalline laminæ, melting at 213° C., and distilling at 360° C. Anthracene is insoluble in water, soluble in alcohol, benzol, and bisulphide of carbon to the extent of 0.6, 0.9, and 1.7 per cent. respectively. Heat greatly increases its solubility in these liquids. It is also soluble in ether and the essential oils, especially oil of turpentine. Light petroleum naphtha, which dissolves naphthaline readily, has little effect on anthracene. Oxidizing agents, such as potassic dichromate and sulphuric or acetic acid, change anthracene into oxanthracene or anthraquinone ($C_{14}H_8O_2$), which, by the addition of O_2, becomes anthraquinonic acid or alizarine, $C_{14}H_8O_4$. Oil of vitriol dissolves anthracene, forming a conjugated acid. With bromine and chlorine, anthracene forms several substitution products. On mixing alcoholic solutions of picric acid and anthracene, beautiful ruby-red needles of picrate are obtained. (See "Anthracene und seine Derivate," by G. Auerbach, Berlin, 1873; Kopp's articles in "Le Moniteur Scientifique du Quesneville," Aug. 15, 1870, Aug. 1 and 15, 1871; also "Jahresbericht über die Fortschritte der Chemie," 1868 *et seq.*, and Wagner's "Jahresbericht der Chemischen Technologie," 1868 *et seq.*) C. F. Chandler.

An'thracite [Lat. *anthraci'tes*, from the Gr. ἄνθραξ, a "coal"], an important fossil fuel, the hardest variety of stone coal, consisting, when pure, almost exclusively of carbon. It has a conchoidal fracture, a black color, and an imperfectly metallic lustre, from which it is sometimes called *glance coal*. It burns slowly, with intense heat, without smoke, and with little flame. Anthracite, like all other varieties of coal, is of vegetable origin, and is, in fact, formed from softer and more bituminous coals by the action of subterranean heat, which has driven off most of their volatile matter. The composition of anthracite is the same as that of coke formed artificially from bituminous coal, and it is more dense than coke only because it has been heated under great pressure. Anthracite has no definite composition, but shades imperceptibly into graphite on one hand, and into bituminous coal on the other. The anthracite beds of Pennsylvania are all of carboniferous age, and were once connected with the bituminous coals of the Alleghany coal-field, having been separated and changed in character by the upheaval of the Alleghany Mountains. The coals of that State show a regular gradation of composition in going from the east to the west, and receding from the focus of metamorphic action in the Alleghanies. For example, the coal of the Lehigh basin is most baked, and contains the least amount of volatile matter—3 to 7 per cent.; the Scranton coal, from 9 to 12 per cent.; the semi-bituminous coal of Blossburg and Broad Top, from 17 to 25 per cent.; the bituminous coal of Western Pennsylvania, from 30 to 50 per cent. In Rhode Island a small basin of carboniferous rocks has been still more thoroughly calcined, and the coal is partially converted into graphite (graphitic anthracite). Anthracite may be of any geological age. In China the coals are mostly, if not altogether, of mesozoic age, and over large areas they are anthracitic. Near Richmond, Va., trap dikes bursting through the triassic coal-beds have changed some of them locally into a spongy anthracite, a "natural coke." Near Santa Fé, N. M., an outburst of volcanic rock has, over many square miles, converted a cretaceous lignite into anthracite. The triassic coal of Los Bronces, Sonora, has been extensively metamorphosed by the action of igneous rocks, and on Queen Charlotte Island, N. of Vancouver's Island, a local eruption of trap has converted a cretaceous lignite into one of the most compact and brilliant anthracites known.

The density and great heating power of anthracite make it the best of all fuels for metallurgic purposes, while its freedom from smoke specially commends it for combustion in cities. For the generation of steam, anthracite has no superiority over the best bituminous and semi-bituminous coals; and as a household fuel, cannel is preferred for open fires from its cheerful flame and the facility with which it is kindled; but the steadiness, cleanliness, and economy of an anthracite fire will always make it the staple fuel of the communities which can obtain it.

Anthracite occurs and is largely mined in Wales, Ireland, and other parts of Europe, but the most extensive and productive beds of anthracite are those of Pennsylvania. These form several detached basins lying between the folds of the Alleghany Mountains. Their aggregate area is only about 500 square miles, but from their proximity to the chief centres of population and manufacture they have had a most important effect on the development of the industry and wealth of America. (See COAL.) (See TAYLOR'S "Statistics of Coal;" DABOW'S "Coal, Iron, and Oil;" and MCFARLANE'S "Coal Formations of America.")

J. S. NEWBERRY.

Anthraquinone. See ANTHRACENE and ALIZARINE.

Anthropol'atry [from the Gr. ἄνθρωπος, "man," and λατρεία, "service," "worship"] signifies the worship of man. The primitive Christians accused the heathen of anthropolatry, because they deified certain heroes or represented their gods as having a human form.

Anthropol'ogy [from the Gr. ἄνθρωπος, "man," and λόγος, a "treatise"] is a term used in several senses: (1) It signifies the science of man as an object of natural history, and as compared with other animals; (2) the science which treats of man's whole nature, as distinguished from psychology, which treats of the mind or spirit of man; (3) in a theological sense it denotes the study of man in his relations to God. (For a notice of anthropology in the former senses see the article MAN, by PRES. M. B. ANDERSON, LL.D.)

ANTHROPOLOGY [ἀνθρωπολογία, "doctrine respecting man"], in the theological as distinguished from the physiological sense, is that part of the Christian system which treats of man in distinction from God. In its entire extent it includes the description of man both as created and as fallen, and therefore properly includes both the holiness and the sin of the human race. It begins with the creation of man as composed of body and soul, and thus supposes a basis in physical anthropology. It then considers the soul as created in the image of God, and thus discusses the nature of holiness and the happiness of an unfallen creature in the paradisaical state. But inasmuch as man continued in his primitive holy condition but a brief time, his history is made up mainly of his apostasy and its consequences, so that practically the subject of anthropology relates to such topics as original and actual sin, the free and the enslaved will, the relation of the human to the divine efficiency in regeneration, and the related doctrines. The great controversies which have resulted in the several anthropologies that have a place in the history of religious opinions were concerned almost exclusively with sin, and it is in this reference that we shall examine the subject.

In the primitive Church of the first three centuries the fact of apostasy was universally acknowledged, but only in a general form. The doctrines of sin and grace in their more difficult and scientific aspects did not seriously engage the attention of the Church. The theological mind was occupied with the doctrine of the Trinity and the great controversy concerning the deity of Christ. The statements of Scripture concerning the fall of Adam and its consequences were taken without much discussion, and no acute and powerful exegesis was expended upon them for the purpose of answering the more difficult questions respecting the nature and depth of human depravity. When, however, these latter points were presented, and any direct response was given, sin in its nature was referred, to a considerable degree, to a sensuous ground, and its intensity was not regarded as so great as to deprive the human will of all power to good. The origin and development of human corruption was traced to the body full as much as to the activity of the spirit itself, and hence a remainder of energy was assumed to exist in the fallen will, by which it could co-operate with the Holy Ghost in regeneration. This view appears particularly in the writings of Clement of Alexandria and Origen, and colors the anthropology of that Alexandrine School which acknowledged those theologians as its great leaders.

It would be a mistake, however, to regard Clement and Origen as the only representatives of the anthropology of the primitive Church. In Tertullian and Cyprian a tendency appears towards that theory which was afterwards elaborated by Augustine. While the part which the sensuous nature has in determining the origin and nature of sin is still asserted, yet more weight is attached to the self-determination of the human will itself—to the purely mental and spiritual energy that originates and perpetuates it. This naturally leads to more assertion of the bondage of the will, and a more profound conception of sin as enfeebling and ruining the moral power of the soul. This tendency was strengthened by the adoption by Tertullian of the traducian view of the origin of the individual. This North African Father, in a somewhat crude and materializing manner, held that both the body and soul are propagated. Both the immaterial essence of the soul and the material substance of the body are individualized portions of human nature as created in Adam. There is no creation from nothing after the creative act on the sixth day, when "God created man male and female, and blessed them, and called their name Adam." (Gen. v. 1, 2.) There is only procreation, or the deduction of individual after individual from this original unity. Such a theory of the propagation of the soul, however difficult in itself, yet made the propagation of sin more intelligible, and prepared the way for the subsequent doctrine of the propagation of sin itself, and not of mere physical evil.

The anthropology indicated in this brief statement of the views of the early Church received a subsequent modification in the later Alexandrine and Antiochian Schools. The best representatives of the first were Athanasius, the two Gregories, and the two Cyrils; of the second, Theodore of Mopsuestia, Theodoret, and Chrysostom. The influence of Origen upon these Greek theologians is apparent, but they receded from his extreme positions and modified his anthropology, (1) by the adoption of creationism instead of pre-existence; (2) by recognizing more distinctly the effects of the Adamic transgression upon the soul itself, including the will; and (3) by making a more guarded assertion of power to good in the fallen man. They agreed, however, with the earlier anthropology in affirming that original sin, or inherited corruption, is not culpable. It is only a propagated disorder of the sensuous nature seen in exorbitant physical appetites, from which temptation issues, and to which every human individual yields without exception. But until this act of the individual will there is no sin, properly so called, no sin in the sense of guilt, in any man. The mortal Adam could beget mortal descendants, but the sinful Adam could not beget strictly sinful and guilty descendants. "What, then," says Chrysostom, "is the meaning of the phrase 'were made sinners?'"

(Rom. v. 19.) It seems to me to denote liability to suffering and death." In this exegesis, Chrysostom put a secondary meaning upon the verb "to sin," which has come down to the present time, and which has unquestionably exerted an influence upon many theologians who would agree with the Golden-mouthed in most of his positions, and also upon many who would be unwilling to adopt his anthropology.

The question as to the guilt of original sin, and the justice of imputing that "disobedience of one man whereby many were made sinners" (Rom. v. 19), is, in truth, the hinge upon which the whole subject of anthropology must turn. And the way in which it is answered constitutes the dividing line between the two great dogmatic divisions which from Augustine down to the present day appear in the history of the Church. Augustine, in his controversy with Pelagianism, but still more with Semi-Pelagianism, maintained that the first sin of Adam is imputable to the posterity as guilt, and is a just ground of condemnation, because the posterity existed in the progenitor, and in some real but inexplicable manner acted in him in the first transgression. "We were all," he says, "*in* that one man, since we all *were* that one man. The particular form in which we were to live as individuals had not been created and assigned to us, man by man, but that *seminal nature* was in existence from which we were to be propagated." (*De Civitate Dei*, xiii. 14.) If the mystery of such a generic existence and such a natural union between the progenitor and the posterity could be believed and the fact conceded, then the imputation of Adam's sin to his descendants would be made upon the same principle that it is imputed to Adam himself—upon the principle, namely, of attributing to every real and veritable agent every real and veritable act of the agent. The consequence of this primal act of apostasy was the total depravation of the entire human species, then existing in the progenitors, and consequently every individual produced out of this species is born entirely depraved. Beginning in the higher parts of the soul, the reason and will, sin penetrates and poisons the lower powers, and vitiates the bodily appetites and propensities. Sin is spiritual evil in its very outset, and becomes sensuous corruption in its final issue. The soul itself falls from God, and carries the body with its sensuous nature along with it. Unlike the anthropology of Origen, that of Augustine explains the disordered appetites of the flesh by the rebellion in the spirit, and not the rebellion in the spirit by the disorder of the flesh.

Another point of difference between Augustine and his Semi-Pelagian opponents relates to the question as to the amount of power to holiness in man after apostasy. Pelagianism, as defined and defended by its ablest advocate, Julian of Eclanum, contended for plenary power in every man to keep the moral law. The apostasy still left the will free, and freedom means the liberty of indifference, or the power of choosing either good or evil at any instant. This view was deemed to be extreme by those who would find a middle view between Pelagius and Augustine. Cassian and Faustus of Rhegium, the best representatives of the so-called Semi-Pelagianism, maintained that by the fall of Adam his posterity were greatly weakened, but not made absolutely impotent to good. There still remained a minimum of goodness, which is capable of co-operating with God, and therefore regeneration is a joint product of grace and free-will. Neither can do without the other. In opposition to this, Augustine contended that there is no power to good, not even a minimum, left in the human soul since apostasy. The heart and will are wholly determined to evil, and there is no remainder, however small, of either inclination or affection that is friendly to God and holiness. The carnal mind is enmity towards God, and nothing but enmity. Hence, man cannot co-operate with God in regeneration. Not until the sinner is made willing (Ps. cx. 3; Phil. ii. 12, 13) can he will the right.

The Pelagian anthropology, which was the occasion of forcing out the systematic statements of Augustine, denied that any physical or moral corruption of human nature resulted from the Adamic transgression, interpreted the statements of the fifth chapter of Romans as teaching the influence of bad example, and asserted that sin is not strictly universal, but that some have lived without transgression. Pelagianism itself never exerted much influence within the Church. It contained too few elements of truth, and was too utterly at variance with the Scripture representations of sin and grace, to get the advocacy of any who possessed an evangelical experience. It was rejected as heresy. But the middle view of Semi-Pelagianism held its ground by reason of its recognition of the injurious effects of Adam's apostasy upon his posterity, and its acknowledgment of the need of grace in order to recovery therefrom. Moreover, the *degree* of power to good which many of the Semi-Pelagians asserted was much less than that asserted in the Alexandrine anthropology, and in some instances it was reduced to so low a minimum as to border closely upon the Augustinian impotence. Wiggers compares the three systems with each other as follows: Augustinianism asserts that man is morally *dead;* Semi-Pelagianism maintains that he is morally *sick;* Pelagianism holds that he is morally *well.*

The Augustinian and Semi-Pelagian anthropologies (that of Pelagius being rejected by all parties within the Church) continued to hold their ground with varying success. The Augustinian theory of sin and grace was adopted by the Western Church at the Councils of Orange and Valence, in 529, as the catholic orthodoxy, not merely in opposition to Pelagianism, but also to Semi-Pelagianism and all grades of the synergistic theory of regeneration. But it would be an error to suppose that the Western Church as a body continued to adhere to the views of the venerated North African Father. Theologians like Leo and Gregory in the fifth and sixth centuries, and like Bede, Gottschalk, and Alcuin in the eighth and ninth centuries, propagated the teachings of Augustine respecting the corruption of human nature and the agency of the Holy Spirit in regeneration, but the middle theory found increasing currency in the mediæval Church. Its less rigorous character, together with its comparative silence upon the more difficult parts of the doctrines of original sin, predestination, and the enslaved will, recommended it to a large class of minds; while the element of human efficiency which it introduced into the doctrine of regeneration was thought to render it a more intelligible and practical doctrine. It was not strange, consequently, that in course of time the Latin Church, though holding the name of Augustine in the highest veneration, and claiming not to depart from his teachings, should have lapsed very generally into Semi-Pelagianism. It came thus upon the same doctrinal position with the Greek Church, which, during all the controversy at the West respecting sin and grace, continued to adopt the views of Chrysostom and the Greek Fathers generally. In the eleventh century the wonderful intellect and saintly piety of Anselm maintained the Augustinian view with great power and depth of reasoning, but was not able to turn the current which was sweeping with an increasing flood in the other direction. Schoolmen like Bernard and Aquinas were nearer to Augustine than to any other great authority of the past, but the main influence of Scholasticism as a whole tended to undermine his positions. The dawn of a new era at the Reformation opened the old questions. Luther, Calvin, and the Protestant theologians generally not only adopted the Augustinian anthropology, but stated the doctrines involved in it with still greater clearness, and defended them with still closer reasoning. The papal Church took the opposite view. The Council of Trent enunciated Semi-Pelagianism, and endeavored to give it currency under the great authority of Augustine, whose opinions were in some instances honestly misconceived, and in others knowingly misrepresented.

Wherever Protestantism prevailed, Augustinianism prevailed also. Augustine's theory of sin and grace pervaded and moulded the symbols of the Reformation almost without an exception, and from them passed into the heart and life of the Protestant Church. But in process of time the same transition occurs in Protestantism which we have seen taking place in the Latin Church. The more rigorous type gives way to the milder in some quarters. The Arminian controversy in reality turned upon the same points that were discussed between Augustine and the monks of Adrumetum, between Prosper and Cassian. Calvinism is the revived Augustinianism, and Arminianism is the revived Semi-Pelagianism. These two types of doctrine in reality exhaust and include all the varieties of doctrinal opinion that prevail in modern evangelical Christendom. There are minor differences, but churches and individuals are either Calvinistic or Arminian, as in the Patristic period they were either Augustinian or Semi-Pelagian. There is no real mid-point between these two, although schools and theologians have frequently attempted to find one.

The difference between these anthropologies is due to logic rather than to practical experience. The follower of Arminius agrees with the adherent of Calvin in holding the fundamental doctrines of the Trinity and the incarnation, of apostasy and redemption, and the religious experience of both alike is evangelical; that is, it springs out of faith in the atonement of the Son of God. The difference between them relates not to the general facts and truths of the New Testament, but to the more specific and exact definitions of them. The modern Arminian, like the ancient Semi-Pelagian, while confessing sin and trusting in the blood of Christ, urges what he believes to be a valid argument against the doctrines of predestination and irresistible grace, and that particular form of the doctrine of

original sin out of which the doctrines of predestination and irresistible grace issue as necessary corollaries. And his opponent shows his respect for this belief by entering into the debate, and defending what he thinks to be the more exact and self-consistent and all-comprehending statement of that same evangelical system. The issue of a controversy that originates in logic must therefore be left to logic. The closest reasoner from the scriptural premises and the evangelical experience must be adjudged to be the victor. If the Arminian anthropology shall in the course of time prove itself to be the more scientific and self-consistent system of the two, it will be recognized and accepted as such. But if in the same calm and cool atmosphere the Augustinian statements shall evince their superiority, they must pass for Christian science.

W. G. T. SHEDD.

Anthropomor'phism [from the Gr. ἄνθρωπος, a "man," and μορφή, a "form"], the representation of the Deity under a human form or with human affections; the figurative application to God of terms which properly relate to human beings. Also the heresy of the ANTHROPOMORPHITES (which see).

Anthropomor'phites, or Anthropomor'phists, persons who believe or imagine that the Deity has naturally a human form, as the ancient Greeks and other pagans. This error has been also entertained by some Christians, especially the Audæans or Audians, a Syrian sect formed about 350 A. D. The tendency to anthropomorphism arises from the inability of man to form any conception of a divine Person except by imagining that there is some similarity between the human and the divine nature.

Anti [ἀντί, "against"], a Greek preposition which occurs as a prefix to many English words, denoting opposition, as *antidote*, "given against" [poison]; *antipodes*, "opposite [our] feet," etc.

Antibes, ôn'teeb' (anc. *Antip'olis*), a fortified seaport-town in the S. E. of France, in the department of Alpes Maritimes, is on the Mediterranean, 17 miles by rail S. W. of Nice. Its port is small but deep, and is furnished with a lighthouse. Lat. 43° 35′ N., and lon. 7° 81′ E. It has a college, and a considerable trade in olives, fruits, oil, salt fish, etc. Here are some remains of great antiquity. It was founded by a Greek colony about 340 B. C. Its Provençal name *Antiboul* readily recalls the ancient Greek appellation. Its coins, the remains of its theatre and of certain Roman constructions, have excited the interest of antiquaries, but its ancient history is obscure. Pop. in 1866, 6064.

An'tichlore, a name given by papermakers to substances which are employed to remove from the pulp the chlorine which, in the form of chloride of lime, had been used to bleach it, and which, if allowed to remain in the pulp, would not only damage the machinery, but injure the strength of the paper. Sulphite and bisulphite of soda were first employed, but at present hyposulphite of soda is almost invariably used. Sulphide of calcium, proto-chloride of tin, and coal-gas have been used. (See BLEACHING.)

An'tichrist [Gr. Ἀντίχριστος, from ἀντί, "against," and Χριστός, "Christ"], a name which has been variously applied by Christian writers to a supposed powerful individual or institution destined to arise in opposition to Christianity, and to obtain a partial or temporary triumph over it. This idea has been traced back beyond the Christian era by some writers, who cite in favor of this view the prophecy of Ezekiel concerning Gog and Magog. The word Antichrist occurs in the Scriptures only in the First and Second Epistles of John. He says "that every spirit that confesseth not that Jesus Christ is come in the flesh" is Antichrist. The "Man of Sin" and "Adversary" of Paul's Second Epistle to the Thessalonians are commonly identified with the Antichrist of John. Many writers, both before and since the Protestant Reformation, have made the pope, or the papacy, Antichrist. Many writers, both Roman Catholics and Protestants, have suggested one or another of the persecuting emperors, such as Nero or Diocletian. Others say a succession of Roman emperors.

Anticli'max [for etymology, see CLIMAX], in rhetoric, a sentence in which the ideas become less important or impressive at the close: a sentence which descends from great to little, and is the reverse of a climax, as in this verse of Pope: "Die and endow a college or a cat;" and this line from Horace: "Parturiunt montes, nascetur ridiculus mus."

Anticli'nal Ax'is, in geology, a term used to denote an imaginary line dividing the portions of a stratum which dip in opposite directions. It may be compared to the ridge of a house which has a steep roof sloping in opposite directions.

Anti-Corn-Law League, in British politics, an association formed about 1838 to procure the repeal of the corn laws, in order that breadstuffs might be imported free from duty. The constitution of the League was dated Mar. 20, 1839, and the central office was located at Manchester. This free-trade movement was opposed by the Conservative party and by the landed interest. The principal orators of the League were Richard Cobden and John Bright. A large amount of money was expended by the League in paying lecturers and in the distribution of printed arguments on the subject, among which was General Thomson's "Catechism of the Corn Laws." The corn laws were repealed in 1846. See LEAGUE, ANTI CORN-LAW.

Antico'sti, a large island of the province of Quebec, Dominion of Canada, in the Gulf of St. Lawrence, between lat. 49° 04′ and 49° 58′ N., and lon. 61° 45′ and 64° 35′ W. Area, more than 3750 square miles, over one-half of which is arable land of excellent quality. Its length is 140 miles, and its greatest breadth is 35 miles. The climate is healthful, and remarkably fine for the latitude. The island was long regarded as worthless, but it has been surveyed and pronounced to abound in valuable forests of pine, spruce, tamarac, ash, and other valuable timber; also in coal, peat, plumbago, salt-springs, marl, marble, building-stone, grindstones, and valuable minerals. The island abounds in fur-bearing animals, and its waters already afford valuable fisheries. In 1873 the island was divided by the "Anticosti Company" into twenty counties of five townships each. Ellis Bay (the chief settlement) and Fox Bay are the only tolerable harbors.

Antic'yra [Gr. Ἀντίκυρα], an ancient city of Thessaly, on the river Sperchius. Another Anticyra was a city of Phocis, with a harbor on the Corinthian Gulf. Both were noted for the production of hellebore.

Antidicoma'rianites ("enemies of Mary") were followers of Bonosus and Helvidius, two Italians of the fourth century who taught that the Virgin Mary, the mother of Jesus, was also the mother of other children.

An'tidote [from the Gr. ἀντί, "against," and δίδωμι, to "give"], a medicine given to overcome or prevent the injurious effects of poisons. Antidotes are chemical or physiological. The first act by neutralizing the poison, converting it into an insoluble or harmless substance. Physiological antidotes produce action within the body which enables it to resist the effect of the poison. Thus, belladonna and opium, both poisonous, are physiological antidotes or counter-poisons to each other. Alcohol or ammonia is the physiological antidote of certain snake-poisons. The more important antidotes are mentioned in this work under the name of the poison for which they are administered.

Antietam, a township of Washington co., Md. P. 854.

Antietam Creek is the name of a small but deep river in Maryland, which empties into the Potomac about 6 miles above Harper's Ferry, and which gives name to the battle fought near Sharpsburg on Sept. 17, 1862, between the Federal troops, under Gen. McClellan, and the Confederates, under Gen. Lee. The Confederate army had crossed the Potomac near Leesburg on the 4th, 5th, and 6th of September, and had occupied Frederick and the surrounding country along the Monocacy. McClellan threw a part of his army between the enemy and the fords of the Potomac, and thus forced Lee to leave Frederick on the 12th, who then marched towards Hagerstown. Two days previously, Jackson had separated himself from the main army, and hurried by forced marches towards Harper's Ferry, which was occupied by Col. D. S. Miles. On Sept. 15 this important position was surrendered to the Confederates, and Jackson made over 12,000 prisoners. In the mean while, the Federal army had followed Lee towards the N., and on the 14th had taken Crampton's Gap and the heights of South Mountain, which commanded the road to Hagerstown, thus forcing Lee to re-

treat over the Antietam to Sharpsburg. On the afternoon of the 16th he was followed by Hooker, who, after a sharp engagement, secured a favorable position. On the following morning the real battle was begun by Hooker, who rapidly drove back the left wing of the Confederates under Jackson, while at the same time Burnside engaged the right wing. The battle at first raged around a corn-field surrounded by woods, to which Hooker had in the beginning driven the enemy. Twice the Federal troops had been repulsed, before a party detached from Franklin's division succeeded in holding it. But Hooker had already been wounded and carried from the field, and the command had devolved upon Gen. Sumner. In the mean while, Burnside on the extreme left had made two unsuccessful attempts to cross the Antietam, when at three o'clock in the afternoon he placed himself at the head of the troops and drove back the enemy, until a row of hills occupied by batteries checked his farther advance. At four o'clock Burnside received orders to gain this position at any price. The first battery was then taken. But by this time Lee had succeeded in strengthening the second hill by A. P. Hill's division, so that Burnside declared himself not able to hold the ground gained, if not assisted by McClellan with the reserve. McClellan did not accede to this demand, and the Federal troops were driven back to the bridge, which the Confederates did not venture to attack. In the centre, French's division steadily advanced, without being able, however, to occupy the hills. Richardson, who commanded another division of Sumner's corps, drove the Confederates from the river halfway back to Sharpsburg. Thus, the Federal army, when darkness put an end to the battle, had gained a few advantages at all points, but had not been able to gain a decisive success. The following morning the Confederates asked for an armistice to bury their dead, which was granted, and under cover of these operations Lee retreated in the night of Sept. 18–19 to the right bank of the Potomac, without encountering much resistance. With regard to the forces at the disposition of the two commanders-in-chief, the statements vary considerably. McClellan states that his army numbered 87,164, and estimates that of the Confederates at 97,445 men, while Lee himself states it to have been only 40,000. According to the Richmond "Enquirer," Lee had 60,000 under his personal command, while Pollard ("Southern History of the War") estimates Lee's forces in the morning at 45,000 and in the afternoon at 70,000 men. The losses seem to have been pretty nearly equal. McClellan gives his at 12,469, inclusive of 2010 dead, while official accounts for Lee's losses are wanting. According to the reports of the commanders of the several corps, they amounted during the fortnight's campaign in Maryland to 13,533. According to McClellan's report, they were several thousand more.

Antig'one [Gr. Ἀντιγόνη], a daughter of Œdipus, king of Thebes, and Jocasta. She attended her father in his exile, and buried her brother Polynices in defiance of the edict of the tyrant Creon, who, for her disobedience, immured her alive. Her tragic story is the subject of one of the dramas of Sophocles.

Antigo'nish, a county in the extreme N. E. part of Nova Scotia, bordering on St. George's Bay. Area, about 500 square miles. Coal is found. Capital, Antigonish. Pop. in 1871, 16,512.

Antigonish, capital of the above county, is situated on the Gulf of St. Lawrence, 40 miles from New Glasgow. It is surrounded by a fine agricultural district, and has one weekly newspaper. Pop. about 4000.

Antig'onus [Gr. Ἀντίγονος], king of Asia, surnamed Cyclops (*i. e.* "one-eyed"), a Macedonian general, was born about 382 B. C. He took part in Alexander's campaign against Persia, and became satrap of Phrygia in 333. In the division of the empire which followed the death of Alexander, Antigonus received the provinces of Lycia, Pamphylia, and the Greater Phrygia. Having become an enemy of Perdiccas, he formed an alliance with Antipater and Ptolemy in 321 B. C. After the death of Perdiccas (321 B. C.), Antigonus waged war in Asia Minor against Eumenes, whom he defeated and put to death in 316. He obtained by conquest several provinces in Asia, and indulged an immoderate ambition, to restrain which Ptolemy, Cassander, Seleucus, and Lysimachus formed a league against him in 315 B. C. In the long war that ensued, Demetrius Poliorcetes, the son of Antigonus, defeated Ptolemy in a naval battle in 306, soon after which Antigonus took the title of king. He encountered the united armies of the allies at Ipsus in Phrygia, where he was defeated and killed in battle in 301 B. C.

Antigonus, king of the Jews, a son of Aristobulus II., was born about 80 B. C. After the death of his father he was expelled from Judea by Antipater and Herod. He was restored to the throne by the Parthians about 39 B. C., but the Roman senate refused to recognize him as king. Mark Antony took Jerusalem and put Antigonus to death about 36 B. C.

Antig'onus Do'son [Gr. Ἀντίγονος Δώσων], king of Macedon, was a descendant of Antigonus surnamed Cyclops, and a nephew of Antigonus Gonatas. He became regent or king in 229 B. C., during the minority of Philip V., who was heir to the throne. He was an ally of the Achæan League in a war against Sparta, and he defeated the Spartan Cleomenes in 221 B. C. He died in the same year, and left the throne to Philip V.

Antig'onus Gona'tas [Gr. Ἀντίγονος Γονατᾶς], a son of Demetrius Poliorcetes, was born about 320 B. C. at Gona, or Gonni, in Thessaly, whence his surname. Having defeated an army of Gauls who under Brennus had invaded Macedonia, he became king of that country in 277 B. C. He was expelled from his kingdom by the famous Pyrrhus, king of Epirus, in 273, but he recovered the throne after the death of Pyrrhus in 271. He died about 240 B. C., and was succeeded by his son, Demetrius II.

Antig'orite, a species of serpentine in which a portion of the silica is replaced by alumina. It has a weak lustre, and feels smooth but not greasy. It is found in the Antigorio valley in Piedmont.

Anti'gua, a British West India island, the most important of the Leeward Group, was first settled in 1632; the area is 89 square miles. It is 22 miles S. of Barbuda. The capital, St. John's, is in lat. 17° 8′ N., lon. 61° 52′ W. The surface is diversified, the climate dry and healthy, and the soil of the interior is fertile. Sugar, molasses, and rum are the chief articles of export. The exports in 1870 amounted to £234,012, and the imports amounted to £164,178. Pop. in 1862, 37,125.

Antilegom'ena [from the Gr. *ἀντί*, "against," and *λέγω*, to "speak"], literally, "spoken against," a theological term applied in ancient times to certain books of the New Testament, the authority of which was questioned by some biblical critics—namely, the Second Epistle of Peter, those of James and Jude, the Epistle to the Hebrews, the Second and Third of St. John, and the Apocalypse. They were, however, ultimately admitted into the canon.

An'ti-Lib'anus, or **An'ti-Leb'anon,** a mountain-range of Palestine and Syria, extending about 90 miles in a N. E. and S. W. direction nearly parallel with Lebanon, from which it is separated by the valley of Cœle-Syria. It is of Jura limestone formation. The highest summit of this range is Mount Hermon, which has an altitude of about 10,000 feet. The valley of Cœle-Syria, between the two ranges, now called *Bŭkâ'a*, is from 4 to 6 miles wide. (See Robinson's "Physical Geography of the Holy Land," 1865.)

Antilles, The [some have supposed the name to be corrupted from the Latin words *ante*, "before," and *insulæ*, "islands," because they seemed placed before the continent, which was only reached after the islands had been passed], a term applied generally to all the West India Islands except the Bahamas. They lie between the Atlantic Ocean and the Caribbean Sea, and extend from the Gulf of Mexico nearly to the Gulf of Paria. They are divided into two groups—the Greater Antilles, and the Lesser Antilles, or Caribbean Islands, which are the most eastern of the two groups. The Greater Antilles comprise the four largest islands of the archipelago—namely, Cuba, Hayti (or St. Domingo), Jamaica, and Porto Rico, with the small islands along their coasts. They are situated in the torrid zone, and are subject to frequent hurricanes and earthquakes. In the central parts of these islands rise high mountains of granitic formation. The staple products are sugar, rum, tobacco, cotton, and coffee.

The Lesser Antilles are small in size, but very numerous, and are arranged in a long curved line or row like a crescent, the convex side of which is towards the east. They are divided into two groups—viz. the Windward, or South Caribbee Islands, and the Leeward, or North Caribbee Islands. The Windward Islands are Barbadoes, Grenada, the Grenadines, Martinique, St. Lucia, St. Vincent, Trinidad, and Tobago. All these belong to England except Martinique, which is a French colony. The Leeward Islands are Anguilla, Antigua, Barbuda, Deseada (French), Dominica, Guadeloupe (French), Marie Galante (French), Montserrat, Nevis, Saba, St. Bartholomew (Swedish), St. Christopher, St. Eustatius, St. Martin (French and Dutch), Santa Cruz, and a group of several small isles called the Virgin Islands, British, Danish, and Spanish. The Leeward Islands are British, except those otherwise designated, and three of the Virgin Islands. Many of the Lesser Antilles are of volcanic origin, and some are of coral formation. The staple productions are similar to those of the Greater An-

tilles. A large portion of the population of the Antilles are negroes and mulattoes, who are free, except in the Spanish islands of Cuba and Porto Rico. Pop. about 4,000,000.

Antiloca'pra ("antelope-goat"), the generic name of the prong horned antelope (*Antilocapra Americana*), which inhabits the drier portions of the North American continent W. of the Mississippi. With the possible exception of the so-called Rocky Mountain goat, this is the only antelope found in America, and it differs widely from all the Old

Prong-Horned Antelope.

World antelopes in this, that the sheaths of its horns are shed annually, like the deciduous horns of the Cervidæ. In this respect the prong-horned antelope stands quite alone, and forms a kind of connecting link between the hollow-horned and solid-horned ruminants.

Antim'achus [Αντίμαχος], a distinguished Greek epic poet, a native of Colophon or Claros, lived about 400–360 B. C. He was a friend of Plato, and author of an epic poem entitled "Thebais," which was highly commended by some ancient critics, but is not extant. He wrote an admired elegy called "Lyde," and other works, which are all lost except small fragments.

Anti-Masonry is a term which indicates repugnance to secret societies (that is, societies which conserve secrets) in general; but it more directly implies opposition to the order known as Masons or Free Masons, for which a high antiquity and wide influence are claimed. This order early excited the suspicions of European governments, some of which regarded it as a mask for conspiracies against throne and altar. Some of them protected themselves, so far as they might, by procuring the election of princes or other eminent personages to the chief offices of the order.

In the summer of 1826 a thriftless tailor, named William Morgan, living in the village of Batavia, in Western New York, it was whispered, was engaged in preparing a revelation of the secrets of the Masonic order, whereof he was a member. Other Masons, including the editor of the village gazette, were understood to be engaged with him in the enterprise. Suddenly, Morgan disappeared one evening, and it was soon proved that he had been forcibly abducted. Excitement naturally arose, committees of vigilance and safety were organized, and he was traced westward to Fort Niagara, near Lewiston, N. Y., where he was temporarily imprisoned, and whence, it was ultimately testified, he was taken out into deep water in Lake Ontario and there sunk, though this was strenuously denied, and various stories from time to time affirmed that he was subsequently seen alive at Smyrna in Asia and other places. Such reports did not allay the excitement, which deepened and diffused itself, finding vent in a political party, which cast 33,000 votes in the State of New York in 1828, about 70,000 in 1829, and 128,000 in 1830; but of this last a fraction were not Anti-Masons, but only Anti-Jackson. The party spread into other States, and nominated William Wirt for President and Amos Ellmaker for Vice-President in 1832, when they were heartily supported in several States, but carried Vermont only. They probably diverted votes enough from Clay to give the States of Ohio and New Jersey to Jackson. They nearly elected Joseph Ritner governor of Pennsylvania in 1832, and did elect him in 1835, through a split in the Democratic ranks. The excitement gradually died out, and absorbing questions of finance and political economy soon dissolved the Anti Masonic party.

HORACE GREELEY.

Anti-Me'los, or **Antimi'lo** (*i. e.* "over against Melos"), a small island of the Grecian Archipelago, is 3 miles N. W. of Melos or Milo.

Anti-mission Baptists, called by themselves **Old-School Baptists,** a denomination of Baptists of the U. S. who have no Sunday schools, missions, colleges, or theological schools, holding that these things make the salvation of men to depend on human effort, and not upon divine grace.

Antimo'nial Wine, a solution of tartar emetic in sherry or other wine.

Antimon'ic Acid, the acid of antimony. It exists in two modifications—antimonic acid, $HSbO_3$, and metantimonic acid, $H_4Sb_2O_7$.

An'timony [etymology uncertain; Lat. *stib'ium*, from which is derived the chemical symbol, Sb], a brittle metal of a silver-white color and of a peculiar taste. It occurs in nature native, combined with other metals, as nickel, silver, etc., with oxygen and with sulphur. The sulphide, "stibnite" or "gray antimony," is the source of all the antimony of commerce. The most abundant supplies of this ore are obtained from Borneo. It also occurs in considerable quantities in Hungary, Cornwall, New Brunswick, California, and Nevada. The sulphide, being very fusible, is often separated from the accompanying gangue-rock by heat, and cast in blocks or loaves. The metal, or "regulus of antimony" as it is called in commerce, is separated from the sulphide in various ways, such as heating with metallic iron, sodic carbonate, and charcoal, or cream of tartar and nitre. The extraction of antimony from its ores is mainly carried on at Linz, in Germany, where the sulphide of antimony is found extensively, and in Great Britain, which receives its supply of ore from Singapore and Borneo, commonly as ballast. The process consists in heating the crude ore, covered with charcoal, on the bed of a furnace, when the sulphide of antimony fuses, leaving unmelted the earthy impurities; and thereafter the liquid is drawn off into iron moulds, where it solidifies into cakes or loaves. The latter are reduced to coarse powder, placed on the bed of a reverberatory furnace, and heated with access of ordinary air containing oxygen, when the sulphur passes away as gaseous sulphurous acid, SO_2, leaving behind the antimony as the teroxide, Sb_2O_3. The roasted mass is now mixed with one-sixth of its weight of powdered charcoal, the whole moistened with a solution of carbonate of soda, and raised to bright redness in crucibles, when the metal antimony trickles to the bottom, and the impurities are left above in the spent flux or scoria, which is known in the arts by the name of *crocus* of antimony. The antimony thus prepared is more or less contaminated by sulphur, copper, arsenic, iron, lead, etc. It may be freed from all these metals except lead by reducing it to a coarse powder and fusing with one-sixteenth of gray sulphide and one-eighth of dry sodic carbonate. The resulting metal must then be pulverized and fused with one-tenth of dry sodic carbonate, and the process repeated.

Owing to the extensive use of antimony preparations in medicine, the removal of arsenic is of special importance. This can be effected by mixing 4 parts of powdered antimony with 5 parts nitre and 2 parts dry sodic carbonate, projecting the mixture into a red hot crucible. The semi-fused mass is boiled with water, and the insoluble potassic antimoniate is reduced to metal by fusion with cream of tartar. Several successive fusions of pulverized antimony tartar. Several successive fusions of pulverized antimony with one-eighth of nitre are said to completely remove the arsenic.

Antimony is a brilliant metal of a bluish-white color and highly crystalline or laminated structure. Its density is 6.7 to 6.86. It is extremely brittle, and may be easily pulverized in a mortar. Its melting-point is 450° C. (842° F.). It may be distilled in an atmosphere of hydrogen at a white heat. Heated in the open air, it burns with a bluish-white flame, and forms copious fumes of antimonious oxide (Sb_2O_3), or "flowers of antimony." A peculiar *amorphous* antimony was prepared by G. Gore (*Proc. Roy. Soc.*, ix., 70 and 304) by electrolyzing certain solutions of the metal. A mass having the appearance of polished steel, with a bright, metallic, amorphous fracture, was obtained of a density of 5.78, which, on being broken or heated, suddenly passed into the crystalline form, with the evolu-

tion of sufficient heat to make it take fire (*Feuererscheinung*). Antimony is oxidized by nitric acid, with the formation of antimonous oxide (Sb_2O_3), antimonic oxide (Sb_2O_5), or antimonoso-antimonic oxide ($Sb_2O_3.Sb_2O_5$). Antimony forms with acids or chlorous radicals two classes of compounds: 1, antimonous or tri-compounds, as the trichloride, $SbCl_3$; trioxide or antimonous oxide, Sb_2O_3; trisulphide, Sb_2S_3. 2, Antimonic or penta-compounds, as pentachloride, $SbCl_5$; pentoxide or antimonic oxide, Sb_2O_5; pentasulphide, Sb_2S_5.

Antimonous chloride, or *trichloride* ($SbCl_3$), called *butter of antimony*, is obtained by dissolving antimonic sulphide in hydrochloric acid. In its concentrated form it appears as a yellow oily liquid of the consistence of melted butter. Poured into water, it produces a buttery white precipitate of oxychloride (*powder of algaroth*), $SbCl_3$, Sb_2O_3, or SbO.Cl. Mixed with olive oil, butter of antimony is used for bronzing gun-barrels. Powdered antimony poured into a jar of chlorine takes fire, forming $SbCl_3$ or $SbCl_5$.

Antimonic chloride, or *pentachloride* ($SbCl_5$), is a colorless volatile liquid, prepared by heating antimony in an excess of chlorine. By the action of water it is changed to antimonic acid and hydrochloric acid.

Antimonous hydride, or *antimonetted hydrogen* (SbH_3), a colorless gas produced by the action of zinc and sulphuric acid on a solution of antimony. It burns with a greenish flame, evolving fumes of Sb_2O_3. Passed through a red-hot tube, it is decomposed, with the formation of a black deposit of Sb. A similar deposit is formed on cold porcelain held in the flame. When the gas is passed into a solution of argentic nitrate, a black precipitate of antimonide of silver ($SbAg_3$) is formed. This gas (SbH_3) is the analogue of ammonia, NH_3, phosphine, PH_3, and arsine, AsH_3; as is also the silver compound, $SbAg_3$. A class of organic bases, represented by triethyl stibine, $Sb(C_2H_5)_3$, belongs to the same group. (See AMINES.)

Antimonous, or *trioxide* (Sb_2O_3), found native in beautiful crystals, as *valentinite* and *senarmontite*. Boiled with cream of tartar ($K.H.C_4H_4O_6$), antimonous oxide dissolves, with the formation of *potassio-antimonous tartrate*, or *tarter emetic* ($K.SbO.C_4H_4O_6$). An impure oxide is manufactured for the preparation of this salt, by roasting the powdered sulphide, and fusing the product at the end of the process. It is known as *glass of antimony*.

Antimonic, or *pentoxide* (Sb_2O_5), is formed by heating powdered antimony with excess of strong nitric acid, by decomposing $SbCl_5$ with water, or by fusing powdered antimony with nitre. Potassic antimoniate is the only reagent for the precipitation of soda. There are two modifications of this acid, known as antimonic acid, $HSbO_3$, and metantimonic acid, $H_4Sb_2O_7$.

Tetroxide, or *antimonoso-antimonic acid* (Sb_2O_4 or $Sb_2O_3.Sb_2O_5$), occurs native as *cervantite*. It is the ultimate product of the action of heat and air on the metal.

Trisulphide, or *antimonous sulphide* (Sb_2S_3), the ore *stibnite*, or *gray antimony*, prepared artificially by fusing antimony with sulphur, or as an orange precipitate by passing sulphuretted hydrogen through a solution of tartar emetic. This sulphide is a sulphur-acid, which unites with basic sulphides, forming salts in every way analogous to the oxygen salts. Such are $3K_2S.Sb_2S_3$; zinkenite, $PbS.Sb_2S_3$; miargyrite, $AgS.Sb_2S_3$; pyrargyrite, $3AgS.Sb_2S_3$.

Pentasulphide, or *antimonic sulphide* (Sb_2S_5), is also a sulphur-acid, forming sulpho-antimoniates, analogous to the ortho-phosphates. The sodic sulpho-antimoniate is Na_3SbS_4. Precipitated from a mixture of antimonic pentachloride and tartaric acid, it appears as a yellowish-red powder, the golden sulphuret.

Kermes is an oxysulphide ($Sb_2O_3.2SbS_3$) which occurs native as the beautiful cherry-red kermesite.

ALLOYS OF ANTIMONY.—*Type-metal* is composed of antimony 1, lead 4 parts, and when used for stereotype plates receives an addition of one-eightieth to one-fiftieth of tin. This alloy is not only hard, but, owing to the fact that it expands at the moment of solidification, it takes a very sharp impression of the mould. *Britannia* is composed of antimony 1, tin 9 parts. *Pewter* is another alloy of antimony and tin. Antimony also enters into the composition of some of the *anti-friction* alloys. Tartar emetic is the most important preparation of antimony used in medicine; in large doses it is very poisonous. The old-fashioned "family pill" was a small bullet of metallic antimony, which was swallowed for certain difficulties, and carefully preserved for future occasions. C. F. CHANDLER.

Antino'mians [from the Gr. ἀντί, "against," and νόμος, "law"], a name applied to those who maintained that the law is of no use or obligation under the gospel dispensation. They took their rise from JOHN AGRICOLA (which see), who was originally a disciple and friend of Luther, and who contended that his views were the legitimate deductions from the principles taught by Luther himself. He taught, among other things, that good works do not promote our salvation, nor evil ones hinder it. Luther attacked the Antinomian heresy with great zeal, and at length, in 1540, Agricola recanted his more obnoxious tenets, and pledged himself to teach in conformity to the Church of Wittenberg. Antinomianism afterwards appeared in a more extravagant form in England, where, during the protectorate of Cromwell, some zealots maintained that if they should commit any kind of sin, it would do them no harm, nor affect in the slightest degree their condition in a future state, and that it is one of the distinguishing characteristics of the elect that they cannot do anything displeasing to God. English Antinomianism survived till the present century. Crisp was one of its warmest advocates—Wesley and Fletcher its sharpest assailants.

Antinoöp'olis, an ancient city built by the emperor Hadrian in Egypt, on the site of a more ancient city named Besa, and named in honor of his favorite Antinous. It was on the E. bank of the Nile, near the modern village of Ababde. Here the ruins of its theatre and hippodrome are still visible.

Antin'ous, a beautiful youth, a native of Bithynia, became a favorite and attendant of the emperor Hadrian. Having accompanied that emperor to Egypt, he was drowned in the Nile in 122 A. D. As a monument to him, Hadrian built the city of Antinoöpolis, in Upper Egypt. Statues almost innumerable were also erected to perpetuate his memory and his form, by artists whose emulation gave a new impulse to the fine arts. Some of these statues are still extant.

An'tioch [Lat. *Antiochi'a*; Gr. Ἀντιόχεια: Turk. *Antakia*], an ancient city and the former capital of Syria, situated on a fertile and beautiful plain, on the left bank of the river Orontes, 57 miles W. of Aleppo; lat. 36° 11′ N., lon. 36° 9′ 30″ E. It was founded in 301 B. C., by Seleucus Nicator, and named in honor of his father Antiochus. It was the favorite residence of the Seleucid kings of Syria, was called "Antioch the Beautiful," and was widely celebrated for the splendor of its luxury and the magnificence of its palaces and temples. The population in the time of its greatest prosperity is supposed to have been 400,000 or more. Antioch has been nearly ruined by earthquakes, one of which occurred in 115 A. D., and one in 1822. On April 3 and 10, 1872, the city was visited by severe earthquakes, which destroyed many houses, and caused the death of a considerable portion of the population. The disciples of Christ were first called Christians in Antioch, which occupies a prominent position in the history of the primitive Church as the scene of the labors of the apostle Paul. In the fifth century the bishops of Antioch received the title of patriarch, and ranked equal to the patriarchs of Rome, Constantinople, and Alexandria. In the Greek Church the patriarchs still retain this rank. In the Roman Catholic Church four prelates (of the Greek, Syrian, Maronite, and Latin rites) have the title of patriarch of Antioch, but none of them at present reside in Antioch. The Jacobite patriarch of Antioch is the head of that Church. Many councils of the Church were also held here. The crusaders took Antioch from the Saracens in 1098, after which it was the capital of a Christian principality until 1269. Among the remains of its former grandeur are the ruined walls and aqueduct. The modern town, Antakia, is meanly built, has about twelve mosques, and some manufactures of pottery and cotton stuffs. The culture of silk is the chief branch of industry. Pop. variously estimated at from 6000 to 18,000.

ANTIOCH was also the name of an ancient city of Asia Minor, in Pisidia, visited by the apostle Paul (see Acts xiii. 14, and xiv. 21), who planted a church there. Of this city extensive ruins exist. Besides the above, there were at least six other Oriental towns of this name.

Antioch, a township of Hot Springs co., Ark. P. 320.

Antioch, in Contra Costa co., Cal., is a growing town on the Sacramento River, and is the trading-point of an extensive grain-growing district. Large quantities of wheat, barley, and coal are shipped from this place, which has 30 feet of water at low tide. It is the terminus of the projected King's River Canal, and is about 15 miles from Martinez. It has two potteries, copper-smelting works, twelve stores, two churches, and a weekly paper.

J. P. ABBOTT, ED. OF "ANTIOCH LEDGER."

Antioch, a post-township of Lake co., Ill. Pop. 1595.

Antioch, a post-village of Dallas township, Huntingdon co., Ind. Pop. 449.

Antioch, a township of Wilkes co., N. C. Pop. 704.

Antioch, a post-village of Perry township, Monroe co., O. Pop. 165.

Antioch, Bay of, is a port of the Mediterranean, at the mouth of the Orontes River, and lies between high mountains on the N. and S., by which it is mostly well sheltered. The waters are deep.

Antioch College, at Yellow Springs, Green co., O., was founded in 1852, and opened in the following year. Though under the patronage of Unitarians, this college is designed to be free from sectarian influences, and to develop good character as well as mental excellence in its pupils. The sexes are educated together with the best results. The college was established with a view of diffusing education at the lowest possible cost, and thus far with encouraging success. There is a music school and a preparatory department. The presidents have been Hon. Horace Mann, LL.D. (1853–59), Thomas Hill, D.D. (1859–62), G. W. Hosmer, D.D. (1866–72), and Edward Orton, the present incumbent.

Anti'ochus I. [Gr. 'Αντίοχος], surnamed SOTER (*i.e.* "saviour"), a king of Syria, of the dynasty of Seleucidæ, was a son of Seleucus I. Nicator, and was born about 324 B. C. He commanded the cavalry which fought against Antigonus at Ipsus, in 301. Having succeeded his father in 280 B. C., he gained a victory over the Gauls, who had invaded his dominions, from which victory he derived the surname *Soter*. He was killed in battle by the Gauls in 261 B. C.

Anti'ochus II. THEOS, king of Syria, was a son of the preceding, and began to reign in 261 B. C. The people of Miletus, who had received a favor from him, gave him the title of *Theos*, "God." In his reign the Parthians revolted with success, and Arsaces became king of Parthia, which was previously subject to the king of Syria. A war which he waged against Ptolemy of Egypt was ended in 252 B. C. by a treaty, in accordance with which he married Berenice, a daughter of Ptolemy, and repudiated his first wife, Laodice. After the death of Ptolemy he reinstated Laodice, who poisoned him in 246 B. C.

Antiochus III., surnamed THE GREAT, a grandson of the preceding, and a son of Seleucus Callinicus, was born about 238 B. C. He succeeded his brother, Seleucus Ceraunus, in 223 B. C. His capital was Antioch, and his kingdom comprised Syria Proper, Babylonia, Media, and a part of Asia Minor. For the possession of Palestine he waged war against Ptolemy of Egypt, by whom he was defeated at Raphia, near Gaza, in 217 B. C. While he was suppressing a revolt of Achæus in Asia Minor, in 214, the Parthians occupied Media, but, after a successful campaign against Arsaces of Parthia, Antiochus reconquered Media in 212. He afterwards conducted a victorious expedition across the mountains of Hindu-Kush into India, and, having formed an alliance with several Indian princes, returned to Antioch, from which he had been absent seven years. He took Palestine from the king of Egypt in 198 B. C., and invaded Thrace in 196. By this movement he provoked the hostility of the Roman senate. He led an army into Greece, was defeated at Thermopylæ in 191 by Acilius Glabrio, and retreated into Asia Minor. The Roman army, commanded by L. Cornelius Scipio, passed over into Asia in 190 B. C., and gained a decisive victory over Antiochus at Magnesia. The war was then ended by a treaty dictated by the Romans, who required him to cede all the provinces west of Mount Taurus, and to pay about 15,000 talents. In order to raise this sum, he plundered a temple in Elymais, for which act the populace killed him in 187 B. C. He left the throne to his son, Seleucus Philopator. (See POLYBIUS, "History.")

Antiochus IV., surnamed EPIPHANES ("the illustrious"), was a son of the preceding. He passed about twelve years in captivity in Rome, whither he was sent as a hostage in 188 B. C. He became king on the death of his brother, Seleucus Philopator, in 176 B. C. He invaded Egypt in 170, and captured the king, Ptolemy Philometor, but was constrained by the Roman senate to retire from that country in 168 B. C. About this date he plundered the temple of Jerusalem and persecuted the Jews, who rose in arms and were led by Judas Maccabæus, who defeated the Syrian armies in several battles. (See 1 Maccabees ii.) Died in 164 B. C.

Antiochus VII., surnamed SIDETES, a son of Demetrius Soter, was born about 164 B. C. He became king of Syria in 137, and defeated the Parthians in several battles, but was killed in battle by them in 129 B. C.

Antiochus VIII., second son of Cleopatra (the wife, first of Alexander Balas, then of Demetrius II., and then of Antiochus VII.), who reigned over Syria with his mother from 126 to 122 B. C., and then alone till 114 B. C., when his authority was disputed by his half-brother, Antiochus Cyzicenus (Antiochus IX.). He was assassinated by an officer of his court 96 B. C.

Antiochus IX., surnamed CYZICENUS, son of Cleopatra by Antiochus VII., survived Antiochus VIII., and committed suicide 95 B. C.

Antiochus X., surnamed EUSEBES, son of the preceding, succeeded his father in 95 B. C., but was soon after expelled, and died in obscurity.

Antiochus XI., surnamed ASIATICUS, was the twentieth and last king of the dynasty of the Seleucidæ. He began to reign about 69 B. C., and was deposed by Pompey in 65 B. C., when Syria became a Roman province.

Anti'oco, an island in the Mediterranean, near the S. W. coast of Sardinia, is 8 miles long and 3 miles wide. The soil is fertile. Pop. about 2200.

Antioqui'a, one of the states of the United States of Colombia, is bounded on the N. by Bolivar, on the E. by Bolivar, Santander, and Cundinamarca, on the S. by Cundinamarca and Cauca, and on the W. by Cauca. Area, 22,700 square miles. The state is chiefly covered by large forests, and is rich in precious metals. The chief occupation of the inhabitants is mining. Capital, Medellin. Pop. in 1870, 365,974.

Antip'aros, Oli'aros, or **Ole'aros,** a Grecian island in the Ægean Sea, about 1 mile W. of Paros, is one of the Cyclades. It is 8 miles long and 2 or 3 miles wide, and consists of a mass of marble, covered with soil which produces some grain, wine, etc. Here is a celebrated stalactitic cavern called the Grotto of Antiparos, which is about 300 feet long and 80 feet high. The roof and sides are adorned with white incrustations of great splendor and beauty. This grotto was discovered by M. de Nointel in 1673. It was probably not known to the ancients. Pop. about 1200.

Antip'ater [Gr. 'Αντίπατρος], a Macedonian general, who was a pupil of Aristotle, and held a responsible position under Philip of Macedon. He was appointed regent of that kingdom by Alexander the Great in 334 B. C., when he departed to invade Persia. He defeated Agis, king of Sparta, in a battle near Megalopolis in 330. After the death of Alexander, his generals or successors agreed that Antipater should govern Macedonia and Greece. The Athenians, in alliance with other Greek states, made an effort to regain their independence in 322, and defeated Antipater near Lamia, but, having been reinforced by Craterus, he gained a decisive victory in the same year. The Lamian war was then ended by a treaty dictated by Antipater, who required the Athenians to deliver Demosthenes to him. He joined Antigonus in a league against Perdiccas, and on the death of the latter, in 321, succeeded him as regent of the empire. He died in 319 or 318 B. C., and left a son, Cassander. (See THIRLWALL, "History of Greece;" DIODORUS SICULUS, "History.")

Antipater, a son of Herod the Great and Doris, was notorious for his wickedness. Having procured the death of his half-brothers Aristobulus and Alexander, and conspired against his father, he was put to death in 1 B. C.

Antipater the Idumean, a son of Antipas, and the father of Herod the Great, became governor of Idumea. Having assisted Julius Cæsar in his war against the Egyptians, he was rewarded with the office of procurator or governor of Judea, about 46 B. C. Died in 43 B. C.

Antipater of Tarsus, a Stoic philosopher who lived about 140 B. C., wrote several works on philosophy and morality. He opposed the skepticism of Carneades. Cicero represents him as a man of remarkable subtlety.

Antip'athy [Lat. *antipathi'a*; Gr. ἀντιπαθεία, from ἀντί, "against," and πάθος, "feeling"] is a term applied to a peculiarity of the physical or mental constitution in which certain persons feel a strong aversion to particular objects not offensive to others. Some have from childhood an antipathy to animal food, while others dislike one particular kind. That this is not always the effect of caprice is shown by the fact that contact with the object of aversion produces very disagreeable, and in some cases injurious, effects on the system. Certain medicines affect particular persons dangerously: a single grain of mercury has been known to cause profuse salivation. The most remarkable antipathies are those affecting the special senses. Persons have been known to faint at the sight of reptiles and other animals. The smell of musk or ambergris has been known to throw some people into convulsions, and Zimmermann mentions the case of a lady who was similarly affected by touching silk, satin, etc.

Antiph'ilus [Αντίφιλος], an eminent Greek painter, born in Egypt, is supposed to have flourished about 330 B. C., but according to Lucian he lived about 220. He was distinguished for facility of execution. Among his works were "Cadmus and Europa," and a portrait of Alexander the Great.

Antiphlogis'tic [from the Gr. ἀντί, "against," and φλόγωσις, to "burn"], a term applied to remedies and treatment adapted to subdue inflammation or exhaustion of the system in inflammatory diseases. Among these remedies are purgatives and blood-letting.

An'tiphon, or **An'tipho** [Gr. Αντιφῶν], one of the ten

Attic orators, born at Rhamnus in Attica about 480 B. C., was a son of Sophilus the Sophist. He opened a school of rhetoric at Athens, and made reforms in the art of oratory. Among his pupils was Thucydides, who expressed a high opinion of him. Declining to plead in court or appear as a public speaker, he gained much influence and distinction by composing orations for politicians and arguments for persons who were accused. He was an adversary of Alcibiades in politics, and was the chief promoter of the revolution which in 411 B. C. abolished democracy and converted Athens into an oligarchy ruled by a council of 400. A sudden reaction restored Alcibiades to power, and Antiphon was tried for treason. He made an able speech in his own defence, but was convicted and executed in 411 B. C. Fifteen of his orations are still extant. (See D. RUHNKEN and P. VAN SPAAN, "Dissertatio de Antiphonte Oratore Attico," 1763; A. DRYANDER, "Commentatio de Antiphontis Vita," 1838.)

An'tiphon [Gr. *ἀντίφωνος*, from *ἀντί*, "against," "in reply to," and *φωνή*, a "voice"], a piece of music performed in cathedral service by choristers, who sing alternately; a short verse which was sung in the ancient Church before the psalms and other portions of the service.

Antiph'ony [Gr. *ἀντίφωνον*], a term applied by the ancient Greeks to a species of musical accompaniment in the octave by instruments or voices.

ANTIPHONY is also a sacred song sung by two parties, each responding to the other; the answer of one choir to the other when an anthem is sung alternately. This practice prevailed amongst the ancient Hebrews and in the early Christian Church. Ignatius, bishop of Antioch, is said to have introduced it into the Eastern Church in the second century.

Antip'odes [from the Gr. *ἀντί*, "against," and *πούς, ποδός*, "the foot"], in geography, signifies people who live on opposite sides of the globe, and whose feet point against each other. The antipodes of any place are those who live at the other end of a straight line drawn from that place through the centre of the earth to its opposite surface. Thus, the antipodes of London, which is in lat 51° 30′ N. and lon. 0°, must be in lat. 51° 30′ S. and lon. 180° E. or W. The noon of any point corresponds with the midnight of its antipodes, and the summer of one coincides with the winter of the other.

Antipodes, a small island in the South Pacific Ocean, S. E. of New Zealand; lat. 49° 32′ S., lon. 178° 42′ E. It is so called because it is the nearest land to the antipodes of London.

An'tipope, one who assumes or usurps the office of pope, but is not regularly elected or generally recognized as such. The emperors of Germany in several instances, having quarrelled with the pope, appointed another person to the office. The emperor Henry IV. in 1080 appointed the antipope Clement III. in opposition to Pope Gregory VII. In some cases two rival popes have been elected by different parties of cardinals. The great Western schism began in 1378, when the Italian party chose Urban VI., and the French cardinals voted for Clement VII., who held his court at Avignon, and was recognized by France and Spain. This schism was continued after their death by another double election, but in 1415 the Council of Constance deposed both of the popes, and elected Martin V. The last antipope was Felix V. (originally Amadeus VIII. of Savoy), who was elected in 1439, and abdicated in 1449.

An'tiquaries, Society of, the title of several associations of learned men, formed to promote the study of antiquities. The London Society of Antiquaries was founded in 1572, and reorganized in 1707, but received its charter in 1751. The Scottish Society of Antiquaries was founded in 1780. The American Antiquarian Society was organized in Massachusetts in 1812.

An'tiquary [Lat. *antiqua'rius*, from *anti'quus*, "ancient"]. The term (in Latin) was originally applied to persons who copied old books in convents before the invention of printing. In modern language an antiquary is one who studies and collects ancient monuments and remains, such as medals, coins, statues, manuscripts, and inscriptions; or who makes researches into the history, manners, and customs of former generations. The antiquary renders an important service to society by collecting materials for history and rescuing many documents from the ravages of time. The word is nearly synonymous with archæologist. Pausanias is said by some to have been the first antiquary.

Antique, an-teek′, a French word derived from the Latin *anti'quus*, "ancient," signifies old, ancient, old-fashioned, antiquated. In the language of art, the epithet antique is applied to the style of the ancient Greek artists, especially the sculptors, in contradistinction to the mediæval and the modern styles. The word *antique*, variously defined, is generally understood to refer to a period antecedent to the revival of classical studies in the West and the *renaissance* of art. The Greek sculptors excelled in ideal beauty of form, and the antique style is by most critics considered more perfect than the mediæval or the modern.

Antiq'uities [Lat. *antiquita'tes*, from *anti'quus*, "ancient"], an important department of learning, comprises all memorable facts, ideas, and things which relate to or illustrate the origin, early institutions, and development of nations. Thus, the study of antiquities, in the largest application of the term, includes a knowledge of the religion, laws, language, arts, traditions, manners, and customs of ancient peoples, as well as a cognizance of ancient monuments of architecture, sculpture, and other arts. In a more restricted and perhaps more popular sense, the study of antiquities is limited to the discovery, collection, verification, description, and explanation of the relics of antiquity, such as medals, statues, inscriptions, manuscripts, ruined buildings, bas-reliefs, and hieroglyphics. About the time of the revival of learning after the Dark Ages the study of classical antiquities became a distinct branch of research, which was pursued by many eminent scholars. Grævius published a valuable work on Greek antiquities, entitled "Thesaurus Antiquitatum Græcarum" (12 vols. fol., 1697 et seq.); and Roman antiquities were amply illustrated by Gronovius in his "Thesaurus Antiquitatum Romanarum" (13 vols. fol., 1697). Champollion, Young, and Bunsen are the highest authorities in Egyptian antiquities. Among the best antiquarian works may be mentioned MONTFAUCON, "Antiquité Expliquée" (15 vols., 1719–24); HEEREN, "History of Ancient Commerce;" Dr. W. SMITH'S "Dictionary of Greek and Roman Antiquities;" MONTFAUCON, "Monuments de la Monarchie Française" (5 vols., 1725). (For the difference between archæology and antiquities, see ARCHÆOLOGY.)

Antiquity of the Human Race. See MAN, by PRES. M. B. ANDERSON, LL.D.

Anti'quus (JAN), a skilful Dutch painter, born at Groningen Oct. 11, 1702. He passed many years in Rome, Florence, and Venice, and after his return to Holland was patronized by the prince of Orange. Among his works are a "Fall of the Giants," a "Parnassus," and many portraits. Died in 1750.

Anti-rent'ers, a name given to the inhabitants of several counties in Eastern New York, who refused to pay the rents and feudal services required of them by the so-called lord-patroons, the owners of the land. This disturbance, which at one time nearly amounted to insurrection, was at length ended by the triumph of the Anti-rent party in the constitutional convention of 1846, in which a clause was inserted abolishing thenceforth all feudal tenures and incidents.

Anti-Sabbata'rians, a sect of Christians who recognize no obligation to observe the Sabbath, and who affirm that the New Testament does not call for the observance of the Sabbath or any other day.

Antisa'na, a volcanic peak of the Andes, in Ecuador, 35 miles S. E. of Quito, and 20 miles N. E. of Cotopaxi, has an altitude of 19,140 feet.

Antis'cii (the plu. of **Antis'cius**), or **Antiscians** [from the Gr. *ἀντί*, "against," and *σκιά*, a "shade" or "shadow"], literally, having "opposing shadows" or having their shadows in opposite directions at noon; a term applied to the people N. and S. of the equator, considered in relation to each other.

Antiscorbu'tic [Lat. *antiscorbu'ticus*, from the Gr. *ἀντί*, "against," and the Lat. *scorbu'tus*, the "scurvy"], corrective of *scorbutus*, or scurvy. (See SCURVY.) Onions, lime-juice, potatoes, lemons, horse-radish, scurvy-grass, etc. are the best antiscorbutics. Diet, and not medicine, is needed to effect the cure.

Antisep'tic [from the Gr. *ἀντί*, "against," and *σήπω*, to "putrefy"], opposed to or preventing putrefaction. Antiseptics are substances which prevent or check the decay and putrefaction of organic matters. As air, moisture, and heat are necessary conditions of putrefaction, the exclusion of one of these from the animal or vegetable matter is an antiseptic process. The common practice of preserving fruit in air-tight cans of tin or glass is an illustration of this principle. Generally speaking, so long as the air is excluded no decomposition or decay can take place. Cold is a powerful antiseptic; intense cold will prevent change even in those substances which putrefy most readily. To render timber more durable and less liable to decay, corrosive sublimate, chloride of zinc, and heavy oil of tar are sometimes used. For this purpose the wood is placed in a steam-box, its pores are filled with steam, and a vacuum is formed in the pores by the condensation of the steam. The pores are then filled with the antiseptic substance.

The more important chemical antiseptics are alcohol, wood-spirit (or pyroxylic acid), creasote, carbolic acid, heavy oil of tar, sugar, glycerine, sulphurous acid, common salt, charcoal, nitre, alum, chloride of zinc, sulphate of copper (blue vitriol), cresylic acid, sulphate of iron, aluminum chloride and acetate, and other aluminum compounds, corrosive sublimate, and arsenic. Sulphurous acid acts by deoxidizing the substance; sugar acts by combining with the water of the substance to be preserved; creasote, tannic acid, alum, chloride of zinc, sulphate of copper, corrosive sublimate, and arsenic form compounds with the organic matter which are not liable to become putrescent; alcohol, salt, and nitre act both by combining with the water of the putrescible substance, and by combining with the substance itself. (See PRESERVATION OF FOOD, PRESERVATION OF TIMBER, DISINFECTION, and FERMENTATION.)

Anti-Slavery, a term which originated during the long agitation that resulted in the overthrow of slavery in the U. S. It was used nearly synonymously with "abolition," but was preferred by many as being more definite, since the latter term might as well be applied to the "abolition of royalty" (a phrase much in vogue during the first French Revolution) as to the doing away with slavery. The anti-slavery sentiment in the U. S. became more and more widely diffused and more intense as the evils of slavery became more apparent, but it found its most decided and forcible expression through the organization known as the American Anti-Slavery Society. (See next article.)

Anti-Slavery Society, American. This society was organized in Dec., 1833, in the city of Philadelphia, by a convention of delegates from a few anti-slavery societies already in existence in the U. S., and of other persons who were friends of emancipation. The preamble and second and third articles of its constitution express the character and purposes of the society. The preamble asserts that, "Whereas, slavery is contrary to the principles of natural justice, of our republican form of government, and of the Christian religion, and is destructive of the prosperity of the country, while it is endangering the peace, union, and liberties of the States; and whereas, we believe it the duty and interest of the masters immediately to emancipate their slaves, and that no scheme of expatriation, either voluntary or by compulsion, can remove this great and increasing evil; . . . we do hereby agree to form ourselves into a society," etc. The second and third articles declare that "the object of this society is the entire abolition of slavery in the United States;" that the society "shall aim to elevate the character and condition of the people of color, by encouraging their intellectual, moral, and religious improvement, and by removing public prejudice, that thus they may, according to their intellectual and moral worth, share an equality with the whites of civil and religious privileges; but this society will never, in any way, countenance the oppressed in vindicating their rights by resorting to physical force."

The society, thus organized, immediately adopted and published a "Declaration of Sentiments," in which they declared: "The right to enjoy liberty is inalienable. To invade it is to usurp the prerogative of Jehovah. Every man has a right to his own body, to the products of his own labor, to the protection of law, and to the common advantages of society. It is piracy to buy or steal a native African, and subject him to servitude. Surely the sin is as great to enslave an American as an African. Therefore we believe and affirm that there is no difference in principle between the African slave-trade and American slavery; that every American citizen who retains a human being in involuntary bondage as his property is, according to Scripture, a man-stealer; that the slaves ought instantly to be set free, and brought under the protection of law; that if they lived from the time of Pharaoh down to the present period, and had been entailed through successive generations, their right to be free could never have been alienated, but their claims would have constantly risen in solemnity; that all those laws which are now in force, admitting the right of slavery, are therefore, before God, utterly null and void, being an audacious usurpation of the Divine prerogative, a daring infringement on the law of nature, a base overthrow of the very foundations of the social compact, a complete extinction of all the relations, endearments, and obligations of mankind, and a presumptuous transgression of all the holy commandments; and that therefore they ought instantly to be abrogated. We further believe and affirm that all persons of color who possess the qualifications which are demanded of others, ought to be admitted forthwith to the enjoyment of the same privileges, and the exercise of the same prerogatives, as others: and that the paths of preferment, of wealth, and of intelligence should be opened as widely to them as to persons of a white complexion."

Respecting the measures by which the society would seek the accomplishment of its purpose, the Declaration asserts: "Our principles forbid the doing of evil that good may come, and lead us to reject, and to entreat the oppressed to reject, the use of all carnal weapons for deliverance from bondage; relying solely upon those which are spiritual, and mighty through God to the pulling down of strongholds." "Our measures shall be such, only, as the opposition of moral purity to moral corruption, the destruction of error by the potency of truth, the overthrow of prejudice by the power of love, and the abolition of slavery by the spirit of repentance." "We shall send forth agents to lift up the voice of remonstrance, of warning, of entreaty and rebuke. We shall circulate, unsparingly and extensively, anti-slavery tracts and periodicals. We shall enlist the pulpit and the press in the cause of the suffering and the dumb. We shall aim at a purification of the churches from all participation in the guilt of slavery. We shall encourage the labor of freemen rather than that of slaves, by giving a preference to their productions. We shall spare no means to bring the whole nation to speedy repentance."

Arthur Tappan, Lindley Coates, William Lloyd Garrison, and Wendell Phillips successively presided over this society from the time of its organization to that of its disbandment. Among the persons who have held offices in it are—Benjamin Lundy, Lucretia Mott, William Jay, John G. Whittier, Abby Kelly Foster, Gerrit Smith, Samuel J. May, Owen Lovejoy, and Edward Beecher. Its organization was the signal for the concentration of the resistance of slaveholders and their allies, North and South, against the anti-slavery sentiment which had always existed, and which had, from time to time, found expression in the community. Numerous anti-slavery societies, of States, counties, and cities, were soon organized throughout the North; and these, with those which had been founded prior to the American Society, became its auxiliaries. Besides this organized aid, it received cordial sympathy and substantial help from men and women not enrolled as its members, who welcomed it as a mighty instrumentality for the overthrow of slavery. It represented the moral sentiment of the country, which was actively warring against American slavery. During its existence it adhered to its original constitution, and carried on its work in accordance with its Declaration of Sentiments. At its tenth annual meeting, held in New York in May, 1844, it adopted a resolution declaring that, whereas the Constitution of the U. S. contained provisions requiring the rendition of the fugitive slave to his master, therefore fidelity to the cause of freedom required the dissolution of the national compact, and forbade abolitionists to hold office or vote under that Constitution. During a long period of years this society and its adherents were opposed by a large portion of the press and of the pulpits of the nation, and were frequently the victims of the violence of mobs, who disturbed their meetings, assaulted their persons, destroyed their property, and imperilled their lives. In May, 1838, Pennsylvania Hall, a large building erected in Philadelphia for the use of public meetings, and especially for anti-slavery meetings (against which nearly all the churches and halls of the country were then closed), was burned to the ground by a furious mob on the fourth day after its opening and dedication. The purpose of this society—namely, the creation of a public sentiment which should overthrow American slavery—was at last accomplished. This moral force, which had been steadily increasing for more than a quarter of a century, and which had called into existence a small and earnest political party, at length pervaded the Republican party to the extent necessary for a successful resistance, first, to the *extension of* slavery, and then to its *existence*. When the thirteenth amendment of the U. S. Constitution was ratified, abolishing slavery within the jurisdiction of the U. S., and the fourteenth and fifteenth amendments had secured to the emancipated slave his personal freedom, by endowing him with the ballot of a citizen, the American Anti-Slavery Society (the work for which it was organized being finished) disbanded its members and ceased to exist, on the ninth day of April, 1870. HORACE GREELEY.

Antispasmod'ics, a name applied to medicines which cure or alleviate spasm. The name is frequently limited to a small class of drugs which have usually a strong and often an unpleasant odor, and which in some cases act as diffusive stimulants. Such are valerian, assafœtida, myrrh, musk, ammonia, ether, etc. Others are sedatives, as hydrocyanic acid. The term might well include the other nervesedatives or depressors of reflex action, like bromide of potassium, belladonna, Calabar bean, curari poison, etc. The best treatment for spasmodic symptoms aims, however, at the restoration of health by proper food, good air, and correct habits of life, and by such special treatment as the case may require.

Antis'thenes [Ἀντισθένης], an eminent Greek Cynic philosopher, called the founder of the Cynic sect or school, was born at Athens, and flourished about 400 B. C. He was a young man when he served at the battle of Tanagra, 426 B. C. He was a pupil and friend of Socrates, whose death he witnessed. After this event he opened a school at Athens in the gymnasium of Cynosarges, where the famous and witty Diogenes became one of his pupils. He was a man of temperate habits and simple mode of life, inculcating a contempt of riches and sensual pleasure. He maintained that virtue is all-sufficient for happiness, and directed his attention chiefly to practical morality. His works on various subjects are lost, but several of his sententious and pithy sayings have been preserved. Socrates reproved the poverty of his dress and his neglect of the conventional by saying, "I can see thy pride through the holes in thy robe." Antisthenes was living in 371 B. C.

Antis'trophe [Gr. ἀντιστροφή, from ἀντί, "against," and στρέφω, to "turn"], a term applied by the ancient Greeks to that part of a song or dance before the altar which was performed by turning from the left to the right. Hence a stanza or portion of poetry following the strophe, and responding to it, was called antistrophe.

An'ti-Tau'rus, a range of mountains in the N. part of Asia Minor, extends from the Bosphorus eastward, and is nearly parallel to the Black Sea. According to some authorities, it extends from Arjish-Dagh (Mount Argæus) north-eastward into Armenia, forming the watershed between the Euphrates and the Kizil-Irmak, which enters the Black Sea. The name Anti-Taurus was given to the range because it is "opposite to or over against the Taurus." As the latter extends along the coast of the Mediterranean, so the former runs along the coast of the Black Sea.

Antith'esis [from the Gr. ἀντί, "against," and θέσις, a "position"], in rhetoric, a figure of speech in which an idea is rendered more emphatic and impressive by juxtaposition and contrast with an opposite or converse idea. Thus a critic said of a certain book, "It contains many good things, and many new; but the good are not new, and the new are not good."

Anti-Trinitarians. See UNITARIANISM, by ORVILLE DEWEY, S. T. D., LL.D.

An'titype [Gr. ἀντίτυπος, from ἀντί, "against," and hence "corresponding to," and τύπος, a "type"], a type or figure which corresponds to some other type. In theology, it denotes that of which the type was a prefiguration; the person in whom any prophetic type is fulfilled. "The holy places made by hands are figures of the true," which are the antitypes of the former. (See TYPE.)

An'tium [It. *An'zo*], an ancient city of Latium, on the sea-coast, 34 miles S. S. E. of Rome, was a favorite resort of opulent citizens of Rome, in whose villas famous works of art have been discovered. Among these was the Apollo Belvedere. The emperors Caligula and Nero were natives of Antium, the site of which is now occupied by a village called Porto d'Anzo (*i. e.* the "port of Antium").

Anti'vari, a town and seaport of Albania, on the Adriatic, 14 miles N. W. of Scutari. The harbor is shallow, and admits only small vessels. It exports oil, etc., and has, with its suburbs, about 1000 houses. Pop. about 5000.

Ant-Lion, the larva of several species of *Myrmeleon,*

Ant-Lion.

and other cognate genera, insects of the order Neuroptera, found in sandy tracts in different parts of the world. The perfect insect is similar in appearance to the dragon-fly. The larva is remarkable for the curious and insidious mode in which it catches the ants and other insects on which it feeds. It excavates a funnel-shaped cavity in the sandy soil, and lies in wait at the bottom until an insect comes so near to the edge of the pit that the loose sand gives way and the insect falls down the slope. If, before reaching the bottom, its victim begins to climb upward, the ant-lion throws sand upon it and brings it down. Several species of ant-lion are found in the U. S.

Antœci, an-tee'sī [from the Gr. ἀντί, "against," and οἶκος, a "house" or "dwelling-place"], in geography, is applied to people who live under the same meridian and at the same distance from the equator, but the one in north and the other in south latitude. The summer of one coincides in time with the winter of the other.

Antoine, a post-township of Clarke co., Ark. P. 1835.

Antoine, a township of Pike co., Ark. Pop. 238.

Antommar'chi (FRANCESCO), an Italian anatomist, born in 1780, a native of Corsica, became anatomical dissector to a hospital of Florence. In 1819 he was sent for to attend Napoleon at St. Helena. The ex-emperor was so well pleased with him that he left him a legacy of 100,000 francs. He published "The Last Moments of Napoleon" (2 vols., 1823). In 1836 he settled in New Orleans as a homœopathist. He died in Cuba April 3, 1838.

Anton Ulrich, a son of the duke of Brunswick-Wolfenbüttel, was born in 1714. He married in 1739 Anna Carlovna, who was a niece of the Russian empress, Anna Ivanovna, and who became regent in 1740. In Dec., 1741, Anna was deposed, and banished with her husband to the government of Archangel. He is supposed to have died about 1780.

Antonel'li (GIACOMO), an Italian cardinal and astute politician, born at Sonnino April 2, 1806. He became grand treasurer of the two apostolic chambers in 1845, and was appointed minister of finance by Pius IX., soon after his election. In 1847 he was made cardinal-deacon. He acquired much influence with the pope, and opposed the liberal movement of 1848. In 1849 he was appointed papal secretary of foreign affairs (*i. e.* prime minister), which place he occupied when Rome, in 1870, was incorporated with the kingdom of Italy. He strenuously opposed the cause of Italian unity. D. Nov. 6, 1876.

Antonel'lo, or **Antonelli** (ANTONIO), surnamed DA MESSINA, from the place of his birth, an eminent painter, born at Messina in 1414. He is reputed to be the first Italian who painted in oil, having visited Bruges and obtained from J. van Eyck the secret of oil-painting. He returned to Italy about 1445, after which he worked at Milan, and removed to Venice about 1470. He gained distinction by the brilliance of his coloring. Died in 1475.

Anto'nia (MAJOR, or the ELDER), a Roman lady, a daughter of Mark Antony the Triumvir, was born in 39 B. C. Her mother was Octavia, a sister of Augustus Cæsar. She was married to L. Domitius Ahenobarbus, and was the grandmother of Nero.—Her sister, ANTONIA MINOR (the Younger), was born 36 B. C. She was the wife of Claudius Drusus Nero, and mother of the famous Germanicus and of the emperor Claudius. She is said to have been virtuous and fair. Died in 37 or 38 A. D.

Anto'nides van der Goes (JOHANNES), a Dutch poet, born at Goes in 1647. He held an office in the admiralty. His principal work is a national epic poem on the river Y, which is entitled "Ijstroom," or "Y-Stroom" (1671), and was very popular. Died Sept. 18, 1684.

Antoni'nus (MARCUS AURELIUS), usually called **Marcus Aurelius,** sometimes surnamed THE PHILOSOPHER, a Roman emperor highly distinguished for his wisdom and virtue, was born in Rome in April, 121 A. D. He was a son of Annius Verus and Domitia Calvilla, and his original name was MARCUS ANNIUS VERUS. His education was directed by Fronto and Herodes Atticus. He became a disciple of the Stoic philosophy, with the principles of which his habitual conduct was consistent. Having been adopted as a son by the emperor Antoninus Pius in 138 A. D., he assumed the name of M. Ælius Aurelius Verus Cæsar. He was chosen consul in 140, and married Faustina, a daughter of Antoninus Pius, whom he succeeded in 161 A. D. He then admitted Lucius Commodus (or Lucius Verus) to a share of the imperial power, but the latter died in the year 169. Before this date the Roman army gained several victories over the Parthians. Although the temper of Marcus Aurelius was pacific, he was involved in frequent wars by the aggressions of northern barbarians and the revolts of his subjects. He conducted in person an expedition against the Marcomanni, which was successful, in 168 A. D., and he afterwards drove them out of Pannonia. In 174 A. D. he gained over the Quadi a famous victory, which was reputed

miraculous. According to Dion Cassius and other writers, the Romans, who were suffering with thirst, were refreshed by a shower of rain, while their enemies were demoralized by a violent storm of hail. One of his generals, named Avidius Cassius, then commanding in Syria, revolted in 175 A. D. and obtained possession of Egypt and part of Asia, but he was killed by his own officers in the same year. In 176 the emperor visited Syria and Egypt, and displayed great clemency towards persons who had been implicated in the recent rebellion. On his homeward journey he passed through Athens, where he founded a chair of philosophy for each of the four sects, Platonic, Stoic, Peripatetic, and Epicurean. His ardent love of learning continued unabated in advanced age, and he cherished constantly, amidst the turmoil of war and the distractions of public life, his philosophic and philanthropic aspirations. No monarch was ever more warmly and generally beloved by his subjects. It is a strange anomaly in his character and conduct that he persecuted the Christians. During a campaign against his inveterate enemies, the Marcomanni, he died at Sirmium or at Vindobona (Vienna) in Mar., 180 A. D., and was succeeded by his son Commodus. He was author of an excellent ethical work in Greek, called "Meditations," a good English version of which, by George Long, appeared in 1862, under the title of "Thoughts of M. Aurelius Antoninus." "His writings," says the eminent philosopher, J. Stuart Mill, "the highest ethical product of the ancient mind, differ scarcely perceptibly, if they differ at all, from the most characteristic teachings of Christ. This man, a better Christian in all but the dogmatic sense of the word than almost any of the ostensibly Christian sovereigns who have since reigned, persecuted Christianity. To my mind this is one of the most tragical facts in all history." (See J. Capitolinus, "Marcus Aurelius Philosophus;" Ripault, "Histoire de l'Empereur Marc-Antonin," 5 vols., 1820; Tillemont, "Histoire des Empereurs;" De Steckau, "Étude sur Marc-Aurèle," 1857; Dion Cassius, "History;" Aurelius Victor, "De Cæsaribus Historia.")

William Jacobs.

Antoni'nus, Column of, a pillar which Marcus Aurelius erected in Rome to the memory of Antoninus Pius, or perhaps in his own honor. It is a combination of the Corinthian and Doric orders, and is adorned with bas-reliefs of the victories which Marcus Aurelius gained over the Marcomanni. It stands in the Piazza Colonna.

Antoninus, Itinerary of [Lat. *Antoni'ni Itinera'rium*], a valuable geographical work, the date and author of which are unknown. It contained the names of all places and stations on the roads of the Roman empire, with their distances in Roman miles.

Antoni'nus Pi'us (or, more fully, **Titus Aure'lius Ful'vus Boio'nius Ar'rius Antoni'nus**), a Roman emperor, born at Lanuvium Sept. 19, 86 A. D., was a son of Aurelius Fulvus. He was chosen consul in 120 A. D., and married Anna Galeria Faustina. Having, as proconsul in Asia, distinguished himself by his wisdom and equity, he was adopted by Hadrian in 138 A. D., and he ascended the throne on the death of Hadrian, in July of that year. He adopted as his successor Marcus Aurelius. His reign was so peaceful and prosperous that it furnishes but scanty materials for history. Antoninus promoted literature, and treated the Christians with mildness. As a man he was temperate, humane, learned, and eloquent. The name of "Pater Patriæ" ("Father of his Country") was given to him by the vote of the Roman senate. He had two sons, whom he survived. He died Mar. 7, 161 A. D., and was succeeded by Marcus Aurelius. His memory was greatly venerated by the Romans of his own and later ages. (See J. Capitolinus, "Vita Antonini.")

Antoninus, Wall of (anc. *Antoni'ni Val'lum*), a rampart or intrenchment raised in Scotland by the Romans under Lollius Urbicus, in the reign of Antoninus Pius, in 139 A. D. It extended from the Clyde to the Frith of Forth, was 35 miles long and 20 feet high, and was built of earth and stone. Its remains are called "Græm's dyke."

Anto'nio (Nicolas), [Lat. *Nicola'us Anto'nius*], an eminent Spanish critic and bibliographer, born at Seville in 1617. He published "Bibliotheca Hispana Nova" (2 vols., 1672), and "Bibliotheca Hispana Vetus" (2 vols., 1696), which contain catalogues of all the Spanish books, with biographical notices, and are highly esteemed. He was Spanish agent at Rome 1659–81. Died April 13, 1684.

Anto'nius (Caius Hybrida), a Roman consul, was a son of M. Antonius the Orator, and an uncle of Mark Antony the Triumvir. He was chosen consul as the colleague of Cicero in 63 B. C. He was a profligate politician, and did not earnestly co-operate with Cicero in opposing the conspiracy of Catiline. Died in 44 B. C.

Antonius (Marcus), called the Orator, an eminent Roman orator and lawyer, born in 143 B. C., was grandfather of the famous Mark Antony. He became praetor in 104, and consul in 99 B. C., and was attached to the aristocratic party. Having become an adherent of Sulla in the civil war, he was assassinated by the order of Marius in 87 B. C. He was perhaps the most eloquent Roman orator of his time. His eloquence is highly extolled by Cicero in his treatise "De Oratore," and in his "Brutus." The orations of Antonius are not extant.

Antonius (Marcus), surnamed the Triumvir, commonly called in English **Mark Antony,** a celebrated Roman general and politician, born in 83 B. C., was a son of M. Antonius Creticus. His mother Julia was a daughter of L. Julius Cæsar, who was consul about 90 B. C. Though in his youth he was addicted to licentious vice and debauchery, he distinguished himself at an early age by his talents and riotous audacity. He obtained about 57 B. C. command of the cavalry of Gabinius in Syria and Egypt. Having been elected quæstor in 53 or 52, he served in Gaul as legate of Cæsar, and displayed superior talents in several campaigns. Through the influence of Cæsar he was elected augur and tribune of the people in 50 B. C. As tribune he promoted the interest of Cæsar, and vetoed a decree of the senate which ordered Cæsar to disband his army. Early in 49 B. C. he fled from Rome to the camp of the general last named. After the civil war began, and Cæsar passed into Spain, he appointed Antony commander-in-chief of his forces in Italy. The latter commanded the left wing at the battle of Pharsalia, 48 B. C. In the year 47 he became master of the horse to Cæsar, who was now invested with the office of dictator. He married Fulvia, the widow of the demagogue P. Clodius, about 45 B. C., and was chosen consul with Cæsar as his colleague in 44. Although he indulged freely in licentious orgies, and disgraced himself by the effrontery with which he violated the proprieties of life, he displayed great political ability, especially in the crisis which followed the death of Cæsar. He negotiated with Brutus and Cassius, and temporized with the senate, whom he induced to ratify the acts of the late dictator. His eloquent funeral oration over the body of Cæsar excited such popular indignation against the conspirators that they were compelled to retreat from Rome. In 43 B. C. Antony was defeated in battle by the consuls Hirtius and Pansa at Mutina (now Módena). About this time he was denounced by Cicero in a series of famous orations called "Philippics." Before the end of the year 43, Antony, Octavius, and Lepidus united to form a league (triumvirate) against the senate and the republicans, many of whom were put to death by the myrmidons of the triumvirs. At the instigation of Antony, Cicero was proscribed and killed. It was the military skill of Antony which defeated Brutus and Cassius at the decisive battle of Philippi (42 B. C.), which rendered the triumvirs masters of the Roman world. This victory was followed by another bloody proscription. Antony, who received for his share of the empire the Asiatic provinces and Egypt, now gave himself up to pleasure and luxury. He was so captivated by Cleopatra, queen of Egypt, that he neglected public affairs while Octavius was marching with stealthy steps towards supreme and undivided power. Antony and Octavius were involved in a quarrel in the year 41, but they were formally reconciled in 40 B. C., and Antony then married Octavia, the sister of his rival or colleague. About the end of the year 38 the triumvirate was renewed for a period of five years. Arousing once from his indolent and luxurious mode of life, he marched with an army into Armenia and invaded Parthia, in which he fought many battles. He soon divorced Octavia, and returned to his dalliance with Cleopatra. The conflict which had been postponed now became inevitable, and Antony was defeated at the naval battle of Actium in Sept., 31 B. C. He then retreated to Alexandria in Egypt, and was deserted by his fleet. Reduced to a desperate extremity, he killed himself in 30 B. C. He left two sons, Iulus and Antyllus. (See Plutarch, "Life of Antony;" Drumann, "Geschichte Roms;" Appian, "Bellum Civile.")

William Jacobs.

Antony, or **Anthony** [Lat. *Anto'nius*], Saint, surnamed Abbas, an eminent anchorite, called the founder of monachism, was born in Upper Egypt in 250 A. D. He reduced himself to voluntary poverty, and retired to a desert, where he passed many years in ascetic devotion and solitude. About 305 he founded a monastery near Faioum (or Phaiûm). He was an opponent of Arianism, and was venerated as a saint and oracle by his contemporaries. During the persecution of the Christians in 311 he went to Alexandria in the hope of obtaining the crown of martyrdom, but he was disappointed, and returned to the desert. He had an interview many years later with Athanasius, who wrote an account of his life. Some of the letters of Saint Antony are extant. Died Jan. 17, 356 A. D.

Antony, or **Anthony** (Saint), **of Padua** [It. *Anto'nio*], was born at Lisbon Aug. 15, 1195. He became a Franciscan monk, and preached at Toulouse, Bologna, and Padua, where he died June 13, 1231. According to a legend, he once preached to the fish in the sea an eloquent sermon, which attracted the devoted attention of his finny auditors. This sermon is extant. An abstract of it may be seen in Addison's "Remarks on Italy." He was canonized in 1232.

Antony (Milton), M. D. See Appendix.

An'tony of Bourbon [Fr. *Antoine de Bourbon*], duke of Vendôme and king of Navarre, was born in Picardy April 22, 1518. He was a brother of the prince of Condé. He married, in 1548, Jeanne d'Albret, the only child of the king of Navarre. In 1560 he was appointed lieutenant-general of France. Soon after that date he formed a coalition with the duke of Guise and Constable Montmorency, and became a Roman Catholic. He commanded the royal army for a short time in the civil war, and was mortally wounded at Rouen, and died Nov. 17, 1562. He was the father of Henry IV. of France.

An'trim, the extreme N. E. county of Ireland, in Ulster, bounded on the N. by the Atlantic, on the E. by the Irish Channel, on the S. by the Lagan River, and on the W. by the river Bann. Area, 1164 square miles. The surface near the sea-coast is hilly, and the soil is mostly light. The rock which underlies it is basaltic trap, with some new red sandstone. Lignite of good quality is mined. On the N. coast is the famous Giants' Causeway, one of the most perfect examples of columnar basalt in the world. Oats and flax are the staple products of the soil. The county has extensive manufactures of linen and cotton. Chief town, Belfast. Pop. in 1861, 378,588; in 1871, 419,782.

An'trim, a county in the N. W. part of the southern peninsula of Michigan, is bounded on the W. by Grand Traverse Bay. Area, estimated at 700 square miles. It contains several lakes. Wheat, timber, fruit, butter, and potatoes are the chief products. Capital, Elk Rapids. Pop. 1985.

Antrim, a township of Shiawassee co., Mich. Pop. 992.

Antrim, a post-township of Watonwan co., Minn. P. 263.

Antrim, a post-township of Hillsborough co., N. H. It has manufactures of lumber, leather, furniture, sewing silk, etc. Pop. 904.

Antrim, a post-village of Morris, Charleston, and Delmar townships, Tioga co., Pa., at the southern terminus of the Corning Cowanesque and Antrim R. R., 38 miles from Lawrenceville. Here are mines of excellent semi-bituminous coal, and forests of timber of the best quality.

Antrim, a township of Wyandot co., O. Pop. 1061.

Antrim, a township of Franklin co., Pa. Pop. 3762.

Ant'werp, a province of Belgium, is bounded on the N. by Holland, on the E. by Limbourg, on the S. by South Brabant, on the W. by the river Scheldt. Area, 1093 square miles. The river Dyle forms part of its southern boundary. The soil is generally fertile, and produces grain, hemp, madder, hops, and pine timber. Capital, Antwerp. Pop. in 1869, 485,883.

Ant'werp [Dutch *Ant'werpen*; Lat. *Antuer'pia*; Fr. *Anvers*, ôn'vair'; Sp. *Amberes*], the chief commercial city of Belgium, and capital of a province of its own name, is on the right bank of the Scheldt, 26½ miles by rail N. of Brussels; lat. 51° 13′ N., lon. 4° 24′ E. It is strongly fortified, and has among its defences a citadel built by the duke of Alva in 1567. The magnificent public buildings, the numerous churches, the stately and antique houses, and the profusion of ornamental trees, render the general appearance of the city very picturesque. The streets are tortuous and irregular, but one of them, called the Place de Meir, is scarcely surpassed in beauty by any street in Europe. Foremost among the public buildings is the cathedral, one of the largest and most beautiful specimens of Gothic architecture in Europe. It is 500 feet long and 240 feet wide, and contains the principal masterpieces of Rubens. Among the other public edifices are the exchange and the marble hôtel de ville. The principal institutions are—the Academy of Sciences, the Academy of Painting and Sculpture, a rich gallery of pictures, a public library, and a botanic garden. Antwerp has an excellent harbor, which will admit the largest vessels. Railways extend from this place to Holland, Prussia, Brussels, and Ghent. It has an extensive trade, and is an important market for hides. Here are manufactures of black silk stuffs, cotton, linen, lace, carpets, sewing-silk, and printers' ink. Antwerp was a city as early as the eighth century, and was formerly more populous than it is now. In the fifteenth and sixteenth centuries it was the great centre of European commerce, and had 200,000 inhabitants or more. It is stated that 500 vessels daily entered its port. It was besieged and taken by the prince of Parma in 1585, soon after which much of its commerce was transferred to Amsterdam. By the treaty of Paris, Antwerp, with the rest of Belgium, was annexed to the kingdom of Holland in 1814. In the popular rising of 1830 against that government the citadel was held by Dutch troops under command of General Chassé. The resulting siege of Antwerp by the French was a fine practical example of the science of sieges, which excited the interest of military amateurs of all nations. The defence exhibited a conspicuous example of fortitude and endurance. The capitulation took place Dec. 24, 1832, the trenches having been opened Nov. 30. During recent years, Antwerp, the true military capital of Belgium, has been fortified under a very distinguished engineer, Colonel Brialmont, as the central point of a great intrenched camp on the Scheldt, by a system of works "unrivalled in Europe in the intelligent application of the true principles of art to a great practical example." Pop. in 1869, 126,663.

Revised by J. G. Barnard, *U. S. Army.*

Antwerp, a twp. of Van Buren co., Mich. Pop. 2690.

Antwerp, a village of Jefferson co., N. Y., in a township of the same name, on the Rome Watertown and Ogdensburg R. R. It has one newspaper and one bank, and is the seat of the Northern New York Conference Seminary. Two hundred thousand tons of iron ore are raised from beds in this vicinity per year. The Jefferson Iron Company is located here. Pop. of township, 3310; of the village, 773.

Ed. of "Antwerp News."

Antwerp, a post-village of Paulding co., O., on the Toledo Wabash and Western R. R., 23 miles N. E. by E. of Fort Wayne, Ind., and on the Wabash and Erie Canal. It has one weekly newspaper. Pop. 717.

Anu'bis, or **Anepu,** an idol of the Egyptians, was represented as a son of Osiris, and as having the form of a dog, or a man with a dog's head.

Anvari', or **Anwari,** a Persian poet, born in Khorassân. He rose to celebrity about 1150, and enjoyed the favor of the Seljukide sultan Sanjar, at whose court he passed many years. He wrote numerous lyrical poems, which are much admired. His elegy on the capture of Sanjar by the Ghaurians has been translated into English. Having turned his attention to astrology, and predicted that a great hurricane would occur in 1185 or 1186, he fell into disgrace when his prediction was not fulfilled. Died about 1200.

An'vil, an iron block with a smooth surface on which blacksmiths hammer and shape their work. It varies in form and in size. The common or middle-sized anvil, on which iron is forged with a sledge-hammer, is in the form of an oblong table, which has a conical horn at one end, and sometimes a pyramidal horn at the other end. The upper surface of the anvil is sometimes made of steel.

Anville, a township of Sumpter co., Ala. Pop. 410.

Anville, d' (Jean Baptiste Bourguignon), a celebrated French geographer, born in Paris July 11, 1697. He devoted his whole life to the study and improvement of geography, and is recognized as the first who raised geography to the rank of an exact science. He was appointed geographer to the king, and became a member of the Academy of Sciences. Among his works are "Orbis Romanus" ("Roman World"), "Orbis Veteribus Notus" ("The World known to the Ancients"), and a "Compendium of Ancient Geography" (in French, 3 vols., 1768). He published 211 maps and plans, which embrace nearly every country in the world. Although he never travelled, he delineated various foreign countries with remarkable accuracy. The correctness of his map of Egypt was confirmed by the French survey of 1798–99. Died Jan. 28, 1782. (See Condorcet, "Eloge de M. d'Anville," 1762.)

Anzas'ca, Val d', a picturesque valley of Piedmont, in the province of Novara. It has beautiful cascades, and affords fine views of Monte Rosa. Gold is found here.

Anzin, a town of France, in the department of Nord, 1 mile N. W. of Valenciennes. It has iron-foundries and glass-works, and is the centre of the greatest collieries of France. Pop. in 1866, 7283.

Ao'nia, a district of ancient Greece, in Bœotia, contained Mount Helicon (the Aonian Mount) and the fountain Aganippe. These were celebrated as the favorite resorts of the Muses, who were called *Aon'ides.*

A'orist [from the Gr. *ἀ*, priv., and *ὅρος*, a "limit"], a form of the Greek verb which represents an action as taking place in an indefinite time. The Greek language has, in addition to the imperfect, perfect, and pluperfect, the aorist, which is peculiarly adapted to the narrative style. The aorist has two forms, called first and second aorist, but very few verbs have both in use.

Aor'ta [Gr. *ἀορτή*, from *ἀείρω*, to "raise up," to "support," to "suspend," because it is supported or suspended

from the heart], the large arterial trunk arising from the left ventricle of the heart, and giving origin directly or indirectly to all arteries except the pulmonary and its ramifications. The curve that it makes in the upper part of its course, during which it sends off the innominata and the left carotid and subclavian arteries, is called the arch of the aorta. The *thoracic* aorta extends from the third dorsal vertebra to the diaphragm, where it takes the name of *abdominal* aorta, which in the lower part of the abdomen, about opposite the fourth lumbar vertebra, divides into the two iliac arteries, going to supply the lower extremities. The thoracic aorta gives off two or three bronchial arteries to supply the tissue of the lungs. The abdominal aorta gives off two phrenic arteries to the diaphragm, and the cœliac axis, which divides into three branches to supply the stomach, liver, and spleen, besides several smaller arteries. (See CIRCULATION OF THE BLOOD.)

Aos'ta (anc. *Augus'ta Præto'ria*), a town of Italy, in the province of Turin, is on the river Dora, in a valley 50 miles N. N. W. of Turin. It has a Gothic cathedral, the remains of a Roman amphitheatre, and a fine triumphal arch. The valley of Aosta produces large forests of pine, and has mines of copper, silver, iron, and lead. Cheese, leather, wine, and hemp are exported. Pop. in 1861, 5958.

Apa'ches, a warlike tribe of savages who infest New Mexico and Arizona, and hitherto have persisted in hostility against the Mexicans and the white people of the U. S. They make frequent incursions into the states of Chihuahua and Sonora. They fight on horseback, and gain a subsistence by robbery. The rifle and bow and arrow are their principal weapons. They are divided into several bands or tribes.

Ap'afi (MICHAEL or MIHALY), prince of Transylvania, was born in 1632. He began to reign in 1661, and was for many years an ally of the Turkish sultan. In 1687 he became tributary to the emperor of Germany. Died April 15, 1690. He was succeeded by his son Mihaly, under whom Transylvania was invaded by the Turks, who took several towns. He sold his principality to Austria for a pension. Died in 1713.

Apalach'in, a post-village of Owego township, Tioga co., N. Y., on the S. bank of the Susquehanna. Pop. 300.

Apame'a, an ancient city of Syria, on the river Orontes, which here expands into a lake named Apamea, about 75 miles S. of Antioch. It was probably named in honor of Apame, the wife of Seleucus Nicator. The place was called *Famieh* in the time of the Crusades. Its extensive ruins still exist.

Ap'anage, or **Ap'panage** [from Lat. *ad*, "for," and *panis*, "bread," "living"], in feudal law, an allowance to the younger sons of a sovereign or prince out of the revenues of the country, generally joined with a grant of the public domain. In England the duchy of Cornwall is an apanage of the prince of Wales, but the younger sons of the sovereign are dependent upon the liberality of Parliament.

Apatin', a town of Hungary, in the county of Bacs, on the left bank of the Danube, 60 miles S. of Baja. It has a trade in silk, madder, and hemp. Pop. in 1869, 11,047.

Ap'atite [from the Gr. ἀπάτη, "deceit," so called because it deceives the observer by its resemblance to other minerals], the native phosphate of lime, which is extensively used as a manure in England and the U. S. It usually occurs in crystalline rocks, such as granite and greenstone, but is also found in granular limestone and serpentine. The most abundant supplies, however, are derived from beds of animal remains, bones, etc. When crystallized it appears in six-sided prisms, sometimes of a greenish color, and containing calcic phosphate, with a certain proportion of calcic chloride and fluoride, $Ca_3(PO_4)_2 + Ca(Cl_1F)_2$. The amorphous apatite which is used in the preparation of artificial manure is imported from Spain and Norway, and from Sombrero, Navassa, Swan, and some other small islands in the West Indies. Before it is applied to the soil it is ground to powder and subjected to the action of sulphuric acid, which renders the phosphoric acid of the apatite soluble in water. The efficacy of apatite as a fertilizer of the soil depends on the presence of phosphoric acid, which is essential to the growth of such plants as wheat, barley, and oats. It is often mixed with guano, bones, and other manures to make a complex fertilizer, which is better than the simple mineral phosphate. A rich deposit of apatite in the form of nodules has been found in the postpliocene marls of South Carolina, near the Ashley, Stono, and Edisto rivers. Large quantities of these nodules, which contain 25 or 30 per cent. of phosphoric acid, are converted into "superphosphate of lime" at Charleston, S. C., and at Camden, N. J. It is stated that about 13,000 tons of apatite (otherwise called phosphatic guano) were imported into the U. S. in 1868. Apatite occurs in large crystals, associated with white limestone, in St. Lawrence co., N. Y. Massive apatite is found in England, Ireland, Spain, and other countries. (See GUANO, BONE, FERTILIZERS, AGRICULTURAL CHEMISTRY.)

Apcheron. See ABSHERON.

Ape [Gr. πίθηκος; Lat. *pithe'cus* or *sim'ia*], a name of a division of animals closely allied to monkeys, but having no tail. It comprises the chimpanzee, orang outang, gorilla, gibbon, etc. The ape belongs to the order Quadrumana and class Mammalia, having four extremities, which are all adapted to grasping, like the human hand. Their structure is better adapted for climbing trees than for walking on the ground, and accordingly in the forest they swing from tree to tree with great agility and ease, but on the ground they are slow and almost helpless. A remarkable peculiarity in the habits of these animals is that they use clubs and stones as weapons for defence or offence. Apes are natives of Africa, India, Borneo, etc. (See CHIMPANZEE, GORILLA, ORANG-OUTANG.)

Ap'eldorn, or **Apeldoorn,** a beautiful village of Holland, in Gelderland, on the river Grift, 16 miles N. N. E. of Arnhem. Here are an agricultural school and manufactures of paper, blankets, and coarse woollen fabrics. Pop., with adjacent hamlets, in 1867, 12,411.

Apel'les [Gr. Ἀπελλῆς], a Greek painter, lived between 352 and 308 B. C. We do not know when or where he was born, nor when nor where he died, and not one of his pictures remains; yet his name stands for supreme excellence in the art of painting. Suidas says he was born at Colophon; Strabo and Lucian make him an Ephesian; and a doubtful reading in the case of each makes both Pliny and Ovid seem to call him a Coan. He studied first with Ephorus of Ephesus; afterwards with Pamphilus of Amphipolis. Plutarch (Aratus) says he joined the school of Melanthius at Sicyon, not to learn, but to gain credit. He painted many portraits of Philip, and also of Alexander, who would sit to no other painter. He probably accompanied Alexander to Asia, and after his death went to Egypt, from which time we hear no more of him. Apelles was generous to other painters and devoted to his art. He admitted that in some things he was excelled by other artists, but he claimed to surpass all others in grace. His industry gave rise to the proverb, "No day without a line." He knew when to stop correcting, declaring that "Too much labor is sometimes hurtful to a piece." To a cobbler, who, having rightly criticised the painting of a shoe in one of his pictures, went on to blame the leg, he said, "Let the cobbler stick to his last." He is thought to have invented the process known as glazing or toning, and he painted on movable panels—never, says Pliny, on walls. His most famous picture was that of "Venus Rising from the Sea" (*Venus Anadyomene*), painted for the temple of Æsculapius in Cos. (See PLINY, "Natural History XXXV. 10;" SUIDAS, "Apelles;" CARLO DATI, "Vite dei Pittori Antichi," 1667; DELLA VALLE, "Vite Pittori Antichi," 1795; WUSTMANN, "Apelles' Leben und Werke," 1870.)

CLARENCE COOK.

Ap'ennines [It. *Apenni'no*], (anc. *Mons Apenni'nus*), a long chain of mountains extending through the whole length of the Italian peninsula, and forming the watershed between the Adriatic Sea and the Mediterranean. This chain belongs to the system of the Alps, from which it branches off near the Col de Tenda. The northern portion, called the Ligurian Alps, is nearly parallel to the Gulf of Genoa, and is in close proximity to the coast. The entire length of the chain is about 800 miles, and its general direction nearly south-eastward. None of its summits rise to the limit of perpetual snow. The highest summit in the peninsula is Monte Corno, which has an altitude of 9546 feet, but Mount Etna, regarded by some as a part of the Apennine system, is 10,840 feet high. The average height of the chain is about 4000 feet. The geological formations of the Apennines are either metamorphic or secondary, and limestone is the predominant rock. They are remarkable for their rich quarries of marble of various colors, but are poor in metals. Rocks of volcanic origin abound in the former kingdom of Naples. The mineral riches of these mountains consist chiefly in the celebrated marbles of Carrara, Seravezza, and Sienna. The Apennines are somewhat deficient in sublime and magnificent scenery, and their general aspect is that of a wall, with few projecting peaks to break the monotony of the scene. The higher parts of these mountains are mostly dry, rocky, and destitute of trees, but below the altitude of 3000 feet they are covered with forests of the evergreen oak, chestnut, beech, and other trees. The olive, orange, and palm also flourish near their base, especially where they are in close proximity to the sea, as near the Gulf of Naples and at the

Riviera of Genoa. Some geographers divide this chain into four parts: 1. The Northern Apennines, extending from the Col de Tenda to the Pass of Borgo San Sepolcro, near Arezzo; 2. The Central Apennines, from Arezzo to the valley of the Pescara, which separates the provinces of Teramo and Chieti; 3. The Southern Apennines, from the Pescara to Cape Spartivento; 4. The Insular Apennines, in the island of Sicily. In Central Italy the western or southwestern side presents a very gradual descent, but in the northern part of the range, which approaches the coast, there is a very steep declivity next to the sea.

Apenra'de, a seaport-town in Sleswick, on a fiord of the same name in the Little Belt, 35 miles north of Sleswick. It has a good harbor and beautiful environs. Shipbuilding is carried on here. Near this town is the castle of Brundlund, built by Queen Margaret about 1410. Pop. in 1871, 5932.

Aphanip'tera, or **Aphanop'tera** [from the Gr. ἀφανής, "invisible," and πτερόν, a "wing"], *i. e.* with wings not apparent, although they have rudimental elytra (hence termed in English *aphanipterous*), the term applied to an order, sub-order, or family of wingless haustellate insects, composed of the different species of fleas, and forming the family Pulicidæ, and closely allied to the flies. There are many species, of which the common flea (*Pulex irritans*) may be regarded as the type. The female deposits her eggs, generally about a dozen in number, of a white color, in any favorable situation; and in about six days the larvæ are hatched, attaining their full size in ten or twelve days more. At the end of this time the larva spins itself a little silken cocoon, in which it passes into the pupa state, and in about twelve days afterwards emerges a perfect flea. This metamorphosis distinguishes the flea and chigoe from other blood-sucking parasitic insects; and they are further distinguished by the number of segments into which their bodies are divided, and by their five-jointed tarsi. The chigoe (*Sarcopsylla penetrans*) is a native of South America and the West Indies, and is an exceedingly annoying, and sometimes even a dangerous, insect. It penetrates the skin entirely out of sight, and in this way often forms troublesome ulcers, which, if neglected at first, are very difficult to heal.

Apha'sia [from the Gr. ἀ, priv., and φήμι, to "speak"], a loss of speech which is a symptom of brain disease, as distinguished from *aphonia*, loss of speech from disease of the larynx or direct paralysis of that organ. Aphasia may coexist with the most perfect ability to utter words, or even to think, the patient sometimes persisting in giving things names which do not belong to them. At other times the patient, though he can utter words, cannot clothe his thought in articulate language, but manifests by signs, etc. a normal condition as regards intelligence. Aphasia is not necessarily a precursor of insanity, though sometimes observed in its early stages. One of the most remarkable facts in this connection is that apoplectic effusion, traumatic injury, or disease of the left frontal lobe, and especially of the third convolution, is notably liable to be followed by this symptom, which is not very frequent, and which sometimes ends in perfect recovery. (See Aphonia.)

Aphe'lion [from the Gr. ἀπό, "from," and ἥλιος, the "sun"], that part of a planet's orbit which is the most distant from the sun, and is opposite to the perihelion, or the point nearest the sun. In consequence of the mutual attractions of the planets, the figures and positions of their orbits are continually but slowly changed.

Aph'ides (sing. *a'phis*, gen. *aph'idis*, a "plant-louse"), the name applied to numerous homopterous insects of the family Aphidæ, and commonly known as plant-lice. They inhabit trees and plants, on the juices of which they feed. The aphides are remarkable for their saccharine secretion, but more especially for a peculiarity in their generative economy which consists in the first fecundation of the female influencing not only the ova developed immediately afterwards, but those of the females resulting from that development, even to the ninth generation, which are successively impregnated, and continue to produce without any intercourse with the male. In autumn the males are produced, when the last set of females are impregnated, and the fecundated eggs brought forth for the ensuing year. The body of these insects is generally flask-like, being furnished with six legs, a pair of antennæ, and two small tubes not far from the extremity of the abdomen through which the saccharine fluid is exuded. In some of the aphides wings are present, but in others they are not. The sweet fluid which they throw out is known as *honey-dew*, and is sometimes produced in such quantities as to fall in drops from the leaves of the trees to the earth. Ants have a special fondness for this substance, and often frequent plants on which it is deposited. They may sometimes be seen milking the aphides, as it is termed—that is, stroking these sugar-tubes with their antennæ, to induce them to furnish them the saccharine fluid more abundantly. Hence the aphides have been termed the milch-cows of the ants. Some species of this genus are very destructive to vegetation, as the hop-fly (*A'phis hu'muli*), and the aphis of the turnip cabbage (*A'phis bras'sicæ*), which have sometimes destroyed whole crops. The aphides are often infested by certain minute parasites, which, by laying their eggs in the bodies of those insects, cause the death of great numbers. It is remarkable that one of these parasites (*Aphid'ius*) has itself still more minute ichneumon parasites, whose eggs are deposited in its body.

Aphides.

Aphis. See Aphides.

Apho'nia [from the Gr. ἀ, priv., and φωνέω, to "make a sound"], a loss of speech in which the patient more or less completely loses power to utter sounds. This may arise from disease of the larynx, from direct paralysis of that organ, or from some functional disease, as hysteria or chorea. The treatment varies with the disease of which the aphonia is a symptom. As a general rule, these cases are temporary, unless there is a destruction or serious organic change in the tissues of the larynx.

Aph'rodite, a name of a hydrated silicate of magnesia found in Sweden. It is a soft, earthy mineral, with a waxy lustre, and resembles meerschaum.

Aphrodite. See Venus.

Aph'tha, plu. **Aph'thæ** [from the Gr. ἅπτω, to "set on fire"], ulcers of the mouth, beginning with numerous minute vesicles and terminating in white sloughs. Aphthæ are usually the seat of microscopic vegetation, but whether the growth is an essential or only an accidental element is a disputed point. Aphthæ resemble "thrush" in appearance, but in the latter disease no vesicles are formed.

Aphthar'to-Doce'tæ [from the Gr. ἀ, neg., and φθαρτός, "corruptible," and δοκέω, to "think," to "believe"], literally, "believers in [that which is] incorruptible," the name of the followers of Julian of Halicarnassus, who lived about 520 A. D., and taught that the body of Christ was divine and incorruptible.

A'pian [Lat. *Apia'nus*], or **Appian** (Peter), a German astronomer and mathematician, born in Misnia in 1495. His proper name was Bienewitz. He became professor of mathematics at Ingolstadt about 1524, and gained distinction by his writings, among which is a work on cosmography (1524). He first proposed the method of ascertaining the longitude by lunar observations. He was ennobled by the emperor Charles V. Died April 21, 1552.

Apic'ius (Marcus Gabius), a celebrated epicure who lived at Rome in the reigns of Augustus and Tiberius. His name became proverbial for gluttony and luxury in eating. According to Seneca, he expended more than $3,500,000 in the indulgence of his taste for rare dishes, and then discovering that his fortune was reduced to ten million sesterces (about $360,000), he poisoned himself, because he could not continue his expensive style of living.

A'pion [Ἀπίων], surnamed Plistonices, a Greek grammarian and historian, born in the Great Oasis, Egypt, lived about 20–50 A. D. He opened a school of rhetoric in Rome about 45 A. D., and wrote several works, among which were a "History of Egypt" and a lexicon to Homer's poems. Josephus's work, usually called "Against Apion," was written in answer to a book which Apion wrote against the Jews. On account of his egotism and loquacity, Tiberius used to call him *Cymbalum Mundi* (the "Cymbal of the World"). His works are lost, except small fragments.

A'pios Tubero'sa, a papilionaceous plant of the natural order Leguminosæ, was formerly included in the genus *Glycine*. It is a native of Virginia, Ohio, New York, etc.,

has a twining stem, pinnate leaves, and tuberous roots, which are used as food, and resemble the potato. The roots are commonly called ground-nuts.

A'pis [Gr. Ἆπις], the name of the bull of Memphis, the favorite idol and object of worship of the ancient Egyptians. According to some authorities, he was sacred to Osiris, or was a symbol of Osiris, and was not permitted to live more than twenty-five years, at the end of which time he was secretly put to death by the priests. During his life he was kept in the temple of Ptah in Memphis, and served by a retinue of priests. His death was followed by a general mourning until a calf with the requisite color and marks was found to supply his place. The principal of these required marks were—black color with a white square on the brow, the figure of an eagle on the back, and a peculiar knot under the tongue.

Aplanat'ic Lens [from the Gr. ἀ, priv., and πλάνη, "deviation"], in optics, a lens which causes all the rays of light that fall on it to converge to a single point or true focus. In order to be aplanatic, the lens must not only have the true geometrical figure necessary to destroy aberration, but must be formed of different media, so as to be achromatic. These conditions cannot be accurately fulfilled in practice.

Ap'lin, a township of Perry co., Ark. Pop. 439.

Apoc'alypse [Gr. ἀποκάλυψις, from ἀποκαλύπτω, to "reveal"], a word signifying "revelation," and usually applied to the last book of the New Testament. (See Revelation.)

Apocalyp'tic Knights, a secret society of which scarcely anything is known, founded at Rome in 1692 by Agostino Gabrino, a citizen of Brescia. To defend the Roman Catholic Church against Antichrist is said to have been the avowed object of this society, but many suspected that the real design was hostile to the established social order, and that by Antichrist was meant the pope.

Apocalyptic Number, the mystical number 666 spoken of in the book of Revelation (xiii. 18). Some critics interpret this to be an enigmatical expression of the word *Latinus*, the Greek characters of which, taken as numerals, amount to 666. The connection between *Latinus* and the Roman power has given Protestants a reason, or pretext, to apply this passage to the Roman Church, and the Roman Catholics retort by making the same number stand for Luther, Calvin, and other Protestants.

Apocren'ic Ac'id [from the Gr. ἀπό, "from," and κρήνη, a "fountain," so called because derived from some fountains or springs], an extractive or brown matter found in some spring water and in ordinary vegetable mould. It is a product of the natural decay of wood and other vegetable tissue. (See Humic Acid.)

Apoc'rypha [from the Gr. ἀπόκρυφος, "hidden"], a term applied by Protestant theologians to a collection of writings which have been regarded as an appendage to the Old Testament, and sometimes as a part of it. They are valuable chiefly as historical records, and for the light they throw on the religious condition of the Jews from the period of the Old Testament to the Christian era. They are divided into three classes: 1st, those which originated in Palestine, such as the book of Jesus son of Sirach, first book of Maccabees, and book of Judith; 2d, those of Egypto-Alexandrian origin—the book of Wisdom, second of Maccabees, and the addition to Esther; 3d, those which show traces of Chaldaic or Persian influence, as Esdras, Tobias, Baruch, and the additions to Daniel. The Council of Laodicea in Phrygia, between 343 and 381 (commonly referred to circ. 360), condemned the use of "uncanonical books;" but the list of canonical books which follows is now generally thought to be an interpolation. The third Council of Carthage (Aug., 397), in the forty-seventh of its fifty canons, gives a list which includes Ecclesiasticus, Wisdom, Tobit, Judith, First and Second Maccabees. There are in all fourteen apocryphal books, or portions of books, all but three of which were pronounced canonical by the Council of Trent in 1546. The Roman Catholic Church calls these books deuterocanonical or antilegomena, and applies the name "apocryphal" to those books to which a reception into their canon of the books of the Old Testament has been refused. By Protestants these books are generally called Pseudepigrapha (which see). The Church of England in her Articles mentions the Apocrypha as books which "the Church doth read for example of life and instruction of manners, but yet doth it not apply them to establish any doctrine." They are entirely rejected from public worship by Protestants in America, and by the dissenting churches in Great Britain. Revised by R. D. Hitchcock.

Apocyna'ceæ, or **Apocyn'eæ** [so called from *Apocynum*, the name of one of its genera], an order of exogenous herbs, trees, and shrubs. The calyx is usually 5-partite, persistent; the corolla monopetalous and hypogynous, the stamens are five, inserted on the corolla. Many of the species have a poisonous milky juice, and others are used in medicine. The whole number of the species is said to be more than 550. This order comprises the oleander; the hya-hya, or cow tree, the milk of which is wholesome; the *Cerbera*, which produces the Tanghin poison of Madagascar; the *Carissa edulis* of Arabia; and the *Apocynum cannabinum*, or Indian hemp, which grows in North America.

Ap'odal Fishes, or **Ap'odes** [from the Gr. ἀ, priv., and πους, ποδος, a "foot"], a term applied to fishes destitute of ventral fins or homologues of the posterior extremities. In the Linnæan system, Apodes was the name of an order of such fishes, but in the system of Cuvier less importance is attached to this distinctive character. Eels are apodal fishes.

Ap'ogee [from the Gr. ἀπό, "from," and γῆ, the "earth"] signifies the point of the moon's orbit most remote from the earth; the point which is opposite to the perigee. The apogee of the lunar orbit advances eastward among the stars, and completes a revolution in nine years.

Apolac'on, a township of Susquehanna co., Pa. P. 528.

Apol'da, a town of Central Germany, in Saxe-Weimar, on the railway from Berlin to Weimar, 11 miles by rail N. E. of Weimar. Here are mineral springs. Pop. in 1871, 10,507.

Apollina'ris (or **Apollina'rius**) the Younger, a learned bishop and philosopher, was a son of a grammarian of the same name. He became bishop of Laodicea in 362 A. D., and gained distinction as an orator and writer. Among his works were "Thirty Books against Porphyry" and commentaries on the Bible. He was an opponent of Arianism, and in 375 founded the sect of Apollinarians, who were regarded as heretics. The heresy of which he was accused was the denial of the human soul in Christ, the place of which, he taught, was supplied by the *Logos*. His heresy was condemned at Alexandria in 362, and at Rome in 374. At the Council of Constantinople, in 381, he was condemned by name. He died in 390, and by the middle of the subsequent century the sect he founded was extinct. (See Werner-dorff, "Dissertatio de Apollinare Laodiceno," 1694.)

Apollina'ris Sido'nius (Caius Sollius), Saint, a Latin poet and ecclesiastic, born at Lugdunum (Lyons), in Gaul, in 430 A. D. He was a son-in-law of Avitus, who was emperor of Rome for a few months in 455–456 A. D. Anthemius, who became emperor in 467, appointed him chief of the senate. In 471 he was elected bishop of Clermont (Augustonemetum). He wrote "Carmina" and "Epistolæ," which are extant, and have some historical value. Died in 482 A. D. (See Germain, "Essai sur Apollinaris Sidonius," 1840.)

Apol'lo [Gr. Ἀπόλλων], in Greek mythology, the god of light or day, of poetry, music, archery, etc., was a son of Jupiter and Latona. He was often called Delius, because he was born on the island of Delos; and Phœbus, which signifies "shining." As the god of light (the presence of which is necessary to the existence of beauty) he presides over poetry, the arts, etc. According to the later poets, he was the god of the sun, and was identified with Helios, but Homer represents them as distinct deities. Apollo may be considered the ideal representative of the Hellenic people, and the impersonation of Hellenic life in its most noble and beautiful forms. He was recognized as the author of the healing art, and as the god of prophetic inspiration as especially manifested in the oracle of Delphi. Under the name of Pæan he was invoked as a healer of disease and as a destroyer, for his arrows were believed to deal out pestilence. Apollo was also worshipped by the ancient Romans, who derived their idea of him from the Greeks. He was represented by artists as a beautiful young man, crowned with laurel, and holding in his hand a harp or a bow and arrow.

Apollo, a post-borough of Armstrong co., Pa., on the Kiskaminetas River, and on a branch of the Central R. R., 40 miles E. N. E. of Pittsburg. Pop. 764.

Apol'lo Belvede're, a beautiful antique marble statue of Apollo which was discovered at Antium about 1503, and was placed in the Belvedere of the Vatican. The name and date of the artist are unknown. This statue, which is about seven feet high, is considered the most perfect model of manly beauty. The attitude of the statue is generally supposed to represent Apollo as he appeared after he had discharged the arrow that killed the Python. (See Byron's "Childe Harold," canto iv., stanzas clxi., clxii., and clxiii.) But another opinion is gaining ground that it represents the god with the ægis in his hand as he appeared to the Goths who were invading his sanctuary at Delphi. (See "Apollon Boëdromios bronzn. Statue im Besitz des

Grafen Sergei Stroganoff erläutert, von Ludolf Stephani, mit vier Kupfertafeln," St. Petersburg, 1860.) Clarence Cook.

Apollodo'rus [Gr. 'Απολλόδωρος], a celebrated Greek painter, surnamed the Shadower, was born at Athens about 440 B. C. He was a rival of Zeuxis, the founder of a new school, and the reputed inventor of chiaroscuro. His works are highly praised by Pliny, who says he was the first who painted objects as they really appear.

Apollodorus of Athens, a celebrated grammarian and historian who lived about 140 B. C., was a pupil of Aristarchus. He wrote numerous works, which are lost, and a manual of Greek mythology entitled "Bibliotheca," a large part of which is extant. It is considered very valuable by classical scholars as the best work on the subject. It was published by Heyne in two volumes; 2d ed. 1803.

Apollodorus of Damascus, a distinguished architect, born at Damascus, lived about 100 A. D. He was patronized by Trajan, and erected in Rome numerous works, among which were the Basilica Ulpia, the Forum of Trajan, and the Column of Trajan, which is still extant. His capital work was a noble bridge over the Danube, near the mouth of the Aluta, built in 105 A. D. He was put to death about 128 A. D. by Hadrian, whom he had offended by criticising a temple which that emperor had designed.

Apollo'nia [Gr. 'Απολλωνία], an ancient city of Illyricum, on the Adriatic Sea, about 40 miles S. of Dyrrhachium. It was founded by colonists from Corinth and Corcyra, and became an important city. The site is now occupied by a village called Polina or Pollina, and some ruins of temples.

Apollo'nius [Gr. 'Απολλώνιος] **of Rhodes,** an eminent Greek sculptor, lived probably about 200 B. C. Aided by his brother Tauriscus, he executed a group of Zethus and Amphion tying Dirce to the horns of a bull. Some persons identify this with the group called "Toro Farnese" which is now at Naples.

Apollonius, a skilful Athenian sculptor, a son of Nestor. His date is unknown, and nothing is known about him but that he executed the marble statue of Hercules, of which a large fragment, called the Torso of the Belvedere, is now in Rome.

Apollonius, a grammarian and Sophist of Alexandria, lived in the time of Augustus. His lexicon to Homer's "Iliad" and "Odyssey" is extant, and is highly prized.

Apollonius, surnamed Dyscolus (the "Morose"), an eminent Greek grammarian of Alexandria, was the father of Ælius Herodian. He lived about 120–160 A. D., and wrote many works which are lost, but a "Treatise on the Syntax of the Parts of Speech" and three others are extant. He was styled by Priscian *grammaticorum princeps* —"prince of grammarians."

Apollonius, surnamed Pergæus, a celebrated and profound Greek geometer, born at Perga, in Pamphylia, about 250 B. C. Little is known of his life, except that he resided in Alexandria in the reign of Ptolemy Philopator (222–205 B. C.). His most important work is a Greek "Treatise on Conic Sections," in eight books, which is extant except one book. He wrote other works, which are lost. He was also distinguished as an astronomer.

Apollo'nius Mo'lon, a Greek rhetorician, born at Alabanda, in Caria. He taught rhetoric at Rhodes and Rome, which he visited in 81 B. C. Cicero and Julius Cæsar were his pupils soon after that date.

Apollo'nius Rho'dius ['Απολλώνιος ὁ 'Ρόδιος], a Greek poet, born at Alexandria (or at Naucratis) about 235 B. C., was a pupil of the poet Callimachus, and at an early age removed to Rhodes, of which he became a citizen. He taught rhetoric at Rhodes for many years, and afterwards returned to Alexandria. About 194 B. C. he was appointed keeper of the great Alexandrian library. His chief work is an epic poem entitled "Argonautica," on the expedition of the Argonauts, which displays great erudition, and was much admired by the ancient Romans. Critics generally agree that it contains beautiful passages. (See Weichert, "Ueber das Leben und Gedicht des Apollonius," 1821.)

Apollo'nius Tyanæ'us (or **Apollo'nius of Tyana**), [Gr. 'Απολλώνιος Τυανεύς], a Pythagorean philosopher, born at Tyana, in Cappadocia, lived about 30–70 A. D. He performed a journey to India in order to learn the doctrines of the Brahmans, and after his return gained a high reputation as a sage, an oracle, and a worker of miracles. He is considered by some authors as an impostor, and by others as a prophet or magician of extraordinary powers. He travelled extensively in Europe and Africa, and is said to have passed his latter years at Ephesus. Many marvellous and absurd stories are related of him by Flavius Philostratus, who wrote his life. Apollonius wrote in reply to Euphrates an Apology, which is extant. (See John H. Newman's "Life of Apollonius Tyanæus," 1853; Philostratos, "Life of Apollonius," in English, 1809; F. C. Baur, "Apollonius von Tyana und Christus," 1832.)

Apol'los, an eloquent preacher among the early Christians, was originally a Jew and a native of Alexandria. He is said to have been ordained bishop of Corinth. (See Acts xviii. 24; 1 Corinthians i. 12; iii. 4.)

Apol'lyon [Gr. 'Απολλύων, from ἀπολλύω, to "destroy"] signifies the "destroyer," and answers to the Hebrew *Abaddon*, and to the *Asmodeus* of Tobit.

Apologet'ic Fa'thers, a name given to those early Christians who addressed to pagans and Jews apologies for the Christian religion. Some of these were remonstrances against the judicial punishment of Christians as such, addressed to the Roman emperor or senate. Others were defences of Christianity against the charges of the Jews and pagans. Among the former were the apologies of Justin Martyr, Melito, bishop of Sardis, and the Liber Apologeticus of Tertullian. Origen, Tertullian, Clement of Alexandria, and Justin were among the principal writers of the latter class.

Apol'ogy [Gr. ἀπολογία], a term originally used to denote a written defence or answer to an accusation; a work written in defence of certain doctrines, as Plato and Xenophon's "Apology for Socrates." Tertullian, Justin Martyr, and other early Christians wrote treatises in defence of the Christian religion, which they called Apologies. Among the modern works of this class are Bishop Watson's "Apology for Christianity," and Robert Barclay's "Apology for the True Christian Divinity." In its modern or recent acceptation apology signifies the acknowledgment of a fault, usually accompanied by some explanation which may palliate or excuse it.

Apoph'yllite [from the Gr. ἀποφυλλίζω, to "exfoliate"], a zeolitic mineral with a lamellar structure, is so called because it exfoliates before the blowpipe. It is a hydrated silicate of lime and potash occurring in square prisms, the solid angles of which are sometimes replaced by triangular or rhombic planes. It is brittle, and has a white or grayish color, often tinged with green, yellow, blue, or red. It is found in beautiful crystals in the Hartz Mountains, in Poonah, and in the Bergen Tunnel at Jersey City.

Ap'oplexy [Lat. *apoplexia*, from the Gr. ἀπό, "away," and πλήσσω, to "strike;" as we speak of a *stroke* of apoplexy or of paralysis], a disease marked by the sudden failure of volition, sensation, motion, and mental action, the symptoms being caused by a pressure upon the brain originating within the cranium. Apoplexy is of various kinds, differing not so much in symptoms as in pathology. The typical form is characterized by an escape of blood into the substance of the brain from a ruptured vessel. The rupture itself may be caused (1) by a non-inflammatory, fatty degeneration of the blood-vessel, caused by bad nutrition, etc.; (2) by a brittle condition of the vessel, resulting from an inflammatory process. These causes may be supplemented by a full habit of body or by a hypertrophied heart, or both; and it is easy to see how such secondary causes might assist in the rupture of a weakened blood-vessel. Apoplexy may, however, be produced by an extravasation of blood between the meninges, by a sudden and large serous effusion into the ventricles of the brain, or even by a congestion (hyperæmia) of the brain. The apoplectic stroke may end in partial recovery or in speedy death. Cases not fatal generally result in permanent or temporary paralysis of one side of the body (hemiplegia), often on the side opposite that in which the mischief has occurred.

The symptoms of apoplexy are often unexpected. The patient falls suddenly (with or without an outcry), his respirations are long, slow, and stertorous, the pulse is slow, one or both the pupils usually small. If the patient does not die during the attack, a secondary inflammation follows which may destroy life. Bleeding may be resorted to if the pulse be strong and the heart and lungs in good condition, but it is often injurious. Mustard to the extremities and frictions of the skin should be resorted to, and the bowels should be moved by enema. Persons having reason to fear apoplexy should avoid excesses of all kinds, yet live upon nutritious food, paying special attention to hygienic conditions.

Revised by Willard Parker.

A posterio'ri and **A prio'ri.** Before the time of Kant the former of these terms denoted a reasoning from effect to cause, and the latter a reasoning from cause to effect. Since Kant's time, and owing to his influence and that of his school, these terms are generally used more in relation to the doctrine of knowledge; *a posteriori* knowledge being empirical knowledge, or knowledge through experience, and *a priori* knowledge being rational knowledge, or a

knowledge through the reason of that which is prior to experience.

Apos'tle [Gr. Ἀπόστολος, *i. e.* "one sent forth," from ἀπό, "away" or "forth," and στελλω, to "send"], the name given originally to the twelve disciples of Jesus, whom he had chosen to make known his doctrines to the world. The greater part were Galileans, laboring people, and destitute of high culture. Their names were Simon Peter (called also Cephas and Bar-Jona), Andrew, James the Elder (son of Zebedee), John his brother, Philip, Bartholomew (Nathanael), Thomas (Didymus), Matthew (Levi), James the Younger (son of Alpheus), Thaddeus, Simon, and Judas Iscariot. Matthias was chosen in the place of Judas, and subsequently Paul and Barnabas were called to the apostleship. It is a disputed point between the advocates and the opponents of episcopacy, whether or not the term apostle is applicable to any except the original twelve, and to Barnabas, Matthias, and Paul; some maintaining that the office is perpetuated in bishops, while others hold that it was temporary, and belonged only to those who were witnesses of the resurrection of Christ, and were employed by him to found the Christian Church. In the third year of the Saviour's ministry the apostles were commissioned by him to preach the gospel to the Jews only, but a short time before his ascension he commanded them to "Go and teach all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghost." On the day of Pentecost the apostles received miraculous gifts, and began their work with the public announcement of Christ as the Messiah. They travelled over Greece, Syria, and Asia Minor, but there appears to be no foundation for the tradition that they divided the known world into twelve parts, each taking one for his special sphere. We have little information concerning the time or the place of the death of most of the apostles. The Epistles and the Acts of the Apostles are the only genuine records concerning them now extant.

Apostles, Acts of [Gr. Πράξεις τῶν Ἀποστόλων], the fifth book of the New Testament, written by Luke, containing the history of the period from the ascension of our Lord to Paul's arrival at Rome; that is, in all probability, from 30 to 61 A. D. It is proper to observe that though this portion of the Scriptures is styled the Acts of the Apostles, it treats only of the acts of Peter, Paul, and James; and of these, only Paul's career is narrated fully and connectedly. The book is avowedly a continuation of the third Gospel, and, though restricted within such narrow limits, may be said to give those great events in the history of the apostles in which the Christian Church would naturally feel the greatest interest. Among these events the pouring out of the Holy Spirit at Pentecost, the martyrdom of Stephen, and the conversion of Saint Paul, as well as most of his subsequent journeys and labors, are fully related.

Apostles' Creed [Lat. *Sym'bolum Apostol'icum*], called also the Creed or Confession of Faith, is the most universal creed of the Christian Church. It is as follows: "I believe in God the Father Almighty, maker of heaven and earth; and in Jesus Christ his only Son our Lord; who was conceived by the Holy Ghost, born of the Virgin Mary; suffered under Pontius Pilate, was crucified, dead, and buried. He descended into hell [or hades]; the third day he rose again from the dead; he ascended into heaven, and sitteth on the right hand of God the Father Almighty; from whence he shall come to judge the quick and the dead. I believe in the Holy Ghost; the Holy Catholic Church; the communion of Saints; the forgiveness of sins; the resurrection of the body; and the life everlasting. Amen." According to a tradition prevailing in the fourth century, but now generally discredited, this creed was composed by the apostles themselves, each contributing one of the articles. Some churches omit the clause, "He descended into hell," asserting that it was not a part of the original creed. (This subject is more fully discussed under Creed (which see).)

Apostles' Islands, or the **Twelve Apostles,** a group of twenty-seven islands in Lake Superior, 70 miles W. of Ontonagon. The principal islands are Ile au Chêne, Madeline, Bear, Stockton, and Outer Island. The islands belong to Wisconsin. They are covered with fine timber, and their cliffs have been worn into strange forms by the action of the waves. The land area is estimated at 200 square miles. Brown sandstone is quarried and exported from the islands. La Pointe, on Madeline Island, is the capital of Ashland co., Wis. This place was settled by the French in 1680. These beautiful islands have several Jesuit missions, one of which was established in 1658.

Apostol'ic, or **Apostol'ical,** a general term given to everything directly derived from, or bearing the character of, the apostles. The Roman Catholic Church styles itself the Apostolic Church, and the papal chair is called the Apostolic chair, because the pope is supposed to be the legitimate and lineal successor of Peter, the chief apostle. The Church of England claims to be apostolic in virtue of regular episcopal ordination from the Church before the Reformation; so also do the Protestant Episcopal churches in Scotland and the U. S. Several churches of Jerusalem, Antioch, Ephesus, Corinth, and Rome, which were the special scenes of the labors of the apostles, were called apostolic churches. With the increasing power of the Roman Catholic Church, the word apostolic was more exclusively applied to whatever belonged to that Church, as Apostolic See, Apostolic Canons, etc.

Apostol'ic Can'ons and Constitu'tions are notes of ecclesiastical customs regarded as apostolical. The Apostolic Constitutions (*Constitutiones Apostolicæ*) consist of eight books, the first six of which contain a comprehensive rule for a Christian life. These are supposed to have been written about the end of the third and beginning of the fourth century. The Apostolic Canons (*Canones Apostolici*) were composed at a later period. The first fifty, translated from Greek into Latin by Dionysius Exiguus, were acknowledged by the Latin Church alone. The Greek Church accepted the thirty-five canons put forth early in the sixth century; and this became a point of dissension between the Eastern and Western churches. The Apostolic Constitutions have been ascribed by some writers to Clement of Rome.

Apostol'ic Fa'thers, the name given to the disciples and fellow-laborers of the apostles, especially to those who have left writings. They are Barnabas, Clement of Rome, Ignatius, bishop of Antioch, Polycarp, bishop of Smyrna, Hermas, and Papias of Hierapolis. Some also include the author of the epistle to Diognetus among these Fathers. Cotelerius (Paris, 1672) issued an edition of the works of the Apostolic Fathers, which was improved by Clericus in 1698, and again in 1724. Of recent editors, the best are Jacobson (1838; 4th ed. 1866), Hefele (1839; 4th ed. 1855), and Dressel (1857; reissued 1863).

Apostol'ici, or **Apostol'ic Breth'ren,** a name given to a sect of religious reformers who originated in Italy in the latter part of the thirteenth century, and had for their leader Gherardo Segarelli of Parma. They travelled over Italy, France, and Switzerland, preaching the duty of renouncing worldly ties, property, etc. Having denounced popery, they were condemned by Pope Honorius IV., and Segarelli was burnt at the stake (1300). His place was filled by Dolcino, formerly a priest of Milan, who, after a brave resistance, was, with his adherents, taken by the forces of the pope, and perished at the stake in 1307.

Apostol'ic Maj'esty, a title of the kings of Hungary, was first conferred on the duke of Hungary by Pope Sylvester II. in 1000 A. D. The title was renewed in 1758 by Pope Clement XIII. in favor of Maria Theresa.

Apostol'ic Par'ty, a party of fanatical Spanish Catholics formed about 1820 for the promotion of an absolutist political policy. Their leaders were priests. In 1830 they merged themselves into the Carlist party.

Apostool' (Samuel), a Dutch Mennonite theologian, born in 1638. He became in 1662 a minister of a Waterlandian congregation in Amsterdam. He and Galenus engaged in a doctrinal dispute which divided the Church into two sects, called Apostoolians and Galenists. Died about 1700.

Apos'trophe [from the Gr. ἀπό, "from," "away," and στροφή, a "turning"], in rhetoric, a digressive address; a figure of speech by which the orator suddenly changes the course of his oration, and addresses with emotional emphasis a person present or absent, or some inanimate object. Frequent examples of it occur in the speeches and writings of great orators and poets.

Apoth'ecary [from the Gr. ἀποθήκη, a repository where anything is kept], a person who compounds and sells medicines and makes up medical prescriptions. In England the profession of an apothecary may be not incorrectly described as an inferior branch of the medical profession. He is legally entitled to attend sick persons and prescribe for them, as well as to make up and dispense medicines. It is not, however, usual for him to prescribe medicines to be prepared and supplied by others. But although he may attend sick persons and prescribe for them, he cannot charge both for his attendance and his medicines, but must make his election between the two. Although, therefore, the apothecary is inferior in professional rank and authority to the physician and surgeon, he is considered to be of a higher grade than the chemist and druggist, who merely vends drugs and medicinal compounds, but whose qualification, beyond the payment of a small annual tax by way of license, does not necessarily offer any test or guarantee of skill. The rules of the Pharmaceutical Society of Great Britain, incorporated in 1843 by royal charter, and the

powers of which have been considerably enlarged by a statute passed on the 30th June, 1852, operate as some restraint on ignorance and want of skill. Apothecaries and grocers (like surgeons and barbers) were in England and other countries formerly members of the same guild, and hardly distinguishable from each other. They were chartered as one company in London in 1606, but in 1617 James I. granted the apothecaries a charter as a separate corporation.

In the U. S. the vocation of the apothecary is mostly quite distinct from that of the medical practitioner. Among physicians it is generally regarded as contrary to professional ethics for a practitioner, in large cities at least, to be directly interested in the retailing of medicines. The education of pharmacists in the U. S. has greatly advanced of late years. Many of them are now graduates of colleges of pharmacy (the most important of which are in New York and Philadelphia), wherein excellent scientific and practical training is obtained. There is also a well-organized national pharmaceutical association. To limit the danger connected with the unskilful dispensing of drugs, a law has recently (1871) been put in force in New York and other States, requiring all apothecaries to pass a rigid examination.

Apothe'osis [from the Gr. *ἀπό*, "away," and *θέος*, a "god;" the idea being to take one away from among mortals, and to place him among the gods], a Greek word meaning deification, or the practice of raising a human being to a place among the gods. This practice was common among the ancient Greeks, who deified and worshipped heroes and benefactors after their death. Among the Romans, Romulus was the first who received such an honor, and Julius Cæsar appears to have been the second. Alexander the Great sent to all the states of Greece an order that they must recognize his divinity, and received from Sparta this laconic answer: "Since Alexander desires to be a god, let him be (or become) a god!" Several Roman emperors apotheosized themselves and their favorites.

Appalach'ee Bay, a large open bay near the northern part of Florida, is a part of the Gulf of Mexico, and is about 30 miles S. of Tallahassee. It extends inland about 50 miles.

Appalach'ee In'dians, a once powerful tribe of West Florida. They were conquered and converted to Christianity by Spanish missionaries, but the oppression and cruelties of the colonial authorities, together with the destructive invasions of English colonists and Indians from Carolina, greatly diminished their numbers. Soon after 1700 a part removed to what is now Alabama, and the tribe soon ceased to exist.

Appala'chian Moun'tains, a general term for the numerous ranges of mountains traversing the eastern part of the U. S., mostly parallel to each other, and in the main parallel to the Atlantic coast. This mountain-system is about 1300 miles long, extending, under various names, from the northern part of Alabama to Maine, and occupying, with the valleys which it forms, a space nearly 100 miles wide. The portion of this chain in New Hampshire is called the White Mountains, the highest summit of which, named Mount Washington, rises 6288 feet above the level of the sea. In New York the system takes the name of the Adirondacs, the Catskill Mountains, and the Highlands. In Pennsylvania and the Southern States they are called the Alleghany Mountains, and the name of Blue Ridge is applied to the range in Virginia which is nearest to the Atlantic Ocean. These ranges are remarkable for the uniformity of their outline, and for the parallelism of their ridges and long narrow intervening valleys of limestone formation. Among the latter is the Great Valley of Virginia, which is bounded on the S. E. by the Blue Ridge, and extends across the whole State. The ridges are remarkable for their near approach to a rectilinear direction, and the comparative uniformity of their height. The highest summit of the system is the Black Dome, or Mitchell's High Peak, in N. C., which rises to 6707 feet.

The geological formations of this chain include all those from the metamorphic rocks to the coal-measures, including the latter, and the strata belong entirely to the oldest or palæozoic division of the fossiliferous rocks. The aggregate thickness of these, measured in Pennsylvania as they appear in succession at the surface, is about seven miles. They may be classed under the three great divisions of sedimentary rocks—namely, sandstones, slates, and limestones, between which are interstratified beds of coal and iron ore. Geologists affirm that the origin of the Appalachians is more ancient than that of the Andes and the Alps, as is proved by the fact that on the high summits or slopes of the latter are found strata of a formation more recent than the carboniferous age. Their original height has been greatly diminished by the long-continued degrading agency of rain, frost, etc. The strata of this system are remarkable for their plications and complexity of flexure, in consequence of which some parts of the strata are nearly vertical. "The coal-measures of Pennsylvania," says Dana, "which were originally spread out in horizontal beds of great extent, are now tilted at various angles or rise into folds, and the strata are broken and faulted on a grand scale. The folds vary from a few rods to one hundred or more miles in breadth, and are in many successions over the region, wave succeeding wave." . . . "The following are some of the most important facts established with regard to the Appalachian flexures: 1. They occupy the whole *Appalachian* and *eastern border-regions* of the continent, nearly or quite to the Atlantic Ocean. 2. They are parallel with the general course of the mountains, and nearly so with the Atlantic coast. 3. They are most crowded and most abrupt over the part of the regions which is towards the ocean—that is, the S. E. side. 4. The steepest slope of a fold is that which faces the N. W." "A uniform series of S. E. dips over such a region is evidence that the strata correspond to a number of decapitated folds." (*Manual of Geology.*) Among the mineral resources of this chain are coal, copper, iron, zinc, nickel, and lead.

REVISED BY J. S. NEWBERRY.

Ap'palachico'la, a river, formed by the union of the Chattahoochee and Flint, at the S. W. extremity of Georgia. It flows southward through Florida, and after a course of 100 miles enters Appalachicola Bay, a part of the Gulf of Mexico. It is navigable for steamboats.

Appalachicola, a port of entry, the capital of Franklin co., Fla., is on the river of its own name at its entrance into St. George's Sound, a bay of the Gulf of Mexico, 85 miles S. W. of Tallahassee. Large quantities of cotton were once shipped here. At present there is a trade in timber and fish. Pop. 1129.

Ap'panoose, a county of Iowa, bordering on Missouri. Area, 492 square miles. It is intersected by the Chariton River, which affords water-power, and also drained by the South Fork of the Chariton. The surface is undulating; the soil is fertile. This county contains beds of coal, which is extensively mined. Grain, dairy products, cattle, wool, and tobacco are largely produced. It is traversed by the S. W. branch of the Chicago Rock Island and Pacific and Burlington and South-western R. Rs. Capital, Centreville. Pop. 16,456.

Appanoose, a post-twp. of Hancock co., Ill. P. 1018.

Appara'tus [from the Lat. *ap'paro, appara'tum,* to "prepare," to "arrange"], a term which in modern language is applied to a complete set of instruments or utensils for performing a scientific experiment or operation; the implements or machinery used in the operations of practical chemistry, or in the illustration of the principles of natural philosophy.

Appa'rent [Lat. *appa'rens,* the present part. from *appa'reo,* to "appear"], that which appears to the eye in distinction from true or real. This term is used in astronomy to express several important distinctions, as "apparent time," which is indicated by the sun, and differs from true time. The apparent magnitude of a heavenly body is the dimension of the angle formed by two lines drawn from the ends of its diameter to the spectator's eye. The apparent diurnal motion of the sun and moon is an optical illusion caused by the rotary motion of the earth, and the real motion of the moon is contrary to its apparent motion. An heir-apparent to a throne is a person whose title is better than any other except the actual occupant of the throne, and whose succession does not depend on any contingency if he survive the reigning monarch.

Appari'tion [Lat. *appari'tio*; for etymology see preceding article], literally, an "appearance" or "appearing," in common language signifies a spectre, a ghost, a visible spirit. In astronomy it means the first appearance of a heavenly body after it has been eclipsed or obscured. Stars which appear to revolve around the Pole, and which never set below the horizon, are said to be within the circle of perpetual apparition, which circle grows larger and larger in proportion as the spectator approaches the Pole.

Appar'itor [from *appa'reo,* to "appear"], a general name among the ancient Romans for the officers or public servants who attended the magistrates and judges, including heralds, lictors, scribes, etc. In England it is applied to the beadle of a university, who carries the mace, and to a messenger of a spiritual court, who serves its process.

Appeal' [from the Lat. *appello,* to "call"], in law, is an accusation of a private citizen against another of some heinous crime, demanding punishment for the peculiar injury suffered, rather than for the offence against the public. This proceeding has been entirely abolished in England, and does not exist in this country. The word also means the removal of a cause from an inferior to a superior court

for the purpose of obtaining a review and re-trial of the case. It differs from a *writ of error* and a *certiorari*, inasmuch as they merely bring up for review the questions of law involved in the proceedings in the lower court, while by an appeal the questions both of law and fact may be re-examined. In a popular sense, the word signifies the removal of a cause, or of a proceeding in a cause, from an inferior to a superior court for the purposes of review, by whatever means effected. Codes of procedure in a number of States abolish writs of error in civil cases, and establish a review by appeal in all actions, whether of a common-law or equity nature. The word "appeal" is used in parliamentary law to indicate the mode of questioning the decision of the presiding officer as to a parliamentary rule.

Appear'ance [from the Lat. *appareo*, to "be seen"], in law, the act by which a party to an action brings himself, or is brought, into court, usually applied to the defendant. Appearance is either voluntary or compulsory. It is said to be voluntary when no process has been served. It is also special or general. It is said to be special when made for special purposes, not extending to the entire subject of litigation. It is general when absolute and unconditional. A notice of appearance will suffice, or the performance of some act from which an appearance can be inferred, such as serving a pleading. In civil cases it may be made by an attorney as well as by a party. In criminal cases personal appearance of the accused is frequently requisite, particularly in cases of felony.

Appen'dage [Lat. *appen'dix*, from *ad*, "to," and *pen'do*, to "weigh" or "hang"], in botany, is applied to all parts which are regularly arranged around any other part. Thus, leaves are appendages of the axis; so are all the flowers, theoretically. The supernumerary sepals in a strawberry are appendages of the calyx, and so on. In zoology, the bones of vertebrate animals are appendages of the vertebræ; the limbs of articulates are appendages of the segments.

Ap'penzell, a canton in the N. part of Switzerland, is bounded on every side by the canton of St. Gall. In consequence of religious differences it was divided in 1597 into two half cantons—Appenzell Inner Rhodes (Catholic) and Appenzell Outer Rhodes (Protestant). Inner Rhodes has an area of 62 square miles, and had in 1870 a population of 11,909. Outer Rhodes has an area of 100 square miles; pop. in 1870, 48,726. It consists completely of a wild mountain country, intersected by narrow valleys. It has manufactures of embroideries, linen, and calico. In 1864 the expenses of Inner Rhodes amounted to 176,026 francs, and of Outer Rhodes to 203,736 francs. Appenzell contributes 4060 men to the federal army. Capital of Inner Rhodes, Appenzell, and of Outer Rhodes, Trogen. The canton was formerly subject to the abbey of St. Gall, gained its independence early in the fifteenth century, and joined the confederation in 1513. (See ZELLWEGER, "Geschichte des appenzeller Volkes," 4 vols., 1830.)

Appert (BENJAMIN NICOLAS MARIE), a French philanthropist, born in Paris Sept. 10, 1797. He founded schools for the mutual instruction of the poorer classes, and devoted much time to the improvement of the condition of prisons and their inmates. He published, besides other works, a "Treatise on the Education of Prisoners" (1822).

Ap'pian [Gr. Ἀππιανός; Lat. *Appia'nus*], an historian, born at Alexandria, in Egypt, flourished about 120–160 A. D. He removed to Rome in early life, distinguished himself as an advocate, and obtained the important office of procurator. He wrote in Greek a valuable work on "Roman History" (Ῥωμαϊκὴ Ἱστορία) in twenty-four books, of which eleven are extant. His style is commended as clear and agreeable, but some critics estimate him as a mere compiler. (See DOMINICUS, "Programma de Indole Appiani," 1844.)

Appia'ni (ANDREA), an eminent Italian painter, born at Bozzio May 23, 1754, imitated the style of Correggio. He is thought to have excelled all the artists of his time in fresco painting. About 1805 he was appointed court-painter to Napoleon, whose portrait he painted. His principal merits are grace, purity of design, and brilliancy and harmony of color. Among his masterpieces are the frescoes on the ceiling of the royal palace of Milan, and those in the church of Santa Maria Vergine, in the same city. Died Nov. 8, 1817. (See G. LONGHI, "Elogio Storico di A. Appiani," 1826.)

Ap'pian Way [Lat. *Vi'a Ap'pia*], the most celebrated of the ancient Roman roads, was constructed by Appius Claudius Cæcus about 313 B. C. It extended originally from Rome to Capua, 125 miles, but was eventually continued to Brundisium. It was built in a very expensive manner, and was paved with large polygonal blocks of the hardest stone, accurately fitted to each other, so as to appear like a solid mass. The substructure was solidified by cement. The road has been partly restored by excavation, and is found to be in a remarkable state of preservation.

Applause [from the Lat. *applau'do*, *applau'sum*, to "strike upon," to "clap"], a shout of approbation; an approving acclamation; a public expression of approbation and praise by striking upon the floor or the clapping of hands. This custom prevailed among the ancient Greeks and Romans. The Roman comedians usually terminated their performances with a request that the audience would applaud, *valete et plaudite!* Three species of applause were used by the Romans—namely, *Bombus*, a confused hum, like the buzzing of bees, produced by the mouth or the hands; and *Imbrices* and *Tegula*, which were sounds made by striking vessels placed in the theatre for this purpose. The last was like the sudden crash produced by the fall and fracture of a set of china-ware.

In modern times, French politicians and dramatists often avail themselves of the services of hired applauders, called *claqueurs*, who cry *Bis, bis!* ("twice," "again," "encore"), or *Bien, très bien!* The audiences of English actors signify their approbation by the cry of *Encore!* but in the British House of Commons applause is expressed by cries of *Hear! hear!*

Ap'ple (*Py'rus ma'lus*), a fruit of a tree of the natural order Rosaceæ, which is native or naturalized in the temperate regions of Europe and Asia. It was cultivated by the ancient Romans, who called it *pomum*. The fruit called apple in the English translation of the Bible was probably different from the fruit now known by that name. The wild crab-apple of the Old World is the parent of almost all the varieties of apple which are cultivated, and which have been much improved by cultivation. The apple is considered the most valuable fruit of temperate climates, and is more extensively cultivated than any other. The fruit in botanical language is a *pome;* the leaves are ovate, acute, serrate, or crenate; the blossoms are beautiful and fragrant. The tree, which is hardy and slow in growth, will live probably two hundred years under favorable circumstances. The number of varieties of cultivated apples is over 200, and is continually increasing. This fruit may be divided into three classes, with respect to the season in which it matures: namely, summer, autumn, and winter apples, the former of which, in the Middle States of the Union, begin to ripen about June.

Among the best varieties of winter apples are the Baldwin, Spitzenberg, Rhode Island Greening, Bellflower, Swaar, Northern Spy, Rambo, Roman Stem, Peck's Pleasant, Roxbury Russet, Wine Apple or Winesap, Ashmore, Belmont, Hubbardston Nonsuch. Large quantities of apples are exported from the Northern U. S. to Great Britain. The finest quality of this fruit is produced in New York and other States in the same latitude. Among the products obtained from the apple is a beverage called cider, and a chemical substance called MALIC ACID (which see). The wood, which is hard, durable, and fine-grained, is used to make weaver's shuttles, shoe-lasts, cog wheels, etc.

The Siberian crab (*Pyrus baccata* or *Pyrus prunifolius*), a native of Siberia, is cultivated in Europe and the U. S. for preserves. The *Pyrus coronaria* (or American crab) is a small tree which grows wild in the U. S., and bears a sour and harsh-tasted fruit scarcely an inch in diameter. This is used for preserves. An important distinction among apples is expressed by the terms natural fruit and grafted fruit. The former, which is raised from the seed, is mostly very inferior in quality. (See POMOLOGY.)

Apple Blight, a disease of apple trees, caused by a species of aphis (the *Aphis lanigera*). This little insect penetrates the chinks in the bark, extracting the sap, causing diseased excrescences, and ultimately the death of the tree.

Apple Creek, a township of Cape Girardeau co., Mo. Pop. 2626.

Apple Creek, a post-village of East Union township, Wayne co., O., 7 miles S. E. of Wooster, and on the Cleveland Mount Vernon and Delaware R. R. Pop. 300.

Ap'plegrove, a township of Morgan co., Ala. Pop. 1379.

Apple Oil (artificial), a solution of valerianate of amyl in six parts of alcohol.

Apple River, a post-township of Jo Daviess co., Ill. Pop. 1108.

Ap'ples of Sod'om, a fruit mentioned by Josephus and other ancient writers as growing near the Dead Sea. It was fair in appearance, but when grasped in the hand collapsed into dust and ashes. Some modern writers have supposed that it was the fruit of *Solanum Melongena* (nightshade), but Robinson identifies it with the *Asclepias*

pias gigante'a, the fruit of which looks like an orange, but disappoints those who touch it by its nauseousness in an immature state, and its emptiness when fully ripe.

Ap'pleton, a post-township of Knox co., Me. It has manufactures of lumber, leather, agricultural tools, and lime. Pop. 1485.

Appleton, a city, capital of Outagamie co., Wis., on the Lower Fox River, 30 miles S. of Green Bay. Its railroad facilities include the Chicago and North-western, the Milwaukee Lake Shore and Northern, the Milwaukee and Northern, and the Wisconsin Central R. Rs. The river is navigable for steamboats, and is the route of the Green Bay and Mississippi Improvement Company. The manufactures include woollens, iron, machinery, farming-tools, flour, beer, hubs and spokes, barrels, baskets, pulp for paper, etc. The river has here a constant fall of forty-nine feet, furnishing inexhaustible water-power. There are one daily and three weekly papers, two national banks, and nine churches. The city is the seat of Appleton Collegiate Institute and of Lawrence University. Pop. 4518.
STONE & FULLER, Eds. "DAILY TIMES."

Appleton (JESSE), D. D., an American theologian, was born at New Ipswich, N. H., Nov. 17, 1772, and settled over the Congregational church in Hampton, N. H., in Feb., 1797. In 1803 he was one of the most prominent candidates for the chair of theology in Harvard University. In 1807 he was chosen president of Bowdoin College, and died Nov. 12, 1819. A man of rare abilities and high classical culture, he was distinguished also for saintliness of character, and singular dignity and grace of manners. His works, in two vols. 8vo, with a memoir prefixed, were published by his son-in-law, Prof. Alpheus S. Packard, in 1837.

Appleton (JOHN), LL.D., a jurist, was born in 1804, graduated at Bowdoin College in 1822, became a judge of the supreme court of Maine in 1852, and chief-justice in 1862. He published two volumes of "Reports" (1841).

Appleton (JOHN), born at Beverly, Mass., Feb. 11, 1815, graduated at Bowdoin College in 1834, became a lawyer and prominent Democratic editor in Portland, Me., where he settled in 1837, became chief clerk of the U. S. treasury department in 1845, and afterwards held a similar position in the state department; was *chargé d'affaires* to Bolivia (1848–9), member of Congress (1850–59), secretary of legation in London (1855–56), U. S. minister to Russia (1860–61). Died Aug. 22, 1864.

Appleton (NATHAN), LL.D., a merchant, born at New Ipswich, N. H., Oct. 6, 1779, became a partner of his brother Samuel in Boston. He was one of the founders of Lowell. He was chosen a member of Congress in 1831, and again in 1842. Died July 14, 1861.

Appleton (SAMUEL), an eminent merchant and philanthropist, brother of the preceding, was born at New Ipswich, N. H., June 22, 1766. He removed to Boston about 1794, and amassed a fortune by trade and the manufacture of cotton. He gave $25,000 annually for charitable purposes, and made a donation of $10,000 to Dartmouth College. He died July 12, 1853, without issue, and left $200,000 to be applied to "scientific, literary, religious, and charitable purposes."

Appleton (WILLIAM), born at Brookfield, Mass., Nov. 16, 1786, became a successful merchant of Boston, to which he removed in 1807. He was a member of Congress (1851–55, 1861–62), and was distinguished for his benevolence. He gave $30,000 to the Massachusetts General Hospital. Died Feb. 15, 1862.

Appleton City, a post-village of St. Clair co., Mo., on the Missouri Kansas and Texas R. R., 59 miles S. W. by S. of Sedalia.

Ap'pling, a county in the S. E. part of Georgia. Area, 1060 square miles. It is bounded on the N. and N. E. by the Altamaha River, and drained by Little Satilla River. The surface is level, and the soil is sandy. Corn, rice, molasses, and honey are among the chief products. It is intersected by the Macon and Brunswick R. R. Capital, Holmesville. Pop. 5086.

Appling, a post-village, the capital of Columbia co., Ga., 27 miles W. of Augusta.

Appoggiatura, åp-pod-jå-too'rå, literally, a "support," an Italian musical term, indicates a form of embellishment by insertion of notes of passage in a melody. The notes are printed in a smaller character than the leading notes of the melody.

Appoint'ment [remotely from the Lat. *ad*, "to," and *punctum*, the "point"], in law, a disposition of property made by one authorized by a power contained in a deed, will, or other instrument to direct its use; an instrument executed pursuant to a power of appointment directing the disposition of property agreeably to such power. (See POWERS.) The word is also used to indicate the designation by lawful authority of some person to hold an office or to perform a public duty. Under the U. S. Constitution the President has the power to nominate, and, with the consent of the Senate, to "appoint," persons to hold certain specified offices.

Ap'pold (J. GEORGE), F. R. S., an English mechanician, born in 1800, was the inventor of a celebrated centrifugal pump, of machinery for paying out marine telegraph cables, and of a process for dressing furs, which last gave him the control of that business. His house was a museum of wonderful mechanical devices, which opened and closed doors, shutters, and gates, and performed many other surprising acts, by automatic machinery. Died Aug. 31, 1865.

Appold Centrifugal Pump. See PUMP.

Appomat'tox, a river of S. E. Virginia, rises in Appomattox county, flows in a general easterly direction, and enters the James River at City Point. Length, estimated at 150 miles. It is navigable for large vessels to Petersburg, 20 miles from its mouth.

Appomattox, a county in the S. central part of Virginia. Area, 260 square miles. It is bounded on the N. W. by the James River and canal, and drained by the Appomattox, which rises in it. The surface is hilly; the soil mostly productive. Tobacco, grain, and wool are its chief products. It is intersected by the South Side R. R. Capital, Appomattox Court-house. Near this place General Lee surrendered his army to General Grant, April 9, 1865, and thus terminated the civil war. Pop. 8950.

Appomattox Court-house, a post-village, capital of Appomattox co., Va., was the scene of the surrender of Gen. R. E. Lee, with the Confederate army of Northern Virginia, to Gen. Grant, April 9, 1865.

Apponyi (GEORG), COUNT, born in 1808, became the leader of the Conservative party in Hungary, and opposed the revolutionary movements in 1848. He was appointed in 1859 a life-member of the imperial council of Vienna, As royal commissary he opened the Diet at Buda in 1861.

Appoquin'imink, a hundred of New Castle co., Del. Pop. 4299.

Appor'tionment [from the Lat. *ad*, "to," and *portio*, a "share"], in law, the division of a thing into parts; the distribution of a claim or charge among different persons in proportion to their interests in the subject-matter to which it attaches. The leading cases concern—1, Incorporeal rights in land, such as commons and rents; 2, Encumbrances upon land; 3, Contracts. 1. The principal case under this division is that of rents. The question of apportionment may arise as to the rights of different owners either of the rent or of the land to which the burden of the payment of the rent attaches, or it may occur in case of a partial failure of the title as to the territorial extent of the land rented, or because the right of the tenant to hold the land ceases before the time agreed upon, on account of the expiration of the landlord's estate. Thus, a landlord, after a lease of two houses by one contract for a specified rent, may sell one of them. The purchaser would be entitled to collect a proportionate part of the rent. So, if the lessee should assign to a stranger all his rights in one of the houses, the latter would during his ownership be bound to pay a proportionate part of the rent. In case the title to a portion of the premises failed, as if in the case supposed the landlord did not own one of the houses that he assumed to lease, and the tenant was accordingly evicted, he would pay a proportional part of the rent for the remaining house. By the common law there was no apportionment where there was a failure as to time. This case is illustrated by a lease made by a life tenant for a specified period—*e. g.* a year. Should he die before the time expired, the lease would of course instantly terminate, and the tenant would pay no rent for the time intervening since the last payment of rent fell due. This defect in the law has been remedied by statute. It should be added that there is by common law no apportionment where the property leased is simply diminished in value. Should a house and lot be hired and the house be destroyed by fire, no deduction can be claimed, as the rent is deemed to be paid for the land, which still remains. This rule may be obviated by agreement of the parties. 2. *Encumbrances.*—It is a general rule that several owners of land must bear the burden of an encumbrance upon it in proportion to their respective interests. Thus, if land were mortgaged, and then conveyed to A for life, and, subject to A's estate, to B, the respective owners should share between themselves the burden of payment; while the mortgage remained, A should pay the interest. If it became necessary to pay the mortgage, A would need to raise a sum equivalent to his entire duty to pay the interest during his life. His

probabilities of life are estimated by well-known tables indicating longevity, such as the Northampton, Carlisle, and others. On a similar principle, if mortgaged lands be sold in parcels, the duty to pay the mortgage is apportioned among the owners of the respective parcels. This is clearly the rule where the sales are contemporaneous; but if successive in point of time, the better opinion is that there is no apportionment, but that the lots must be taken to satisfy the mortgage in "the inverse order of alienation." By this is meant that the lands last sold by the proprietor must be first resorted to as a means of paying the mortgage. As soon as enough money is thus realized the remaining lots are discharged. 3. *Contracts.*—As a general rule, there is no apportionment of contracts. In other words, a party to a contract must completely fulfil his own obligation before he can enforce the agreement against the other party. Thus, if a servant agreed to labor for a year at a specified salary, and should work for a portion of the time, and leave without cause, he could collect no portion of his wages. There are special cases where a contract is apportioned. One is where, after it has been partly performed, it is dissolved by mutual consent. So also in a contract for personal service there is an implied understanding that the contract is not to be completely fulfilled unless life should continue. Accordingly, if the servant should die before the expiration of the time specified in the contract, his wages would be apportioned according to the time of actual service. Some jurists have objected to the severity of the general rule, and would allow an apportionment, even where a contract is deliberately broken by a party, corresponding to the benefit received by the other party; but the prevailing opinion of courts is, and the better philosophy would seem to be, to adhere to the rule as modified by the special cases referred to.

T. W. Dwight.

Apportionment Bill, in American politics, denotes an act of Congress which determines the total number of members sent by all the States of the Union, and also the number that each State shall send, to the House of Representatives. A new apportionment is made after each decennial census. The same term is applied to the act by which a State legislature distributes among the counties their respective portions of representation. A populous county often forms a district by itself, and elects several members, while another district is formed by the union of two or three small counties. Those of the dominant party of the State sometimes so contrive the apportionment that they gain an advantage in the election, by forming districts in each of which a county that gives a majority against them is joined to a county that gives a larger majority for their side. This is called *gerrymandering*.

Appraise'ment, or **Apprize'ment** [from the Lat. *appre'cio*, to "value," to "set a price upon"], the act of estimating the value of property; the valuation of property made by an authorized person, who is called an appraiser. The mode of appointing appraisers varies in the different States of the Union. The law of the U. S. requires that there shall be an appraisement of the inventoried property of decedents and insolvent debtors, of property appropriated to public use, and of real estate seized upon execution. In England, appraisement, as a legal term, signifies a valuation of goods taken under a distress for rent by two appraisers, who are sworn by the sheriff or constable. The appraisers of England must be licensed for the office.

Appren'tice [remotely from the Lat. *apprehendo*, to "comprehend," to "learn"], a person, ordinarily a minor, bound in due form of law, usually by indenture, to another for a certain time to learn some art, trade, or business. In most of the States of this country statutes borrowed from English legislation allow minors, with their own consent, and with that of their father, mother, or guardian, to be bound out to service—if males, till the age of twenty-one; if females, till the age of eighteen, or for a shorter time. When the child is a pauper, he may be bound without his consent by public officers or by orphan asylums, houses of refuge, or of industry. The same rule is followed in the case of children charged with petty crimes. Apprenticeship is thus to some extent a mode of penal discipline, and is reformatory in its nature, particularly where some central authority oversees from time to time the conduct both of the apprentice and the master. The master in many respects stands in the relation of a parent. It is his duty to instruct the apprentice in the art which he has undertaken to teach him, to give him a reasonable support, and to provide for him in case of sickness. The apprentice, on his part, is bound to render faithful service and obedience to his master, who may administer for misconduct reasonable corporal punishment. This relation is not regulated by the ordinary rules governing master and servant, but depends upon special grounds of public policy. It may usually be dissolved by magistrates where the object of the apprenticeship has failed, and in special cases the apprentice may be punished by them for wilful neglect to perform his duties. The contract of apprenticeship is of a personal nature, and is not assignable.

T. W. Dwight.

Approach'es, a military term which denotes the entire system of works employed in the methodic *approach* by siege of a fortification. The works consist of enveloping trenches called *parallels*, and trenches of communication called *boyaux* or *zigzags* (terms indicating the tortuous or *zigzag* form given them, in order to screen from the fire of the place), *places of arms*, etc. The earth removed is thrown upon the side towards the besieged place, by the height of which and the depth of the trench itself adequate cover is gained for the passage of troops, and even of artillery. Approaches sometimes acquire great development, as at Sebastopol, where, as is stated, the allies dug seventy miles of trenches. Recent changes in artillery and small-arms have rendered almost obsolete the methodic rules for the location and construction of approaches laid down in text-books on sieges.

Appropria'tion [from the Lat. *ad*, "for," and *proprius*, "one's own"] **of Payments,** in law, the application of money paid by a debtor to his creditor to one of several debts. The general rule is that when the payment is voluntary, and not under process of law, the debtor has a right to direct the application of the money. If he does not exercise this right, the creditor may elect to which debt to apply it; and in case of the failure of both parties to make such election, the law will apply the money in accordance with certain rules, so as best to promote the rights of the parties. When the payment is not voluntary, but is made under compulsion, the rules as to election give way, and the money should be applied ratably to all the claims. Where a debt bears interest, that is extinguished before application to the principal.

Approx'imate [from the Lat. *ad*, "to," and *prox'imo*, *proximat'um*, to "approach," to "draw near"], in zoology, is applied to that arrangement of the teeth in the jaws where one is placed against the side of the next, and there is no intervening vacancy or diastema. The disposition of the teeth in the human species and in the *Anoplotherium* forms an example.

Appui, ăp'pwe', a French word signifying "support." In military language the phrase *point d'appui* is applied to a base or position fitted to give support to troops; a fixed point at which troops form and on which operations rest. Lakes, marshes, hills, or steep declivities sometimes serve as *points d'appui*.

Appur'tenances [remotely from the Lat. *appertineo*, to "belong to"]. In law, this word signifies something belonging or appertaining to another thing as principal, as a right of way appurtenant to land. In a conveyance of land with the "appurtenances," all easements and privileges in use and necessary to the enjoyment of the estate granted will be included. Land itself will not be considered as appurtenant to land. It is often a difficult question of construction to determine whether land can be regarded as *a part* or *parcel* of the thing granted; in which case it will pass, while it would not be embraced in the word "appurtenances." Thus, in the conveyance of a "mill" or a "mansion-house," land which in the narrow acceptation of the terms "mill" or "mansion-house" would not be included, might be in a comprehensive sense, since there could be no complete enjoyment of the mill or mansion-house without them.

Aprax'in (Fedor Matveievitch), a Russian admiral, called the creator of the Russian navy, was born in 1671. He was one of the principal coadjutors of Peter the Great in his efforts to civilize Russia, and enjoyed his confidence in a high degree. He built several ships-of-war, became an admiral and president of the admiralty in 1707, and took Viborg from the Swedes in 1710. In 1713 he ravaged the coasts of Finland, and commanded a fleet in the war against Sweden. Died Nov. 10, 1728.

Apraxin (Stepan Fedorovitch), a Russian general, a grandson of the preceding, was born in 1702. He served in a war against the Turks, rose rapidly, and became a field marshal. Having the command of a large army in the Seven Years' war, he defeated the army of Frederick the Great at Gross-Jägerndorf in Aug., 1757. He neglected to improve the victory by marching to Berlin, and was recalled and tried by a court-martial, but before the trial was finished he died, Aug. 26, 1758.

Aprice'na, a town of Italy, in the province of Foggia, 23 miles N. of Foggia. Pop. in 1861, 5272.

Ap'ricot [from the Lat. *apri'cus*, "sunny"], (*Prunus Armeni'aca*), a fruit tree of the natural order Rosaceæ, is a native of Armenia, and is extensively cultivated in

Europe and the U. S. It is nearly related to the plum. The blossoms appear before the leaves, which are ovate, subcordate, and acuminate. The fruit, a velvety drupe, ripens earlier than the peach, which it resembles in some respects. The color of the apricot is mostly yellow, with a red-brown or ruddy cheek on the side which is most exposed to the sun. It is propagated by budding on plum, peach, or wild-cherry stocks. Among the numerous varieties of the apricot, the Moorpark is by many persons the most esteemed. A variety called Breda is preferred for standards in some places.

A'pries [Gr. Ἀπρίης], a king of Egypt, called in the Bible PHARAOH-HOPHRA, was a son of Psammuthis (or Psammis), whom he succeeded about 595 B. C. He waged war against the Greeks, by whom he was defeated. His subjects revolted and killed him about 568 B. C., and Amasis then obtained the throne.

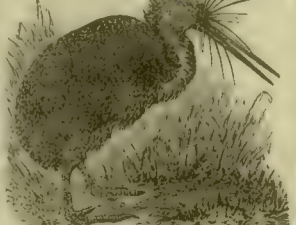
A'pril [Lat. *Apri'lis*], the name of the fourth month of the year, was derived from the Romans, but in the early age of the Roman republic it was the second month.

April Fool's Day, the name given to the first of April, from the prevailing custom of playing tricks upon people or sending them upon bootless errands on that day. It is supposed to have been derived from some ancient pagan custom, such as the Huli festival among the Hindoos, or the Roman Feast of Fools. In France the person tricked is called *poisson d'Avril* ("April fish"), and in Scotland he is called a *gowk* (cuckoo).

A Priori. See A POSTERIORI.

A'pron, a term applied to a piece of sheet lead which covers the touchhole of a cannon, tied by two pieces of rope. In shipbuilding the apron is a piece of curved timber fixed behind the lower part of the stem, and just above the foremost end of the keel, in order to fortify the stem. Apron is also a platform or flooring of plank at the entrance of a dock.

Apse [Lat. *ap'sis*], a semicircular recess usually formed at the east end of the choir or chancel of a Romanesque or Anglo-Norman church. Such structures are numerous in England and in Germany. (See APSIDES.)



Apsheron', Apcheron, or **Abcheron,** a peninsula which extends into the Caspian Sea at the S. extremity of Daghestan. It forms the eastern termination of the Caucasian chain of mountains. It is famous as the place of the sacred flame which is venerated by the fire-worshippers (Ghebers), and is produced by inflammable gas rising from the soil. Large quantities of naphtha are procured here.

Ap'sides [from the Gr. ἀψίς, a "circle" or "curvature"], sing. **Ap'sis,** the two points in the orbit of a primary planet which are at the greatest and the least distance from the sun, corresponding to the aphelion and perihelion. The term is also applied to the extreme points in the orbit of a satellite, which in the case of our moon are the same as the apogee and perigee. The straight line connecting them is called the line of the apsides.

Ap'tera [from the Gr. *a*, priv., and πτερόν, a "wing"], in the Linnæan system an order of insects without wings, called *apterous insects.* This word is not recognized as the name of an order by recent entomologists, the wingless insects being assigned to various orders.

Ap'teral, a term applied to those temples of the ancient Greeks and Romans which had no lateral columns. The Greek temples were generally peripteral—*i. e.* with columns on the sides and ends.

Ap'teryx [from the Gr. *a*, priv., and πτέρυξ, a "wing"], a genus of birds, natives of New Zealand, allied to the ostrich and emeu. It is called by the natives of New Zealand *kiwi-kiwi.* It has scarcely any trace of wings, but has fine plumage, and a long bill, on which it supports itself when it rests. It feeds upon insects of various kinds, more especially on worms, which it is said to attract to the surface by jumping and striking on the ground with its powerful feet. Its skin is very tough but flexible, and is prized by the chiefs for the manufacture of their state mantles. Three species have been found, but they are believed to be nearly extinct.

Aptéryx.

Ap'thorp (EAST), a clergyman of the Anglican Church, was born at Boston, Mass., in 1733, and educated at Cambridge University. He passed many years in England, and obtained a benefice at Finsbury. His four letters to Gibbon in defence of Christianity (1778) were very favorably received. Died April 17, 1816.

Apule'ius (ACLUS LUCIUS), a celebrated Latin Platonic philosopher and satirical writer, was born at Madaura, in Africa. He lived about 150 A. D., travelled extensively, and was distinguished for his learning and eloquence. After he had spent his fortune in travel, he married a rich widow, and was involved in a lawsuit with her relatives, who accused him of using magical arts to gain her affection. He defended himself with success by an "Apology" which is still extant. He became popular as an orator at Carthage, the senate of which raised statues in his honor. His chief work is a romance entitled the "Metamorphoses, or the Golden Ass," which is supposed to be intended as a satire on priests, quacks, magicians, etc. It has been translated into English by T. Taylor (1822), by Sir George Head (1851), and by several others. Some of his works are lost. (See F. HILDEBRAND, "Commentarius de Vita et Scriptis Apulcii," 1835.)

Apu'lia [It. *La Puglia*], an ancient province of Southern Italy, was bounded on the N. E. by the Adriatic Sea, and was a portion of Græcia Magna. It was bounded on the S. W. by Lucania and Samnium. Among the chief towns of this once populous and famous region were Canusium, Arpi, Luceria, and Arpinum. The battle of Cannæ, and most of the important events of the second Punic war, occurred in Apulia. It was conquered by the Normans about 1042 A. D. Apulia is included in the modern provinces of Foggia, Bari, and Lecce. Area, 8541 square miles. Pop. in 1871, 1,416,792.

Apulia, a post-village of Fabius township, Onondaga co., N. Y., on the Syracuse Binghamton and New York R. R., 19 miles S. by E. of Syracuse. Pop. 181.

Apu're, a river of Venezuela, rises in the Andes near lat. 7° N. and lon. 72° W. It flows eastward, and enters the Orinoco in lat. 7° 36′ 43″ N. and lon. 66° 45′ W. Length, estimated at 736 miles.

Apure, a province of Venezuela, is bounded on the N. by Merida, Barinas, and Caracas, on the E. by Guiana, and on the S. and W. by Colombia. Area, about 22,250 square miles. This province is in the most level and lowest part of Venezuela, and is almost entirely without trees. The chief occupation of the inhabitants is the raising of cattle. Chief town, San Fernando de Apure. Pop. 32,485.

Apu'rimac', a river of South America, and one of the head-streams of the Amazon, rises in the Andes, in Peru, about lat. 15° 38′ S., and about 75 miles from the Pacific Ocean. It flows nearly northward, and unites with the river Urubamba about 8° 38′ S. The stream thus formed is called the Ucayale. Its length from its source to the Ucayale is estimated at 600 miles.

A'qua, plu. **A'quæ,** the Latin name for water; the pharmacopœial name for spring water, or natural water in its purest attainable state. It is a compound of oxygen and hydrogen; symbol H_2O, or Aq. The principal varieties of water are distilled water (*aqua destillata*), river water (*aqua ex flumine*, or *aqua fluvialis*), sea water (*aqua marina*), rain water (*aqua pluvialis*), and spring water (*aqua fontana*). These terms are used in pharmacy, in which various watery solutions are also called *aquæ.*

A'qua For'tis (*i. e.* "strong water"), a name given to nitric acid by the alchemists, is still the common commercial name of that compound. (See NITRIC ACID.)

Aqua Marine, a name sometimes given to the BERYL (which see).

A'qua Re'gia (*i. e.* "royal water"), a name given to a mixture of nitric acid with hydrochloric (muriatic) acid. The usual proportion is one of the former and two of the latter acid. This is remarkable for its power of dissolving gold, regarded as the king of metals. The product is auric terchloride, $AuCl_3$. (See GOLD, by PROF. W. P. BLAKE.)

A'qua Regi'næ (*i. e.* "queen's water") is a mixture of concentrated sulphuric acid and nitric acid, or of sulphuric acid and nitre. It has been used as a disinfectant.

Aqua'rians [from the Lat. *a'qua*, "water"], a name given to those ascetic persons who used water in the sacrament instead of wine, because they had scruples against the use of the latter. This practice is said to have originated with Tatian in the second century.

Aqua'rium (plu. **Aquaria**), or **Aquaviva'rium,** a Latin term commonly applied to a glass tank or vessel containing either salt or fresh water, in which living aquatic animals and plants are kept as an ornament of drawing-rooms, an aid to scientific study, and a source of rational amusement. It must contain both animals and plants in something like a due proportion, as the animals depend for breath on the oxygen which is given out by the plants, and

the latter are nourished by the carbonic acid gas which the animals exhale. The water should be often aërated by agitation, which may be effected by dipping up portions of it and pouring them in again from a small height. Aquaria are stocked with Mollusca, Algæ, Confervæ, Crustacea, zoophytes, gold-fish, sticklebacks, minnows, and other fish, sea-anemones, etc. The presence of molluscous animals is necessary for the consumption of the vegetable matter which is about to decay and the numerous spores of the Confervæ, unless the water be continually renewed, as in the "fountain aquarium." No dead animal or decaying plant should be permitted to remain in the aquarium, the temperature of which should be kept between 50° and 70° F. (See P. H. Gosse, "Handbook of the Marine Aquarium," 1855.)

Aqua'rius [from the Lat. *a'qua*, "water"], the "Water-Bearer," is the eleventh sign of the Zodiac, into which the sun enters about the 20th of January. It is represented by ♒. Aquarius is also the name of a constellation which coincided with that sign at the time when the signs were named, but in consequence of the precession of the equinoxes it is now in juxtaposition with the sign Pisces.

Aquas'co, a post-township of Prince George's co., Md. Pop. 1723.

Aquat'ic An'imals are those which live constantly in the water, as fishes, and those which frequent the water to swim on its surface or dive in search of food, as ducks and other web-footed birds, otters and beavers among quadrupeds, etc. Among the aquatic animals are the majority of the grand division of Mollusca; numerous tribes of the Articulata, as crabs, lobsters, and shrimps; and a large portion of the Radiata. Whales and dolphins are examples of aquatic animals of the class Mammalia. The total number of aquatic animals is greater than that of all terrestrial animals (exclusive of insects). Those which live partly on land, and cannot breathe under water, are called amphibious. The peculiarities of structure by which they are fitted for swimming, wading, etc. are very admirable. Some water-fowls have long legs for wading; others have webbed feet which enable them to swim with ease, and have waterproof plumage adapted to their mode of life. In aquatic animals of the higher vertebrate classes provision is made for the maintenance of the proper degree of animal heat by a coat of blubber, fur, or plumage, as in the case of otters, ducks, etc. The air-breathing animals that inhabit salt water have an organic structure greatly modified, and their extremities resemble the purely aquatic type more than the terrestrial.

Aquatic Plants, or **Water Plants,** a term applied to various vegetable organisms that grow either partially or entirely immersed in water. The latter mode of life is mostly confined to cryptogamous plants. Many phænerogamous plants which take root at the bottom of ponds, ditches, and running streams are called aquatic, although the flowers and leaves are raised above the water or float upon its surface. A primary distinction occurs between the plants that grow in salt water and those which grow in or near fresh water. The most of the plants which live in the sea belong to the division Algæ (which see). Among the cryptogamous plants that inhabit fresh water are the Confervæ. Aquatic plants have a less compact structure than most other plants, and are generally deficient in rigidity and firmness of stem. Some water-plants are furnished with air-bladders, which enable them to rise to the surface and float upon it. Besides those which grow in the sea, there are plants whose habitat is the sea-shore, and which require the influence of salt water. These are sometimes called saline or maritime plants. Among the aquatic plants growing in fresh water are the species of the orders Alismaceæ, Naiadaceæ, Ceratophyllaceæ, and Nymphæaceæ.

Aquatint. See Engraving, by Pres. M. B. Anderson.

A'qua Tofa'na, a secret poison, the invention of which is ascribed to a Sicilian woman, a notorious poisoner, named Tofana. She lived about 1650–1730. It is said that there was, about 1660, a society of young married women in Rome who used this aqua Tofana to poison their husbands. It was sold in vials marked "Manna of St. Nicholas of Bari." Some suppose it to have been a solution of arsenic.

A'qua Vi'tæ (*i. e.* "water of life"), [Fr. *eau de vie*], a Latin term applied to brandy, and sometimes to other ardent spirits.

Aquavi'va (Claudio), a son of the duke of Atri, born at Naples in 1543, was appointed Feb. 19, 1581, general of the Jesuits. His principal work is entitled "Ratio Studiorum" ("Method of Studies"), 1586. Died in 1614.

Aq'ueduct [Lat. *aquæduc'tus*, a "channel for conducting water"]. The name is applied more especially to artificial constructions for bringing water from a distance for the supply of cities, and to those bridges which serve to convey the water of canals of navigation and of irrigation, and of mill-races, at an elevation across deep valleys or streams.

As no very large city could exist without an abundant supply of water, we may assume that aqueducts were constructed very early in history. The Romans built many aqueducts, not only for Rome, but for their principal cities in Europe, Asia, and Africa, and the massive and picturesque ruins of the great bridges of these aqueducts are at once suggested to the scholar by the word "aqueduct."

Rome, the capital of the ancient civilization, was bountifully supplied with water by many aqueducts. Twenty are said to have existed in its period of greatest prosperity, bringing water from the hills and lakes of Italy from distances of from five to sixty miles. The greater part of the courses of all these aqueducts were subterraneous, but as the Romans were not as skilful in the working of metals as the moderns, as metal pipes were with them much more costly than masonry, and as cast iron was unknown, they were compelled to construct lofty bridges of stone and brick to conduct the channels of water at a regular slope or descent from the elevated ranges to the N. and E. of Rome across the wide and gradually descending slopes of the Campagna or country immediately surrounding the city. These bridges were generally built of rude masonry of brick or of rubble stones. The mortar was good, and the stone and brick, though rough, were durable. The masses, though not generally remarkable for their height, were in the aggregate immense, and hence, while the greater part of these constructions have perished, very considerable remains exist to this day.

Rome has never been without inhabitants, and the rulers of the city have from time to time repaired and utilized the different conduits, so that at the present day the city is amply supplied with water, the greater part of which is brought over ancient aqueducts repaired by the popes. The Appian aqueduct, attributed to Appius Claudius Cæcus, is said to have been completed 311 years before the Christian era, after the building of the Appian Way. Its length was about 6 miles, and it brought, by a devious course, to Rome the waters of a spring whose fountain-head was 5 miles from the city, near Rustica on the Via Collatina. The Aqua Augusta was at a later period added to this aqueduct. It supplied the most ancient portion of the town and the Transtiberine city.

The Anio Vetus was built B. C. 272 by Manius Curius Dentatus. It brought its supply from near Augusta in the valley of the Anio, 43 miles from Rome. It was almost entirely subterraneous, and the only fragment now visible lies below the road and under the Aqua Marcia, outside the Porta Maggiore.

The Aqua Marcia (B. C. 145), built by the prætor Quintus Martius Rex, was 37 miles long, of which 6 miles were on arches still visible, crossing the Campagna by the Frascati and Albano roads. This aqueduct is crossed by the Claudian aqueduct, which for some distance runs parallel to it. It has been restored, and the city is for its present population amply supplied with water.

Aqua Tepula (B. C. 126), the work of Cneius Servilius Cæpio and Cassius Longinus, is 10 miles long. Its channel or *specus* can still be seen at the Porta San Lorenzo and Porta Maggiore in connection with the channels of the Aqua Marcia and Aqua Julia.

Aqua Julia (B. C. 34), by Augustus, named in honor of Julius Cæsar, 12 miles long. Its water was brought to the city in a *specus* or conduit above the Tepula, and, like that, upon the arches of the Aqua Marcia, which thus brought the waters of three different sources separately to Rome. Its channel is still to be seen at the gate of San Lorenzo and at the Porta Maggiore.

Aqua Virgo, also by Augustus. Its source is said to have been pointed out by a young girl, whence its name. Its course is mostly subterraneous, about half a mile only being on arches. It was restored by Pope Nicholas V. as the Aqua Vergine, and it still supplies Rome with its cool water. The fountains in the Piazza di Spagna, Piazza Navona, and the magnificent fountain of Trevi are supplied by this aqueduct, as are many others. On the fountain of Trevi, the virgin pointing out the source to the soldiers sent by Augustus appears among many other marble reliefs and statues. This is perhaps the finest fountain in the world. An inscription, still legible, in a cellar of No. 12 Via del Nazareno, near the Palazzo del Bufalo, states that it was repaired A. D. 52 by Claudius, after having been disturbed by Caligula in the construction of his wooden amphitheatre.

Aqua Alsietina, 30 miles in length, built by Augustus; restored by Trajan, who added to its waters those of several springs along the hills to the W. of Lago Braccianо. Its original sources were around the smaller lake Alsietinus, now the Lago de Martignano. It was restored by Paul V.,

and now supplies the fountains of the great Piazza of St. Peter's and the magnificent fountain Paolina, and turns the wheels of many flour-mills on the slopes of the Janiculum. It is known indifferently as the Aqua Alsietina and the Aqua Paolina.

Aqua Claudia, built by Caligula and Claudius (A. D. 36 to 50). Its sources were near Agosta, about 38 miles from Rome. Its devious course was over 46 miles in length, of which 36 were below the surface and 10 miles were on arches. Six miles of arches stretching across the Campagna still attest the power and liberality of the Roman empire. Repaired by Septimus Severus, by Caracalla, and by Pope Sixtus V., its arches now bring to Rome the Aqua Felice from the springs near the Osteria dei Pantani, on the road to Palestrina. They supply the Fontana dei Termini, near the railroad dépôt in the Baths of Diocletian, the fountain of the Triton, that of Monte Cavallo, and some twenty-four others in different parts of the city.

Anio Novus, also by Claudius, from the forty-second mile of the Via Sublacencis. This was the longest of the ancient aqueducts, having a course of 62 miles, 48 of which were under ground. Its channel or *specus* is still visible above the Aqua Claudia on the arches of the Porta Maggiore. It is also visible at the Villa Braschi, near Tivoli, where it is nine feet high by four feet in width, but is choked up by a calcareous deposit, which encrusted, and finally, unless removed, obstructed the channels of many of these ancient aqueducts, especially those from the valley of the Anio.

It is estimated that Rome received daily 377,000,000 gallons of water. The Acque Vergine, Felice, Marcia, and Paola, having their sources in volcanic districts, supply a pure and delicious water, which does not obstruct its channels, and at this day they bring into Rome 160,000,000 gallons of water daily. By channels of masonry the water is led to fountains in every part of the city, and by pipes of metal and of burned clay it is distributed to most of the great houses or palaces, in each of which it flows constantly into a basin, frequently an ancient sarcophagus, of stone or marble. The water is rarely carried by pipes to the upper stories.

Rome being the capital of the civilized world for so long a time, its aqueducts were on a greater scale than any others, but the chief cities of the ancient world were supplied with water by aqueducts, many of which were built during the Roman domination.

During the Middle Ages also aqueducts were constructed, and the pointed arch of the Goths is seen in some of the existing remains. Among those most noted, generally lofty bridges of masonry forming part of the channels of true aqueducts, are those of Lyons, Nîmes, Segovia, Spoleto, Carthage, Constantinople, Lisbon, Marly, Caserta, Metz, Tarentum, and many others.

In modern times many aqueducts have been constructed. The New River of London and the Canal de l'Ourcq of Paris are true aqueducts. The new aqueduct of the Vanne is one of the supplies of Paris. The aqueduct of Roquefavour carries the water of the Durance to Marseilles; that of Loch Katrine supplies Glasgow.

Vienna is now constructing an aqueduct to bring the water of two springs a distance of 59 miles. The conduit is of masonry, the channel itself varying in size from five feet eight inches by six feet to two feet nine inches by four feet, according to the slope, on which depends the velocity of the current. The sources are at a height of about 1000 feet, and the principal distributing reservoir is 277 feet above the site of the city. The supply is estimated at 24,000,000 gallons daily, or 24 gallons to each of 1,000,000 inhabitants. Whenever Vienna attains to this population it will appear that the supply is only one-fourth of that which modern civilized man requires.

In the U. S. there has been of late years great activity in the construction of aqueducts for its rising cities. The city of New York has the Croton aqueduct, 50 miles in length. Boston has the Cochituate; Baltimore, that of Jones's Falls; and Washington, the Washington aqueduct.

Fig. 1 is a view of High Bridge (so called) over Harlem River, N. Y. The Croton Aqueduct passes over this bridge in three pipes, one wrought and two cast iron. The wrought iron is seven feet six inches in diameter, and the two cast iron are each three feet. The bridge is 1460 feet in length, having eight arches, in the river, of 80 feet span and 100 feet high, and seven others, of fifty feet span, on the two banks. The bridge is 116 feet above high-water mark.

The Washington aqueduct, which supplies the capital of the U. S., we select as one of the most recent and important examples of modern aqueduct construction for fuller illustration and description.

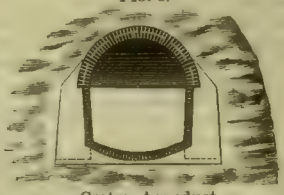
It is a circular conduit of brick and rubble masonry laid in hydraulic cement. Brick and stone were used indifferently in its construction, each section being built with the material which would be most easily and cheaply obtained. Its clear internal diameter is nine feet. Its descent or inclination is nine and a half inches to the mile. The length

Fig. 1.

High Bridge, Harlem River.

of the conduit from the Great Falls of the Potomac to the distributing reservoir is 11 miles; from the latter the aqueduct is continued by large iron pipes to the capitol, 5 miles. Its capacity is 70,000,000 gallons per day. Its construction is shown in ordinary ground (side-hill) by Fig. 4.

It takes its water at the Great Falls from the Potomac River at an elevation of 150 feet above tide-water by a deep rock-cut passing under the Chesapeake and Ohio Canal (Fig. 5), to a gate-house (Fig. 5), furnished with gates and screens to regulate the flow of water and to exclude injurious substances. A dam raises the water of the river about six feet to the level of the aqueduct, 150 feet above tide. The aqueduct follows the valley of the Potomac, crossing the drainage of its left bank by six bridges and many culverts. It passes through several tunnels. A waste-weir permits any excess of water to escape before it can do injury to the conduit.



Its course is generally subterranean; embankments have been avoided wherever possible, as more liable to degrada-

Cochituate Aqueduct.

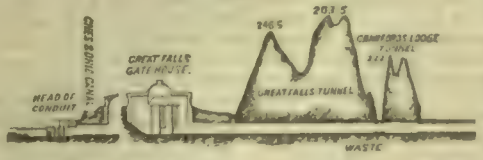
Fig. 3.

Croton Aqueduct.

tion and injury than a masonry conduit deep below the natural surface. There are four bridges under the conduit. Fig. 6 is the most important of these, the Cabin John Bridge or Union Arch, a granite arch of 220 feet span, the *longest* stone arch in existence. This bridge is 101 feet high and 20 feet wide. The water is delivered into the receiving reservoir, of about fifty-six acres, made by damming up the valley of Little Falls Branch. (Fig. 7.) Two miles farther on the aquednct enters the distributing reservoir of forty acres by a gate-house. A branch of the conduit, seven feet only in diameter, leads around this reservoir for use when the reservoir is being cleaned.

In Fig. 8 is a section of the tower, in which the branch terminates in a four-foot iron pipe, with regulating sliding iron

Fig. 4.



gate. Fig. 9 is a profile of the outlet gate-house and screen-well, and of the subterranean vault in which are the stop-cocks and connections of the iron mains which convey the water into the cities. There are connections for four pipes of forty-eight inches diameter in this vault. There are now three mains laid, the original two, 30 and 12-inch, and a 36-inch main recently added, the cities having already outgrown the smaller ones laid fourteen years ago.

At College Branch two 30-inch mains, braced as in Fig. 10, cross a small inlet and valley by an arch of 120 feet span. Rock Creek is crossed by an iron bridge (Fig. 11) composed of two cast-iron pipes of four feet diameter, which serve as the ribs of an arch of 200 feet span and 20 feet rise. These pipes convey the water, and also sup-

port a platform bearing a road and railway track. This bridge, the College Branch, and the Cabin John bridge

FIG. 5.

are unique. The highest portion of the streets of Washington is forty-five feet below the level of the reservoir; but a part of Georgetown is at a greater height than any part of the aqueduct. To supply this a circular reservoir covered by a brick dome (Fig. 12) has been constructed. It is supplied with water by a water-pressure engine situated in the vaults of the west abutment of the Rock Creek bridge, capable of pumping 10,000 gallons per hour into this reservoir, at a height of 226 feet above tide. It is worked by the pressure of water from the 30-inch main.

The aqueduct is capable of delivering 70,000,000 gallons per day. The three iron mains as yet laid, with 120 miles of small iron distributing pipes, which now supply 120,000 people, and are connected with 10,000 houses, are capable of bringing into the cities of Washington and Georgetown 30,000,000 gallons daily. The actual consumption of the cities is already 17,500,000 gallons in twenty-four hours.

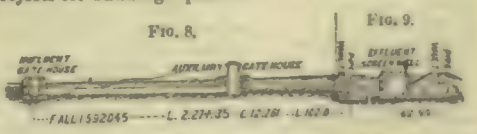
In California gold-mining the agent for the separation of the gold from the soil is water, and this has led to the construction of many large aqueducts, there called mining ditches. Some of these are 100 miles in length, and the ingenuity of their builders has made some veritable improvements in the science and art of hydraulic engineer-

FIG. 6.

Washington Aqueduct: Cabin John Bridge (Union Arch), 220 feet span.

ing. These aqueducts are generally open channels or ditches, which follow winding courses along the mountain-slopes, preserving regular grades, which are regulated by the necessity of the case, the limit being whatever the soil will bear without washing away. These grades are as high in some cases as thirteen feet to the mile. The channels are very crooked. Gulches, gullies, valleys, and streams are crossed by wooden troughs supported on trestles. These are estimated to last for about fifteen years. Deeper valleys are crossed by sheet-iron pipes. In one example a mining aqueduct brings to the mine, with a head of 300 feet, from 80,000,000 to 90,000,000 gallons of water daily. A valley is crossed by pipes of No. 14 to No. 16 gauge sheet iron—*i. e.* one-sixteenth of an inch in thickness—which are twenty-seven inches in diameter. These pipes are put together on the line of the work, the

FIG. 7.



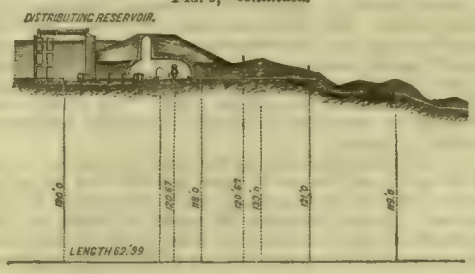
sheets, perforated with rivet holes, being brought into the mountains on wagons, and finally on pack-mules. They are bent to shape and riveted in place. The joints are slip-joints, like those of stove-pipe, and they are kept together against the pressure and shocks of the water by lashings of wire around lugs secured to the sheet iron.

Chopped straw is thrown into the water at the head, and soon packs all the imperfectly fitted joints and makes them water-tight. It is recorded that the Romans, who made much use of earthenware or terra-cotta pipes, used ashes in this way to stop all leaks. The cost of these 27-inch sheet-iron pipes is about $4 per foot, or $20,000 per mile. Many cities which hesitate to provide themselves with the best of all water-supplies—that by gravitation, natural flow—on account of the great first cost of the aqueduct, may profit by this California experience. While the wooden and sheet-iron pipes will not last as long as bridges of masonry and pipes of heavy cast iron, they will still last for many years, and the saving in interest upon the original capital needed for the more solid construction will not only keep them in repair, but rebuild them every fifteen years. The lighter constituents of the soil through which the aqueduct is carried as an open ditch or canal are soon removed by the current, leaving the bottom and sides of the channel protected by the gravel and pebbles, too heavy to be removed by the regular current, which remain and form a covering for the softer and lighter soil. Aqueducts thus constructed may be built for $15,000 to $20,000 per mile, and thus bring ample and cheap supplies of water to many cities which now depend upon steam-engines and a daily expense of fuel for scanty supplies of this precious element.

It has been customary in America to estimate twenty-eight to thirty gallons per day for each inhabitant, old and young, as a sufficient supply for a great city. But the experience of all those in which aqueducts have been in use for twenty years shows that in the U. S. the supply should not be less than 100 gallons per head per day. This consumption is reached in Boston, New York, Philadelphia, and Washington, and, where the works afford it, it promotes health and contributes to cleanliness, to pleasure, and to safety. It is better that this quantity be assumed in all projects for building aqueducts.

FIG. 8.

FIG. 9.



We have seen that the cross-sections of the *specus* or channel of the Roman aqueducts were generally rectangular. In modern times a great variety of forms have been used—rectangular, two-side walls with flat floor and roof; curved floor and arched roof, with vertical sides; oval, or egg-shaped, with the smaller end of the oval at the bottom; and finally circular.

As the circle is that geometrical figure which with the least circumference encloses the greatest area, it follows that in lining with masonry a channel cut through the earth the circular form will convey the most water with the least masonry. Moreover, this form gives the channel with the least wetted perimeter. As it is at the surface of contact of the water and its channel that friction occurs, the flow of the water will be less retarded by friction in a circular channel than in any other of the same capacity. Therefore, in building a covered channel for conveyance of water this form will generally be found the best and cheapest.

Bricks or flat rubble stones are laid with great rapidity into the form of a circular conduit. The excavation in the earth is cut carefully at the bottom to the form of a semi-

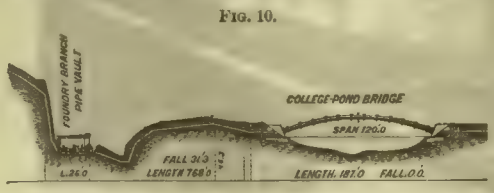


FIG. 9,—*continued.*

cylinder to receive the masonry, which is laid in hydraulic mortar simply upon the earth, until the lower half cylinder of masonry is formed. Then two portable wooden centres, each of which is one quarter of the cylinder, are placed in position on props of wood, and the upper half of the conduit is laid as an arch upon them. The inside of the pipe is to be plastered with mortar of hydraulic lime and sand, and, the whole being covered to a proper depth, we have a conduit which will serve for ages, and is liable to no decay or destruction except by earthquakes or waterspouts, which may break it open or wash it away.

As the cost of the excavation and construction of the conduit is but a part of the aggregate cost of an aqueduct, it is wise in all such constructions for cities and villages to

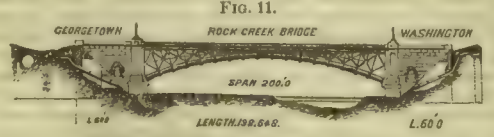

FIG. 10.

at first make the conduit itself large enough to convey all the water of the source. The conduit should also in any case be large enough for a man to pass through conveniently, for the purposes of cleaning it and repairing any cracks, which in long lines of masonry resting upon soils of different natures will occur from settlement of the soil and from expansion and contraction of the masonry itself.

When the source of supply is a great river or lake, the conduit should be built to convey more water even than 100 gallons a day for each inhabitant. Cities continually increase, and while at present this quantity appears to be enough for actual needs, the greatest abundance of water flowing through the fountains and cleansing the streets,

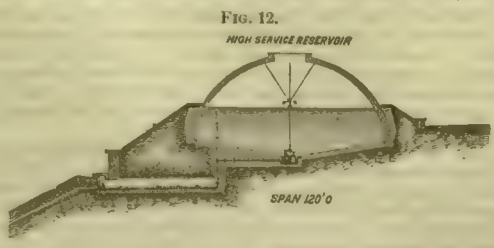

FIG. 11.

courts, and drains of a city adds to the health, the pleasure, and comfort of the people. There is scarcely a city in the U. S. which in the course of twenty years has not found its aqueduct insufficient for its wants.

We defer till we treat of water-supply of cities remarks upon the reservoirs and pipes for the distribution through them of the water brought by the aqueduct from the source to their confines, noting only that the modern prac-

FIG. 12.

tice makes reservoirs much more extensive and capacious than the ancient. The Romans brought large supplies through aqueducts of rapid flow. A small portion only was stored in reservoirs, generally of masonry covered with arches, and the surplus was allowed to flow out through great fountains and cascades in constant streams. The moderns provide large reservoirs in which the water not used is stored up to compensate during periods of scarcity for the scanty supply of the original source. These reservoirs are sometimes covered with brick arches, as in London, but generally they are open ponds or lakes of many acres. The magnificent covered reservoirs, such as that for the Roman fleet at Baiæ, and the arched reservoirs of Constantinople, supported on stone columns, are no longer constructed. They remain among the most stately monuments of the Roman empire. (See WATERWORKS and WATER-SUPPLY, by PROF. C. F. CHANDLER, Ph.D., M. D., LL.D.) M. C. MEIGS, *U. S. Army.*

A'queous Hu'mor. See EYE.

Aqueous Rocks, a geological term synonymous with sedimentary rocks, is applied to rocks and strata which have been formed by the agency of water, and have been deposited at the bottom of seas and lakes. The materials of these strata were partly derived from the disintegration of older rocks, which, being reduced to particles of small size, have been carried along the rivers in the form of mud, sand, and sediment, and deposited in the sea. Humphreys and Abbott estimate that the Mississippi conveys into the Gulf of Mexico annually an amount of silt equal to a mass one square mile in area and 241 feet in depth. The waves of the sea also, dashing continually against the shores and undermining the rocks, contribute to this process of erosion and disintegration. Some aqueous rocks, as chalk and limestone, are formed by the accumulation of the calcareous shells of marine animalcules, called Foraminifera. Other strata of the carboniferous formation which are of vegetable origin are included among the aqueous rocks, which in reference to their composition are distinguished as arenaceous, argillaceous, calcareous, carbonaceous, and saline. The rocks termed metamorphic are now generally regarded as aqueous in their formation. (See LITHOLOGY and ROCKS.) (For further information about these rocks the reader is referred to the articles on the Silurian, Devonian, Carboniferous, Cretaceous, Oolitic, Triassic, Eocene, Miocene, and Pliocene formations.)

Aqui'a, a post-village and township of Stafford co., Va., 13 miles N. E. of Fredericksburg. Pop. of township, 2085.

Aqui'a Creek, in the eastern part of Virginia, flows south-eastward through Stafford county, and enters the Potomac River. It is navigable for schooners. It is also the name of a station on the railroad from Washington to Richmond, and on the Potomac River, 75 miles N. of Richmond. Passengers going northward are here transferred from the cars to a steamboat.

Aquifolia'ceæ [from *Aquifo'lium*, a former name of the holly], a natural order of exogenous plants, all trees or shrubs with simple leaves, and mostly natives of America. The ovary is superior, with two or more cells, each of which contains a solitary anatropal ovule, and generally becomes bony as a stone in the fruit, which is fleshy. Among the species of this order is the holly (*Ilex*). The species are quite numerous in the U. S.

Aq'uila ("the Eagle"), a constellation of stars near the equator, and on its N. side.

A'quila, a fortified town of Italy, capital of the province of Aquila, is situated on the Pescara, near the Apennines, 58 miles N. E. of Rome. It is well built, and has numerous churches. Here are manufactures of linen. It was much injured by earthquakes in 1688, 1703, and 1706. Aquila was built by the emperor Frederick II. about 1240, on or near the site of the ancient *Amiternum.* Pop. in 1861, 12,627.

Aquila, a province of Italy, formerly called Abruzzo Ulteriore II., is bounded on the N. E. by Ascoli, on the E. by Teramo and Chieti, on the S. by Campobasso and Caserta, on the W. by Rome and Perugia, and on the N. W. by Perugia. Area, 2510 square miles. The chief products are grain, vegetables, rice, wine, oil, and fruits. Pop. in 1871, 333,791.

Aquilaria'ceæ [so called from *Aquila'ria*, one of the genera], a natural order of exogenous plants, all of which are trees and natives of the tropical parts of Asia. The leaves are entire; the perianth coriaceous, turbinate, or tubular; the stamens usually ten; the ovary 2-celled, with two ovules; the fruit a drupe or capsule. The order comprises only ten known species, one of which produces the fragrant ALOES WOOD (which see).

Aquile'ja, Aquileia, or **Aglar,** an old town of Austria, in the Littoral provinces, near the Adriatic or Gulf of Venice, with which it is connected by a canal, is 22 miles W. N. W. of Trieste. During the Roman empire it was an important city, was called the second Rome (*Roma Secunda*), and was the chief emporium of the trade between the north and south of Europe. The emperor Augustus often resided here, and here were held several councils of the

Church, the first of which was in 381 A. D. The bishops of Aquileja in the sixth century took the title of patriarch, and assumed the rank next to the pope. Aquileja was burned by Attila in 452 A. D., at which time it is said to have had 100,000 inhabitants. Pop. 1728.

Aqui'nas (THOMAS), SAINT, a celebrated scholastic doctor and theologian, surnamed THE ANGELIC DOCTOR, was born in the kingdom of Naples in 1227. He was a grand-nephew of the emperor Frederick I. Barbarossa. About 1243 he joined the order of Dominican monks, and became a pupil of Albertus Magnus. After he had studied theology and scholastic philosophy, he began to teach and preach at Paris with great applause. Having acquired a European reputation by his talents and learning, he left Paris in 1261, and was induced by Pope Urban IV. to remove to Rome, where he taught philosophy. He was distinguished for his modesty, and refused the offer of a bishopric, but he had great influence in the Church. The greatest of the schoolmen were the Dominican Thomas Aquinas and the Franciscan Duns Scotus. They were founders of rival sects, which wrangled with each other for two or three centuries. Aquinas wrote a number of works, the most important of which is his "Sum of Theology" ("Summa Theologiæ"), which was regarded as the most complete compendium of scholastic divinity. He died at Fossanuova, in Naples, 1274. His disciples were called Thomists. Aquinas was a great admirer of the philosophy of Aristotle. He was canonized in 1323. (See REES D. HAMPDEN, "Life of Thomas Aquinas," 1848; MAFFEI, "Vita di Tommaso d'Aquino," 1842; THOLUCK, "Dissertatio de Thoma Aquinate," 1842; P. S. CARLE, "Histoire de la Vie et des Écrits de Thomas d'Aquin," 1846; "Philosophie de Thomas d'Aquin," par CHARLES JOURDAIN, Paris, 1857; "The Life and Labors of S. Thomas of Aquin," by the Very Rev. ROGER BEDE VAUGHAN, 2 vols., 1871–72. See DUNS SCOTUS.)

Aquita'nia [Fr. *Aquitaine*], the ancient Latin name of the most south-western of the three divisions of Gaul. It originally included the country between the Pyrenees and the Garonne, but Augustus added to it the territory between the Garonne and the Loire. The ancient inhabitants were Iberian tribes. It was an independent duchy under the feeble princes of the Carlovingian dynasty, and became an English possession in 1152 by the marriage of Henry II. with Eleanor of Guienne, who was the heiress of the duke of Aquitaine. It was united to France in 1451.

Arabesque, ăr-a-bĕsk', signifies "in the Arabian style or manner." It is applied to the fantastic decoration which was profusely employed in the architecture of the Arabs or Moors in Spain. As employed by the Arabs, it consisted of infinitely diversified combinations of curved and straight lines, and imaginary foliage and flowers, curiously intertwined with other vegetable forms. The figures of animals were excluded from the arabesques of the Moors, because the religion of Mohammed prohibited their representation. The Moors are supposed to have derived this kind of ornament from the Romans, by whom it was extensively used. Among the most beautiful specimens of Moorish arabesques are the decorations of the famous palace of the Alhambra. The name of arabesque was applied to this mode of decoration because it had been long known and admired in the works of the Arabs before the discovery of the beautiful paintings in the Baths of Titus, by Raphael and his pupil Giovanni da Udine, made the world acquainted with a magnificent specimen of the original. The early Italian painters and sculptors, however, had always taken delight in this style of decoration, as they found it in the antique Roman sculpture, where scrolls, flowers, fruit, and leaves are mingled with animals and genii. Raphael painted his famous arabesques in the Loggie of the Vatican in direct imitation of the frescoes on the Baths of Titus. He was largely assisted by Giovanni da Udine. CLARENCE COOK.

Arabgir', or **Arabkir',** an important city of Asia Minor, on the Arabgir-Su, and on the road from Aleppo to Trebizond, 100 miles E. S. E. of Siwas. It has considerable trade, and a large community of Protestant Armenians. Pop. estimated at from 25,000 to 30,000.

Ara'bia [Arab. *Jezee'ret* (or *Jeziret*) *-el-A'rab*, *i. e.* the "isle or peninsula of the Arabs;" Turk. and Pers. *Arabistan;* Lat. *Ara'bia*], a peninsula forming the extreme S.W. part of Asia, is encompassed by the sea on all sides except the N. It is bounded on the N. by Asiatic Turkey, on the N. E. by the Persian Gulf and Sea of Oman, on the S. E. by the Indian Ocean, and on the S. W. by the Red Sea. It extends from lat. 12° 35′ to 34° N., and from lon. 32° 10′ to 59° 40′ E. Its area is estimated (Behm and Wagner, "Bevölkerung der Erde," Gotha, 1872) at 1,030,000 square miles. It is connected with Africa by the Isthmus of Suez at the N. W. corner. The Euphrates forms a part of the N. E. boundary of Arabia, the southern part of which is included in the torrid zone. The topography of the interior of this peninsula is imperfectly known to European geographers. We know, however, that it is generally arid and sterile, destitute of forests, has no large rivers, and few permanent streams. The surface is diversified by hills of naked rock, plains of sand, and ranges of mountains of no great elevation. The central part of Arabia appears to be occupied by an elevated table-land. A long range of mountains extends through the W. part nearly parallel with the Red Sea, from which it is not more than eighty miles distant, and in some parts less than that. The peaks of these mountains are from 5000 to 8000 feet high. In the vicinity of the mountains, and of the torrents which flow from them, are a number of fertile valleys called *wadys*. Among the remarkable features in the geography of Arabia is Mount Sinai, which is 7497 feet high. Ancient and foreign geographers divided this country into three parts—namely, ARABIA FELIX, the Happy; ARABIA PETRÆA, the Stony; and ARABIA DESERTA, the Desert. The first comprises the south-eastern part, bordering on the Persian Gulf, the Indian Ocean, and part of the Red Sea; Arabia Petræa includes the north-western part, bordering on the Red Sea; and Arabia Deserta, the interior and northern portions. According to the native geographers, the principal divisions are—1. Hedjaz, or Hejaz, which extends along the Red Sea from lat. 19° N. to 29° N., and is bounded on the N. E. by the desert; 2, Yemen, which borders on the Red Sea, and extends from Hejaz to the Strait of Bab-el Mandeb, and along the Gulf of Aden to Hadramaut; 3, Hadramaut, a large tract bounded on the S. E. by the Indian Ocean; 4, Oman, which extends from the Persian Gulf to the Indian Ocean, and borders on the Sea of Oman, being bounded on the W. by the desert; 5, Lahsa (El Achsa), or Hadjar, which extends along the Persian Gulf from Oman to the mouth of the Euphrates; 6, Nej'd or Nedjed, the central desert region, nearly connecting with Arabia Deserta. The climate is hot and extremely dry. Muscat and Mocha, both on the sea-coast, are among the hottest inhabited spots on the earth. The temperature of the plains is often 100° in the shade. In many parts of Arabia rain never falls in the course of the year, and the sun is rarely obscured by a cloud. On the coasts of the Red Sea there is a rainy season of two or three months in summer, but on the southern or south-eastern coast the scanty supply of rain falls in the winter, so that the hottest months of the year are also the driest. To the extreme dryness of the atmosphere may be ascribed the remarkable degree of cold sometimes felt in Arabia, for ice and snow frequently occur on mountains ranging from 6000 to 8000 feet in height in the part of the peninsula which is in the torrid zone. Among the remarkable phenomena of the climate is a hot south wind called *simoom*, the poisonous quality of which has been exaggerated by travellers. The soil, where it is irrigated, produces cotton, coffee, indigo, tobacco, tamarinds, the date-palm, barley, rice, sugar, and many aromatic plants. The flora of Arabia comprises the characteristic plants of its neighboring countries. Among the wild plants are the mimosa, the Euphorbiaceæ, lavender, jasmine, the aloe, and the trees which yield gum-arabic and olibanum. The animal kingdom is here represented by the camel, the antelope, the ibex, hyena, wolf, jackal, wild-ass, wild-boar, the jerboa, monkey, ostrich, eagle, etc. The Arabian horse is celebrated, and perhaps unrivalled, for docility, endurance, beauty, and speed. Among the mineral resources of Arabia are copper, iron, lead, coal, emeralds, carnelians, agate, onyx, alabaster, marble, sulphur, and saltpetre. Few nations of the world have been more nearly stationary or have made such little progress in industrial arts. The division of the Arabs into numerous independent and unsettled tribes, with consequent absence of national unity, is a great obstacle to their improvement and organization. The government is neither a monarchy, a republic, nor an aristocracy, but each tribe is subject to a chief called an emir, sheik, or imâm. Having the advantage of occupying the coasts between India on the east and Africa and Europe on the west, the Arabs distribute the cotton goods of India among the peoples of Africa, and carry back ivory, gums, dyewoods, etc. Merchandise is conveyed across the deserts by large caravans of camels, which are styled "the ships of the desert." The principal exports of Arabia are dates, coffee, gum-arabic, myrrh, aloes, pearls, balsam, and other drugs. The population, formerly estimated at from 10,000,000 to 15,000,000, amounts, according to the recent calculations, to only 4,000,000, and is divided into two classes—the nomadic Bedouins, who have no habitations but tents, and have loose notions of the rights of property; and agricultural and mercantile Arabs, who live in towns and villages. The chief towns are Mecca, Medina, Loheia, Mocha, Aden, Muscat, Yambo (or Yumbo), and Rostak.

History.—Owing to its desert character, Arabia was never touched by any of the great conquerors of ancient times.

After the death of Alexander the Great, the Arabians conquered a part of Chaldæa, and founded the empire of Hira. Another tribe founded the empire of the Ghassanides, on the river Ghassan. In 107 A. D. the Roman emperor Trajan was the first to penetrate to the interior. With the advent of Mohammed the different tribes began to unite and act in concert, and, leaving their peninsula, founded large and powerful empires in three continents. (See MOORS and CALIPHS.) At the time of the conquest of the caliphate of Bagdad in 1258, and the expulsion of the Moors from Spain in 1492, the Arabian rule in Europe and Asia Minor came to an end. In the sixteenth century the Turks conquered Yemen, but were driven back in the seventeenth, but again gained the nominal authority over the holy cities and Hejaz. From 1508 to 1609 Muscat was subject to Portugal. The most important event of recent times in the internal history of Arabia is the advent of the WAHABEES (which see) in 1770, and their defeat by Mehemed Ali in 1811. At present, the only European power having possessions in Arabia is England, which has taken possession of Aden. In consequence of an attack made on the Christians in Djidda in 1858, the city was bombarded by the British. (See CRICHTON, "History of Araby," 1852; SEDILLOT, "Histoire des Arabes," 1854; MÜLLER, "Beiträge zur Geschichte der westlichen Araber," 1868; WEIL, "Geschichte der islamitischen Völker," 1868; MALTZAN, "Wallfarth nach Mekka," 1865; WREDE, "Reisen in Hadhramaut," 1870, and the accounts of NIEBUHR, BURCKHARDT, BURTON, PALGRAVE, and others.)

A. J. SCHEM.

Ara'bian Ar'chitecture, a style sometimes called MOORISH, originated almost simultaneously with the Mohammedan religion, and followed the progress of that religion into Eastern Europe, Spain, and Africa. The early temples or mosques of the Moslem Arabs were modifications of Byzantine architecture. The most peculiar and original feature of the Arabian architecture is the horseshoe arch. The pointed arch was also very extensively used by the Moors or Saracens. Among the finest specimens of Arabian style is the ALHAMBRA (which see).

REVISED BY CLARENCE COOK.

Arabian Language and Literature. The Arabic belongs to what is termed the Semitic (or Shemitic*) family of languages, and is closely related to the Hebrew, which it resembles in its general grammatical structure, as well as in the form of many of its words. Like the Hebrew, it is written from right to left, and like it, also, the vowels are not written in the body of a word or name, but are indicated (if indicated at all) by certain marks placed above or below the consonants to which they belong (see 29). The alphabet consists of twenty-eight letters, as follows:

	Unconnected.	Final Connected.	Medial.	Initial.	Name.	Power.
1.	ا†	ـا	ـا	ا	alif,	a.
2.	ب	ـب	ـبـ	بـ	bâ,	b.
3.	ت	ـت	ـتـ	تـ	tâ,	t.
4.	ث	ـث	ـثـ	ثـ	thâ,	th.
5.	ج	ـج	ـجـ	جـ	jeem or jîm,	j.
6.	ح	ـح	ـحـ	حـ	hâ,	h.
7.	خ	ـخ	ـخـ	خـ	khâ,	kh.
8.	د†	ـد	ـد	د	dâl,	d.
9.	ذ†	ـذ	ـذ	ذ	dhâl,	dh.
10.	ر†	ـر	ـر	ر	râ,	r.
11.	ز†	ـز	ـز	ز	zâ,	z.
12.	س	ـس	ـسـ	سـ	seen or sîn,	s.
13.	ش	ـش	ـشـ	شـ	sheen or shîn,	sh.
14.	ص	ـص	ـصـ	صـ	sâd,	s or ss.
15.	ض	ـض	ـضـ	ضـ	dsâd,	ds or dh.
16.	ط	ـط	ـطـ	طـ	tâ,	t.
17.	ظ	ـظ	ـظـ	ظـ	dza,	dz or dh.
18.	ع	ـع	ـعـ	عـ	ain (â'in or în),	‡
19.	غ	ـغ	ـغـ	غـ	ghain (gâ'in or gîn),	‡
20.	ف	ـف	ـفـ	فـ	fâ,	f.
21.	ق	ـق	ـقـ	قـ	kâf,	k
22.	ك	ـك	ـكـ	كـ[2]	kâf,	k.
23.	ل	ـل	ـلـ	لـ	lâm,	l.
24.	م	ـم	ـمـ	مـ	meem or mîm,	m.
25.	ن	ـن	ـنـ	نـ	noon or nûn,	n.
26.	و†	ـو	ـو	و	waw,	w.
27.	ه	ـه	ـهـ	هـ	hâ,	h.
28.	ى	ـى	ـيـ	يـ	yâ,	y.

1. ا at the beginning of a word is sounded variously, according to the vowel-points upon it (see the paragraph on Vowels given below); in the middle of a word it is sounded as *a* long, as in بَاب (*bâb*), a "gate."

2. ب sounds like *b* in English.

3. ت has the sound of the Spanish *t*, which is pronounced by placing the tip of the tongue against the upper teeth.

4. ث sounds like our *th* in *thin*.

5. ج is usually pronounced like the English *j*, though in some dialects (for example, in that of Egypt) it has the sound of our *g* hard.

6. ح sounds nearly like the German *ch* in *ach*, but it is formed lower in the throat.

7. خ sounds like the German *ch* in *ach*, *doch*, etc. It is usually represented in the French and English languages by *kh*, and in the German by *ch*.

8. د nearly resembles in sound the English *d*, but, in pronouncing it, the tip of the tongue is placed against the teeth. It may be said to bear the same relation to our *d* that the Spanish *t* does to our *t*.

9. ذ has no exact equivalent in any European language, though it resembles the sound of our *th* in *thy*. It is often represented by *dh*, and sometimes by *ds*, *dhs*, or simple *d*.

10. ر sounds like the French or Italian *r*, or like *rr* in the English word *terror*.

11. ز has the sound of *z* in English.

12. س sounds like our *s* in *this*.

13. ش is like the English *sh*.

14. ص sounds nearly like the English sharp *s*; but, in pronouncing it, the teeth are not brought so nearly into contact. It is sometimes represented by *ss*, or by ç.

15. ض has no equivalent in any European language. It is variously represented by *dz*, *dh*, *dd*, and *ds*.

16. ط is in sound nearly like the English *t*, but is pronounced somewhat harder. It is commonly represented by *t* or *tt*, and often, especially by German writers, by *th*.‖

17. ظ somewhat resembles ض in sound. It cannot be represented by any English letter or combination of letters.

18. ع has no exact equivalent in any European tongue. It nearly corresponds to the Hebrew ע. In the hiatus produced in uttering â—â in quick succession, we make a sound similar to the Arabic *ain*, but the latter is formed lower in the throat.

19. غ has no equivalent in English. It bears nearly the same relation to hard *g* that *kh* does to *k*. It is sometimes represented by *g*, but more frequently by *gh*, especially by French and English writers.

* A term derived from Shem, the eldest son of Noah.

† The letters thus marked ought never, according to the rules of Arabic orthography, to be connected with those that follow them.

‡ These letters have in sound nothing like them in English.

[2] Written, also, ك.

‖ In such cases *th* is not intended to indicate a sound like *th* in English or the Greek θ, but rather one similar to that of the Hindoo *th*.

20. ف has the sound of our *f*.

21. ق is similar to our *k*, but is formed lower in the throat. It is sometimes represented by *ḳ* (with a dot under it), and sometimes by *q*.

22. ك in sound is exactly like our *k*.

23. ل is like the English *l*.

24. م is pronounced like our *m*.

25. ن is in sound like the English *n*.

26. و, as a vowel, is equivalent to ōō or û; as a consonant, it sounds like the English *w* or *v*.

27. ه sounds like our *h*; when final, it is nearly silent.

28. ي, as a vowel, sounds like *ee* (or î), in which case a *kasra* is implied or expressed; as a consonant, like *y*. In the middle of a word the sound of ي may be doubled by means of the *tashdeed*, which, in writing, is often omitted. Preceded by *fatha* (see Vowels below), this letter assumes the sound of our long *i*, and is represented by *ai*.

☞ All the foregoing characters are regarded by Arab grammarians as consonants. Alif has been compared to the soft breathing (*spiritus lenis*) of the Greeks; Ain is a similar breathing, though the place of its formation is lower in the throat.

VOWELS.

29. In Arabic the true vowels are three. They are called —1. *Fat'ha* (*a**); 2. *Kas'ra* (*i*, sometimes *e*); and 3. *Dhamma* (*oo* or *u*†). Fatha is written over the consonant to which it belongs, thus ـَ; kasra is placed beneath its consonant, thus ـِ; dhamma (which is in fact a minute و) is written over its consonant, thus ـُ. These vowels are always joined to the consonant which in pronunciation they follow: thus, in قَلَم (kălăm), a "reed" or "pen," the first fatha is considered to belong to the *kâf*, over which it is placed, the second to the *lâm* (not to the *meem* which comes after it); and so in all similar cases: it necessarily follows that no vowel can stand by itself.‡ Hence, if we wish to write an initial short fatha, it must be associated either with *alif* or *ain*, as أَحَد (ăhăd), a "unit," عَفُو (ăfû), "forgiveness." If we would write a short initial kasra or dhamma, we must begin the word in the same manner: *e. g.*, اِبن (Ib'n), a "son," عِبَاد (Ibâd), "servants," أُف (uf or ŏŏf), "fie!" عُبُور (ubûr or ŏŏbŏŏr), a "passage" or "crossing."

30. If any one of the simple vowels is joined to an ordinary consonant, or to an initial *alif* or *ain*, it is generally short, as will be seen from the foregoing examples; but if in any syllable *not initial* they are joined with any of the (so-called) consonants (*alif*, *ain*, *waw*, etc.) to which they naturally correspond, they become long: thus, fatha with *alif* or *ain* gives us the sound of *â*, as بَاب (bâb), a "gate," بعد (bâd or bâ-ad), "after;" so kasra with *yâ* gives the sound of î (or *ee*), as سِين (seen or sîn), the name of the letter س; so also dhamma with *waw* gives the sound of û or ōō, as نُون (nûn or nōōn), the name of the letter ن. It should be observed that the fatha or dhamma is not written *on* the *alif* or *waw*, nor the kasra *under* the *yâ*, but is joined to the previous consonant, the semi-consonants coming after, for the sole purpose, it would seem, of prolonging the vowel.‡ In order to indicate the sound of *â* at the beginning of a word, it is usual to place a circumflex over the *alif*,—thus, آ. The initial long *i* (î or *ee*) is represented by إِ, and long *u* (*û* or *ōō*) by أُ.

The vowels are usually omitted in Arabic manuscripts, and they are scarcely needed by the native Arabs, who are already familiar with the language; but they are of the utmost importance to foreigners in learning Arabic. The same may be said of the jăzm or jĕzm (ْ), a mark placed upon a consonant to show that it has no vowel following it, as أَزْرَق (ăzrăk, "blue," which without the jăzm might be pronounced ăzărăk), and the tashdeed or tashdeed (ّ), placed on a consonant to show that it is to be doubled in pronunciation: as مُحَمَّد (Mohammed).

It is proper to observe that when the Arabic article *al* or *el* is followed by certain letters, the sound of the *l* is changed to that of the letter following; thus, *el-Deen* becomes *ed-Deen*; *el-Doulah*, *ed-Doulah*; *al-Rahmân* or *el-Rahmân*, *ar-Rahman* or *er-Rahman*; *al-Temeemee*, *at-Temeemee*; and so on.

The Arabic characters are supposed to have been derived from the Syriac, and to have been introduced into Arabia by Christian missionaries before the time of Mohammed. The oldest form is called the Cufic (or Kufic), from Koofa, a town in the Euphrates, where it is said the transcription of the Koran was extensively carried on. These characters were extremely rude and coarse, and, being only sixteen in number, could but very imperfectly represent the twenty-eight consonant sounds of the Arabic tongue. In the tenth century they were replaced by the *neskhi* characters, as they are called, which are still in use. At present the Cufic letters are scarcely to be met with, except in ancient inscriptions or in the books of antiquarians.

Of the Arabic tongue there are two principal dialects—namely, the northern or prevailing dialect, in which the Koran is written, and the southern, which included the Himyaritic, originally spoken in Yemen and the extreme southern portion of Arabia. The Himyaritic (a term derived from Himyar, an ancient king of Yemen) is supposed to have been the basis of the Ethiopian language.

The Arabic is one of the most extensively diffused languages in the world. It not only prevails in Arabia, in Syria, and in a part of Mesopotamia, but it is spoken in its various dialects (which are more or less corrupted) throughout a large part of Northern Africa, from the shores of the Atlantic to the Red Sea. The language is spoken with much purity in Egypt, which, since its conquest during the caliphate of Omăr, in 640 A. D., has been one of the principal centres of Arabian culture. From about the ninth to the twelfth or thirteenth century it was the prevailing tongue of a large part of the Spanish Peninsula, and its traces are still seen not merely in many of the names, but in the language, of Spain at the present day.

ARABIAN LITERATURE is very rich, especially in poetry and other productions of the imagination. Even before the time of Mohammed, the Arabs had celebrated poets, who sang the praises of heroes and the charms of beautiful women. During the great fairs at Mecca poetic contests were held in much the same manner as at the games of ancient Greece, and the poems which received the prizes were, it is said, written out in golden characters, and suspended in the Kaaba (Caaba) at Mecca, the famous temple which was said to have been built by Ishmael. From this circumstance they are called Mo'allakât (معلقات)—that is, "suspended."

Among the Arabian poets, Mohammed is admitted to hold, beyond all comparison, the highest place. His followers were wont to refer their opponents to the sublimity and beauty of the Koran as an unanswerable proof that its author was divinely inspired.

It may be said that, with perhaps the exception of Mohammed, the Arabs have had no poet of the highest class, nor have they produced any great epic, or any drama worthy of the name. It is in lyric and romantic composition that they most excel.

There is one kind of poetical fiction, called "Assemblies" (Arab. Makâmât مقامات), which may be said to be peculiar to Arabic literature. The "Assemblies" may be regarded as the first step towards dramatic composition. The author of this species of writing was Hamadânee (or Al-Hamadânee), who flourished towards the close of the tenth century. He imagined a witty and unscrupulous improviser wandering from place to place, and living on the presents which the display of his marvellous talents procured from his hearers, and a narrator, or story-teller, who should be continually meeting with the other, should relate his adventures and repeat his excellent improvisations. He gave to these compositions the name of "Assemblies," because the improviser was always introduced as making his appearance in some company or assembly of strangers, where the narrator also happens to be, and is sure to be greatly astonished at the tricks, wit, and genius of the other, which he afterwards relates in his own language, and these relations constitute the "Assemblies" as they are presented to us. Of this species of composition the "Assemblies" of Hareeree (Hariri) furnishes, perhaps, the best

* Often represented by *e*, and sometimes (in English) by *u* short.

† Often represented by *o*, as in the name of Mohammed.

‡ It may be remarked as an apparent exception to this rule that Ibn, "son," is often written simply بن (*bn*); but this is usually to be considered as an abbreviation for اِبن, though *ben* or *bin* is not unfrequently used instead of the longer form *ibn*.

‡ The long vowels in Arabic are to be pronounced very full and long, especially the long *a*, which is not only longer, but somewhat broader, than our *a* in *far*.

specimen. Hareeree is regarded by the Arabs as a consummate master of diction, and the highest authority in the use of language. "For more than seven centuries," says a recent writer, "his work (the 'Assemblies') has been esteemed as, next to the Koran, the chief treasure of the Arabic tongue. Contemporaries and posterity have vied in their praises of him. His 'Assemblies' have been commented on with infinite learning and labor in Andalusia and on the banks of the Oxus." (See Introduction to the "Assemblies of Al-Harîrî," translated by T. CHENERY, London, 1867.)

In romance especially the Arabs may be said to excel. Among the works of this class we may name the "Feats of Antar," the stories or fables of Ibn Arabshâh, etc. But perhaps the most universally popular, not merely of Arabian fiction, but of all fiction of which we have any knowledge, is the famous collection of tales known as the "ARABIAN NIGHTS" (which see).

In philosophy, mathematics, history, geography, medicine, and physics, the Arabs, during the period of their power, rendered important services to science and civilization; the Arabic terms still found in the language of science, such as *alcohol, algebra, almanac, azimuth, nadir, zenith*, etc., sufficiently attest their influence on the early intellectual culture of Europe. During the period known as the Dark Ages the scientific works of Aristotle and other Greek philosophers were translated for the most part by Christian scholars, who resided as physicians at the courts of the califs in great numbers. These works were diligently studied in the Mohammedan capitals of Bagdad, Damascus, and Córdova, and served to diffuse a knowledge of those great writers among nations who otherwise would have remained in utter ignorance of them and their writings.

The most glorious period of Mohammedan culture extended from about 750 to 1200 A. D. During this period the Abbasside califs, Haroun-al-Raschid, Mamoon, and Motassem, reigned at Bagdad, which, under their auspices, became a magnificent centre of science, letters, and the arts. In the far East, Mahmood of Gazna (about 990–1030), though a sanguinary conqueror, was ambitious of the distinction of a patron of literature. At his court flourished Firdousee* (Firdausi), the greatest not only of all Persian but of all Moslem poets, Mohammed only excepted. In Spain, under the califs of the Omeyyade dynasty, the period of Arabian culture was not less glorious, and was of much longer duration, than that under the Abbassides. Al-Hakem, calif of Córdova (961–76), had, it is said, a library of 600,000 volumes. The high reputation for learning of the Spanish Arabs is shown by the fact that some of the best students of Christendom visited Córdova in order to study the philosophy of Aristotle, medicine, and mathematics under Arabian professors. To the Arabs we are indebted for the preservation of many works from classical antiquity, which without their care and zeal would in all probability have perished during the long period of darkness and semi-barbarism that followed the overthrow of the Western Roman empire.

Among the most distinguished Arabian authors, besides those already mentioned in this article, we may name—1. In poetry, Khansâ, a female poet contemporary with Mohammed; Ibn-Doreid (838–933); Al-Mootenabbee (about 900–965); and Booseeree (or Busîrî), who flourished in Upper Egypt (about 1250). 2. In philosophy, Alchindus flourished under the calif Mamoon (about 820); Alfarabius, who lived at Damascus (about 950); Avicenna (980–1037), who was even more celebrated as a physician than as a philosopher; Averroes (about 1120–98), wrote at Córdova, in Spain, a commentary on Aristotle, to which Dante alludes. 3. In medicine the Arabs excelled all the nations of that period; they are commonly regarded as the earliest experimenters in chemistry (alchemy). Among their celebrated physicians were Razes (or Rhazes), (870–930), who is said to have been the first to describe the smallpox accurately; Avicenna (Ibn Sînâ), already mentioned, the most famous of all the Arabian physicians; Averroes was also distinguished as a physician; Abulcasem (Abulcasis), the most distinguished of Arabian surgeons, is supposed to have practised in Córdova (about 1050–1110); he left a treatise on surgery, the most valuable that has come down to us from early times. 4. In mathematics the labors of the Arabs were not less useful than in other branches of science, though they cannot perhaps boast of so many famous names as in philosophy and medicine. They contributed greatly to simplify and improve the science of numbers by the introduction of the Indian numerals, with the decimal notation. They appear to have been the first to introduce the knowledge of algebra (which had been previously cultivated by the Greeks and Hindoos) into Western Europe. Mohammed Ibn Moosa (who flourished at Bagdad from about 810–833) is said to have been the first of his countrymen who wrote on algebra. He also wrote on optics and astronomy. Albategnius (Albatenî), who died at Bagdad in 929, wrote some valuable works on astronomy; Aboolfeda combined mathematics and astronomy with geography. 5. In history and geography, Masoodee, one of the first of Arab historians, was born at Bagdad, and died at Cairo in 956. His "Meadows of Gold and Mines of Gems" comprises the history, the politics, the religion, and the geography of many Oriental and European nations. Aboolfeda (1273–1331) has left works of great value in this and other departments of knowledge. His "Description of the Countries" is considered the best work on geography which the Arabian writers have bequeathed to us. Abulfaragius and Elmacin (or Elmakin), though Christians, wrote in the Arabic language valuable general histories. Ibn Khaldoon (1332–1406) wrote a valuable history of the Arabs, Persians, and Berbers. Makreezee flourished at Cairo (1360–1442), and wrote some excellent historical works. Makkaree, or Al-Makkari (1585–1631), wrote a history of the "Mohammedan Dynasties of Spain," which has been translated into English by Gayangos, London, 1840.

Those who seek for a general view of Arabian literature are referred to HAMMER-PURGSTALL'S "Encyklopädischen Uebersicht der Wissenschaften des Orients" (Leipsic, 1804), and his "Literaturgeschichte der Araber" (7 vols. 4to, 1850–56); RENAN, "Averrhoes et l' Averrhoisme;" WHEWELL, "History of the Inductive Sciences."

J. THOMAS.

Arabian Nights, sometimes called **The Thousand and One Nights,** the title of a collection of wild and fanciful Oriental tales, first brought to the notice of Europe in the latter part of the seventeenth century, by Antoine Galland, a French Orientalist. These fascinating fictions are probably more widely diffused and read than almost any other production of the human mind. The origin and author of this collection are still unknown. According to some authorities, the "Arabian Nights" may be properly divided into three portions, which may be respectively traced to a Persian, an Indian, and an Arabian origin. Throughout the entire work, however, everything appears to be conformable to the character and customs of the Arabian people and to the Mohammedan faith. The fact that Haroun-al-Raschid figures in several of the stories goes to prove that they, at least, must have been written after his death; while the omission of any mention of coffee and tobacco (except in two or three instances, where the names are supposed to be interpolations) shows that the work must have been composed before the introduction of those articles into Western Asia (in the latter half of the fifteenth century). "Many of the tales," says Mr. Lane, referring to this remarkable work, "are doubtless of different and early origins, and its general plan is probably borrowed from a much older production bearing the same title." After some further remarks, he states it as his opinion that the composition in its present form was probably commenced in the last quarter of the fifteenth, and completed in the first quarter of the sixteenth, century, and that the author or authors must have been Egyptian, because the description of Arab life as it is seen in Cairo is so minutely accurate in all respects. But respecting the date and place of its composition, Oriental critics are far from being agreed. The work has been translated by W. Beaumont (1811), Macnaghten, Scott, Torrens, E. Foster (1802), and Lane (1839). Most of these translations were from the French. It is noteworthy that the tales differ considerably in various Arabic texts. Among the best translations of the "Arabian Nights" is that of the celebrated Oriental scholar already mentioned, Mr. Edward Lane. The translation is perhaps unequalled for its thoroughness and accuracy, and in the graces of style is probably not inferior to any other in our language. The "Arabian Nights" has given rise to many imitations, among the best of which in English is "Tales of the Genii," by Rev. James Ridley. J. THOMAS.

Arabian Numerals or **Figures,** a name given to the characters 1, 2, 3, 4, 5, 6, 7, 8, 9, 0, which the Europeans received through the Arabs from the Hindoos. The use of these numerals was not general in Europe before the invention of printing.

Arabic, Gum, exudes spontaneously from the stems of several species of acacia. (See ARABIN and GUM.)

Arab'ici (*i. e.* "Arabians"), an heretical sect which arose in Arabia in the third century, the founder of which

* All Mohammedan culture may be considered to be in one sense an offshoot of Greek culture. Not only was the genius of the poetry of the modern Persians greatly modified by the influence of Islamism, but the Persian language itself includes a very large mixture of Arabic words and phrases. This is especially remarkable with respect to some of the later poets. To understand thoroughly the works of Saadi, for example, a very considerable knowledge of Arabic is absolutely requisite.

was Beryllus, bishop of Bostra. They denied Christ's divinity, and believed that the soul dies, and is raised again with the body. They were confuted by Origen.

Ar'abin, the essential principle of gum-arabic, is obtained pure by adding alcohol to a solution of gum arabic in water. It dissolves readily in cold water, forming a gummy solution, and is precipitated by alcohol. It appears to be a weak acid, and to exist in the natural gum in combination with lime, magnesia, and potash. Its composition, like that of cane-sugar, is $C_{12}H_{22}O_{11}$.

Aracan', or **Arracan** [called by the natives **Rakhaing'**], a British province of Farther India, extending along the E. side of the Bay of Bengal, and bounded on the E. by the Burmese empire, from which it is separated by a range of high mountains. The greatest length from N. to S. is about 280 miles, and the area is 15,104 square miles. The surface is diversified, and extensively covered with forests. The chief productions are rice, tobacco, indigo, cotton, salt, oil, ivory, hides, and timber. Aracan was conquered from the Burmese by the British in 1826. Chief town, Akyab. Pop. 321,522.

Aracan, or **Arracan,** a town of Farther India, in the above province, situated on the river Aracan, about 50 miles from its entrance into the Bay of Bengal, about lat. 20° 45′ N., and lon. 93° 15′ E. It was formerly the capital of the province and a populous town, but it is now much reduced. Pop. estimated at 10,000.

Araça'ri, or **Aricari** (*Pteroglos'sus*), a genus of birds,

Curl-Crested Araçari.

natives of tropical South America, and nearly allied to the toucan, but generally smaller, with longer tails. The bill of one species is white, with a blood-red stripe along the middle. One of the most remarkable is the curl-crested araçari, having the feathers upon its head beautifully curled.

Araca'ty, a port in the province of Ceará, Brazil, has three churches, several schools, and a trade in hides and cotton. It is on the river Jaguaribe; lat. 4° 31′ S., lon. 37° 48′ W. There is a bad bar at the river's mouth. Pop. about 9000.

Ara'ceæ [so named from *Arum*, one of its genera], a natural order of endogenous herbaceous plants, natives of temperate and especially of tropical countries. The leaves are sheathing at the base, convolute in the bud; the flowers are naked; arranged on a spadix, which is usually enclosed in a spathe; the male flowers at the upper part of the spadix, and the female at the base. The genus *Arum* is the type of this order, which is characterized by an acrid juice and a nutritious amylaceous substance which is used for food. The *Amorphophallus* is cultivated in India for its roots (or corms), which are edible. (See Arum.)

Arachis. See Pea-nut.

Arach'nida, or **Arach'nides** [from the Gr. ἀράχνη, a "spider"], an order of articulated animals which resemble insects in many respects, and are properly regarded as a subdivision of that class, but they have no antennæ, have simple eyes, and generally have eight legs. Like the Crustacea, they have the head and thorax united into one piece. They are mostly carnivorous, and some of them are parasitic. The primary divisions of this class are Araneina (spiders), Pedipalpi (scorpions, etc.), and Acarina (ticks and mites).

Arach'noid [from the Gr. ἀράχνη, a "spider," also "spider's web," and εἶδος, "form" or "resemblance"], resembling a spider's web, applied to the second or middle membrane of the brain. (See next article.)

Arach'noid Mem'brane (sometimes called *me'ninx me'dia*), the fine cobweb-like serous membrane situated between the dura and pia mater. It covers both brain and spinal cord. It is a closed sac, disposed in two layers.

Arad, a county of Hungary, is bounded on the N. by Bihar, on the E. by Zarand and Transylvania, on the S. by Temes and Krasso, and on the W. by Csanad. Area, 2322 square miles. In the E. it consists of high mountain-ranges, but the W. is a fertile plain, traversed by the White Körös. Grain of all kinds, wine, and tobacco are produced here in large quantities and of an excellent quality. Chief town, Arad. Pop. in 1869, 304,713.

Arad, New [Hun. *Uj Arad*], a town of Hungary, in the county of Temesvár, and on the left bank of the Máros. Here is an extensive fortress, which is one of the strongest in the Austrian empire, and is used as a prison for political offenders. Pop. in 1869, 4960.

Arad, Old [Hun. *O Arad*], an open town, capital of the county of Arad, is on the right bank of the Máros, 35 miles E. of Szegedin. It is a bishop's see, has a Greek theological seminary, a normal school, and manufactures of tobacco, etc. It is an important cattle-market, and has a considerable trade in grain. Pop. in 1869, 32,725.

Ar'adus [the *Arvad* or *Arpad* of the Bible], one of the chief cities of ancient Phœnicia, was built upon the island now called *Ruad*, which is small and rocky, and is situated 35 miles N. of Tripoli, and 2 miles from the main land. It long continued to be a place of great population and importance. It was supplied with water from submarine springs. It was destroyed and depopulated by the Moslems in the seventh century. Many relics of its former greatness remain. It has still a small population.

Arafat', Mount, or **Jebel-er-Rahm** (*i. e.* the "mountain of mercy"), a granite hill of Arabia, 15 miles E. of Mecca, rises about 200 feet above the plain. It is visited annually by a great multitude of Mohammedan pilgrims, who believe that this is the place where Adam and Eve first met after they had been expelled from Paradise and had been separated 120 years.

Ar'ago, a post-village of Richardson co., Neb., on the Missouri River, about 28 miles below Brownville. Pop. of village, 364; of Arago township, 1245.

Arago (Dominique François), a French astronomer and savant, was born at Estagel, near Perpignan (Eastern Pyrenees), Feb. 26, 1786. He entered the Polytechnic School in 1803, and became in 1805 secretary to the bureau of longitudes. In 1806, Arago and Biot were employed by the government to perform the measurement of an arc of the meridian from Barcelona to the Balearic Isles, in order to complete an important operation which Delambre and Méchain had commenced. While he was engaged in this arduous work among the mountains, war broke out between the French and Spaniards. Arago escaped from the violence of the Spaniards, who suspected him to be a spy, but on his voyage towards home was driven by a tempest to Algiers, where he was held as a slave. He was finally liberated, and returned to France in July, 1809. In consideration of his services and sufferings he was elected a member of the Institute in 1809, although he was under the age that the rules required. About the same time he was appointed professor of analysis in the Polytechnic School, where he lectured for many years. He afterwards devoted much attention to optics, astronomy, and magnetism. In 1812 he commenced a course of lectures on astronomy, which were rendered very popular by a brilliant style added to their other merits. Arago and Gay-Lussac founded in 1816 the "Annales de Chimie et de Physique." He advocated the undulatory theory of light, and made several discoveries in the science of electro-magnetism. For his discovery of the development of magnetism by rotation, he received the Copley medal of the Royal Society of London in 1825. He became in 1830 director of the Observatory of Paris and perpetual secretary of the Academy of Sciences. His reputation as a writer was increased by the eulogies which he composed on Condorcet, Ampère, and Carnot, and other members

of that academy. He displayed a remarkable faculty of popularizing science in his writings and lectures.

Arago promoted the revolution of 1830, and was elected in 1831 to the Chamber of Deputies, in which he acted with the *extrême gauche*, the advanced republicans. He was a member of the provisional government formed by the republicans in Feb., 1848, and co-operated with Lamartine in resistance to the socialists and in the maintenance of order. He officiated as minister of war and the marine for several months, and was one of the executive committee of five elected by the Assembly in May, 1848. About this time the voters of his native department elected him to the National Assembly. He opposed the election of Louis Napoleon to the presidency, and refused the oath of allegiance after the *coup d'état* of Dec., 1851. The emperor recognized his eminent services by excepting him from the enforcement of the law on this point. Arago died on the 2d of Oct., 1853, leaving a son, Emmanuel, noticed below. He was a friend of Alexander von Humboldt and of Faraday; was a man of a generous disposition, an ardent temperament, and great energy of character. "The popularity of M. Arago," says De Loménie, "the European reputation which he enjoys, his marked position in politics, have all combined to attach to his name the idea of a species of intellectual royalty." The same biographer attributes to him a "marvellous faculty of illumining with unexpected radiance the most abstract theories." (See L. de Loménie, "Galerie des Contemporains;" D. F. Arago, "Histoire de ma Jeunesse," 1854; Charles Robin, "Biographie de D. F. Arago," 1848; J. A. Barral, "F. Arago," 8vo, 1853; Bertrand, "Arago et sa Vie Scientifique," 1865; Audiganne, "François Arago," 1869.) William Jacobs.

Arago (Emmanuel), a son of the preceding, born at Paris Aug. 2, 1812. He studied law, and gained distinction as an advocate and counsel for the defence in political trials. Like his father, he was a keen republican, and took an active part in the revolution of 1848. In this crisis he was selected by the republicans to protest in the Chamber of Deputies against the appointment of a regency. He was sent as commissary-general to Lyons in March, was elected to the Constituent Assembly in April, and was sent as minister to Berlin in May, 1848. He resigned this position in Dec., 1848, in consequence of the election as president of Louis Napoleon, whose designs he constantly opposed. The *coup d'état* of Dec., 1851, and the *régime* that followed, excluded Arago from the public service. On the formation of a provisional government by the republicans in Sept., 1870, he became a member of the same. He was elected a member of the National Assembly in 1871.

Arago (Étienne), a dramatic author, a brother of the great savant, D. F. Arago, born at Estagel, near Perpignan, Feb. 7, 1803, produced a number of successful comedies and vaudevilles, which exhibit a talent for satire. Among his works is "The Aristocrats" (1847), a comedy in verse. He fought for the popular cause in the revolution of 1830, and founded the "Reform," a daily republican journal, in 1834. He was director-general of the post-office from Feb., 1848, until December of that year, and in that position acted with much vigor and ability. As a member of the National Assembly he voted with the *gauche* and opposed the policy of Louis Napoleon. He was exiled in June, 1849. After the proclamation of the republic in Sept., 1870, he was appointed maire of Paris, which position he held until November. In Feb., 1871, he was elected a member of the National Assembly, but soon resigned on account of his age.

Arago (Jacques Étienne Victor), a French *littérateur*, brother of the preceding, was born at Estagel Mar. 10, 1790. He accompanied the exploring expedition of Freycinet, as draughtsman, in 1817, and on his return in 1821 published a "Tour round the World in the Uranie," etc. (2 vols., 1822). Among his works are several dramas. Although he had become blind, he joined a party that went to California in 1849 to dig for gold, and published "Travels of a Blind Man in California," etc. (1851). Died in 1855.

Ar'agon, a former kingdom of Spain, bounded on the N. by France, on the E. by Catalonia, on the S. by Valencia, and on the W. by Navarre and the Castiles. Length from N. to S., about 200 miles. Area 17,980 square miles. It is now divided into the provinces of Huesca, Saragossa (Zaragoza), and Teruel. The Pyrenees, which extend along the northern border of Aragon, rise to the height of 11,000 feet. The surface is diversified by several ranges of mountains and many fertile and beautiful valleys. Aragon is intersected by the river Ebro, which flows southeastward and divides it into two nearly equal parts. A considerable portion of the soil is sterile. Among the mineral resources of this region are copper, iron, lead, cobalt, quicksilver, marble, stone coal, alum, and salt. Aragon was conquered by the Moors in the eighth century. The Christian kingdom of Aragon, founded in 1035, became a powerful state, which was united with Castile by the marriage of Ferdinand of Aragon and Isabella of Castile in 1469. The chief towns are Saragossa and Huesca. Pop. in 1867, 925,773. (See Schmidt, "Geschichte Aragoniens im Mittelalter.")

Arago'na, a town of the island of Sicily, in the province of Girgenti, 8 miles N. of Girgenti. It has a ruined castle and large sulphur-mines. Pop. in 1861, 7947.

Ar'agonite, or **Ar'ragonite,** a variety of carbonate of lime, first found in Aragon. It crystallizes in hexagonal prisms, or in crystals of which the primary forms a rhombic prism. It resembles calcareous spar in composition, but differs from it in the form of its crystals, and is reduced to powder by a heat in which calcareous spar remains unchanged. Satin spar is a variety of aragonite.

Ara'gua, a province of Venezuela, is bounded on the N. by Carabobo and Caracas, on the E. by Caracas, on the S. by Guarico and Carabobo, and on the W. by Carabobo. Area, about 3720 square miles. This province is one of the most beautiful and fertile parts of Venezuela, and is traversed by the river Aragua, from which it takes its name, and numerous other small rivers, which all enter Lake Valencia. The hills and mountains are covered with plantations, gardens, and country-seats. Here the strange scene strikes the eye of wheat-fields and plantations of sugar and coffee side by side at an elevation of 3000 feet. Chief town, Victoria. Pop. 81,500.

Araguay', or **Araguay'a,** a large river of Brazil, rises in the mountains about lat. 18° 10′ S. and lon. 51° 30′ W. It flows northward, forms the boundary between Goyaz and Matto-Grosso, and after a course of 1300 miles joins the Tocantins at São João. It is navigable for about 1100 miles. About midway from its source to its mouth it encloses the island of Santa Anna, 210 miles long. The stream on the E. side of this island is called *Furo*.

Ara'lia, a genus of plants of the order Araliaceæ, natives of the U. S., of the Himalaya Mountains, and other regions. It comprises a number of species which are used in medicine, as the ginseng, *Aralia quinquefolia; Aralia nudicaulis*, called wild sarsaparilla, which grows in the U. S.; *Aralia spinosa*, a native of Virginia, which is a stimulant diaphoretic, called angelica tree or toothache tree; and *Aralia racemosa*, or American spikenard, which produces an aromatic gum-resin. Chinese rice-paper is cut from cylinders of the pith of *Aralia papyrifera*.

Aralia'ceæ [so called from *Ara'lia*, one of its genera], a natural order of exogenous plants, natives of tropical, temperate, and cold regions in various parts of the globe. It comprises about 160 known species (trees, shrubs, and herbaceous plants), generally possessing stimulant or aromatic properties. The fruit consists of several one-seeded cells. The leaves of several species are used as fodder for cattle in India. One species of this order, the ivy, is a native of England.

Ar'al, Sea of, a large inland sea or lake in Independent Tartary, is about 150 miles E. of the Caspian Sea. It is included between lat. 43° and 47° N. Length, estimated at 262 miles; breadth, about 184 miles. Area, 26,900 square miles. Next to the Caspian, it is the largest inland sea or lake of Asia. Having no outlet, it is consequently saline or brackish. The S. W. part, called Lake Landau, is shallow, and not more than five feet deep in the deepest part. The Aral is fed by the large river Oxus or Amoo, which enters the sea at its S. side: it also receives the river Sihon or Sir-Daria from the E. The latest measurements make it twenty-six feet above the level of the sea. Seals, sturgeons, and other fish are found in it.

A'ram (Eugene), an English felon, born in Yorkshire in 1704. He had not the advantage of a liberal education, but he acquired a good knowledge of the Latin, Greek, Hebrew, Chaldee, Arabic, and Welsh languages. He became a schoolmaster at Knaresborough, where he was intimate with a shoemaker named Daniel Clarke. The latter, having purchased some goods on credit, suddenly disappeared, leaving his debts unpaid. Aram was suspected of being an accomplice of Clarke in an attempt to defraud. A portion of the goods which Clarke had purchased was found in the garden of Aram, who was tried, but acquitted, after which he removed from Knaresborough. In 1759 a man named Houseman having confessed that he was accessory to the death of Clarke, whom Aram had killed, Aram was tried for the murder, and made an elaborate argument in his own defence, but was convicted, and afterwards confessed his guilt. He was hung Aug. 6, 1759. His story forms the subject of one of Bulwer's novels and of a poem by Hood. (See Scatcherd, "Memoirs of Eugene Aram," 1832.)

Aramæ'a [from *A'ram*, the son of Shem], the ancient name of a region of Asia, the boundaries of which are not well defined. It extended from Mount Taurus on the N. to Arabia on the S., and coincided nearly with the countries called by the Greeks Syria, Babylonia, and Mesopotamia. The Aramaic language, a branch of the Semitic, was divided into two forms or dialects—the Syriac or West Aramaic, and the Chaldee or East Aramaic. The former was the language commonly spoken by the Jews in Palestine at the Christian era.

Aran'da (Don Pedro Abaraca de Bolea), Count of, an able Spanish statesman, born of a noble family at Saragossa Dec. 21, 1718. He served many years in the army, and rose to the rank of general. In 1765 he became president of the council of Castile and prime minister. He used his power to promote reform and a liberal policy, and procured the expulsion of the Jesuits from Spain in 1767. In 1773 he was removed from power by the intrigues of the clergy, but he was sent as an ambassador to France, where he remained until 1787. He was again prime minister for a short time in 1792, and was driven from power by Godoy. He died in 1799.

Aranjuez' (anc. *A'ra Jo'vis, i. e.* "altar of Jupiter"), a town and royal residence of Spain, in New Castile, on the left bank of the Tagus, 30½ miles by rail S. S. E. of Madrid. It is situated in a beautiful valley, has spacious streets, elegant squares, and a royal palace and gardens laid out by Philip II. Here are also a theatre, a hospital, and several summer-houses in the royal gardens. Aranjuez was the scene of the abdication of Charles IV. in Mar., 1808. Pop. 10,725.

Aran'sas, a small river of Southern Texas, rises in Bee county, flows south-eastward and enters Aransas Bay.

Aransas, a post-village of Bee co., Tex.

Aransas, a village of Refugio co., Tex., on the inside of St. Joseph's Island and on Aransas Bay. It has a government warehouse.

Aransas Pass, the principal inlet to Aransas Bay and Corpus Christi Bay, Tex., between St. Joseph and Mustang islands. It is becoming commercially important, but has a troublesome shifting bar. The lighthouse is of brick, forty feet high, and stands on Low Island, inside the pass; lat. 27° 51′ 51″ N., lon. 97° 2′ 58″ W. The Confederate works at this pass were captured by the Federal troops, with 100 prisoners and some guns, Nov. 20, 1864.

Arany (János), a popular Hungarian poet, born at Nagy-Salonta in 1817, became in 1851 professor at Nagy-Körös, in 1859 member of the Hungarian Academy, and in 1860 director of the Kisfaludy Society at Pesth. His first work was a humorous poem called "The Lost Constitution of the Past" (1843), which gained a prize. He afterwards produced poems entitled "Toldi" (1847), "The Conquest of Murány" (1848), "Catherine" ("Katalin," 1850), and "Buda Halála," the first part of an epic trilogy, which in 1864 was crowned by the Hungarian Academy.

Arap'ahoe, a county in the N. E. part of Colorado. Area, estimated at 4500 square miles. It is drained by the South Fork of Platte River, and by Beaver, Bijou, and Terrapin Creeks. The eastern part is a plain, and the western part is hilly or mountainous. Irrigation renders the soil extremely productive. Wheat, corn, oats, butter, and live-stock are extensively raised. Large quantities of gold have been found near the western border. This county is partly intersected by the Kansas Pacific R. R. and the Denver Pacific R. R., which connect at Denver, the county-seat. Pop. 6829.

Arapahoe, a new county of Southern Nebraska, bounded on the N. by the Platte River.

Arapahoe Indians, a tribe of savages who live between the South Fork of the Platte River and the headwaters of the Arkansas. They are associated with the Cheyennes. The two tribes together numbered nearly 4000 in 1859.

Arapai'ma, a genus of fresh-water fishes found in the rivers of South America, and highly esteemed for food. They are the largest fresh-water fishes in the world, and are allied to the Clupeidæ or herring family. Some of them measure about fifteen feet long, and weigh 400 pounds or more. The body is covered with strong, bony, compound scales.

Ar'arat, a celebrated mountain of Western Asia, rises from the plain of the Aras (or Araxes) about 33 miles S. W. of Erivan. It is called by the Persians Koh-i-Nooh, "Mountain of Noah." It is on the boundary between Persia, Asiatic Turkey, and the Russian possessions. The highest peak is in lat. 39° 42′ N. and lon. 43° 38′ E., is covered with perpetual snow, and has an altitude of 16,915 feet above the level of the sea, or 14,200 feet above the plain of the Aras. It is a volcano, the last eruption of which occurred in July, 1840.

Ararat, Little, a peak which is S. E. of the preceding, and rises in the form of a cone to the height of about 13,700 feet above the level of the sea. The summits of these two mountains are seven miles apart in a direct line, but their bases are nearly in contact. According to the eighth chapter of Genesis, the ark rested "upon the mountains of Ararat."

Ararat, or **Pilot Mountain,** a hill in Surrey co., N. C., between the Ararat and Dan rivers, is 3000 feet high. It is visible at a distance, and serves as a landmark to travellers.

Ararat, a township of Susquehanna co., Pa. P. 771.

Arari'pe, Ser'ra de, a table-land or chain of mountains in Brazil. It forms a semicircle around the plain in which Crato is situated, and is near the boundary between Ceara and Pernambuco.

Aras' (the ancient *Arax'es*), a river of Western Asia, rises in the Turkish pashalic of Erzrum. It flows eastward, passes near the northern foot of Mount Ararat, and traverses the Persian province of Adzerbijan. It afterwards turns towards the N. E., and enters Georgia or the Russian dominions, and unites with the river Kur about 60 miles from its entrance into the Caspian Sea. Its whole length is about 500 miles.

Ara'tus ['Aρατος], an eminent Greek poet and astronomer, born at Soli, in Cilicia, flourished about 290–260 B. C. He was patronized by Antigonus Gonatas, king of Macedonia, at whose court he passed his latter years. He wrote an astronomical poem entitled "Phenomena," which is the oldest extant poem on that subject, and was much admired by the ancients. It was translated into Latin by Cicero, and was the subject of a commentary by Hipparchus. He is supposed to be the poet quoted by St. Paul in a discourse to the Athenians. (See Acts xvii. 28.) Aratus also wrote a poem on the weather, called "Diosemeia," or "Prognostica." A good edition of his poems was published by Buhle, 1793–1801.

Ara'tus of Sic'yon, a celebrated Greek general and statesman, born at Sicyon in 271 B. C., was a son of Clinias, who was assassinated about 264. Aratus then escaped to Argos, where he was liberally educated. In 251 B. C., with the aid of other exiles, he liberated Sicyon from the tyrant Nicocles, and united it with the Achæan League, of which he was chosen general (*strate'gos*) in 245. An important object of the league was to maintain the independence of the Greek states against the king of Macedonia. He expelled a Macedonian garrison from Corinth in 243 B. C., was many times re-elected general-in-chief, and managed the affairs of the league with much ability. About 226 the league was involved in a war against Cleomenes, king of Sparta, who defeated Aratus in several battles. Aratus formed in 222 an alliance with Antigonus of Macedon against the Spartans. He died in 213 B. C., leaving the reputation of a true patriot. (See Plutarch, "Life of Aratus;" Polybius, "History.")

Arauca'nia, or **Arauca'na,** an independent state in the S. part of Chili, is bounded on the E. by the Andes and on the W. by the Pacific Ocean. It extends from the river Bio-Bio on the N. to Valdivia, or to lat. 40° S., being about 190 miles long. The physical features, climate, and productions are similar to those of Chili. The Araucanians are remarkable for their independent spirit and their successful resistance to foreign domination. The Spaniards made an unsuccessful attempt to subdue them in 1537 and at several subsequent periods. On this subject Ercilla, a Spaniard, wrote a celebrated epic poem called "Araucana." It is said that they possess many noble qualities, and cultivate poetry, but abhor the restraints of civilization. They recognize a Supreme Being and a future state, but build no temples. The government is administered by four hereditary *toquis*, each of whom rules over one of the provinces into which their country is divided. The most important national questions are decided by the grand council composed of these *toquis*, or by a general assembly. In 1860, a French lawyer, De Tonneins, who had gained considerable influence among the Araucanians, proclaimed himself, under the name of Orélie Antoine I., constitutional king of Araucania. He was in 1861 taken prisoner by the Chilians and sent back to France. In the treaty of Jan. 22, 1870, the Araucanians promised to recognize the authority of Chili, but subsequently King Orélie once more made his appearance in Araucania and defied the Chilian troops. In 1873 financial agents of Orélie made great efforts to effect a loan in London. (See Molina, "History of Chili;" Edward R. Smith, "The Araucanians," etc., New York, 1855.)

Arauca'ria [said to be derived from Araucania (which

see)], a genus of plants of the natural order Coniferæ, natives of the southern hemisphere; all evergreen trees, distinguished by having the male and female flowers on separate trees, the pollen contained in from ten to twenty cases pendent from the apex of each scale, the female flowers two under each scale, each having one ovule. The *Araucaria imbricata*, or Chili pine, a native of the Chilian Andes, attains the height of 150 feet, and produces a seed which is an important article of food; also a fragrant resin in abundance. The timber is hard, heavy, and suitable for the masts of ships. This tree is cultivated as an ornament of landscapes. The Norfolk Island pine, which is about 200 feet high, is *Araucaria excelsa*, a noble tree, and Australia has two or three fine species.

Arau'co, a province of Chili, is bounded on the N. by Concepcion, on the E. by the Andes, on the S. by Valdivia, and on the W. by the Pacific Ocean. Area, 13,714 square miles. The soil is fertile, but as the ground is covered for a large part by forests, agriculture has made very little progress. The chief article of export is timber. Chief town, Arauco. Pop. in 1870, 87,677.

Arau'jo d'Azeve'do (Antonio), Count da Barca, a Portuguese statesman, born at Ponte de Lima May 14, 1754. He negotiated at Paris, and signed, a treaty of peace with France in 1797, but the French Directory annulled it. He became minister of foreign affairs in 1806. After Napoleon had invaded Portugal and captured Lisbon, Araujo accompanied the king, John VI., to Brazil in 1808. He was appointed minister of marine in 1814, and in 1817 sole minister. He was a man of various accomplishments; he wrote poetry and gained distinction by his scientific attainments. Died June 21, 1817.

Arau'jo Por'to-Alle'gre, de (Manoel), one of the most prominent poets of Brazil, was born at Rio Pardo in 1806. He was appointed in 1859 consul-general for Brazil to Prussia. His principal works are an epic entitled "Colombo," and lyric poems called "Brasilianas."

Aravul'li, or **Aravali,** a mountain-range of Hindostan, traverses Ajmeer, and is about 300 miles long. The highest summits are about 5000 feet above the level of the sea. It constitutes the watershed between the Arabian Sea and the system of the Ganges. The general direction of the range is N. N. E. and S. S. W.

Ar'baces [Gr. Ἀρβάκης], a Median general who revolted against Sardanapalus, captured Nineveh, his capital, and on the ruins of the Assyrian empire founded the kingdom of Media, about 876 B. C.

Ar'balest, or **Arbalast** [Lat. *arcuballis'ta*, from *ar'cus*, a "bow," and *ballis'ta*, "an engine for shooting;" Fr. *arbalète*], a name of the crossbow, which was much used in the battles of the Middle Ages. It was sometimes made of steel. The arrow or other missile was placed in a barrel or groove which was perpendicular to the cord or bowstring. The arrow discharged by these bows was called a quarrel.

Arbe'la, now **Arbeel** (**Arbil** or **Erbil**), a small town of Asiatic Turkey, in Koordistân, about 40 miles E. of Mosul. The modern town has some large mosques and bazaars. Arbela gave its name to the battle in which Darius was finally defeated by Alexander the Great, in 331 B. C., but it was fought at Gaugamela. Pop. about 6000.

Arbela, a township of Tuscola co., Mich. Pop. 870.

Ar'biter [a Latin word signifying "umpire"], a person chosen by parties in a controversy to decide a question; sometimes applied to a person who has the power of judging and determining, or who is able to control the destiny of others. Some cases among the ancient Romans were decided by an arbiter, especially when the parties differed in respect to the amount of money which one of them should pay to the other.

Arbitra'tion [from the Lat. *arbitror*, to "act as judge" (*arbiter*)], a submission of some matter in dispute to the judgment and decision of a person called an "arbitrator." It applies to civil cases only, and may be either oral or written. It is voluntary in its nature, as any party has a legal right to have an adjudication upon his case by a court of justice. Statute law sometimes makes arbitration compulsory, as where the investigation of a long account is necessary. Even after parties have agreed to submit a controversy to arbitration, one of them may withdraw his consent against the will of the other at any time before the hearing is closed. The only remedy of the other party is to bring an action for damages, which would usually be nominal. However, when parties enter into a contract, they may stipulate that no rights of action shall accrue under its provisions unless there is a submission on their part to arbitration; in which case the duty to submit becomes a condition precedent, and cannot be avoided. The result of the arbitration is termed an *award*. It is not, however, equivalent to a judgment of a court, and if not performed the regular course of the successful party would be to bring an action upon the award, and thus make it a judgment of a court. To avoid this inconvenience, statute law frequently provides that on reducing the submission to writing a clause may be inserted that the award may be entered on the records of a specified court as a judgment, whereupon it shall have the like force and effect. Having the characteristics of a judgment, the award falls under the control of the court, and modes are provided by which mistakes and errors may be rectified by judicial action. As a general rule, there is no review of the result of an arbitration. There are no methods of appeal provided, as the theory of the proceeding is that the arbitrator is to be the judge of the difference between the parties. This rule does not prevent the rectification of mistakes in matters of fact, nor does it include the case of fraud or the violation of the first principles of justice; as, for example, the act of hearing one party, and not the other.

Arbois, a town of France, department of Jura, about 25 miles S. W. of Besançon. It is celebrated for its wine, and has manufactures of paper and earthenware. Here are some Roman antiquities. Pop. in 1866, 5895.

Arbol-a-brea, the resin of *Canarium album* (an amyridaceous tree), from the Philippine Islands. Baup (*Ann. Ch. Phys.* [3], xxxi., 108) obtained several distinct principles from it.

Arbor'iculture [from the Lat. *ar'bor*, a "tree," and *cultu'ra*, "culture" or "cultivation"], the art of cultivating trees, includes the raising of plantations of forest trees for timber and fuel, and ornamental trees for landscape gardening; but the culture of fruit trees is commonly assigned to a separate head, or to horticulture and pomology. Arboriculture is becoming an art of increasing necessity in the U. S., as the native forests are rapidly disappearing by the consumption of wood for building, manufactures, railway structures, and many other purposes.

Its Importance.—Though at the present time the timber crop is more important than any other product of the land, yet little attention is paid to it by land-owners. We have extended treatises on the management of wheat, corn, and other grain crops, on the best systems of rotation, and on the many details of farm management, but little is said on tree-planting; and not one farmer in a thousand sufficiently appreciates the importance of growing young timber on an extensive scale to supply the deficiency which will soon be felt everywhere as our native woodlands are rapidly cut away. An approximate statement of the amount of consumption may serve to show the absolute necessity of urging the importance of arboriculture on the attention of land-owners at large. In the State of New York alone about 1,500,000 acres are cleared of timber in ten years; and in the U. S. about 3,000,000 yearly, or 30,000,000 acres in ten years, are stripped of their trees. Of the wood thus obtained, about 6,000,000 cords are consumed annually for railroad fuel; and over fifty million dollars' worth of ties has been used in the construction of the railroads of the Union. The wood value of freight and passenger cars is over seventy million dollars, and of wooden bridges fifty million dollars. More than one hundred million dollars' worth of sawed lumber is annually used for shipbuilding, cooperage, and the vast number of manufactures wherein this material is extensively employed. The wood used as fuel cannot be less than twenty-five million cords per annum. Such facts as these naturally suggest the same thoughts that were uttered three hundred years ago by the illustrious and far-seeing Bernard Palissy, when expressing "his indignation at the folly of men in destroying woods." He adds, "I cannot enough detest this thing, and I call it not an error, but a curse and calamity to all France; for when the forests shall be cut, all arts shall cease, and they who practise them shall be driven out to eat grass with Nebuchadnezzar and the beasts of the field. I have divers times thought to set down in writing the arts which shall perish when there shall be no more wood, but when I had written down a great number, I did perceive that there could be no end to my writing, and having diligently considered, I found that there was not any that could be followed without wood."

Forming Wood-plantations.—But we cannot ask land-owners to keep their old woods untouched. They cannot afford to hold a large amount of dead capital in the shape of the original forests. But new timber should be carefully restored as fast as the old is cut away. It is more economical to renew a dense growth of young wood, and to clear it off frequently, or once in about twenty years, than to allow the trees to grow a hundred and fifty years. The land will in the former case yield five or six times as great a quantity as in the latter. There are two modes of renewal. One is to clear away the old trees entirely, and to allow the new growth to spring up spontaneously or from the closely-cut stumps; and the other is to make new plantations on well-cultivated land. The value of the new growth

from the renewal of old trees depends much upon its character and denseness. To secure a good start, the old trees should be entirely cleared away, and not, as is too often the case, merely thinned out, leaving the middle growth standing, for the few scattered trees of medium size which remain will shade and greatly retard everything below them. Every farmer knows that no young crop can flourish under the shade of thin woods. Young trees require the same advantages of air and sunshine as Indian corn, and shaded trees grow only one-fourth or fifth as fast as those under full exposure. To induce free sprouting from the stumps the old trees must be cut away in autumn, winter, or early spring, and not while growing or in full leaf.

Thinning.—The young plantations having been started a few years (cattle being carefully excluded), the first work is thinning. If this is not attended to, trees will crowd and enfeeble each other. The first thinning may be done when the trees are large enough for hoop-poles. The more crooked and feeble growth may be cut out, leaving the best and straightest at as uniform distances as practicable. If the plantation is a fine one, the hoop-poles will more than pay the interest on the land, if not afford a handsome revenue. The first thinning may leave the trees about four feet apart, and should never be so severe that the shade and fallen leaves will not prevent the growth of grass—the leaves mulching the surface. It will be found more convenient, when the growth is abundant enough, to leave the thinned trees as nearly as practicable in straight lines, to allow the free passage of wagons for drawing out the timber. A good approximate rule for distance in successive thinnings, as the trees become larger, is to allow a height of two or three times as great as the distance asunder. If too much sunlight is let in, the growth of side-limbs will render the timber knotty; if too little light is admitted, the trees will be feeble and slender. Experiments show that thinning not only increases the amount of wood grown in a given time, but renders it more valuable and free from defects. A well-managed wood-plantation, on fertile soil, will yield an amount of wood equal to forty cords per acre if cut every twenty years, or two cords per acre annually.

Raising trees from seed, although attended with more labor and care at first, gives more perfect and profitable plantations in the end. The land must be well prepared by ploughing, as for corn or other farm-crops. The seed may be planted in drills or in hills, like corn, and the young trees kept well cultivated a few years, till large enough to shade the ground. If the seeds are of free-growing kinds, the hills may alternate the first year with hills of corn; or if in drills, the corn and trees may be in alternate rows. Such large seeds as those of the chestnut, black walnut, hickory, and oak may be planted in this way, if the seeds have been properly kept through winter. To ensure evenness, a surplus of seed should be used, and the supernumerary plants afterwards thinned out. The smaller and more delicate kinds of seeds should be planted in seed-beds of fine mould, and covered by sifting it over them, and the trees transplanted into rows when they have attained a few feet in height. The depth for covering all these seeds may be nearly determined by observing the general rule (liable to slight exceptions) of burying them at a depth of about three times, and never more than five times, their diameter. At a much greater depth few of the young plants will find their way to the surface, and in most germination will be prevented. The only objection to planting very shallow is the want of sufficient moisture to sprout the seeds. Young evergreen seedlings, in addition to the care here prescribed, will require a partial shading through most of the first summer, gradually removing it to harden the young plants. With the larger seeds which have a horny covering—such, for instance, as the chestnut and horse-chestnut—entire failure to germinate commonly results from permitting this covering to become dried and impervious to moisture; and the only way, therefore, to ensure success is to plant them soon after the seeds ripen, or to keep them from drying by packing in moist sand or pulverized moss. It is for this reason that experiments in planting chestnuts which are bought in market nearly always fail.

Transplanting young trees from seed-beds, after they have been once removed to nursery-rows, is extensively adopted in Britain and other parts of Europe for obtaining woodlands. Setting them out when not more than three or four feet high is attended with less labor, less check in growth, and more certainty of all the trees surviving, than if taken at a greater size. Setting out very large trees is never profitable for any purpose. Much more depends on a good deep soil and thorough after-culture for a few years. The great arboriculturist Loudon confidently affirmed that he could show larger, finer, and more luxuriant trees in five years by setting those of moderate size in deeply-trenched ground, and giving them constant cultivation, than could be obtained in a shorter period by the removal of larger ones—an assertion that was corroborated by the experiments of Sir Henry Stewart in the moist climate of Scotland, where he formed in a single year a landscape garden of large trees set out at great expense, these trees never entirely recovering from the sickly appearance which their removal gave them.
